There will be in all seventeen electric lifts. Fifteen of these will be passenger lifts arranged for load up to 800 lbs. Four of these lifts will travel at a speed of 300 ft. per minute, the height of travel being 148 ft., and the lifts will each serve eleven floors. There will be six express lifts running at a speed of 400 ft. per minute, serving seven floors; two express lifts running at 400 ft. per minute, serving three floors; two express lifts travelling 163 ft. at a speed of 400 ft. per minute, serving three and four floors respectively; and one lift with a travel of 208 ft. at a speed of 400 ft. per minute, and serving six floors. The express lifts will run at full speed until reaching the first floor which they serve, and will then slow down automatically to a speed of about 200 ft. for serving the upper floors. These lifts will be arranged in batteries similar to those in the large buildings in America. Ten of these lifts will be arranged in centre of building, six being express lifts, and four similar lifts will be arranged at the Pierhead entrance. The machines will in each case be fixed overhead.

The motors will be manufactured by the J.L. Manufacturing Co., Ltd., and will be rated at 25 h.p. The motors will be coupled direct to machine-cut worm and wheel winding gear, with case-hardened steel worms and wheels, which will be of large diameter with cast-iron centres and rim, and teeth of phosphor-bronze enclosed in cast-iron case, the thrust of the shaft being taken by Hoffman ball bearings. Each gear will be fitted with large V-grooved winding sheave arranged to plumb from centre of cage to centre of countrweight, and provided with an outer bearing on the end of shaft, supported by bracket from the cast-iron base plate upon which the whole machine is mounted. Each cage will be suspended by four best steel wire ropes, and counter-balanced by a cast-iron weight.

The cages will be constructed with steel frame and suspension bar, with special safety gear fitted beneath the cage and operated in case of failure of suspension ropes by an independent safety rope. A special speed governor will also be provided to prevent undue acceleration when travelling. The cages and balance-weights will be guided by special tee iron runners with gun-metal guides mounted on each cage and weight.

The controller will be specially designed to secure correct acceleration and accurate control, and provided with special automatic slowing-down device so as to reduce the speed whenever the lift is approaching a stop.

D

Digitized by Google

Each lift will be fitted with bell and indicator, and a special flash-light indicator will be fitted to each floor so as to indicate the position of the lift.

There will also be two goods lifts, each of which will be designed for a load of 1 ton at speed of 150 ft. per minute, travelling 165 ft. These lifts will also be operated by electric control with car switch. Special interlocking gear will be fitted to all gates both for passenger and goods lifts, to prevent any gate being opened unless the cage is opposite same, and to prevent the lift being started unless all the gates are properly closed.

COMPRESSED AIR SPARK-GAPS FOR WIRELESS TELEGRAPHY

By C. C. F. Monckton

IN some recent experiments on the reception of radiotelegraphic signals when transmitting with a spark-gap in compressed air, as compared with signals received when an ordinary spark-gap was used, the aerial circuit consisted of a raised capacity averaging 60 to 70 ft. from the ground with a spark-gap, three turns of inductance and a capacity formed of a network of wires lying on the ground. This aerial was charged by a 12-in. induction coil with hammer make and break. The relative surging currents in the aerial were measured by a hot-wire instrument in a secondary circuit in tune with the sending circuit. The make and break of the induction coil was not adjusted except when stated. The pressure readings were measured above the atmospheric pressure. Signals were received at a station sixty miles distant with a very similar aerial, in tune with the sending aerial. Three turns of inductance 9 in. in diameter in this circuit formed the primary of a receiving transformer. The secondary consisted of 48 quadruple turns of 19/0·005 mil. wire on a bobbin 8 in. in diameter, in series with an adjustable condenser set at 0·00014 mf. A recorder with mercury-steel revolving coherer was placed as a shunt across this condenser. This adjustment of the condenser made the secondary circuit in tune with the sending circuit.

Experiments were carried out as follows:—The sending key was pressed for a short interval to enable readings of the surging current, and the current taken by the induction coil. Then a letter of the alphabet was signalled for two minutes. At the receiving station the only adjustment made was to determine the greatest distance that the secondary coil could be removed from the primary and good signals recorded. In general, if the secondary coil were removed 1½ in. further, the signals were still readable, but if removed another inch only flicks were recorded.

The distance between the coils was measured edge to edge.

In the table below let—

P = Air pressure above atmosphere round spark-gap in lbs. per square inch.
C_1 = Current through primary of induction coil in amperes.
U = Pressure at terminals of primary of induction coil in volts.
C_2 = Relative surging current in aerial.
D = Distance between primary and secondary coils of receiving transformer in inches.
L = Length of spark-gap in ordinary air in inches.

Table I.—*Spark-gap $\frac{1}{10}$" in Compressed Air.*

P.	C_1.	V.	C_2.	D.	Remarks.
0	3	10	0·6	0	Signals unreadable
10	4¼	10	1·15	1	
15	4½	10	1·25	1⅜	
20	4¾	10	1·3	2¼	
30	5	10	1·4	3	
40	5	10	1·45	4	
50	4⅜	10	1·4	5¼

Table III.—*Spark-gap ⅛ inch in Compressed Air.*

P.	C_1.	V.	C.	D.	Remarks.
0	4½	10	1·3	2¾	
10	4¾	12	1·5	4½	
15	5½	12	1·55	5⅜	Make and break adjusted.
20	5½	12	1·75	5¼	
30	7	12	2·20	0	Spark failing: no signals.
40	7	12	—	—	No spark.
20	6½	14	1·9	6	Make and break adjusted.
30	7⅓	20	2·4	7	Do.
40	8¾	20	—	—	No spark.

An attempt was made to signal with a $\frac{1}{20}$th inch spark as follows:—

Table IV.

P.	C_1.	V.	C_2.	Remarks.
40	3½	10	1·25	No signals received.
50	3¾	10	1·48	Do.

Resonance curves were taken with the ordinary spark with the spark in compressed air. Very similar results were obtained. Then the earth capacity was raised 30 ft. from the ground and more resonance curves taken.

In the following table, R = condenser reading in subsidiary circuit in degrees, C_2 = surging current in subsidiary circuit when ordinary $\frac{3}{16}$-in. spark was used, C_3 = surging current in subsidiary circuit when $\frac{1}{10}$-in. spark in air compressed 40 lbs. per sq. in. was used.

Table V.—*Resonance Currents.*

Induction coil current 4¾ amperes.
" " pressure 20 volts.
Condenser 10° difference = 0·000105 mf.
Condenser reacting 50° = 0·00084 mf.

R.	C_2.	C_3.	Remarks.
20	0	0	
30	0·1	0·1	
40	0·8	0·7	In taking all the surging current readings there was a considerable variation. The current was rather more steady with the compressed-air spark-gap than with the ordinary spark-gap.
45	1·5	—	
48	1·75	2·35	
50	2·4	2·45	
52	1·6	1·95	
55	1·0	1·4	
60	0·7	0·9	
70	0·4	0·6	
80	0·3	0·5	

Contrary to expectations, the results appear to show that there is no advantage in using compressed air round the spark-gap. At the same time that the dielectric strength of the air is enormously increased, so also is the resistance to the oscillatory spark; both appear to increase at about the same ratio.

Supply Statistics for Switzerland.—According to the annual returns of the electricity works in Switzerland, published in the 1910 year book of the Swiss electrotechnical societies, there were 636 supply undertakings in the country at the end of 1909 (excluding purely traction stations), as against 607 for the year 1908. Of these, 235 were purely generating concerns, 57 were combined generating and transforming concerns, and 344 were transforming concerns only. Full particulars were available from 176 generating stations, with a total capacity of 217,400 kw. Of this, 66,000 kw. was purely water-power, and 146,000 kw. was in combined water-power and heat-engine stations.

Tramways & Light Railways Association.—As we have already announced, the annual congress of this Association will be held on Thursday and Friday, May 12th and 13th, at Dublin. Papers will be read during the congress as follows: Mr. R. S. Tresilian, Secretary, Dublin United Tramways Co.; Mr. Fred Coutts, General Manager, Paisley & District Tramways Co.; Mr. Harry England, General Manager, Wakefield & District Light Railways Co.; Mr. J. R. Salter, General Manager, Lancashire United Tramways Co.; and one or two others to be announced later. A short discussion will follow the reading of each paper. The headquarters of the Association during the Congress will be at the Imperial Hotel, Lower Sackville Street, Dublin.

Electric Smelting in Norway.—During the last few weeks some important trials of the smelting of iron ore in electric furnaces have been made by the Tinfos Co., of Tinfos, near Notodden, Norway. The ore is that obtained from the mines near Kragero and Arendal, and the plant is of such a capacity that some two tons of iron have been produced per day of 24 hours. The company intends to continue the experiments with a view of erecting large iron works at Notodden. A Government Committee has visited the experimental plant, and the members have expressed great satisfaction with the results. It is stated that the smelting industry had declined owing to the increase in the price of fuel, and that a fresh impetus is expected with the application of water-power to supply the necessary energy for electric smelting.

MOTORS FOR INTERMITTENT WORK

DR. R. POHL read a Paper entitled "Rating and Testing of Motors for Intermittent Working," before the Yorkshire Local Section of the Institution of Electrical Engineers on Thursday, March 10th. Under intermittent work he included cases where the alternate periods of work and rest were both short, so that the temperature reached a practically constant value. The chief point to be considered was the formulation of conditions for a short test run which should be equivalent in the temperature which they produce to the actual cycle of operations for which the motor is intended.

In view of the variability of the load, the load factor is better defined as the ratio of the square of the virtual current to the square of the full-load current than simply as the ratio of the time of running to total time. Heavy starting currents can thus be taken into account.

A motor working with a definite load factor will have a temperature curve as shown in Fig. 1, consisting of parts from the heating and cooling curves.

A continuously running motor has reached its final tempera-

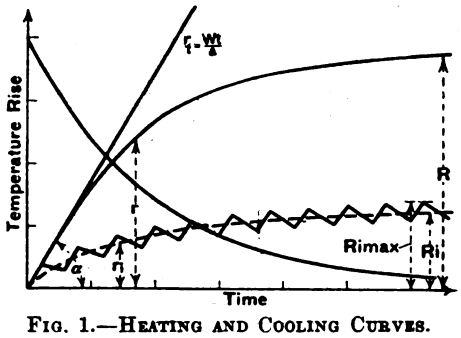

FIG. 1.—HEATING AND COOLING CURVES.

ture when the rate of heat dissipation is equal to the rate of heat generation.

An intermittently running motor will similarly have a final temperature rise—

$$R_i = \frac{W_m}{b}$$

provided that the rate of cooling, *i.e.*, the value of b, is the same whether the motor be running or standing. Hence, from the definition of load factor

$$R_i = \frac{W \times f}{b} = R \times f.$$

The heating curve is an exponential curve of the form—

$$r = R\left(1 - e^{-\frac{t}{T}}\right)$$

where T = time constant of the motor (in hours), and t = length of run (in hours).

The value of T may be expressed as $\frac{a}{b}$ where a = watt hours stored for degree of temperature rise.

For the consideration of test runs of half an hour or less, however, with which we have mostly to deal in practice, we may greatly simplify the result, and use the approximation

$$R_t = \frac{Wt}{a}.$$

Whilst the final temperature rise of an intermittently running motor with given loss depends on the factor b, we now find that the rise after a short full-load run depends on the factor a, and that the latter consists of constituent parts altogether different in character from those forming b. The temperature rise under working conditions is determined by the heat-dissipating properties—*i.e.*, mainly the surface; that under conditions by the heat-storing properties—*i.e.*, mainly by the weights. These two properties are practically independent of each other. It is on account of this essential difference that a short time run is in principle unsuited as a test for intermittently running machines.

The connection between the temperature rise under working conditions and that after a short full-load run are then gone into, and it is pointed out that this depends on the knowledge and character of the time constant. Fig. 2 gives curves for arriving at the conversion factor for half-hour rating. The value of the time constant, however, is not easily ascertainable, and examples are given showing variation from 1·35 for a 10 h.p. motor at 900 r.p.m., at quarter-load factor, to 3 for a 100 h.p. motor at 400 r.p.m. Indeed, the value is not even constant for a given machine, because some of the factors forming it, chiefly the specific dissipation, depend on the speed.

The variability of T necessitates its experimental determination from heating and cooling curves, if any reliable information about the temperature under working conditions is to be obtained from the results of a short time run. Without experimental determination of T the results of a short time run are of little value. The average purchaser of a crane-rated motor, however, cannot be expected to be conversant with these facts.

There are rare instances in which the experienced crane-maker specifies one-hour tests for the larger, and half-hour tests for smaller size motors, and occasionally special requirements are indicated. But the general practice is to specify half-hour tests indiscriminately, and without any reference to the time constant or the load factor.

The results of these short time tests, however, are very misleading, and the conversion of the results by means of the time constant cannot be regarded as a practicable proposition. The customary testing practice places the problem before the designer of producing a motor with a minimum cost of material capable of giving a specified output for, say, half an hour, without its temperature rise exceeding a certain limit. The loss in

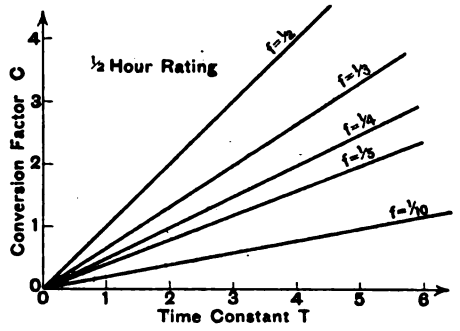

FIG. 2.—CONVERSION FACTORS FOR HALF-HOUR RUNS.

watts for a given output cannot very well be reduced below a known minimum, and the temperature after a run of half an hour depends otherwise only on the heat-storing qualities. With this in view, a heavy cast-iron carcase may be used in place of a light steel frame, and the weight of the other inactive portions may be increased, keeping at the same time the heat distribution factor as high as possible. On the other hand, there is little inducement to pay much regard to the cooling properties which do not directly enter the problem. The final temperature rise under working conditions, however, does not depend at all on the weight, but on the cooling properties, and as these are not appreciably improved, the alterations merely result in a larger time constant, but not in a genuine increase in the capacity of the machine under working conditions.

Thus the practice of short time tests, in addition to being deceptive, is leading the progress of design into wrong channels by establishing a false basis of rating. Indirectly, it retards healthy developments; such, for instance, as improvements in the dissipation from the surface of totally enclosed machines. The test adopted should give direct and reliable information on the temperature rise of the machine under working conditions. It must take the load factor duly into account, which in every instance is to be specified. The factors which determine the temperature rise during the test should be identical with those on which it depends under working conditions, *i.e.*, the heat dissipating qualities, and the method adopted must thus indirectly lead to the cooling surface, and not the weight, being considered the basis of rating.

The real load curve must inevitably be replaced by a curve of more simple form, yet equal load factor, and the duration of the working period will have to be extended.

After discussing various suggestions, Dr. Pohl puts forward the following specification. The temperature rise of machines for intermittent working shall be found by subjecting them to a prolonged test, consisting of successive periods of running and of rest. The running time to be ten minutes, the standing time adjusted in accordance with the specified load factor; the duration of the test to be sufficient for the mean temperature to attain a practically constant value. The last run to be of five minutes' duration, immediately after which the temperature is to be measured.

Another system of testing, which avoids the objections of

Digitized by Google

frequent starting and stopping, is to replace the curve of irregular and intermittent load by one of constant and continuous load, adjusted in such a manner that the loss becomes practically equal to the mean loss under working conditions. Now the mean loss is approximately equal to $W \times f$, therefore the object will be obtained though not accurately, yet nearly enough for practical purposes, if we run the motor continuously with its pressure, and current reduced in proportion to the square root of the load factor, *i.e.*—

$$\text{Test voltage} \ldots = \sqrt{f} \times \text{normal voltage.}$$

$$\text{Test amperage} = \sqrt{f} \times \text{normal amperage.}$$

It is obvious that first of all the copper losses throughout the motor will be exactly f times the copper losses at full load, as desired, and this applies both to the armature and field, whether the motor be shunt or series wound.

The iron losses in the armature are also reduced approximately in the desired proportion on account of both the flux and the speed being smaller than the normal. The friction losses are the only ones which are reduced appreciably less than in the desired ratio.

Taking the sum of all the losses, we find they are very little higher than $W \times f$. The method is applicable to all stationary machines, such as transformers, and also sufficiently accurate for totally enclosed motors for intermittent working; but an objection, however, seems to stand in the way of the employment of a continuous test for all ventilated motors. The temperature of these machines being dependent not only on their losses, but to a large extent on the effectiveness of their ventilation, it will be argued that in spite of the equality in losses, the temperature rise after a continuous test must be lower than it will be under working conditions, when the motor is standing for a considerable portion of its working period. To what extent this argument is correct depends firstly on the importance of the ventilation on the temperature rise generally. In this connection it must be remembered that nearly all crane motors are slow-speed machines.

The test speeds, however, are considerably less than the full-load speed, and an intermittently working motor revolves in practice for a much greater portion of the total period than its load factor f indicates. In the case of series motors the ventilating effect is still further increased during the periods of reduced load on account of the rise in speed. The temperature rise of an intermittently working motor of the ventilated type depends therefore not only on the load factor, but on the whole shape of the load curve. Considering the uncertainty as to the temperature rise of ventilated motors due to the large variety of load curves corresponding to the same load factor which are found in practice, I come to the conclusion that the continuous test is applicable to ventilated machines as well as to totally enclosed ones. In the case of shunt-wound crane motors, we have to distinguish between the load factor of the armature, and that of the field. It will be found in most cases that they do not differ much from each other, and that the test as above described is directly applicable. Otherwise the following modification of the continuous test might be specified:—

$$\text{Test voltage} \ldots = \sqrt{f_{\text{field}}} \times \text{normal voltage.}$$

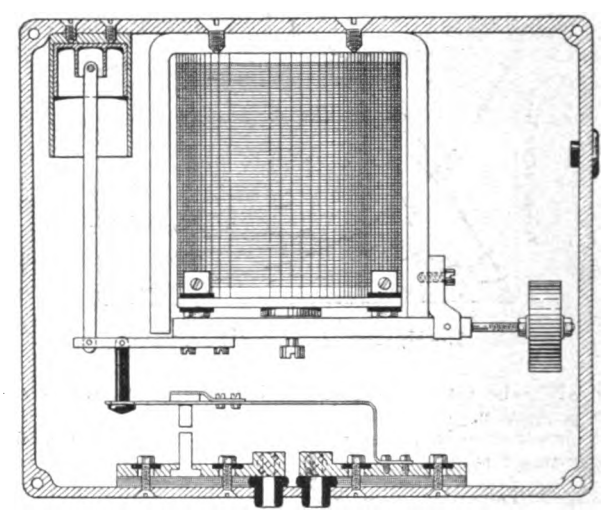
$$\text{Test amperage} = \sqrt{f_{\text{arm}}} \times \text{normal amperage.}$$

The continuous test is also applicable to all alternating-current machines, where necessary, with slight modifications.

Discussion.

Mr. Wilson Hartnell thought that too little attention had been paid in the Paper to the cooling curve, which was a very important matter. The gist of his argument was that a motor cools more quickly when at a high temperature than at a lower one at the beginning of a test. He contended that by testing a few motors to obtain their rising and falling temperature curves such practical results could be obtained that it was possible to foretell the final heating of a motor when tested only long enough to obtain the initial portions of its own curves.

Mr. A. J. Cridge (Electricity Department, Sheffield Corporation) suggested that the Institution should take in hand the formulation of a satisfactory specification for the testing of both continuous and intermittent running motors.



Mr. H. E. Yerbury (Electrical Engineer, Sheffield Corporation Tramways) would disassociate traction motors from crane motors, as the former would not be considered intermittent or short-period service motors. He advocated that all motors should be tested above their full working load with no attempt to copy actual working conditions, as, unless there was a margin in safe temperature rise above the working load, trouble would arise sooner or later.

Mr. Wardale (Sheffield) said that auxiliary motors used on battleships were always subjected to short-time tests. He suggested that Dr. Pohl should test a set of motors according to his proposed method, and then test them again in actual service on a crane and compare the results.

Dr. Pohl, replying, agreed with Mr. Hartnell that the initial rate of cooling was more rapid when the temperature was high than when it was low. The very complication of the present methods of arriving at the value of T induced him to search for a more practical method of testing. If they had Institution rules it would tend to standardisation and reduce the number of special designs. Mr. Wardale's suggestion for a dual test would not give any valuable results, as crane duty is very variable.

A TIME RELAY FOR BELLS

THE accompanying illustration shows a form of relay which has been specially designed by the M. & C. Manufacturing Co. (Conduit Place, Paddington) for use with lift bells on the Tube Railways. Bells are provided, which are caused to commence ringing as soon as an approaching train enters a certain section of the line through the action of relays connected to the track signalling circuit; and the object of this new relay is to interrupt the bell current after a definite interval (in practice about seven seconds), as otherwise it would

"M. & C." Time Relay.

continue to ring as long as the train was on the section in question. The action of the apparatus is very simple. The armature is connected to a dash-pot so that it takes some time to be drawn up, and it is only at the close of its travel that the head of the pin engages with the contact spring and lifts it. The apparatus is substantially made, and carbon contacts are provided. The coil is necessarily of a considerable number (over 5,000) of turns as the apparatus has to work with the signalling current which is as low as 0·043 ampere.

Wireless Telegraphy.—Crystals of the same substance vary greatly in their sensitiveness and in the treatment they should receive to obtain the best results for detecting electro-magnetic waves. It would appear that generally, to obtain the most sensitive results, there should be a very slight contact between the substances employed, but if a crystal can be found sensitive under a fairly hard pressure, the adjustment remains constant for a considerable time. Mr. S. R. Drayton, the chief operator on the Trinidad Government stations, finds that, of all the contact detectors at present tried, the silicon is the most reliable. Using no battery for ordinary working and a fairly hard pressure, this detector remains in adjustment for several weeks if it be short-circuited when transmitting, and a knock does not throw it out. To test if the detector be in adjustment, a fraction of a volt is switched on to the detector and telephone receiver in series; the click in the telephone tells whether the adjustment is correct.

According to a recent note in *The Times*, the Royal Mail Steam Packet Company have arranged for an installation of wireless telegraphy in their steamer the *Nile* for the Brazilian service. The Liverpool and North Wales Steamship Company will have an installation in *La Marguerite*; the Lloyd Brazileiro Steamship Company will have installations in 18 more of their ships; the Pacific Mail Steamship Company will have the United Wireless Company's (de Forest) system in the *Manchuria*, the *Mongolia*, the *Siberia*, the *China*, and the *Algoa*. The Norway, Mexico, and Gulf Steamship Company will use wireless in two of their boats, while the Union Oil Company, California, will have installations of the United Wireless system in three steamships.

NEW GENERATING STATION AT DUNDEE

FOR some time the resources of the original generating station at Dundee have been insufficient to keep pace with the rapidly increasing demand for current for lighting, power, and tramway purposes, and it was none too soon that the fine new generating station at Carolina Port, designed by Mr. H. Richardson (City Electrical Engineer), was opened by Prof. J. A. Ewing, F.R.S. The new station has several interesting features, and presents a good example of a compact, up-to-date plant with large turbo-generator units and remote control switchgear.

The site is advantageous in being near enough to the Tay to enable condensing water to be taken from and returned to that river without the use of cooling towers, although coal has to be brought by railway, but is disadvantageous in that, owing to the nature of the ground, expensive foundations were required. The station is built on foundations consisting of over 300 ferro-concrete piles driven some 30 ft. into the ground, over which is a "raft" of reinforced concrete, a material used also somewhat extensively in the construction of the building itself. The general arrangement is seen from the section in Fig. 1. It may be said to consist of four parallel bays devoted to coal storage, boilers, turbo-generators, and switchgear respectively. One end is closed by a temporary partition, so that extensions can be made by prolonging each bay and repeating the units of each part of the equipment. At present two units only, each of 2,000 kw. capacity, are installed.

The coal-handling plant is very complete. Coal is brought in trucks by an electric locomotive (supplied by the British Thomson-Houston Co., Rugby), and these are emptied into a hopper by a tippler driven by a 4 h.p. electric motor. From this receiving hopper the coal is taken by a tray conveyor to the main bucket conveyor, which carries it to the overhead bunkers of 700 tons capacity, situated over the firing floor. This conveying plant, as well as the boilers, was supplied by Messrs. Babcock & Wilcox, Ltd. The latter, four in number, each of an evaporative capacity of 20,000 lbs. of water per hour, are of the usual double-drum water-tube type, fitted with chain grate automatic stokers, and integral superheaters, giving a superheat of 150° F. The economisers are placed immediately behind the boilers, and the flues have been kept as short as possible. The single chimney is between the two groups of boilers, and natural draught is relied on entirely. The feed pumps are steam-driven, and their exhaust, which is not allowed to mix with that of the turbines on account of its greater proportion of oil, is employed to heat the feed water.

The two units of generating plant forming the initial equipment each consists of a 2,000 kw. 6,000-volt 50-cycle four-pole alternator, of Messrs. Dick, Kerr & Co.'s standard high-speed type, with direct-coupled exciters, running at 1,500 r.p.m., and driven by a Willans-Parsons standard turbine fitted with a hand-operated overload bye-pass valve and electrical control to the governor. Each set is capable of an overload of 25 per cent. for two hours, and 50 per cent. for half an hour. The generators are arranged so that the stators can slide lengthways to give access to the rotors, and are ventilated through air passages from below. The condensing plant, which, as usual, is placed immediately below each turbine, is of the "contra-flow" pattern; with Edwards' electrically-driven air pumps, and is mounted on springs to allow for expansion. The air-pump discharge is pumped by a separate force pump up to the engine room floor, where it is measured by a Lea recorder.

One of the most interesting features of the station is the pumping system for the circulating water, which, as already mentioned, is derived from the River Tay. A section of the pump room, sunk in the riverside is shown in Fig. 2. A pair of vertical shaft 16 in. centri-

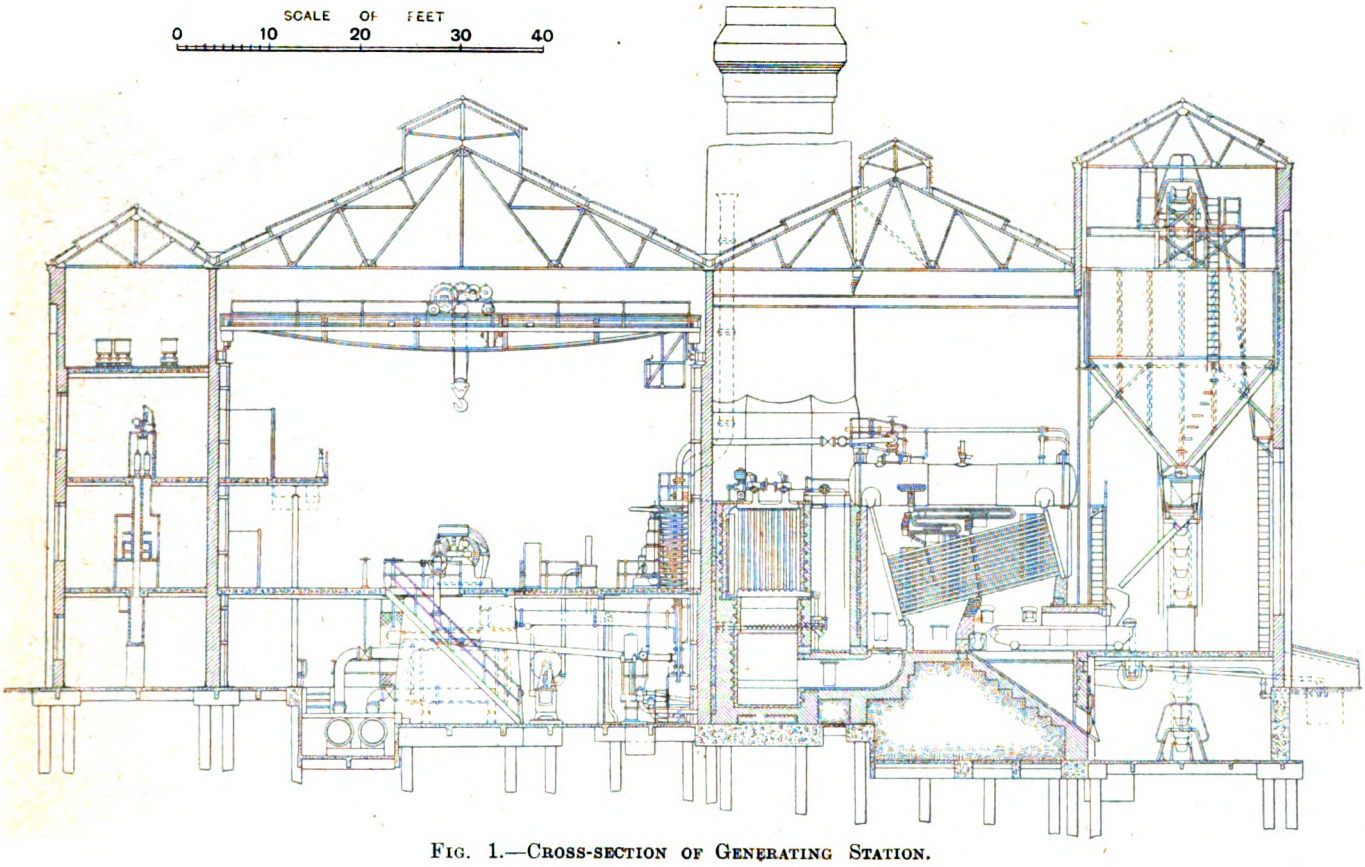

Fig. 1.—Cross-section of Generating Station.

Digitized by Google

fugal pumps, driven by 63 b.h.p. direct-coupled motors, are installed, and these are controlled entirely from the engine room. The maximum rise and fall of the tide amounts to about 18 ft., and in order to reduce the power required and avoid constant regulation due to the varying head, a closed system of piping with the outlet of the discharge pipe below the water level was provided. To make sure that water can always be obtained in emergencies, the pumps are placed below the lowest water level, and should the syphonic action fail, they can be speeded up to supply the full quantity of water. The main pipes are 30 inches diameter, and an air pump connected to a

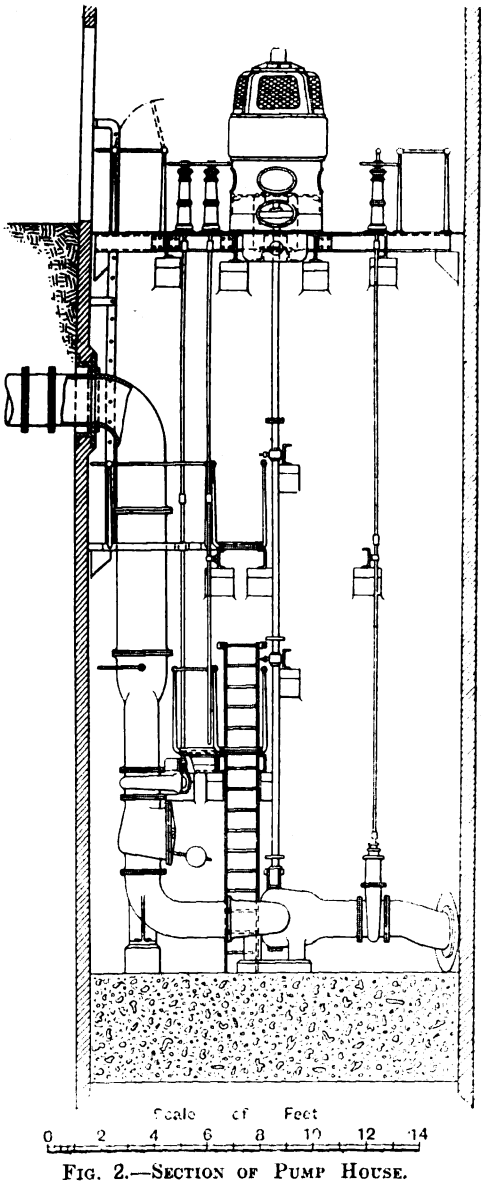

Fig. 2.—Section of Pump House.

barometric pipe is provided to remove air which has been carried in with the water. The engine room plant is completed by two 300 kw. motor generators, providing continuous current to feed the district near the station, and to supply auxiliaries, two steam-driven auxiliary sets serving as exciter and auxiliary stand-by sets, and a 15 kw. motor-generator used for charging a small Tudor battery used principally in connection with switchgear control circuits.

The main switchgear is situated in its own portion of the building, but the operating gallery, which contains also the continuous current board, overlooks the engine room. The whole was supplied by the British Thomson-Houston Co., and embodies their latest form of motor-operated oil switch, in which the actual opening and closing is performed by springs afterwards coiled up by the motor ready for the next operation. The gear is arranged on three floors; the lowest contains the cable dividing boxes, the static dischargers for the outgoing feeders, and the isolating switches. The 'bus-bars in their moulded concrete cells are on the first floor, and the oil switches themselves on the third floor. Triple-pole time-limit overload relays are used on the feeder and motor generator switches, while the generator switches are protected by Andrew's reverse power relays. A Tirill regulator takes charge of the constancy of the 'bus-bar voltage, and a complete system of indicating lamps is provided in connection with the switches. There are two separate sets of 'bus-bars, but these can be coupled when required by an oil switch.

The E.H.T. supply is taken to three sub-stations at Clepington, Dudhope, and Lochee, all equipped with rotary converters, supplied by the British Westinghouse Co., and provided with special boosters, so that they can be used for either the traction or the lighting supply.

B.T.-H. MAZDA LAMPS WITH DRAWN TUNGSTEN FILAMENTS "Mazdawire."

SINCE the first introduction of the tungsten lamp, many improvements have been made in the processes of manufacture of the pressed or built-up tungsten filament with the object of increasing its strength, and, although a large measure of success has been attained so that the best filaments now on the market have the appearance of sound wires, they still have low tensile strength and small resistance to flexure.

The processes which have hitherto been used are well defined: the first, which has been enormously successful, being the process in which the metal is shaped by means of a carbonaceous binder, which by a subsequent treatment is eliminated; another process is one in which the plastic colloid of tungsten alone is used as the basis for forming filaments, and another the B.T.-H. patented process in which the tungsten is held together by a ductile alloy which is shaped by drawing or pressing into the filamentary form and then treated to remove the metal binder.

These processes have been carried to a high state of perfection, and lamps are now made which have been proved to be thoroughly satisfactory for the market requirements. But in a new art, such as tungsten lamp manufacture, it is inevitable that radical developments will take place from time to time owing to the continuous striving of all the manufacturers to perfect their product. For several years the resources of the research department of the General Electric Company of America have been devoted to the development of a process of manufacture which would so condition tungsten that it can be drawn into filaments, and the British Thomson-Houston Company, who are the owners of the patent rights in Great Britain, are now able to announce the successful result of this work, and their patents claim this invention broadly. An abstract of the patent appeared in our issue of January 6th, 1910 (p. 5).

The B.T.-H. Co. will shortly place on the market lamps containing pure drawn tungsten filaments, which, they inform us, are as strong as steel of the same section. This remarkable result has never hitherto been achieved, and has been stated by the majority of the well-known metallurgists and workers with tungsten to be impossible of achievement. But by the process in question tungsten of surprising ductility and strength is produced, so that it becomes possible to draw it into the finest filaments necessary for incandescent lamps.

Until the process of manufacture is fully established, the drawn filaments will only be supplied on one or two types of lamps.

HIGHGATE HILL TRAMWAYS

TRAFFIC was opened on Friday on the Highgate Hill section of the L.C.C. tramways. The line was previously worked on the cable system by a company, but after a period of disuse, has been equipped electrically on the conduit system by the London County Council. A six-minute service is to be run, and special cars, somewhat smaller than the standard L.C.C. cars have been constructed. The chief point of interest in the equipment is the provision of an entirely new form of mechanical brake of great power, for use on the hill, which acts on the slot rail, gripping it simultaneously from above and below. For this purpose a specially constructed slot with heavier rails than usual has been provided. The new line forms a connection at the Archway Tavern with the London County Council lines to the City, Holborn, and Euston Road, and also with the Metropolitan Electric Tramway Company's line to Finchley and High Barnet.

THE WILLANS-IMPULSE "DISC AND DRUM" STEAM TURBINE

THE new pattern of steam turbine which has recently been introduced by Messrs. Willans & Robinson, Ltd., of Rugby, under the name of the Willans-Impulse "Disc and Drum" type turbine, is a combination of the impulse and Parsons turbine, and differs from the present Willans-Parsons turbine in that a single impulse disc is substituted for the high pressure part of the drum. This reduces the length between the bearings by about two-thirds, and is said to eliminate the weak points both of the Parsons and of the impulse turbine.

The steam is expanded in the nozzles of the turbine from boiler pressure down to atmospheric pressure, after which the velocity generated is extracted in a compound velocity disc fitted with two rows of revolving impulse blading and one row of fixed impulse blading. This disc is bolted direct to the low-pressure drum. The same pressure exists on both sides of the disc, which is therefore steam-balanced. The steam, after leaving the disc at atmospheric pressure and temperature (but with the velocity extracted from it) then passes to the rows of Willans-Parsons blading mounted on the low-pressure drum. In this way the turbine has large clearances at all points, and has the great advantage that in most cases steam is not admitted to it at a greater temperature than 212° F. In other words excessive temperature and consequent distortion is confined solely to the nozzle box or nozzle passages, the casing and rotor not being exposed to steam of a higher temperature than 212° F., excepting in special cases. Where steam at a higher temperature than 212° F. is admitted to the turbine, the temperature is still much below that at which steam is admitted to a turbine of the pure Parsons type. This design is further claimed to ensure maximum economy over a wide and varying range of load, due to the fact that the high-pressure steam to the impulse disc is controlled by nozzles which can be opened or closed automatically or by hand.

The same method of connecting the two end-shafts to the "drum" has been adopted, as in the standard Willans & Robinson turbines. The single impulse disc is fitted between the drum and the end-shaft at the high-pressure end, and in no way interferes with the rigid attachment of the end-shaft to the drum. The low-pressure drum is balanced by means of a piston at the low-pressure end of the turbine on the Fullagar system, instead of at the high-pressure end. This means that the low-pressure drum is balanced by steam being admitted to the exhaust end of the drum, so that the low-pressure gland at the exhaust end of the turbine has atmospheric pressure on both sides of it, thus avoiding the tendency of steam to leak outwards, or of air to leak inwards.

REDUCTION IN THE PRICE OF METAL FILAMENT LAMPS

AS will be seen from our advertisement pages, the General Electric Company, Ltd., announce reductions in the price of certain sizes of Osram lamps which will come into force to-morrow, April 1st. The 100–135-volt 25-, 32-, and 55-watt lamps will be reduced from 3s. to 2s. 9d. each, the 200–260-volt 32- and 40-watt lamps from 4s. 3d. to 4s. each, and the 200–260-volt 55-watt lamps from 4s. 3d. to 3s. 9d. each. It will be seen that while the lower candle-powers of the high-voltage lamps are reduced 3d. in price, the price of the 55-watt lamp is reduced by 6d., so that now this lamp will actually be 3d. cheaper than 200-volt lamps of smaller candle-power. Doubtless all these reductions are due to a cheapening in manufacture, but we understand that the reason a lower price in proportion has been fixed for 55-watt lamps is two-fold: It will assist station engineers, by encouraging the public to use 55-watt lamps rather than 25- or 32-watt lamps, while in addition to this it is the 55-watt lamp that is principally used for public lighting in competition with gas.

We announced in our issue of February 10th an improvement in the efficiencies of some sizes of Osram lamps, including the 50 Hefner c.p. 200-volt lamp, which now consumes 55 watts instead of 63, and users of Osram lamps will welcome still more the latest move of the General Electric Company in the matter of prices.

There will doubtless be a large demand for Osram lamps for the next week or two from regular users of these lamps who have been holding back their orders owing to the unsettling effect of the reductions in the prices by other makers, and we recommend our readers to requisition the stock of Osram lamps that they require with as little delay as possible, in order to secure early deliveries.

The British Thomson-Houston Co., Ltd., are reducing the price of two sizes of their Mazda lamps. The price of the 200- to 260-volt 45-watt 32 British c.p. lamp will now be 4s., instead of 4s. 3d., and the 50-watt 40 British c.p. 100- to 135-volt lamp will be sold at 2s. 9d., instead of 3s.

½d. PER UNIT FOR HEATING AND COOKING

THE Southampton Council have adopted, by 26 votes to 4, the recommendation of Mr. H. F. Street, Borough Electrical Engineer, to adopt a uniform charge of ½d. per unit for electricity supply for heating and cooking. In his report, Mr. Street pointed out that it is only by the adoption of a rate considerably under that charged at present (1d. per unit) that gas cooking can be competed with, and he argues that if other undertakings can supply power at ½d. per unit, electricity for heating and cooking can be supplied at the same rate. It is only suggested that this rate apply to houses where electric light is already installed, and where no great capital expenditure is required for services, &c. Mr. Street states that the output of the station could be doubled with only 28 per cent. increase in expenses, and anticipates that a total working cost of ½d. per unit would be attained under the better conditions of load factor which the increased heating and cooking load would bring about. He explains that the greater part of the heating and cooking load would come on at other times of the day than the lighting peak, especially in the small houses, in which he particularly hopes to further the adoption of electric cooking.

Mr. Street is certainly offering the householder a very good bargain, and there is no doubt that many householders in other places than Southampton would be glad to be able to obtain current for heating and cooking on these terms. He and other station engineers who are endeavouring to develop this class of load are longing for the day when a good oven, with a heating element that can be renewed easily and cheaply, can be obtained for about £4. This should surely not be difficult of attainment when central station engineers are doing their utmost to increase the demand for such apparatus by lowering the price of current.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 24th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

5,168/09 and 21,113/09. **Regenerative Control.** Crompton & Co., Ltd., J. C. MacFarlane, and H. Burge. These two patents refer to a system of automatic control suitable for tramcars, omnibuses, flywheel storage sets, &c. According to the first specification, two working motors are connected across the mains in series with the dynamo of a Ward-Leonard motor-generator. By this means the voltage across the motors can be varied from zero to twice the supply pressure. The motors have fields connected across the mains, and are designed to run at normal speed when supplied at twice the supply pressure. In order to strengthen the motor fields automatically during periods of retardation, and to diminish them during acceleration, auxiliary field windings, connected in series and shunted across the dynamo and one motor, are employed. These windings strengthen the fields as the speed diminishes, thus giving the motors series speed-torque characteristics without the necessity of using series windings. An opposing series winding on the generator field limits the current which may be drawn from the mains. (Three claims, two figures.) The second specification covers this latter series winding separately, and for the case where one motor only is used. If the motor is regenerating, the series winding on the generator assists its main field winding. One claim, one figure.

7,471/09. **Arc Lamp.** H. J. Jaburg. An arc lamp without feeding mechanism contains three electrodes. Two are convergent and are supported by being always in contact at their lower ends, while the third is hung vertically alongside and parallel to the plane of the other two, with its point always at a constant distance from the apex formed by the other electrodes. All three electrodes are hung from a common supporting member, and descend by gravity as they are consumed. The arc is struck between the two converging electrodes and the vertical one. The latter passes through a sliding collar on the economiser, which is acted on by a differential coil and strikes and controls the arc. Eight claims, two figures.

10,348/09. **Wiring Conduit.** A. Brampton and F. Osborne. A construction is described in which the securing screws between the two halves of the fitting are enclosed in sleeves around which the cable passes. The sleeve may be in the form of a loose roller round the screw, or may consist of two necks, one on each half of the fitting, tapered and recessed respectively, to engage each other and completely enclose the screw. Five claims, five figures.

10,607/09. **Laying Cables.** The Key Engineering Co., Ltd., and L. Andrews. For laying cables on the solid system, a trough or tube of bitumenised wood fibre is employed. A segmental strip of the wall of the tube is removed longitudinally for inserting the cable and the bituminous filling-in material. The latter is poured in in a semi-liquid condition, and becomes firmly attached to the wall of the trough. Bridge pieces are inserted at intervals to hold the cable in position. The longitudinal strip is pressed into position after the trough is filled. This construction is claimed to withstand bending without cracking or detachment of the bituminous material from the trough. Four claims, three figures.

13,041/09. **Eliminating Circulating Currents due to Harmonics.** Siemens Bros. Dynamo Works and Dr. M. Kloss. When two three-phase generators are coupled in parallel, and their neutral points connected together, any difference in the amplitudes of the third harmonics in the phase E.M.F. wave forms will result in circulating currents. To prevent this, three single-phase transformers with a ratio of 3 to 1 are connected with their secondaries in series between the neutral point of the generator to be protected and the earthing bar, so that the resultant triple-frequency E.M.F. cancels that already in the circuit. Two claims, two figures.

19,210/09. **Compensated D.-C. Machines.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). A field construction suitable for high-speed turbo-generators or variable-speed motors consists of a smooth bore slotted stator with the main field and compensating windings distributed and overlapping around the periphery. This distribution is obtained with a fractional winding pitch of 50 per cent., so that short end connections are used. Each slot contains a coil of each winding, and a space is left in the slots through which air is forced axially by means of a fan. Seven claims, four figures.

20,311/09. **Arc Lamp Electrodes.** A. G. Bloxam (*Gebr. Siemens & Co.*). Electrodes for use in enclosed flame arc lamps contain a number of cores. Each core consists almost entirely of the light enhancing chemicals, and is surrounded with a thin sheath of pure carbon. The several sheaths are connected together so as to form one electrode. Slow burning of the electrode without flickering of the arc is claimed. One claim, seven figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Boult (*Voigt & Haeffner A.-G.*) 14,128/09.

Electric Ignition: Mueller [Magneto machine] 17,664/09; R. Bosch [Distributers] 18,534/09, and 20,656/09; Dier and Primeau [Igniting gas burners] 18,679/09.

Electrometallurgy and Electrochemistry: Patterson [Cell] 11,154/09; Ruthenburg [Furnace electrodes] 12,507/09; Electrolytic Alkali Co., Connor and Stubbs [Electrodes for electrolytic cells] 12,709/09.

Storage Batteries: Twaites [Cell] 6,770/09.

Switchgear, Fuses, and Fittings: Tate [Terminals] 5,302/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Switchgear] 5,418/09; Harris [Time-switch] 5,997/09; Ghadiali [Rendering broken live wires dead] 6,111/09; Ford and Bonshor [Cartridge fuse holder] 8,212/09; Von Ugrimoff [Sliding contacts] 10,175/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Protective devices] 10,594/09; British Thomson-Houston Co. and Richardson [Switchboards] 13,655/09; Raiter [Switch-stand] 22,796/09; Nordentoff [Fuses] 25,445/09; Lundberg [Plug and socket] 29,582/09.

Telephony and Telegraphy: Hughes (*Murray*) [Wireless fog-signalling] 5,685/09; May [Telephone system] 14,244/09; Fessenden [Wireless signalling] 17,450/09; Siemens Bros. & Co. (*Siemens & Halske A.-G.*) [Telephone exchanges] 28,362/09.

Traction: Higgins and Sheridan [Signalling] 9,035/09; Becher [Signalling] 21,215/09; Cain [Signalling] 21,667/09.

Miscellaneous: Racine and Duc [Burglar alarm] 5,375/09; Gilbert and General Electrical Display Co. [Illuminated display apparatus] 5,545/09; Mavor & Coulson, Ltd. [Mining machinery] 6,051/09; Garry and M. P. Galloway, Ltd. [Colliery signal bell] 7,149/09; Seacombe [Massage machine] 12,844/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distribution, &c.: Siemens-Schuckertwerke Ges. [Polyphase transmission system] 3,117/10.

Dynamos, &c.: Farny [Machines] 4,907/10.

Electrometallurgy: Mulacek and Hatlanek [Induction smelting furnaces] 672-4/10.

Instruments: Crowell [Integrating dynamometer] 5,683/10.

Switchgear: White and Carichoff [Electrically operated switches] 4,697/10; White, 4,811/10.

Traction: Westinghouse Electric Co. [Electromagnetic brakes] 4,171/10.

Miscellaneous: Siemens & Halske A.-G. [Sound producer for submarine signalling] 4,967/10.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

7,222 of April 2nd, 1896. **Manufacture of Tubes.** A. S. Elmore (*J. O. S. Elmore, India*). An apparatus for the manufacture of tubes of small diameter by depositing the metal electrolytically; the mandrel is rotated and moved to and fro longitudinally in the tank. The latter is divided into compartments longitudinally, and these contain the anodes and the rubbing contacts alternately.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: W. S. Weedon [Electrodes of rutile] 26,921/04.

Distribution Systems, &c.: J. Jones [Manhole covers] 27,153/02; H. Chitty [Insulating conductors] 27,171/03; G. M. Hardingham (*Felten & Guilleaume Corlswerk A.-G.*) [Insulating conductors] 26,786/04.

Dynamos, &c.: Siemens Bros. & Co. (*Siemens & Halske A.-G.*) [Ventilation of D.C. machines] 27,472/02.

Electric Ignition: H. Brough [Automatic re-ignition of carriage lamps] 26,987/04.

Instruments, &c.: J. R. Dick and Reason Manufacturing Co. [Maximum demand indicators] 26,906/04.

Storage Batteries: L. Lucas [Plates] 28,511/96.

Switchgear, &c.: J. S. Stevens and C. G. Major [Automatic crane and lift motor control gear] 24,567/99; G. W. Johnson (*Electric Control & Supply Co., U.S.A.*) [Resistance units] 25,218/01, and [Motor controllers] 25,219/01; Crompton & Co. and R. C. Harris [Automatic circuit-breaker] 26,856/03; J. C. Dear [Lamp-holder] 26,799/04.

Telephony, &c.: H. H. Lake (*J. S. Stone, U.S.A.*) [Wireless telegraphy] 27,253/02; Marconi's Wireless Telegraph Co. and E. Priddle [Automatic control of telegraphic recorder] 26,748/04.

Miscellaneous: R. M. Lowne [Electric clocks] 25,374/01; Siemens Bros. & Co. (*Siemens & Halske A.-G.*) [Electrically-controlled compressed-air-operated bell] 26,757/04; H. Kenzel [Electric targets] 27,064/04.

Digitized by Google

THE NEW ELECTRIC LIGHTING ACT

THE Electric Lighting Act of 1909 comes into force to-morrow (Friday), April 1st. The object of the measure is two-fold, viz., to broaden considerably the powers of the Board of Trade in relation to electric supply, by avoiding applications to Parliament concerning many small but important matters, as has hitherto been necessary, and secondly, to generalise provisions usually inserted in local Acts dealing with electric supply, thus removing certain difficulties and anomalies which have been experienced in the working of the Electric Lighting Acts of 1882 and 1888.

In spite of the fact that the measure does not provide for all the requirements of every section of the industry, as was seen during the passage of the Bill through Parliament, nevertheless it brings the legislation relating to the electrical industry to something approaching uniformity. The Board of Trade may now, by Provisional Order, authorise many things which previously rendered necessary the promotion of a Bill in Parliament, such as the compulsory acquisition of land for generating stations, supply in bulk, the breaking up of streets, &c., outside area of supply, supply of electricity to railways, tramways and canals partly outside area of supply, and also simply "by order" to premises outside area of supply. The Board of Trade may also, with the concurrence of the Local Government Board, sanction the exercise of electric lighting powers by authorities jointly. New rules as to certification of meters, and revision of maximum prices are included in the Act, and certain provisions relating to supply, which are at present to be found only in private Acts of Parliament, are made standard, including the "Stand-by" clause, apparatus on hire to remain the property of the undertakers, notice to be given by consumers to undertakers before removing, and power to refuse to supply electrical energy in certain cases. An important provision of the new Act is the one which allows electric supply authorities to "associate" to the extent of giving supply in bulk, an action which was expressly forbidden in all previous Acts and Provisional Orders.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[*Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."*]

STEAM PLANT ACCESSORIES.—A pamphlet is to hand from Messrs. James Baldwin & Co. (Keighley, Yorkshire), describing a new type of blow-off cock, the object of which is to eliminate sticking and pipe strains due to unequal expansion. The cock is provided with a jacket through which the steam circulates, maintaining the casing and the plug at an equal temperature. The pamphlet also calls attention to the firm's safety mounts for boilers, the "Betall" renewable valve, and a tube float for boilers.

ELECTRICALLY-DRIVEN AIR-COMPRESSORS.—A leaflet has been sent us by Mr. A. Campbell Adams (52 St. Enoch Square, Glasgow), calling attention to an automatic switching apparatus for use in conjunction with electrically-driven air-compressors. Its object is to maintain automatically a pressure in the receiver between any predetermined limits without stopping the compressor. The latter is slowed down, and runs at the speed necessary to supply the average demand. Should there be no demand, the air-governor unloads the motor, which then runs slowly on no load.

TURBO-ALTERNATORS.—An illustrated pamphlet is to hand from Messrs. Bruce Peebles & Co., Ltd. (Edinburgh), giving general particulars of the firm's open and enclosed type turbo-alternators. Four- and two-pole machines are described, the former having salient pole and the latter cylindrical rotors. The stator windings are supported by gun-metal clamps held by bronze studs screwed into the end plates and insulated by blocks and tubes of moulded mica. The salient pole rotors are cast in one piece. The strip field coils are wound on and held in position by the pole tips and manganese-bronze angle pieces. The cylindrical rotors are built up of steel discs with open slots, the former wound coils being held in position by phosphor-bronze wedges and end-covers. Forced ventilation is employed in the enclosed type machines. The pamphlet includes a table of the outputs at speeds of 1,500 and 3,000 r.p.m. of the various standard sizes, and tables of weights and dimensions.

New Telephone Cable between England and France.—A misprint occurred in this article at the eleventh line from the bottom of page 179. The actual attenuation constant of the cable is 0·0140, and not 0·140. Fortunately the error is fairly evident from the context. The article appeared in our issue of March 17th.

POWER SUPPLY FROM TRAMWAY CIRCUITS

By E. P. Austin

A NUMBER of supply authorities are giving attention to the development of their load in districts which are outside the area supplied by the street mains, by connecting consumers to their traction system, where such system is supplied from one common station. When amicable arrangements can be made between the lighting and tramway departments, such a scheme is of considerable benefit to the generating station, both commercially and technically. Remunerative power loads can be obtained, and such apparatus and machinery as would cause undesirable disturbance if connected to the outskirts of a network can be satisfactorily dealt with off the traction system. As the writer has had some experience in working such a scheme, he proposes to deal, in the following lines, with some of the technical problems that have to be faced when dealing with power supply off traction cables.

Fortunately, the Board of Trade restrictions over 500-volt supply have been modified, and from the point of view of safety it is sufficient to erect all wires, cables, and fittings in accordance with the Board of Trade and Home Office requirements. When installing motors, the difficulties met with are principally due to the large variation in voltage experienced on all traction circuits, with the consequent speed irregularity; and also the possibility of the stoppage of the supply for short periods, caused by the behaviour of faulty cars or short circuits on the trolley wire. Dealing first of all with the question of voltage variation and its effect on motors. The extent to which this is prejudical depends on the class of load to be driven. It is, of course, negligible in the case of cranes, fans, mortar-mills, &c., driven by series motors, but when printing and textile machinery, or any apparatus requiring a constant speed, has to be driven, the question assumes a different aspect.

The standard form of shunt motor will not give the best results, for obvious reasons, although the varying behaviour of

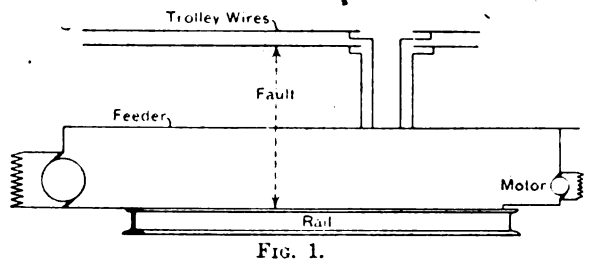

FIG. 1.

different makes of motors working under similar conditions is surprisingly marked. The armature design is chiefly responsible for this and other variations, according as the short-circuit current in the coils on commutation is great or small. The speed variation is particularly marked when the field flux-density is low, as fluctuations in the exciting current with varying voltage will produce a large variation in the flux value, and consequently in the driving torque. Compound motors cumulatively wound are out of the question for constant speed running, and there are reasons, to be detailed later, for not using a differential winding. It remains, then, to consider the commutating pole motor for running off traction circuits. Such a machine, with a high flux density in the shunt field, will, from its inherent characteristics, maintain a nearer approach to a constant speed than it is possible to obtain under these conditions.

There is a peculiarity in the behaviour of shunt-wound motors when supplied off a traction system, which is not met with under ordinary steady voltage conditions, namely, the blowing of the motor fuses when all is running well, and there is no defect in the motor or wiring. The trouble is more persistent when the sparking limit of the machines is somewhat low, and the reason of this will be apparent on considering the running conditions.

When a heavy short-circuit or other cause of excessive current occurs on the tramway system, a large drop in voltage results, which will affect any running motor that is connected to the same section in a manner depending on its position relative to the situation of the fault. For instance, in Fig. 1 a shunt motor is shown, connected to a traction feeder supplying a section on which a fault has developed. The voltage across the motor terminals will drop to the value of the potential across the fault, causing the motor to act by means of its own inertia as a shunt generator on short circuit with a resultant loss of field. Assuming the fault to be cleared rapidly by means of a feeder fuse or similar apparatus, the voltage across the motor terminals will immediately rise to its full value. The self-induction of the field will retard the rise of the exciting current, while the armature current will reach a high figure, and prob-

Digitized by Google

ably cause a flash over the brushes, and thus blow the fuses. It sometimes happens that the starter will be released and a fresh start be all that is necessary, but, as a rule, the action of the starter is not rapid enough to open the armature circuit in time.

The effect of a fault is not so marked when one occurs beyond the point where the motor is connected, as in Fig. 2, and has

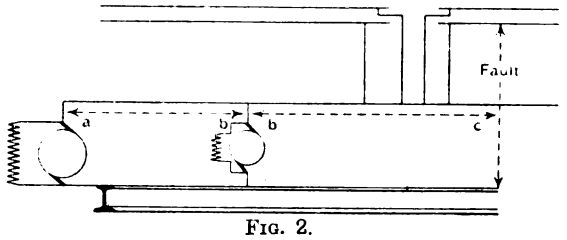

Fig. 2.

little or no effect on a motor when the distance *a—b* is small compared to the distance *b—c*, as the whole matter depends on the fall of potential along the feeder.

There are various means of overcoming the difficulties detailed in the foregoing, and making power supply off traction satisfactory. If the speed variation is not a serious drawback, then a simple remedy for the fuse-blowing trouble is to use a compound motor cumulatively wound, as such a machine will assume a field of some strength when the voltage rises across its terminals after a short on the line.

A differential winding would aggravate the trouble, on account of the larger current the machine would supply to the fault, when it would work as a series generator, also the heavy armature current that follows on the removal of the short would oppose any field due to the shunt winding, and make a flash over the brushes more certain. From these considerations, it appears that the commutating-pole machine will give the best all-round results for working under these conditions.

The efficient protection of circuits supplied from a traction system with one pole earthed is of paramount importance. To instal fuses that will work satisfactorily *in pairs* on 500 volts, is not a guarantee of protection, as any breakdown of insulation on the system, or flashing over of a motor to frame, puts only one fuse in action. It is obvious, then, that the fuse installed on the live wire of any motor circuit must be capable of satisfactorily opening the circuit on a heavy current at high voltage on one pole only. There are a large number of so-called 500-volt fuses on the market which are quite useless for such conditions, principally on account of the restricted space provided for the fuse to blow in. In making a selection, there should be ample length of break and clearance between terminals, and any part of the metal base and cover; also the cables should be brought in at the sides and not at the top or bottom, and provision should be made for efficient ventilation, and there should be ample space for the arc to break in. The safest and most reliable form of fuse for the purpose consists of an open tubular fitting to carry the fuse wire, engaging with knife contacts mounted on an insulating refractory base with back connections, the whole enclosed in an insulated cubicle of ample dimensions.

LOCAL NOTES

ABERDEEN: *Overhead Tramway Equipment.*—The Corporation have passed a resolution transferring to the general manager of the tramways the control of the maintenance and repair of the overhead equipment. Hitherto this has been under the control of the electrical engineer. The Chairman of the Tramways Committee, in moving the resolution, stated that this principle was adopted in all the large towns in Great Britain, including Leeds, Birmingham, Sheffield, London, Newcastle, Nottingham, Sunderland, Glasgow, and Bradford.

ACCRINGTON: *Tramway Through Running.*—Through running of the tramcars between Accrington, Rawtenstall, and Bacup was inaugurated on Thursday.

AYR: *Public Lighting.*—The Lighting Sub-Committee and the Electrical Engineer have for some time past been considering how the cost of public lighting could be decreased. At present the cost of each incandescent electric lamp is £3 17s. per annum, but if the carbon filament lamps now used were replaced by metal filament lamps, it would be possible, they state, to reduce the price to £2 2s. each per annum, and give twice the candle-power. This would mean a reduction of about £400 per annum, and it would cost about £50 to make the necessary alterations. The Committee have unanimously recommended that this should be done. With regard to arc lamps they recommend that the electrical engineer should be allowed to experiment with various types during next winter, and also to consider whether it will not be possible to reduce the number of arc lamps by replacing them with high candle-power metal filament lamps.

BATH: *Extension of Electric Lighting Order.*—The Board of Trade have sent the Corporation the draft provisional Order relating to the proposed extension of the Electric Lighting Order to a radius of three miles from the Guildhall. The Bath Gas Co. opposed the Order, and asked that the charge made by the Corporation for street and other public electric lighting should not exceed the price charged to private consumers, and secondly suggested that the "Northumberland" clause should be inserted, viz., that the prices to be charged during each forthcoming year should be adjusted to preclude the possibility of the revenue being less than the expenditure, the charge to be based upon the experience of the previous year. The draft Order is now under consideration by the Electric Lighting Committee.

BRISTOL: *Advertising Electricity.*—The Bristol Electricity Department have commenced the publication of an *Electrical Bulletin* with the object of bringing before the ratepayers the many useful applications of electricity. The first issue contains articles on how to wire houses cheaply, facts concerning metal filament lamps, loss of power due to counter-shafting, &c.

GOSPORT: *Street Lighting.*—The Lighting Committee recommend that a number of streets should be lighted by electricity. Tenders have been received from the local gas and electric lighting companies, and it is proposed to accept the offer of the Electric Lighting Co. to instal 120-c.p. electric lamps at £3 7s. 6d. per lamp per annum, and 300-c.p. lamps at £8 per lamp per annum. After some discussion at the last meeting of the Council the proposal was referred back to the Lighting Committee with instructions to prepare a statement showing the entire cost of electric lighting and gas for the streets in question.

HALIFAX: *Tramway Profits.*—The Finance Committee is faced with increased estimates for the coming year to the extent of £7,232, but in order to prevent too great an increase in the rates, the Tramways Committee have offered to contribute £5,500 per annum out of the tramway profits towards the deficit.

HASLINGDEN: *Electric Lighting Provisional Order.*—The Board of Trade, having deferred the revocation of the Council's Electric Lighting Provisional Order until September, the Council have again discussed the desirability of putting it into operation. At a meeting last week it was decided to work the Order, and it was referred to the Tramways Committee to report upon erecting a separate generating station, or purchasing current in bulk.

LEICESTER: *Electric Lighting Accounts.*—For the half-year to December 31st the accounts of the Electricity Department show a net profit of £1,121 after meeting capital charges.

LLANELLY: *Electric Lighting.*—The Llanelly & District Electric Light & Traction Co. have given the Council notice that within a period of nine months they propose to supply electricity for public and private lighting under the terms of the agreement

LUTON: *Electric Supply Profits.*—Acting upon the estimated profits of the electric supply undertaking for the financial year to March 31st, the Electricity and Tramways Committee recommend the transfer of £846 to the general district rate. This sum will liquidate the amount standing in the rate books to the debit of the electric lighting undertaking.

WEYMOUTH: "*Fixed Price*" *Light.*—Mr. J. H. Bolam, Borough Electrical Engineer, recommends his Electricity Committee to adopt the "fixed price" system of supplying electricity to small property. In this case it is proposed that the Council itself should undertake the scheme, and not work it through a company. According to a special article in the *Weymouth Telegram*, the Electricity Committee have powers to put the scheme into operation without special permission from the Council, and there is reason to believe that in a few days the scheme will be in full working order, but the important detail that remains to be decided is the rental per lamp.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

GRIMSBY.—A Local Government Board inquiry will shortly be held respecting a loan of £2,000 for street lighting.

HESTON AND ISLEWORTH.—The Electrical Engineer has been instructed to prepare specifications for the extension of the electricity plant at an estimated cost of £3,600, and to invite tenders.

LIVERPOOL.—The Liverpool District Lighting Co. are advised by their electrical engineer to instal a new generating set.

LONDON: *Hammersmith.*—Tenders for cable at an estimated cost of £1,212 are to be invited.

NETHERLANDS.—Tenders are invited for the installation of an electric lighting and power plant at Hertogenbosch.

Digitized by Google

Tenders to "Heer Administrateur der Godshuizen, Gasthuisstraat 9," Hertogenbosch, by April 19th. Plans and specifications may be purchased from the same official on payment of £1.

NEW ZEALAND.—H.M. Trade Commissioner for New Zealand, says the *Board of Trade Journal*, reports that a firm who are building a theatre at Auckland, which is expected to be completed in October next, intend themselves to instal the electric lighting plant, which they will buy in London. Electrical manufacturers interested in theatre lighting, and particularly in auditorium and stage-lighting, luminous signs, &c., might communicate with the firm in question. It would be well in communicating to send a cable code, as there is little time to spare. The name and address of the firm may be obtained by British manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

RUSSIA.—The Russian correspondent of the *Financier* mentions a number of openings for electrical goods and apparatus: A contract is being made with the engineer Laskin to light the town of Hennitchesk, in the Government of Tabriz, with electricity. A considerable extension of the electric lighting system is contemplated at Kieff. The firm A. Lyskin has offered to supply the town of Orgieff with electric for a period of 15 years on concession terms. The "Yuzhnaya Rossia" Electricity Co.'s offer to reconstruct the Rostoff, on the Don, electric station and supply current at a reduced rate is under favourable consideration by the Town Council. The "Tiflis Listok" says that it is intended to begin this spring with the construction of a great series of water-power electrical works near the village of Atazhukino. The "Dalny Okrain" says that there are only two offers for the construction of the Vladivostock Central Station; one by the firm of Varpeboldt, which offers to accept payments over a period of five years. The other is by an American engineer, Yung, who is asking for a twenty years' concession. The St. Petersburg firm of "Volt" is charged to prepare plans for a water and electric lighting system for the town of Novo Nikolaieffsk. The station will be built on the River Ob.

WALTHAMSTOW.—Tenders are invited for a feeder booster switch, switchboard, and accessories. Particulars from the Electrical Engineer, and tenders to the Town Clerk by April 22nd.

Miscellaneous

HASLINGDEN.—Messrs. Copland & Carden have presented a report to the Guardians regarding the use of electricity at the Workhouse and new Union Buildings.

RUSSIA.—The Russian correspondent of the *Financier* mentions several electric tramway projects: The Minsk Town Council is arranging to change over from horse to electric traction. The town of Simperofol is preparing the terms of a contract with Engineer Bielein for a 40-years' tramways concession. The Council of Tchernigoff has decided on establishing a telephone system for the whole of the province.

TURKEY.—The Government have decided, during the next financial year, to instal wireless telegraphy at the Constantinople Dockyard, and upon all naval vessels. The scheme also provides for wireless installations at Trebizond, Salonika, Bayreuth, and Yemen.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

N.—The L.C.C. invite tenders for the wiring and fitting of the Shelburne Road and Tarriano Avenue elementary schools. Particulars from the Chief Engineer to the Council after April 4th and April 11th respectively, and tenders to the Clerk by April 20th.

W.C.—Block of offices on site of Old Sergeant's Inn, Chancery Lane, for the Law, Union, & Rock Insurance Co., Ltd., 126 Chancery Lane.

S.W.—Electric Theatre, Garratt Lane, Springfield, S.W. Builders, L. Whitehead & Co., Ltd., University Mansions, Putney.

Electric Theatre, Upper Tooting Road, Balham, S.W. Builder, J. Watt, The Lodge, Bromley Road, S.E.

Factory, King's Road, Chelsea, S.W. E. K. Purchase, 20 Maddox Street, W.

PROVINCES.

BATH.—Manual training and domestic centre (£5,000). Secretary, Education Committee, Bath.

BEDFORD.—Bacon factory (£15,000). Local Co-operative Syndicate.

BELFAST.—Additions, Union Workhouse (£9,000). Builder, W. Dowding, Cromwell Road, Belfast.

BOURNEMOUTH.—Additions, Sanitary Hospital. F. Lacey, Borough Engineer.

CHESTERFIELD.—Alterations, Corporation Theatre (£1,000). Architects, F. Matcham & Co., Warwick Court, W.C.

DARWEN.—School (£7,000). R. W. Smith Saville, Borough Engineer, Darwen.

DONCASTER.—Variety Theatre. Major Crosby, The Palace, Grimsby.

DUNDEE.—School Board Offices. Architect, J. Langland, Dundee.

GLASGOW.—Presbyterian Church, Nicholson Street (£3,000). Architects, Miller & Black, 58 Renfield Street, Glasgow.

GOVAN.—Shops for Glasgow Engineering Co. (£3,000). Plans by firm's own staff.

KILMARNOCK.—Church (£3,000). Architect, H. E. Clifford, 225 St. Vincent Street, Glasgow.

LIVERPOOL.—School, Rawson Road (£7,000). Builders, W. Hall & Son, Ltd., Liverpool.

MANCHESTER.—Tenders are invited for the wiring of the "Ins and Outs" Homes, Cavendish Road, West Didsbury, for the Chorlton Guardians. Particulars from Messrs. Charles Clegg & Sons, Architects, 21 Spring Gardens, Manchester, and tenders to the Clerk, Union Offices, All Saints, Manchester, by April 11th.

NEW BRIGHTON.—Winter Gardens (£3,000). Architect, J. B. Preston, North John Street, Liverpool.

TENDERS RECEIVED AND ACCEPTED

AUSTRALIA.—The tender of the British Insulated & Helsby Cables, Ltd., has been accepted by the Postmaster-General's Department for the supply of 1,000 common battery wall sets at £1,975. The General Electric Co., Ltd., through their Australian agents, are supplying 200 common battery table sets at £307 10s.

CHICHESTER.—At the last meeting of the Corporation a recommendation was made that the tender of Messrs. Sandell & Co., of Worthing, be accepted for the electric lighting of the new elementary schools at a cost of £105. An amendment to refer the matter back, several members being in favour of gas, was, however, carried.

GRIMSBY.—The tender of the Jandus Arc Lamp Co., Ltd., has been accepted for flame arc lamps.

HULL.—The tender of Messrs. J. MacMillan & Co., of London, has been accepted for the supply of telephone instruments at £369.

KINGSTON-ON-THAMES.—The Council have accepted the tender of the Craigpark Cable Co. for half a mile of 0·1 square inch cable at £175 11s., and for half a mile of 0·05 square inch low-tension cable at £124 16s.

LONDON: *Camberwell.*—The Council have accepted the following tenders for the annual supply of electric lamps: British Thomson-Houston Co., Ltd., 100 volts and 200 volts, 8 and 16 c.p., 5s. 3d. per dozen; 32 c.p., 6s. 9d.; frosted, 5s. 9d. and 7s. 6d.; Pooley & Austin, Osram (carbon filament) lamps, 100 volts, 16 and 32 c.p., 26s. 5d. per dozen.

Woolwich.—The Council have accepted the tender of the Lancashire Dynamo & Motor Co. at £63 for a 20-h.p. motor. They have further placed an order with Messrs. Wellman-Seaver and Head, Ltd., at £38 10s. for switchgear.

WALTHAMSTOW.—The Council have accepted the following tenders for annual supplies to the electricity and tramway undertakings: W. T. Henley's Telegraph Works, Ltd., cables; Liverpool Electric Cable Co., Ltd., I.R. covered wires; Siemens Bros. & Co., Ltd., workshop flexible cord and braided silk, tantalum lamps, trembling bells and barrel pushes, Siemens' carbons for flame arcs; British Electrical Trade Supply & Bitumen Co., box compound, Chatterton's compound and pitch; General Electric Co., Ltd., switches, china bridge fuses and ceiling roses, counterweight sets and dust shot, wood blocks, fuse wire, staples, bell wire, Sinclair insulators, shackle rings, chimney and roof brackets, pole steps, arc lamp hooks; Chamberlain & Hookham, Ltd., ordinary and prepayment meters; Ferranti, Ltd., ordinary and prepayment meters; Electrical Co., Ltd., meters and Nernst lamps; British Westinghouse Co., Ltd., switches, lamp holders, adaptors, cut-outs, gear and pinion wheels, armature coils; Maxim Lamp Works, incandescent lamps, 8, 16, and 32 c.p., and traction lamps; Sunbeam Lamp Co., Ltd., spherical incandescent lamps, 32 c.p., wall plugs, opal shades, and enamelled iron; British Thomson-Houston Co., Ltd., traction lamps; Davis Electrical Co., steel conduit and saddles; Sloan Electrical Co., Ltd., Conradity arc lamp carbons; Ship Carbons, Ltd., carbons for enclosed arcs; J. W. Rowlands & Co., trolley heads, trolley globes; Anti-Attrition Metal Co., trolley wheels.

WIMBLEDON.—The General Electric Co., Ltd. have obtained a contract for the supply of "Osram" lamps to Wimbledon electricity department, which includes a large quantity of 200- and 300-c.p. Osram lamps for street lighting. Successful experiments have been carried out with high candle-power Osram lamps for the lighting of streets at Wimbledon, and a number of arc lamps have been superseded already.

The General Electric Co., Ltd. have also obtained a contract for the supply of Robertson lamps to the Wimbledon electricity department for the forthcoming twelve months.

COMPANIES' MEETINGS AND REPORTS

ISLE OF WIGHT ELECTRIC LIGHT & POWER CO.—The report for 1909 shows a net profit of £11,689. After meeting debenture interest and preference dividends, the directors recommend placing £3,000 to renewal account, £1,000 to reserve, £100 to reserve for bad and doubtful debts, and carrying forward £121.

UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON.—The report for the December half-year shows a surplus of £463 after meeting interest on the 4½ per cent. bonds and 5 per cent. prior lien bonds. The net income from the operation of the Chelsea power-house was £40,241, and the net revenue from the power-house, investments, and properties was £82,359. From the income from the power-house has to be deducted interest on the 4½ per cent. and 4 per cent. power-house debentures, amounting to £19,154. The output of electrical energy during the half-year was 6,005,000 units. The meeting is on April 21st.

LIVERPOOL DISTRICT LIGHTING CO.—At the annual meeting last week, it was stated that a new generating set will have to be installed to meet the increasing demand upon the undertaking.

GUILDFORD ELECTRICITY SUPPLY CO.—For the year to December 31st, after transferring £1,000 to depreciation, there is a net revenue of £3,292. After meeting debenture interest and preference dividends and placing £500 to reserve, the directors recommend a dividend of 5 per cent. on the ordinary shares.

WILLANS & ROBINSON.—The report for the December half-year states that, after writing off the sum of £4,245 as depreciation, and paying £4,263 interest on debenture stock, there is a loss of £8,282. Deducting £1,015, the sum carried forward at June 30th, 1909, there is a loss of £7,267. It is not possible to pay any dividend on the preference shares for the half-year, or to meet the charge for interest on and redemption of the funding certificates. The total arrears of preference dividend is thus brought up to £14,999, and of interest on funding certificates to £1,562. The sum of £15,000, the cost of certain legal proceedings, is taken from reserve, and the directors propose that a further sum of £10,000, to meet certain outstanding liabilities, be also set against the reserve fund, reducing this to £42,522. The report continues that the state of trade throughout the year 1909 was bad. It has been impossible to secure a sufficient volume of work to keep the shops fully employed, and the prices obtainable have been unsatisfactory. Some of the recently adopted lines of manufactures, however, are now beginning to bring in orders. It has been decided to recommend the election of Mr. Frederic R. Davenport as an additional director. Mr. Davenport will give the whole of his time to the service of the company, and it is intended that he shall act as assistant managing director, more especially in charge of the commercial part of the business. By the appointment of Mr. Davenport the directors expect to effect a substantial improvement in the position and operations of the business, and they consider that under these altered conditions it is desirable to leave the election of a chairman in abeyance.

COALITE.—At the annual meeting on Wednesday last week Mr. J. H. Smith, who presided, referred to the value of their process in regard to the generation of electricity. Sir William Preece, at the last meeting, had stated that from the proposed station at Barking they would be able to supply electricity at a lower price than was charged anywhere in Europe. Since then, Mr. Percy Allen, chief engineer of one of the largest chemical manufacturing firms in England, and who was considered one of the foremost experts on the use of gas engines for the production of electricity, was asked to report upon the scheme at Barking to the directors of the British Coalite Company, and his report confirmed the highest hopes of the directors. He clearly demonstrated that as soon as the erection of the required number of units was completed and the gas engines provided, the company would be in a position to produce electricity at such a low cost as would yield profits of a most substantial character. This report absolutely proved that the gas from the coalite process could be utilised to great profit for generating electrical power, in which latter direction there was an unlimited field. This power scheme at Barking was to be followed by others which would be developed on a large scale in different parts of the country and outside Breat Britain.

LYNDHURST ELECTRIC LIGHT CO.—There is a net profit of £1,159 for 1909. After placing £830 to reserve and meeting the 5 per cent. preference dividend, a balance of £8 is carried forward.

SLOUGH & DATCHET ELECTRIC SUPPLY CO.—There is a net profit of £3,835 for 1909. The sum of £750 is transferred to depreciation, and a dividend of 4 per cent. declared upon the ordinary shares.

SWANSEA IMPROVEMENTS & TRAMWAYS CO.—After placing £4,000 to renewals and £1,000 to depreciation and reserve, there is an available balance of £9.060 for the December half of 1909. The directors recommend a dividend of 3½ per cent. on the ordinary shares, carrying forward £1.211.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £61 to £61 10s. per ton (last week, £61 5s. to £61 15s.).

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—A meeting of the General Electric Sign & Engineering Co., Ltd., will be held on April 25th, at 2 p.m., at 28 Basinghall Street, London, to hear the liquidator's account of the winding-up.

The first meeting of creditors in the bankruptcy of W. C. Ellis, Electrician, Applegate Street, Leicester, will be held on April 1st, at 12 noon, at the Official Receiver's Office, 1 Berridge Street, Leicester. The public examination will be held on April 8th, at 10.30 a.m., at the Castle, Leicester.

The public examination of J. W. Hunter and A. Clapham, trading as the Yorkshire Motor Car & Electrical Engineering Co., at 101 Kirkstall Road, Leeds, has been adjourned *sine die*.

W. G. Everingham, Electrician, 37 Auckland Road, Ilford, has been adjudicated bankrupt. The deficiency on the business amounts to £594, and the failure is attributed by the debtor to "want of business experience."

W. H. Durrant, Electrical Engineer, 53 Tonning Street, Lowestoft, has been adjudicated bankrupt.

CHANGE OF ADDRESS.—Electrical Installations, Ltd., of Bassishaw House, Basinghall Street, London, have removed to larger premises at 27 Martin's Lane, Cannon Street, London, E.C., where all communications should now be addressed.

APPOINTMENT

A traffic superintendent is required in the Tramways Department of the Blackpool Corporation at a salary of £200 per annum. (See an advertisement on another page.)

NEW COMPANIES

CHILIAN EASTERN CENTRAL RAILWAY CO.—Registered by Ashurst & Co., 17 Throgmorton Avenue, London. Capital £240,000. To acquire, construct, complete, equip, maintain, and work railways, tramways, telegraphs, &c., in Chili or elsewhere in S. America.

BEDFORD & CO. (CARDIFF), Frederick Street, Cardiff. Capital, £1,000. To take over the electrical engineering business now carried on by C. E. Bedford at the above address.

RUSSIAN MUNICIPAL & INDUSTRIAL CO., 3 New London Street, London, E.C. Capital, £25,000 in 22,500 preferred ordinary shares of £1 each, and 50,000 deferred ordinary shares of 1s. each. To take over a concession granted by the City Council of Oremburg, and to carry on the business of contractors, suppliers of electricity, railway and tramway constructors, &c.

"OSRAM" LAMPS SURVIVE FIREMAN'S HOSE

THE accompanying illustration depicts the scene of a fire which recently occurred on the premises of the Hertford Hardware Supply Co., Hertford. A number of "Osram" lamps were burning during the whole time the fire was in progress, and they came in for a considerable amount of rough usage,

OSRAM LAMPS AFTER A FIRE.

as they were right in the midst of the danger zone; in fact the hose pipe of the Fire Brigade was on several occasions actually played upon the lamps. Although the surroundings were badly damaged and burnt, Mr. J. M. Bowman, Resident Engineer of the Electricity Works, reports that these "Osram" lamps held out during the whole of the time, and are still burning to-day as though nothing had happened.

SUMMARY

Our monthly supplement, "Electrical Engineering in Mines," is included in this issue. It opens with a practical article by a colliery electrician, including notes on the maintenance of colliery electrical plant, and proposed modifications of the special rules. Reports are given of further discussions on Mr. W. Maurice's Paper on "Electric Shocks" at four branches of the Institution of Mining Electrical Engineers. A summary is given of mining patents which have been issued by the Patent Office during March, including one relating to a short face coal cutter by Messrs. Mavor and Coulson. The principal article is a long illustrated description of the electrical equipment of the Ashington Collieries. Reports are also given of two meetings of the Newcastle branch of the Institution of Mining Electrical Engineers, on a Paper by Mr. H. J. Fisher on causes and prevention of electrical accidents in collieries, and on a demonstration by Prof. Thornton and Mr. H. W. Clothier on electrically-caused coal dust and gas explosion. A signalling system for winding plants is also described.

We were afforded an opportunity on Thursday last of seeing the first commercial machine of the type designed by Mr Miles Walker for the purpose of improving the power factor of large induction motors. The machine in question is rated at 6-k.v.a., and is to be used in conjunction with a 900-h.p. slow-speed motor doing haulage work. Besides enabling the motor to work at unity power factor at all loads, it will be possible to make it take a leading current, and thus improve the power factor of the whole system. (Page 229.)

We give some information concerning the 1910 Convention of the Incorporated Municipal Electrical Association at Glasgow from June 14th to 17th. Among the subjects to be discussed are commercial progress; mixed pressure turbines; exhaust steam turbines; chemistry in the boiler-house; continuous records of costs and steam consumption; cheapening of cost of mains and services. (Page 230.)

A letter from Messrs. Brown, Boveri & Co., Ltd., calls attention to the fact that impulse-reaction turbines have been made on the Continent for some time, and mentions sets of exceptional size now in hand. Another letter calls attention to a special starter suitable for use with shunt motors running on tramway circuits. (Page 231.)

An incandescent lamp with a drawn tungsten filament, placed on the market by Messrs. Siemens Brothers' Dynamo Works, Ltd., is illustrated and described. (Page 231.)

The annual report of the Fire Brigade Committee of the London County Council shows that only 106 fires in 1909 could be traced to electricity, out of a total of 3,197. The number of fires due to gas was 334. (Page 231.)

Among the specifications published by the Patent Office on Thursday last was one by H. W. Twaites for

Digitized by Google

a storage battery electrode, comprising a perforated lead tube or box filled with the active material, and plugged at both ends.—A cartridge fuse, consisting of a fibre tube with metal caps, which grip the ends of the fuse wire against flanged metal washers at each end, is described by J. Ford and and E. Bonshor.—The British Thomson-Houston Co. cover a method of equalising the pressure across aluminium cell protective devices by connecting the electrolytes together with siphonic tubes.—Means for isolating sets of 'bus-bars on H.T. switchboards are described in another specification by the same firm.—Opposition has been entered to a patent by the Saltpetersäure Industrie Ges. for an arc furnace for treating gases.—A patent by E. Wohlwill for a method of obtaining chemically pure gold by electro-deposition expires on Wednesday after a life of fourteen years. (Page 232.)

THE centrifugal drying machine used in laundries, and known as the hydro-extractor, is particularly adapted to electric drive. A self-contained machine of this pattern is exhibited at the Laundry Exhibition now open. An electrolytic bleaching plant is also exhibited. (Page 233.)

Two important lawsuits of interest to the electrical industry are down for hearing before Midsummer, viz., the B. T.-H. Co. v. Midland Railway Co., which concerns the Morecambe-Heysham single-phase railway, and W. Griffiths v. Edward Lloyd, Ltd., a libel action in reference to the G.B. surface-contact tramways in Mile End Road. An application by the Electrical Contractors' Association for an injunction against the Leicester Corporation for hiring out fittings and doing house-wiring will only come on after Midsummer. (Page 233.)

A BILL is to be introduced by the Transvaal Government under which electric power companies may only work by licence, and under certain conditions of purchase. Special provisions are inserted in respect of the Victoria Falls and Transvaal Electric Power Co., which has already been granted certain concessions. (Page 234.)

A NEW and very simple rotary pump, with no valves, gear, or vanes has been introduced. In the smaller sizes it is suitable for forcing lubricants, and in the large sizes for circulating-water plant. It has a positive suction, and is claimed to act well at low speeds. (Page 234.)

THE Dover Corporation are considering a recommendation to light their streets completely by electricity. The amalgamation of the tramways and electricity undertakings is also recommended.—The work upon the first electric tramway in Edinburgh has been started.—The Hull City and Electrical Engineers are to carry out experiments upon rail corrugation.—A proposal has been made to carry the mails by tramcar in Oldham.—The Weymouth Corporation have decided to charge 2½d. per week per lamp for the first six lamps, and 2d. per lamp afterwards, in connection with their fixed price light experiment.—The working expenses upon the Gloucester tramways for last year were as low as under 5d. per car mile.—The Birmingham Tramways Committee expect to transfer £2,500 to relief of rates from last year's profits. (Page 235.)

COOLING towers are to be installed at Edinburgh. Grimsby Corporation require a three-wire balancer and continuous-current motor meters; Manchester Corporation, rotary converter and static transformers; Littleborough Council, feeder and distributor cables, transformers and switchgear; Halifax Corporation, a 300 kw. rotary convertor, transformers, and switchboards; and Walthamstow, switchboard and gallery. Mains extensions are to be carried out at Eccles. Particulars are given of a proposed electric supply scheme in India. Shrewsbury Corporation propose installing mechanical stokers and public lighting. Loans for large electrical extensions at St. Helens have been sanctioned. (Page 236.)

A MEETING of creditors of Mr. A. H. Gibbings was held at Liverpool last week. (Page 237.)

IT is proposed to send the London Electric Supply Bill to a Select Committee of the House of Commons. The scheme for amalgamating several of the London tube railways comes before a House of Lords Committee to-day. (Page 238.)

THE report of the South Wales Electric Power Distribution Co. for 1909 states that the company is not now working any generating station, and that the position of the company has considerably improved during the year. At the half-yearly meeting of Messrs. Willans & Robinson, on Tuesday, the shareholders were asked not to be unduly discouraged by the present state of affairs. Given reasonable improvement in trade, there was every prospect of profits being made. Many of the troubles of the company had been inherited at the time of the re-organisation, which ought to have been more drastic. (Page 238.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, APRIL 7TH.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, Westminster, London. "The Progress of Electric Braking on the Glasgow Corporation Tramways," by A. Gerrard.

FRIDAY, APRIL 8TH.

Physical Society.

8 p.m. At Imperial College of Science, London. "An Experimental Demonstration of the Loading of Artificial Cables," by B. S. Cohen.

SATURDAY, APRIL 9TH.

Birmingham and District Electric Club.

7 p.m. At the Colonnade Hotel, New Street. "Choice of Private Generating Plant," by R. V. Brook.

TUESDAY, APRIL 12TH.

National Electrical Manufacturers' Association.

2.30 p.m. Committee Meeting at Balfour House, Finsbury Pavement, London.

Junior Institution of Engineers.

7.30 p.m. At Royal United Service Institution, Whitehall. "High Speed Steam Turbine Design and Construction," by J. M. Newton.

Institution of Electrical Engineers: Glasgow Section.

8 p.m. At 207 Bath Street. "The Progress of Electric Braking on the Glasgow Corporation Tramways," by A. Gerrard.

WEDNESDAY, APRIL 13TH.

Mining Institute of Scotland.

6 p.m. At Technical College, George Street, Glasgow. Discussion on Mr. Robert Nelson's Paper on "Electricity in Mines."

Institution of Electrical Engineers: Students' Section.

7.45 p.m. At 92 Victoria Street, London. "The Theory and Design of Current Transformers," by A. P. Young.

Association of Engineers-in-Charge.

8 p.m. At St. Bride's Institute, Bride Lane, Fleet Street, London. "Welding and its Application," by R. J. Wallis-Jones.

THURSDAY, APRIL 14TH.

Illuminating Engineering Society.

8 p.m. At Royal Society of Arts. Continuation of discussion on "The Measurement of Light and Illumination."

Rontgen Society.

8.15 p.m. At 20 Hanover Square, London. "Some Methods of Using the Alternating Current Mains for Rontgen Ray Work," by Dr. G. B. Batten.

FRIDAY, APRIL 15TH.

Institution of Mechanical Engineers.

8 p.m. At Storey's Gate, St. James's Park, London. "A Research on the Hardening of Carbon and Low-Tungsten Tool-Steels," by S. N. Brayshaw.

SATURDAY, APRIL 16TH.

Institution of Mining Electrical Engineers.

4.30 p.m. Cumberland Branch. At Grand Hotel, Whitehaven. "Direct Current Plant and the Distribution of Current to Outside Pits," by J. Glynn Williams.

Electric Traction for the Mont Cenis Tunnel.—The Italian State Railway authorities have granted the contract for the overhead equipment, transforming stations, and a part of the generating plant in connection with the Mont Cenis line electrification, to the Italian branch of Messrs. Brown, Boveri & Cie. (Tecnomasio Italiano Brown, Boveri). It appears that the authorities hope to have the line electrically equipped in time for the 1911 exhibition at Turin, as the experimental runs are to be made early in 1911.

IMPROVING THE POWER FACTOR OF INDUCTION MOTORS

On Thursday last we had the pleasure of attending a demonstration of the uses of the "Phase-Advancer," a new auxiliary machine designed by Mr. Miles Walker, of the British Westinghouse Electric & Manufacturing Co, Ltd., and described by him last year in a Paper before the Institution of Electrical Engineers. (See Electrical Engineering, Vol. V., p. 65.) The demonstration was given in one of the large machine shops of the Westinghouse Co.'s works at Trafford Park, Manchester. The machine is illustrated in Fig. 1, and is the first of its kind to be constructed on commercial lines. It is to be used in conjunction with a 900-h.p. slow-speed induction motor doing haulage work near Newcastle.

The phase-advancer is a special form of exciter connected in circuit with the rotor winding of the induction motor, to which it supplies magnetising current generated at a low frequency and low voltage. Under these circumstances, the amount of idle power required for magnetising is only a small fraction of

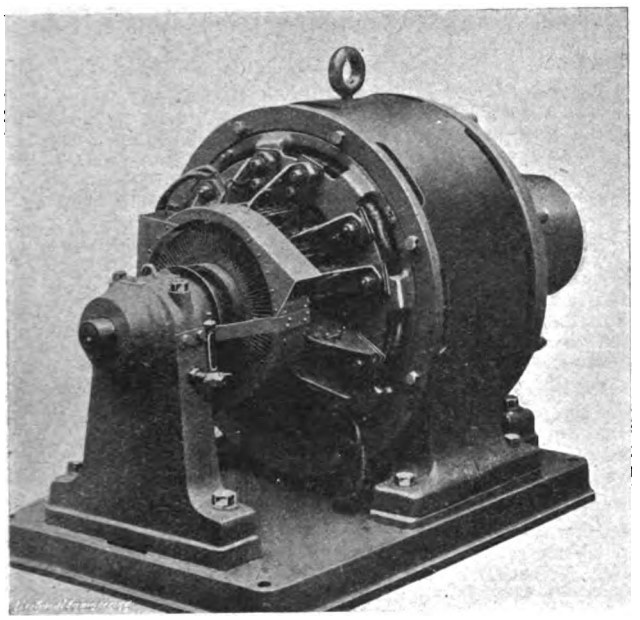

Fig. 1.—6 k.v.a. Phase-advancer.

that required when the magnetising current is supplied to the stator winding at the full frequency and full voltage. For example, a 750-b.h.p. three-phase 50-cycle 2,000-volt 590-r.p.m. motor requires in the stator 50 amperes per phase as magnetising current, or an idle power of 175-k.v.a. We understand that when fitted with a 6-k.v.a. phase-advancer, the same motor will run at unity power factor, and requires no idle power from the mains. Further, if a 12-k.v.a. phase-advancer is used, the motor can be run at a leading power factor of 0·7, when, in addition to taking its ordinary load, it will compensate for the lagging currents produced by other motors representing another 750 b.h.p. A motor with more copper in its windings would be capable of supplying magnetising current to many other motors, with the line working on unity power factor, the only extra cost being that of the 12-k.v.a. phase-advancer and the additional copper of the one motor. There would be considerable saving in generation and transmission, against which must be set off the losses in the phase-advancer and in the windings of the over-compensated motor, which, however, would amount to not more than 6-kw.

Taking, for example, the case of four 750-b.h.p. slow-speed motors, which would have a power factor as low, say, as 0·7, the saving in the capacity of the line and generators would be not less than 220 kw. In this case two phase-advancers would be used, two motors being over-compensated to provide the wattless current taken by the other two, and the losses in the phase-advancers would amount to about 12 kw.

The following is a brief explanation of the working of the machine:—

The phase-advancer may be regarded as an exciter connected in circuit with the rotor winding of an induction motor, and generating magnetising currents at the low frequency of the slip. If these magnetising currents are great enough to create the flux in the motor, the motor will run at unity power factor, as no magnetising current will have to flow into the stator winding. If they are increased, the motor will run on leading power factor. In order that the current in the rotor can exercise a magnetising effect, it must lead in phase on the E.M.F. generated by the rotor slip. The necessary leading E.M.F. is generated by means of an armature revolving in a magnetic field which is excited by a leading current obtained by using the current in one phase to produce the flux which generates E.M.F. in another phase. In the machine shown in Fig. 1 the electrical connections are equivalent to those of Fig. 2. The main difference is that the actual machine has six poles instead of three, there being two poles and two sets of brushes in parallel in each phase. The armature resembles an ordinary direct-current railway motor armature, except that the coil span is different. The inner end of each coil is connected to a star-point, and each outer end is connected to one bar of the commutator. On the commutator are three brushes which bear upon the segments connected to coils, which are for the time being passing under a pole. Each pole is provided with a compen-

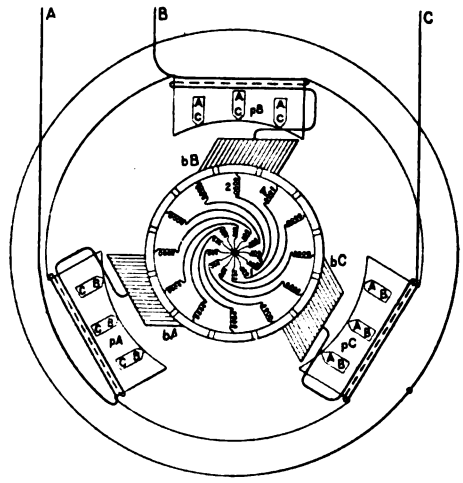

Fig. 2.—Diagram of Phase-advancer.

sating winding placed in slots in the pole-face, the winding being arranged so that the ampere-wires per inch along the pole-face are equal, or slightly greater, than the ampere-wires per inch of periphery of the armature. If we follow one of the armature circuits, commencing from the star-point along coil *1, 2*, it will pass under the pole *pC*, then under pole *pB*, and it will make as many turns in front of the poles *pC* and *pB* as are necessary to generate the required voltage. It then passes to brush *bB* and on to the series exciting coil on pole *pB*. From thence it passes to the compensating windings marked *A* in the slots *pC* and *pB*, and from these to phase *B* of the rotor of the induction motor The currents in the other phases pass through similar circuits. It will be seen that as the part of the coil *1* is under the pole *pC*, the E.M.F. generated in coil *1, 2*, will lead in phase on the current flowing to brush *bB*. Moreover, as the part of the coil *2* is under the *pole pB*, there is generated in the coil *1, 2*, an E.M.F. in phase with the current flowing to brush *bB*. This gives a boosting effect in the rotor circuit which tends to reduce the slip. By reversing the polarity of the poles or by reversing the direction of rotation, this boosting effect can be reversed so as to increase the slip.

The machine we had the pleasure of inspecting is rated at 6 k.v.a., to work in conjunction with a 900-h.p. slow-speed motor. The chief difficulty which had to be overcome in the design was the fact that 1,200 amperes have to be collected from the commutator for each phase. It is a six-pole machine, and each set of brushes deals with 600 amperes. The commutator is only 9 in. in diameter, and has a working face of

Digitized by Google

4 in., so that most of the surface is covered by the carbon brushes. The peripheral speed of the commutator is only 2,500 ft. per min., and the wear on the brushes is very small. The commutation was excellent. The means adopted to get rid of the heat generated can be seen in the photograph of Fig. 1. The armature generates at a pressure of from 5 to 20 volts according to the requirements of the motor, and at a frequency equal to that of the slip of the motor. The machine was shown in operation with two 750-h.p. motor-generator sets destined for South Africa. The motors are three-phase 590-r.p.m., 50-cycle 2,000-volt slip-ring machines, and these were run loaded back upon each other, one motor acting as an asynchronous generator. The motor was started up on a rheostat in the usual way, and the only extra switchgear required was a three-pole knife switch for throwing in the advancer. The latter was belt-driven from a separate motor, but it can be designed for direct-driving from the motor it works with if desired.

The following readings were taken with this combination:—The sets were first run on light load without the phase-advancer, and the motor took some 32 kw. at a power factor of 40 per cent. On loading up to 287 kw., at 1,840 volts, the power factor increased to 86 per cent. The phase-advancer was then thrown in, and at the same pressure, the motor took 300 kw. at unity power factor, the current being reduced by about one-fifth. The current was then brought up to the original amount by raising the pressure to 2,200 volts, and the motor then took 375 kw. at unity power factor. The speed of the phase-advancer was then increased so that it delivered more current into the rotor of the motor By this means the motor (loaded to 375 kw.) was made to take a large leading current on a 50 per cent. power factor, the ammeter reading being nearly 50 per cent. greater than the previous reading at unity power factor. On reducing the load on the motor to only 20 kw., with the phase-advancer still running at the increased speed, the power factor remained at 50 per cent. leading. Finally, the motor was run light, taking some 20 kw., and the power factor adjusted to about 5 per cent. leading. It will be noticed that in the present case the power factor is adjusted by altering the speed of the phase-advancer. If the latter is direct-coupled to its motor, the adjustment is made by means of a diverter across the stator windings of the advancer, the current being increased to raise the power factor or to make the motor take a leading current. To increase the slip of the motor, the current in the stator windings is reduced, so that the rotor of the main motor supplies power to the advancer and drives it as a generator.

The following are some of the uses to which this new machine may be put:—Suppose a large motor with a low power factor at the end of a long feeder. By installing a phase-advancer in conjunction with the motor, the feeder would be relieved of wattless current, and new consumers might be connected to the feeder at the motor end. Another use is in connection with induction motors for winding purposes or for driving rolling mills. The large slip required is now obtained by inserting resistance in the rotor circuit. By means of the phase-advancer any drop in speed may be obtained, and the power returned to the line instead of being wasted. A further use is in connection with induction generators. These machines have the advantage that they may be run up to speed and switched on to the 'bus-bars without synchronising, but have not been much employed, because they take a large magnetising current from the line and are incapable of generating any wattless current to supply to induction motors or other apparatus requiring wattless lagging currents. By using a phase-advancer, an asynchronous generator may be made to supply its own magnetising current, as well as wattless currents to other parts of the system.

Electric Cabs in Zurich.—The *Commercial Motor* quotes a foreign correspondent to the effect that the Zurich Corporation will grant no further concessions for petrol cabs, on the ground that electric cabs can be run quite as efficiently but without the noise and nuisance attending petrol vehicles. It is stated that spring will see the first electric cab running in Zurich, and it is prophesied that petrol cabs will have been wholly tabooed by 1915.

THE I.M.E.A. GLASGOW CONVENTION

THE annual convention of the Incorporated Municipal Electrical Association will be held this year at Glasgow, from June 14th to 17th, under the Presidency of Mr. W. W. Lackie, the City Electrical Engineer.

Tuesday, June 14th.—The Convention will be opened by the Lord Provost of Glasgow, the Hon. H. A. McInnes Shaw, at 10.30 a.m. in the Large Hall of the Institute of Engineers and Shipbuilders in Scotland, Elmbank Crescent. Mr. W. W. Lackie will then deliver his Presidential Address, after which the following Paper will be read and discussed:—"Commercial Progress," by A. C. Cramb (Croydon) and H. Collings Bishop (Newport, Mon.). The Tramways and Electricity Committee will entertain the Association at luncheon at the City Chambers at 1.15 p.m., and in the afternoon visits will be paid to the Springburn Sub-station of the Electricity Department, the Pinkston Tramway Power-house, and the Port Dundas Electricity Works. At 7.30 p.m. there will be a reception and conversazione at the City Chambers by the Lord Provost.

Wednesday, June 15th.—The meeting this day will be in the Freemasons' Hall, 96 George Street, Edinburgh, at 10 a.m., when the Hon. the Lord Provost of Edinburgh will welcome the Association. The following Papers will be read and discussed:—(1) "Mixed Pressure Turbines," by Ashton Bremner (Burslem); (2) "Exhaust Steam Turbines," by F. A. Newington (Edinburgh); (3) "Chemistry in the Boiler-house," by A. R. Sillar (Colchester). The members are invited to lunch at the North British Hotel by the Edinburgh Corporation, and visits to the works of the Electricity Department will be paid in the afternoon.

Thursday, June 16th.—Meeting at 10 a.m. in the Large Hall of the Institute of Engineers and Shipbuilders, Glasgow, when discussions will take place upon the following subjects:—(a) "Advantages of Continuous Records of Costs and of Steam Consumption"; (b) "Cheapening of the Cost of Mains and Services." Visits to the following works will be paid in the afternoon:—(1) St. Andrews Cross Electricity Works; (2) Coplawhill Tramway Works; (3) Govan Corporation Electricity Works. An alternative series of visits will be:—(1) Partick Corporation Electricity Works; (2) Clyde Valley Electric Power Co.'s Yoker Power-house; (3) Messrs. Beardmore's Shipbuilding Works at Dalmuir. The annual dinner will be held in the evening at the Windsor Hotel, which will be the headquarters of the Council during the Convention.

Friday, June 17th.—Annual Business Meeting at 10 a.m. in the Large Hall of the Institute of Engineers and Shipbuilders, Glasgow. At 12 noon the members will leave Glasgow (Central Station) for a sail on the Clyde.

A special programme has been arranged for ladies.

The detailed official programme will be issued in due course, and in the meantime all communications should be addressed to the Secretary, Mr. C. McArthur Butler, Staple Inn Buildings, Holborn, London.

Wind-power Generating Plant.—Messrs. J. G. Childs & Co., Ltd., of Willesden, will shortly install a complete wind-power electric generating plant at a large farm in Somerset. The wind-wheel will be 48 ft. in diameter, and supported on a tower 100 ft. high. The controlling gear will be similar to that described in ELECTRICAL ENGINEERING, March 25th, 1909, Vol. V., p. 280. A storage battery will constitute part of the plant, and the power will be utilised to supply over 300 lamps, motor-driven agricultural machinery, and pumps.

Manchester Municipal School of Technology.—Vol. II. of the Journal of this Institution has just been published, and consists mainly of reprints of a number of Papers by members of the teaching staff read before various societies and institutions in the year 1908. Among the more important are "Fuse Phenomena," by Prof. A. Schwartz and W. H. James; "The Electric Discharge and the Production of Nitric Acid," by W. Cramp and B. Hoyle; "Electrolytic Corrosion," by W. H. Gee; Papers by C. F. Smith and W. Cramp on alternating-current problems, and various other Papers on chemical and miscellaneous subjects.

Current Transformers.—On Wednesday next, April 13th, a meeting of the Students' Section of the Institution of Electrical Engineers will be held at the Institution Library, London, when M. A. P. Young will read a Paper on the theory and design of current transformers. After describing the various uses of current transformers, the author will deal with the mathematical theory, going into the errors introduced in the case of wattmeters on account of the varying phase-displacement between the primary and secondary currents at different power-factors. The influence of frequency and secondary impedance and resistance will also be considered. Tests in connection with current transformers will be explained, and transformers of various makes will be described.

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203-206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

DUTIES OF A COLLIERY ELECTRICIAN

Including Notes on the Maintenance of Colliery Electrical Plant and proposed Modifications of the Special Rules

BY A COLLIERY ELECTRICIAN.

IN some cases both A.-C. and D.-C systems are used in the same group of collieries, and it is therefore essential that electrical engineers in charge of plants should be thoroughly experienced in both systems. As some plants are very isolated and are in mines where a quantity of water underground has to be dealt with, so that the generators have to be run day and night for the pumps, it is therefore necessary that the electrician shall do all his own repairs and as speedily as possible, not only to save loss of production, but also in some cases to prevent a liability of workings being flooded out. For these reasons the electrician in charge, besides having a good theoretical and practical knowledge of A.-C. and D.-C. systems, should also be able to re-wind the machines under his charge, if required. He should be able also to make insulation tests, and must, of course, be capable of making proper insulated joints on cables, and of repairing efficiently all switches, fuses, and controller fittings, &c. A thorough knowledge of ambulance work is also desirable, and last, but not least, he must be a conscientious workman. The writer regrets to say, however, that there are men in charge of plants who do not think it necessary to grind in the metal to metal contacts of a switch or fuse, who do not know that the fingers of a controller should make a full surface-rubbing contact on the plate upon the centre spindle, who think that a covering of ordinary black insulated tape is enough for a joint, and who do not recognise the necessity of stripping the outer covering back and covering the joint in V.R. cables with rubber from rubber to rubber. The joints sent you herewith are examples of what has been done within the last few years in underground work; included in the parcel are the remains of a fuse which was used on a 500-volt circuit.

[The fuse sent us is a double-pole fuse of the type that was used in the early days of electric lighting for 50- and 100-volt circuits. There is a bridge piece between the two poles, through which a screw passes to hold a cover. The wires are brought to the terminals through two holes in a very thin base, and the distance between the centres of these is less than an inch. In one of the joints sent, wires had been teed off a 500-volt paper-insulated lead-covered cable, by wrapping them roughly round the conductors of the cable for a few turns without soldering, and insulated with a wrapping of white unimpregnated tape covered with a rough layer of waterproof tape. In another specimen tappings were taken by means of ordinary shot-firing wire for connecting two lamps on series on the 500-volt circuit, and the joints in this case also were of the very roughest description.]

The mine manager should consider the electrician in charge as an official, and on engaging him should point out the responsibilities of his position, and request him to acknowledge his appointment on an agreement form similar to the following :—

——— is hereby appointed as Electrician [or Electrical Engineer] in charge of the electrical plant at ——— Colliery, and is responsible for the safe working of same in accordance with the special rules for the installation and use of electricity (1905) under the Coal Mines Regulation Act (1887), a copy of which is appended.

(Signed) ———
Manager.

I hereby accept the above appointment and acknowledge receipt of copy of rules, &c., as herein mentioned.

(Signed) ———

A diploma of competency, recognised by the Board of Trade, would be very satisfactory in enabling the mine manager to determine as to the electrician's capabilities.

In the special rules relating to electricity in mines (Section 1, Clause 6), it is stated that suitable means shall be provided for the immediate localisation of leakage. This is very often complied with only by the use of a lamp connected either permanently or temporarily between each pole and earth. In a central station plant it is essential to include a testing set in the equipment, and it is just as important in isolated plants like mining plants, which have often an even larger output than many central station plants for town supply. Another essential article is for cleaning out dust from machines, &c. This is usually done by a pair of bellows, but as a matter of fact they are practically useless for doing the work efficiently. The most suitable and effective article for this purpose is a portable hand air compressor at present on the market, which compresses air to a pressure of 10 lbs. per sq. in., and can be easily moved about underground. A pair of rubber gloves is another requisite.

It should be the duty of the electrician-in-charge to see that all cables and branches are numbered and entered in a book. He should make a weekly insulation test of all cables, enter such tests in the book, and append his signature to it. A weekly test of all motors should also be made, and by doing this and keeping a record, the electrician-in-charge will then be able to detect any cable or machine that is failing, and thus prepare himself for any breakdown which may occur. This system should be specially enforced in mines where there is much water to contend with, as the dampness of the air has a very deteriorating effect upon cables and machines. Under such conditions, in repairs to windings of machines that are done on site, the writer finds the use of a good insulating enamel far preferable to shellac varnish, which is apt to become mouldy in a humid atmosphere.

Trailing cables should be tested for insulation every day before use, and every month they should be brought out of the pit and immersed in water and tested for insulation. In touching cables at any time where there is a doubt as to leakage, this should be done with the backs of the fingers and not with the inside of the hands.

As the working of motors is frequently in the hands of unskilled persons, care should be taken to see that oil does not leak out of the bearings and so run into the windings. Manufacturers of machines should always recess the bottom of the end casings, and should provide a tap or screwed plug at the bottom of the casing for draining off any oil which may have got in.

If I may presume to offer another hint to motor manufacturers, I would suggest that when connecting pins pass through slip-rings in A.-C. machines, it would be very beneficial to let the pin-holes pass through the supporting arms of rings and to put a slot in the end of the connecting pin, so that a broken pin could be withdrawn by using a screw-driver instead of having to drill it out and tap a fresh hole. The sketch in Fig. 1 illustrates this more clearly. Another fault in some motors is the very limited space for getting at and adjusting brush gear. There is a tendency to make these cases with just a small cover on the top, whereas the cover should be large enough to expose all the brush gear when off. It also seems desirable that the end casings of motors should be so made that when cleaning out motors both ends can be opened without dismantling more than is necessary, otherwise the dust is liable to accumulate at

Digitized by Google

the back side of motor. Several manufacturers are now making the slip-rings on induction motors of iron instead of brass. This has a serious disadvantage in damp pits. When the motors stand for the week-end the rings are liable to rust, and thus cause sparking when starting up.

Another suggestion I may offer is that every motor-starting panel be fitted with interlocking gear, which so acts that (after switch is thrown out by overload or no-volt release) it would be impossible to close switch unless starting resistance handle is in off position. Controllers should be so arranged that there is no likelihood of the handle being thrown over to the reverse side when pulled sharply from the forward running position.

As regards resistances, the writer would advocate the use of

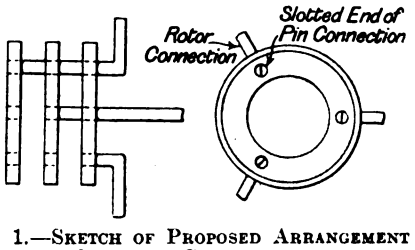

FIG. 1.—SKETCH OF PROPOSED ARRANGEMENT OF SLIP-RING CONNECTIONS.

open grid or plate types, suspended on rails across the airway passing motor house, or in motor house if motor house is closed in at front, in preference to oil-immersed resistances, which are liable to become heated and cause the oil to vapourise.

Coming back to the question of cables, the writer would point out another cause of shock from lead-covered cable. As a result of leakage, the lead has become charged, like a Leyden jar, and a person touching it has received a shock. This points to the possible advisability of lead-covered cables having a covering over the lead. In the particular case observed, the earthing of the cable was continuous, but up to a certain point inbye, iron and steel armouring was used, and beyond that lead covering. In experiments made since similar effects have been obtained, in some cases producing a spark from the lead sufficient to fire a shot. The writer would emphasise the importance of seeing that cables do not get kinked or twisted. A good arrangement for this purpose is to have a horizontal drum with centre

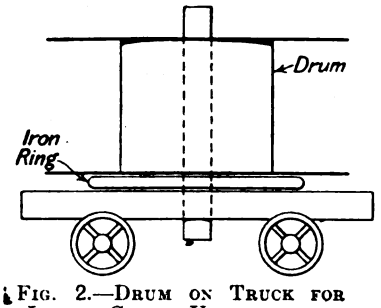

FIG. 2.—DRUM ON TRUCK FOR LAYING CABLES UNDERGROUND.

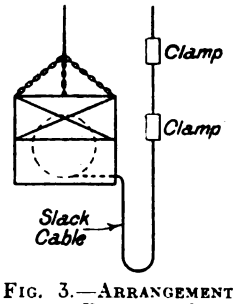

FIG. 3.—ARRANGEMENT OF DRUM IN CAGE FOR PAYING OUT CABLE IN SHAFT.

spindle on an iron ring mounted on a flat tram or bogie, as shown in Fig. 2, so that the drum can be turned round whilst the tram moves. A similar arrangement could be applied to the body of a coal-cutter, to prevent the liability of trailing cable getting under and being cut by the skids. In this case the centre spindle could be made hollow for end of cable to pass in, and the bottom of spindle fitted with contact rings. A word of caution may be issued in running wires or cables down a shaft from a drum on the cage. Always have some slack cable hanging in the shaft below the cage when descending, as shown in Fig. 3. The writer once had a very narrow escape from a serious accident through running a cable direct off a drum with iron arms. Through inattention a man in the cage allowed the cable to become fast on one of the drum arms, and as the cage descended the cable became tight and started to pull the drum out of the cage, pinning the writer between the drum and the safety chain across end of cage. It was only by shouting to the banksman to stop the cage that the pulling out of the drum and four men from the cage, and a consequent fall of 570 yards down the shaft was avoided.

In wiring fittings in motor houses underground especially, it should all be done on the loop-in system, so as to avoid joints, and not, as is often done, wired on the surface and coupled to the leads with joints.

A good system of electric flashlight and bell signals is necessary for shaft signalling. In D.-C. plants no difficulty in wiring these from the home mains is presented, and even in

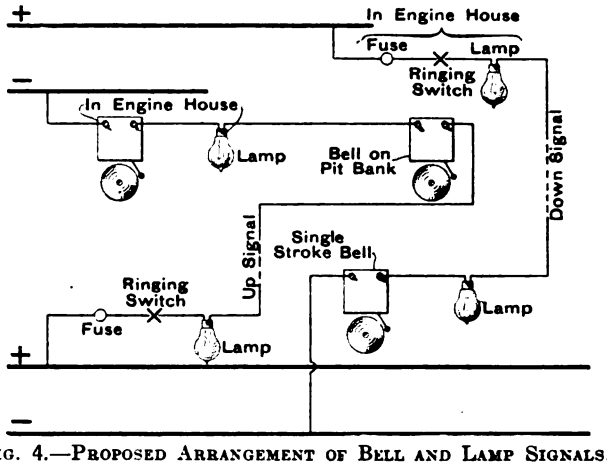

FIG. 4.—PROPOSED ARRANGEMENT OF BELL AND LAMP SIGNALS.

A.-C. plants the signal circuit can be wired off the exciter, as shown in Fig. 4.

As a standby during such time as the electric plant is stopped, a battery-bell signal could be used, wired in accordance with the diagram in Fig. 5.

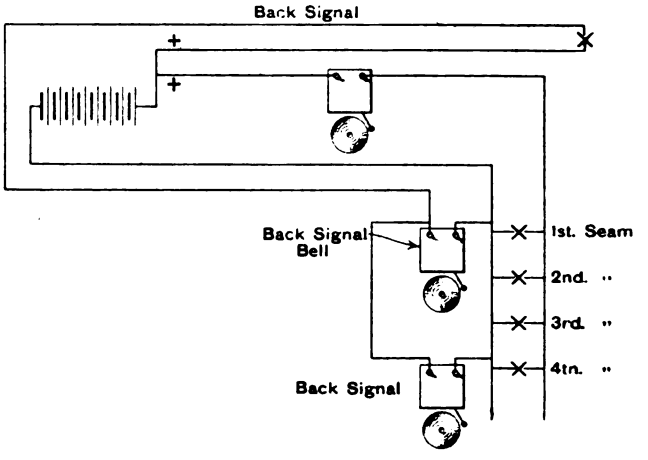

FIG. 5.—PROPOSED ARRANGEMENT OF STAND-BY BATTERY SIGNALS.

In conclusion, the writer would suggest the following alterations to the special rules for the installation and use of electricity in mines. A reduction in the number of rules would be preferable, but in the writer's opinion this will not be possible until the general standard of workmanship and suitability for mining conditions has been raised considerably.

A slight verbal alteration is suggested to Rule 3, Section I., to make it clear that the fittings, brackets, &c., in medium-pressure lighting installations are to be placed at a sufficient distance apart as well as the conductors.

To Rule 6 (which imposes a limit within which the leakage current is to be left) it is proposed to add: "A testing set, with generator of voltage not less than the current voltage in use, shall be provided for making periodical tests of cables, machines, apparatus, &c

In Rule 9, which gives three alternative methods of protection of branch circuits, it is proposed not only to omit the second method, but to prohibit the breaking of a live circuit by drawing fuses underground, and to require the use of a switch. [It is the custom to use a joint box with detachable fuses, which in a wet mine causes liability to shock.]

To Rule 11 it is proposed to add the requirement that the "competent person" appointed to take charge of electrical apparatus shall have had not less than two years' underground experience in electrical work.

To Section II., Rule 3, the following addition is proposed:—Every generator shall have its train *efficiently* earthed, and shall not rely on its foundations, nor on steam pipes, as an earth. [In this connection, attention is drawn to the liability of an attendant receiving a shock when shutting off steam if the insulation has broken down. This could be avoided by insulating the handwheel of the stop valve.]

It is proposed to add to paragraph 3 of Rule 6, Section III., the words:—Where underground cables are buried they should be cased with iron piping. [To prevent damage by picks.] It is proposed to add to Rule 7 the requirement that trailing cables should be tested for insulation every week, and tested after

Digitized by Google

immersion in water every month. The following new rule is put forward :—"All cables, mains or sub-mains, or every circuit shall be tested for insulation at periods of not more than a month, and such tests shall be recorded by the person in charge in a book kept for the purpose.

The following additional rules are proposed to be included under Section IV. :—*Rule* 4.—Oil-immersed switches and controllers must be so constructed that conductors shall not become deteriorated through coming in contact with the oil. *Rule* 5.—The use of oil-immersed resistances, where resistance is kept in circuit for any length of time, is prohibited. [The heat generated has been known to vaporise the oil and to cause an explosion.]

The following addition to Rule 4, Section V., is suggested :—"The use of semi-enclosed motors with extended shafts and slip-rings in separate cases are prohibited in places where General Rule 8 applies." The following two new rules under this section are proposed :—"*Rule* 9."—All enclosed-type motors shall be so constructed that end casings (or part) at each end can be removed so as to allow of efficient inspection and cleaning. *Rule* 10.—All motors shall be tested for insulation at periods of not more than a month, and such tests shall be recorded by the person in charge in a book kept for the purpose.

Under Rule 2, Section VII., it is proposed to add that all fittings, brackets, &c., must be efficiently earthed, and the following new rule is proposed :—*Rule* 5.—"All wiring for lights underground should be done by looping in, or, if in series, should be done without any joints whatsoever.

The following additional rule is also proposed under Section IX. :—*Rule* 4.—Signal wires shall not be used for telephoning purposes where there is a liability of giving a false signal and causing a haulage rope to start or stop.

[It is the practice at some mines to use pocket telephones on the haulage signal wires, and this often tends to confuse the attendant on haulage engine, when the persons using telephones ring to each other.]

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during March.

March 3rd.—Supplement on "Electrical Engineering in Mines," in which, after some correspondence relating to the novelty of a recently described leakage device and on the fixing of shaft cables, an account is given of a series of experiments on electricity and coal dust explosions. The formation of a Cumberland branch of the Institution of Mining Electrical Engineers is recorded, and a new design of enclosed air-cooled mining motor is described and illustrated. Other novelties, of which particulars are given, include a new shot-firing generator, and a watertight magneto mining telephone. Discussions on "Electric Shocks" at six of the branches of the Institution of Mining Electrical Engineers are reported, and a summary is given of electrical mining patents which have been published during February.

March 10th.—A special article describing a number of novelties, including some new forms of hand-lamps, watertight fittings, and an electrically-driven air-compressor. A Paper describing the manufacture of metal filament lamps.

March 17th.—Abstracts of two Papers by Mr. Miles Walker on turbo-alternator construction, with discussion.

March 24th.—Standardisation of electrical machines; overhead line construction.

March 31st.—The rating of motors for intermittent work. Description of a new generating station. The new Willans "disc and drum" turbine.

Colliery Fatalities.—An inquiry was held at Linlithgow on March 22nd concerning the death of W. Mackenzie, a pump attendant in the Blackridge Colliery, owned by the United Collieries, Ltd. It appears that the deceased took hold of a cable where there was a fault in the insulation, and received a shock which proved fatal. The jury returned a formal verdict, as a fuller inquiry is probable. A motor attendant, J. G. Scott, of South Shields, was found dead in a motor-house at the St. Hilda Colliery on March 17th. At the inquest, evidence was given to the effect that the deceased had opened a 3,000-volt switch-box, and must have touched the live portion of the switch. He had no right to touch the box, and had been warned. According to the medical evidence, the post-mortem examination revealed no cause for death, and so the jury concluded that the man had met his death accidentally by electric shock.

The Royal Commission on Mines.—At the National Miners' Conference recently, a strong feeling was expressed that the sittings of the Royal Commission on Mines should be continued, with special reference to the dangers attending the use of electricity in mines. It was apparently the unanimous opinion of the delegates that the whole question of electricity in mines should be thoroughly investigated by an impartial body like the Royal Commission, with the assistance of the best scientific opinion.

PREVENTION OF ELECTRICAL ACCIDENTS IN MINES

THE Paper read before the Institution of Mining Electrical Engineers by Mr. W. Maurice on "Electric Shocks," which forms the introduction to the first part of that Institution's inquiry into the causes and prevention of electrical accidents in mines, has been further discussed at several branches of the Institution. Discussions at Newcastle, Cardiff, Sheffield, Nottingham, Whitehaven, and Manchester have already been reported in ELECTRICAL ENGINEERING IN MINES (February 3rd and March 3rd), but at some of these sections further discussion has taken place since the meetings then reported.

BIRMINGHAM DISCUSSION.

The discussion of the Paper by the Warwickshire and South Staffordshire Branch was resumed at a meeting in Birmingham on February 26th. After the Chairman, Mr. A. HILL, had summarised the conclusions arrived at at the last meeting, Mr. GIDWELL put forward various conditions as tending to safety, such as the wearing of rubber gloves when adjusting machinery, the provision of rubber mats near exposed live parts, and the erection of guard-rails to prevent persons from falling against them. There was some discussion as to whether such rails should be insulated or earthed, but no definite conclusion was arrived at. Another point insisted on by Mr. Gidwell was that all motors should be of such a size as to deal with 100 per cent. overload, but Mr. ENGLISH pointed out that running of motors so much below their full capacity was very uneconomical. The same speaker also dealt with the earthing of coal-cutters by an extra wire in the trailing cable, and various alternative methods of earthing suitable for different circumstances were discussed. In dealing with further questions raised by the Paper, it was agreed that the problem was largely controlled by the human element, and that the best protection was the supervision of a skilled electrical engineer of proved experience. The chairman invited written contributions giving the personal experience of members.

WHITEHAVEN DISCUSSION.

The Paper was further discussed by the Cumberland Branch of the Institution at a meeting at Whitehaven on March 19th. In dealing with Question 7 of the Paper, relating to conditions under which actual accidents have occurred, Mr. BARRACLOUGH (Workington) said that of fifty-one fatalities attributed to shock between 1903 and 1909, thirty-one had been due to defective work and eight to carelessness. Over 50 per cent. were connected with cables. He mentioned cases where coroners' juries had brought in verdicts of electric shock against the evidence of electrical experts. Mr. W. H. BORLASE (Threlkeld) suggested that in these cases the jury should be composed of men with electrical knowledge; and the President, Mr. T. P. MARTIN (Cumberland Coal Association) gave some particulars of the only fatal electrical accident which he knew of in Cumberland, where a signal wire had come in contact with a faulty cable.

Passing on to discuss the relative degree of risk with continuous and alternating current, the general opinion was that there was no marked difference, but Mr. Borlase remarked that the better class of apparatus used with the higher voltages available on alternating circuits was itself a source of safety. With regard to further questions, it was agreed that insufficient protection of cables was the chief source of trouble; and with reference to protective devices, both Mr. Borlase and Mr. J. GLYNN WILLIAMS advocated the exclusion of fuses from mines and the adoption of oil circuit-breakers. In discussing risks other than those arising from leakage, Mr. Williams contended that it was practically impossible with most existing plants to avoid exposing live parts, but thought that protection in this line might arise in new plants in the future. Dealing next with the human element, the importance of skilled supervision was emphasised, although it was to be understood that, with the most efficient engineers in charge, accidents due to bad design and installation would still be liable to occur. After a few remarks on such precautions and the more extended use of rubber gloves and avoidance of touching live parts, the subject of the status of the colliery electrician was returned to, and Mr. Borlase expressed the opinion strongly that there should be a recognised official in charge of the electrical plant, and was supported by Mr. Williams, who said that it was unfortunate that the Institution was prevented from proceeding with the creation of a diploma class of members by the delay in getting the Articles of Association of the Institution passed by the Board of Trade.

CARDIFF DISCUSSION.

The discussion at Cardiff was resumed on March 19th, when Mr. WATKINS (Bargoed) described a case of a fatal electric shock on a 3,000-volt system due to omission to open a feeder switch before working on the feeder. Another case was that of a painter who was ordered to paint the outside of a switch-box, but opened it and came in contact with live parts. He had known cases of one blade of a three-pole switch which had stuck

Digitized by Google

when switching off, and men had obtained shocks in trying to pull it out by their fingers.

Mr. DAVIES (Abersychan) spoke of the advisability of having a visual voltage indicator such as a pilot lamp, which on A.-C. circuits might be worked by a small transformer on all controllers. Switches should have a good positive action, and ample provision to take up wear.

Mr. T. E. RICHARDS gave particulars of a successful case of resuscitation after a severe shock, and said that he favoured the Shäffer method of artificial respiration, which could be used even on a man with a broken arm. The system of earthing they adopted at their colliery was by means of two separate earth plates, one on the surface and one underground, laid in the sump. The earth wire was of copper connected to a tinned cast-iron plate in each case. With regard to cables, they use as far as practicable armoured underground, and bare overhead on the surface. He had not yet experienced any trouble resulting from breakages in the cables. Asked by the President (Mr. S. F. Walker, Bath) whether he preferred armoured cables in preference to non-armoured *but protected* cables, Mr. Richards said he would prefer armoured cables with a sound continuity throughout as regards earthing.

Mr. S. F. WALKER said that he had great objections to armouring, and he thought that if some of the money now spent in armouring were spent on insulation, a better result would be obtained. One of the great objections he had to armoured cables was that when they became damaged by a fall, they were apt to cause flashing, and were difficult to repair.

Mr. T. E. RICHARDS, continuing, related a case of an electrician who was investigating a leak in a 440-volt cable underground, and the method he adopted in finding the leak was by passing his hand along the cable, and was found some time after dead, in an upright position, with his hand on the cable.

Mr. SOARS (Swansea) thought that a very good protection for cables was by covering them in a wooden casing, well dressed with Stockholm tar.

Mr. WATKINS favoured an incombustible casing, as he believed avoiding as far as practicable anything of an inflammable nature underground. He also recommended burying the cables as much as possible.

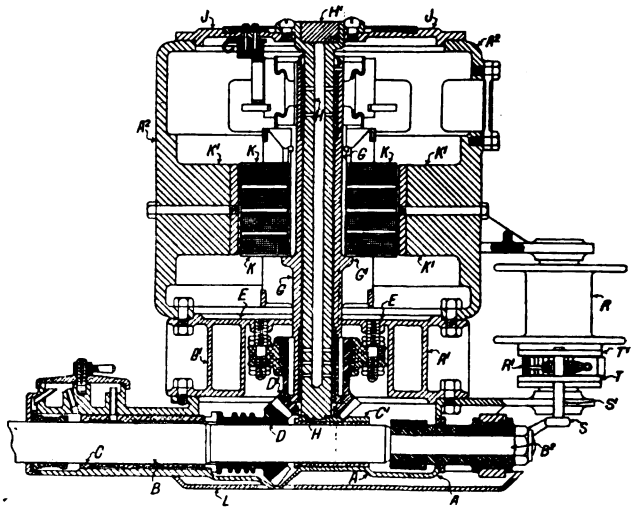
Mr. T. E. RICHARDS mentioned a case where the cable of a pit shaft took fire, and after the fire an insulation test was taken of the cable, which showed very good results.

Mr. WALKER remarked that finely divided carbon was a good insulator, and instanced cases of the coils of arc lamps, after being burnt out, continuing to work as long as they were not disturbed.

Mr. WATKINS emphasised the necessity for periodical insulation testing, and a special specification as regards cables, switches, &c., for mines.

NOTTINGHAM DISCUSSION.

Discussion of the Paper was resumed at Nottingham at a meeting on March 19th. In calling for discussion, Mr. W. Maurice, who was in the chair, mentioned some of the directions in which he would be particularly glad to hear the experience and opinions of members.



The principal speaker was Mr. F. CUSWORTH (East Kirby), who, in discussing limits of leakage, considered that if the leakage could be kept below 20 milliamperes, the leakage shock was practically harmless. The rule that it was not to exceed 1/1000 of the maximum current was no protection against leakage shock. Even with 110 volts the resistance of a man's body, especially under mining conditions, was not high enough protection, and the effects of shock were dependent on the actual current passing through the body and not upon the voltage. In speaking of danger due to defective apparatus, he mentioned a fatal case on a 600-volt A.-C. circuit, where an ammeter case which was badly earthed became live through the fibre base absorbing moisture. He suggested marble bases for such instruments, or protection with an expanded metal guard. After a few words on the protection of lamps and lamp-holders, he passed on to the subject of cables, and advocated double-wire armouring painted with bitumastic solution to avoid corrosion. The care required in their maintenance was in itself a safeguard as preventing the dangerous temporary repairs often found on unarmoured cable systems. The earth wire should not be of less capacity than the feeders, and nothing less than 7/18s. stranded wire should be used for earthing electrical apparatus. In conclusion, he emphasised the necessity for good work on the lighting systems, and recommended the use of conduit tube throughout.

Mr. MAURICE then read some communications received from members, one of whom said he had had no electrical accidents in eight years, and only two hours' stoppage, due to failure of a shunt regulator. In the pits in question certain men are made responsible for the condition of the cables in each district, and all apparatus is inspected weekly. The President also referred to a suggested appliance for automatically switching current off when the percentage of gas in the air reaches a certain figure.

Royal Commission on Mines.—Sir Henry H. Samuel Cunynghame, K.C.B., has been appointed Chairman of the Royal Commission on Mines, in succession to the late Lord Monkswell.

ELECTRICAL MINING PATENTS OF MARCH

A PATENT has been taken out by Mavor & Coulson, Ltd., S. M. Mavor, and H. A. Mavor for an improved coal-cutting machine of the bar- or chain-cutter class particularly adapted for short face workings, and especially where it is desired to make an entry cut into the face in a line with the side wall, finishing at the other end of the face also in line with the side wall. The specification, numbered 6,051 of 1909, has four figures, one of which is reproduced below. The machine itself consists of a motor geared to a rotary cutter bar projecting laterally. An independent haulage apparatus may be used, in which case there is a cable connection between the two, so that the haulage gear can be controlled from the coal-cutter. Alternatively, if the cutter bar has a reciprocatory as well as a rotary motion, a small haulage drum may be attached, as shown in the figure, to the frame of the coal cutter and driven through suitable ratchet gear by the reciprocatory motion of the cutter bar. For supporting the machine during the cutting operation, a steel sledge is fixed to the base, and for moving the machine from one place to another, wheels are provided. These can be raised above the plane of the sledge for working. The cutter bar projects from the front of the casing and radial adjustment is effected by slewing the frame. As shown in the figure, the motor axis is vertical, the cutter bar being driven through bevel gearing. The cutter-bar shaft *B* is supported by a bearing gland *C* formed in the front wall of the casing, and by a central bearing *C*. The motion of the motor shaft *H* is transmitted to the shaft *B* through bevel wheels D_1 and *D*. The wheel D_1 is formed with a boss having thrust collars embraced by a divided bearing with corresponding

SECTION OF COAL-CUTTER FOR SHORT-FACE WORKING. (MAVOR & COULSON, LTD.)

thrust recesses. The motor shaft is tubular, and has transverse passages for distributing lubricating oil fed in at the head. The shaft and armature can be withdrawn through the open head of the casing, the wheel D_1 being left in the base. The mechanism for reciprocating the cutter bar is not shown. The haulage drum *R*, with the ratchet gear operated by the bar, is included, however.

A conveyor for carrying coal along the working face and discharging it into the tubs is described in specification No. 9,817 of 1909 by D. M. Ritchie, a colliery manager of Prestwick. This consists of a long band of leather or canvas thickly studded with rivets, which lies at the bottom of a trough formed of a number of sheet metal sections fastened together. The length of the trough can be easily and quickly altered. At the delivery end the last section rests on an erection carrying a transverse roller. Beneath this are a roller and a drum. Either can be connected by means of a clutch to an electric motor; the former rolls up the leather band and thus draws the coal along to the tubs, while the drum winds up a rope which passes over a pulley at the other end of the trough and draws back the band after all the coal has been discharged.

An improved locking device for attaching to miners' safety lamps is described in specification No. 12,751 of 1909 by J. Prestwich, of Eccles. A steel stud is enclosed in a hollow metal fitting, which is attached to the base of the lamp. The pin is pressed upwards by a spring, and when the upper part of the lamp is screwed into position, the stud enters a recess in a lip attached to the upper part. The pin can only be withdrawn by means of a special electromagnetic device.

A patent by E. Witzenmann (No. 3,917 of 1909) covers a flexible metallic tubular armouring for cables consisting of a metal band of ⊓⊔ section wound helically so that the edges of adjacent coils interlock. The band is wound on tightly so that the insulation is forced up into the section in the form of a screw thread, thus preventing movement of the armouring.

ELECTRICAL EQUIPMENT OF THE ASHINGTON COLLIERIES

THE collieries of the Ashington Coal Co., Ltd., are situated in Northumberland, some twenty miles north of Newcastle, and are the largest and most important in that district. The company owns four collieries, one at Ashington, another at Woodhorn, a third at Linton, and the fourth, on which work is just being commenced, is at Ellington. The total output of these pits amounts to some 2,000,000 tons per year. The company generates its own electric power in a steam station at Ashington.

Electric haulage, pumping, and coal-cutting have been employed for some few years in the Ashington pits, and preparations are now being made for a supply of power from Ashington to Linton, and to the new pits at Ellington, for the purposes of electric haulage and pumping. The total electrical horse-power installed in the Ashington pits is about 2,200, distributed amongst some eighty motors, over 50 of which (aggregating some 1,500 h.p.) were supplied by the General Electric Co., Ltd. There are three shafts for winding coal at the Ashington colliery, named the Bothal, Carl, and Duke shafts respectively. A fourth shaft, carrying the main water pipes, is also fitted with a small cage to ride men only. All the winding engines are steam-driven. The exhaust fans in the ventilation shafts are also steam-driven, and deal with 260,000 cubic feet of air per minute each, but are about to be replaced by electrically-driven fans. An idea as to the extent to which electrical working is employed in the Ashington pits can be obtained from Fig. 1, which is a diagrammatic plan of the cables and motors in the various seams, and represents the state of affairs a month or so ago.

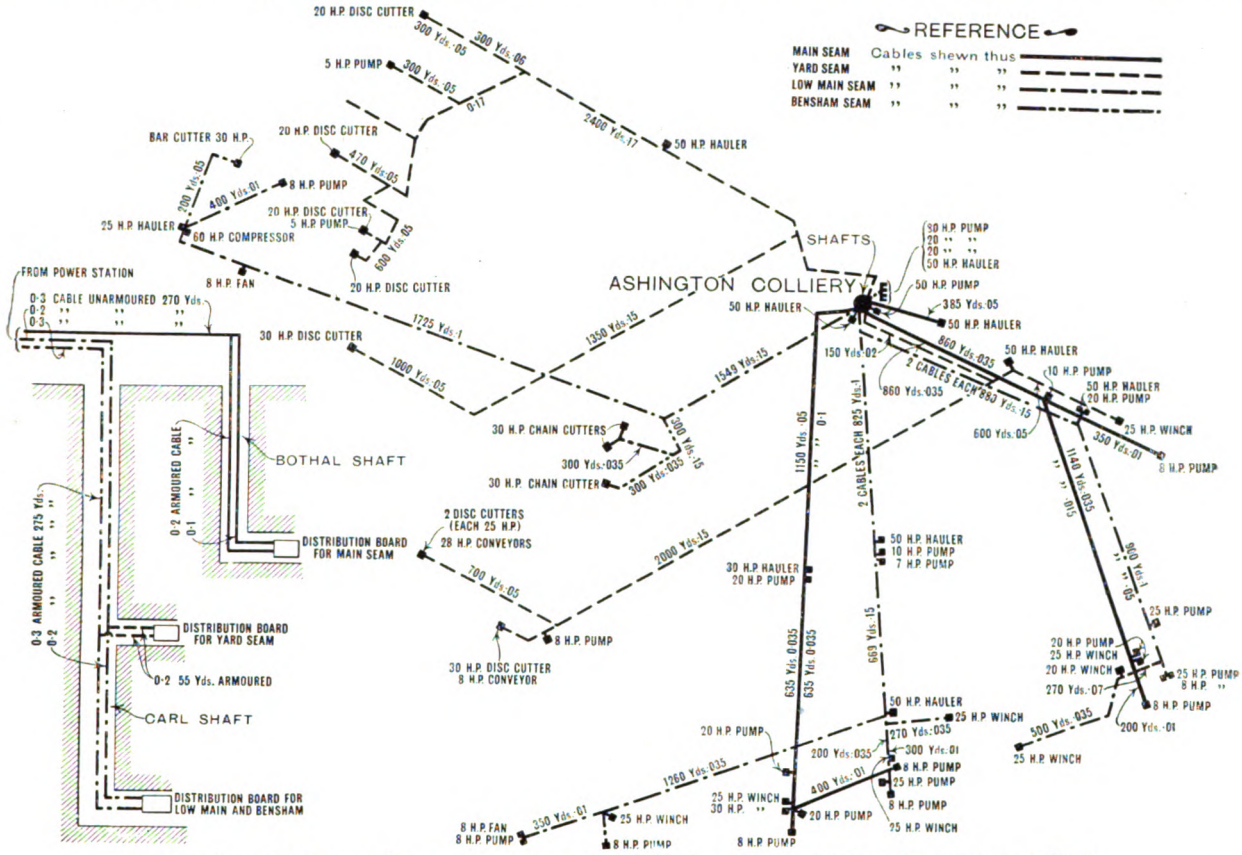

FIG. 1.—DIAGRAM OF SHAFT CABLES AND PLAN OF CABLES AND MOTORS IN ASHINGTON PITS.

From the inset diagram of the shaft cables, it will be seen that there are two feeders from the power station to the Carl pit, one 0·2 sq. in. and one 0·3 sq. in., each consisting of a set of three braided stranded cables. The distance is about 270 yards, and these cables are carried on a single wooden pole line and supported on porcelain insulators. A second pole line carries two 0·3 sq. in. feeders, each consisting of a set of three bare stranded cables, for supplying the Bothal pit and the surface plant. At the mouth of the Carl pit, the 0·2 sq. in. feeder is jointed to an armoured lead-covered cable, and the 0·3 sq. in. feeder to an armoured bitumen cable. These are supported at intervals of from 12 to 18 feet down the shaft by heavy wood cleats bolted to the shaft wall, and both go down the full depth of 275 yards. As indicated in Fig. 1, the cables enter junction boxes at the Yard seam level, from which two 0·2 sq. in. armoured cables are taken to supply that seam. The Bothal pit feeder is jointed at the pit mouth to two armoured three-core cables, 0·2 sq. in. and 0·1 sq. in. respectively, which run down to the main seam distribution board.

Near the distribution boards, the cables enter dividing boxes, from which single-core unarmoured cables protected with sheet-iron lead up to the iron-clad boards. The armoured cables from these boards are carried along the roadways to the various haulage motor rooms, gate-end switches, &c. They are hung from the wooden props struts by short lengths of rope, which would give way in the event of a fall of roof. At intervals the cable is given a deep loop, so that there shall be plenty of slack for repairs, making joints, &c. Where it was necessary to join two lengths of cable, the two ends are brought in to a joint box of the pattern which is divided into three compartments, the two outer ones being intended for filling with bitumen compound for ensuring a water-tight joint. In the present case, the centre compartment containing the joint is filled in solid with insulating compound, and the outer compartments are filled with molten lead, which makes a good electrical contact with the armouring and lead. A joint made in the manner is illustrated in Fig. 2. It will be noticed that a piece of stranded copper cable is moulded into the lead and carried outside the box. This bond is first sweated to both armouring and lead of the cable before pouring in the molten lead. A substantial clamp is also fitted to the box at each end for supporting the cable.

Three-phase current is distributed in the pits at 500 volts through armoured three-core cable. All the

Digitized by Google

cables, excepting the trailing cables for the portable machines, are armoured, and every piece of apparatus is connected to the armouring, which is earthed. The trailing cables are four-core rubber insulated, and covered with hose-pipe, the fourth core being the earth-

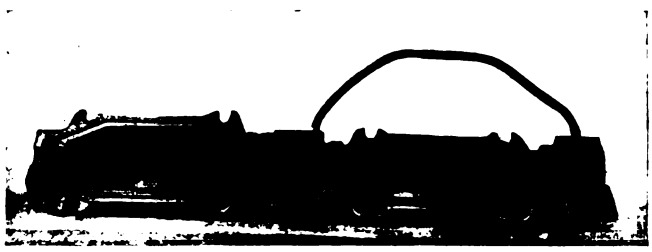

FIG. 2.—JOINT BOX OPENED TO SHOW METHOD OF BONDING.

ing wire. The armouring of the shaft cables is connected to the rising mains from the pumps, to the water-pipes and cooling-ponds at bank, to a 6 ft. hole filled with scrap-iron, and to a four-mile length of wire rope buried in a trench along a transmission line.

The system of protection now being introduced is quite unique, and is protected by a patent taken out by Mr. T. McKie, the electrical engineer to the colliery, and the Ashington Coal Co. In this system, each motor is protected individually by an automatic device

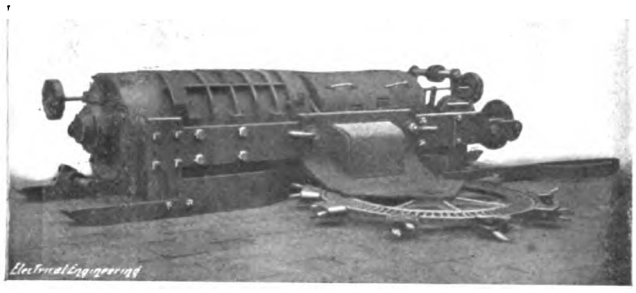

FIG. 3.—DIAMOND ELECTRIC DISC COAL-CUTTER.

on its controlling switch, and any leakage is separately indicated on each main circuit. In the case of a stationary motor, the frame, and in the case of a coal-cutter, the earth-wire of the trailing cable, is connected to the main cable armouring and the switch-box through a solenoid placed in the switch-box. Should there be any leakage in the motor, the leakage current must flow through the solenoid. Energising the solenoid causes a weight to be released, which drops on a trigger and opens the switch. This ensures that

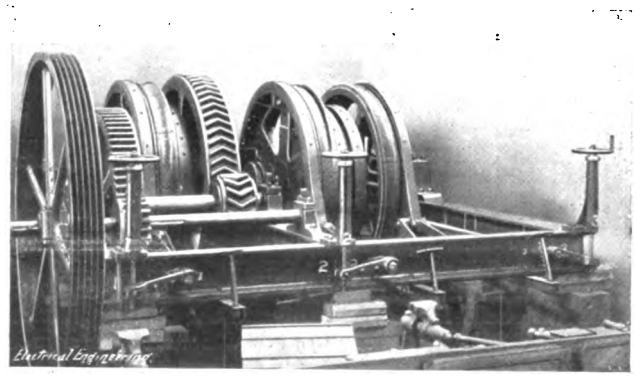

FIG. 4.—50-H.P. THREE-ROAD ENDLESS ROPE HAULAGE GEAR. (ROBEY & CO., LTD.)

the motor is cut off directly leakage occurs. This device has already been fitted on several motors in the pits with every success. At the switchboard, the armouring of each main circuit is connected to a common bar through a relay. This bar is connected to the neutral points of the generators through a choking coil, an automatic circuit-breaker, and a recording ammeter. Should there be a leakage in any part of any circuit, the leakage current flowing back through the armouring will disconnect the faulty motor as explained above, and will also actuate the relay at the switchboard. This causes a lamp to light and indicate on which circuit the leakage has occurred. The ammeter records the leak, and the attendant can write the time and circuit on the chart alongside the kink in the curve. The provision of the circuit-breaker and choking coil in the connection from the armouring of the various main circuits to the neutral point of

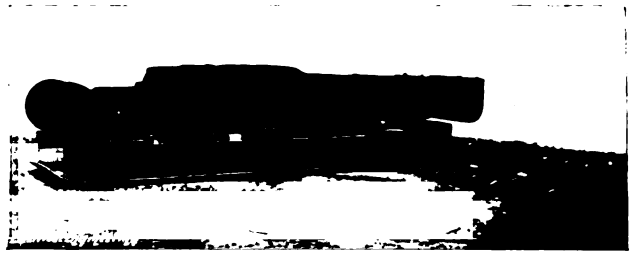

FIG. 5.—DIAMOND ELECTRIC CHAIN COAL-CUTTER.

the generators prevents any damage to the generators due to sudden rushes of current.

A set of switch-pillars on this system is being constructed by the British Westinghouse Co. for use on the 500-volt side of the 3,000 500-v. transformer at the bottom of the Linton shaft for controlling the inbye cables. The leakage trips are instantaneous, and are claimed to be more reliable than overload protection on the three phases. Each motor-switch will be fitted with a minimum leakage trip, so that the motors will not open the feeder-switches except in the case of a heavy

FIG. 6.—DIAMOND GATE-END SWITCH FOR COAL-CUTTER, SHOWING TRAILING CABLE PLUG AND SOCKET.

earth or the motor-switch not acting. As leakage trips are fitted to the branch feeders as well, a triple protection is obtained.

It will be seen from Fig. 1 that in the main seam there are seven pump motors, four 20 h.p., one 10 h.p., and two 8 h.p. capacity. Besides these, there are two 50 h.p., and one 30 h.p. hauling motors, and three winch motors, one 30 h.p. and two 25 h.p. There are no electric coal-cutters in this seam, the work being done by compressed air disc machines, which are supplied from several steam-driven compressor sets on the surface. The punching and drilling machines used in the pits are also worked by compressed air. Electric coal-cutters are employed to a considerable degree in the Yard seam. Here, there are eight disc cutters of from 20 to 30 h.p. each, shown in position. These were supplied by the Diamond Coal-Cutter Co.,

Digitized by Google

of Wakefield. They are fitted with three-phase, 40-cycle, 30 h.p. 500-volt motors of the squirrel-cage pattern with the rotor and stator slots out of parallel to avoid dead points. The motors are provided with ball-bearings, as apart from the simpler lubrication and easier running obtained, there is so little wear that there is no danger of an earth or short-circuit occurring due to the rotor striking the stator. This has been a source of danger, as in some cases a rotor stamping has been known to have cut into the stator winding. Further, the friction may heat up the stator stampings and burn up the slot insulation.

One of the Diamond disc machines is illustrated in Fig. 3. These machines have been fitted with a new pattern of reversing controller and are switched direct on to the supply. The use of the reversing switch reduces the wear and tear of the trailing cable plugs, as these can be left in the same position.

Besides the coal-cutters there are two 50 h.p. haulers, a 50 h.p. pump, a 25 h.p. winch, three 8 h.p. conveyor motors, and two 8 h.p. pumps in the Yard seam. One of the 50 h.p. haulers is illustrated in Fig. 4. This is situated near the Carl shaft, and provides the motive power for three endless rope haulage ways in the Yard seam. The haulage gear, which was manufactured by Messrs. Robey & Co., Ltd., of Lincoln, consists of three endless rope drums, each six feet in diameter, mounted loose on the drum shaft, and fitted with friction clutches for operating the drums independently or together, as may be required. Each drum has a powerful band brake. The shaft is 8 in. in diameter, and the gun-metal bearings have sight-feed drop lubricators. The double helical gear is machine moulded, and is driven by means of a rope pulley on the first motion shaft from a 50 h.p. motor. In order to facilitate the erection below ground, the cast-iron base-plate is constructed in sections. Fig. 4 shows the gear as erected at the makers' works.

Fig. 5 illustrates a chain type Diamond machine which was supplied recently for the Bensham seam. There are three 30 h.p. chain cutters at work in this seam, which is supplied from a Low Main seam cable. In the latter seam, there are no less than fourteen electrically-driven pumps of from 8 to 80 h.p., ten hauling and winch motors of from 20 to 50 h.p., two 8 h.p. fans, one 60 h.p. compressor, and one 30 h.p. bar coal-cutter. The two large 80 h.p. pumps are of the three-throw reciprocating type, and are driven by motors with wound rotors and slip-rings, supplied by the General Electric Co.

Fig. 6 illustrates a pattern of gate-end switch-box supplied by the Diamond Coal-Cutter Co., and used in the Ashington colliery in conjunction with their coal-cutters. This comprises a gas- and water-tight cast-iron case containing a quick-break 3-pole switch and cartridge fuses. The handle is detachable. When the lid is dropped, it locks automatically, and the box can only be opened by moving the handle. It is impossible to switch on while the box is open. Closing the switch locks the trailing cable adapter and the box lid. The live terminals of the switch are protected by an insulating plate, and cannot be touched accidentally when the box is open.

The power station at Ashington contains two 750-kw. Parsons turbo-alternators. These are of the early wire-wound rotating armature type, and run at 2,400 r.p.m., delivering three-phase current at 40 cycles, 500 volts. The machines are remarkable for their large air gaps; one has a gap of 3 in., and the other a gap of 3·5 in. Four slip rings are provided, and the fourth is connected to the neutral point of the star wound armature. The field magnets are excited at 100 volts. On a recent test, one of these machines was found to take only 21 lbs. of steam per kw. hr. on three-quarter load. The working pressure is 140 lbs. per sq. in. At present it is only necessary to run one machine at a time, but when the supply is given to Linton and Ellington the load will be greater than can be dealt with by one machine, and a third unit will probably be installed. The average load on the station is some 500 kw. The main switchboard was supplied by Messrs. Siemens & Co., and comprises nine panels. Two are for the control of the main generators, and two belong to the motor-generators. There are four feeder panels, two controlling two feeders running to the Carl pit, one for the Bothal pit feeder, and one for a feeder supplying the surface plant. The remaining panel is allotted to the air and circulating pumps of the condenser plant. For changing over the load from one machine to the other, a Siemens revolving light synchroniser is used. The surface condenser plant is in duplicate. The air pumps and centrifugal water circulating pumps are electrically driven by G.E.C. and Bruce Peebles three-phase slip-ring motors of from 40 to 60 h.p. each. These are provided with liquid starters and switch-fuses.

The supply to the surface plant, which consists of various coal screening appliances, brickmaking plant, stone-breakers' winches, and general lighting and power supply to the shops, is given by means of an overhead line.

The electrical equipment at the Ashington power house in connection with the supply of power to the Linton and Ellington pits comprises two 200-kw. Westinghouse oil-cooled three-phase transformers, Reyrolle switchgear on a new panel of the main board, and lightning arresters to protect the transmission lines. The secondary pressure is 3,000 volts, and the switches on this side of the transformers are of the Reyrolle automatic oil-break pattern with overload release coils in each phase. The transmission line is in duplicate from Ashington to Linton, the two pole lines being spaced five yards apart. A single line runs from Linton to Ellington. Each line consists of three solid No. 4 S.W.G. copper wires strung on Buller insulators. The poles are 34 ft. long and 11¼ ins. in diameter five feet from the butt, excepting at angles, terminals, and crossings, when they are 37 ft. long and somewhat thicker. There are no cross arms, but the insulators are carried on three galvanised wrought iron side brackets 2 ft. apart. Shackling is effected every ¼ mile, and knuckle bosses are used at all shackling and straining poles. Earthing is effected by running an old steel winding rope in a trench for the whole distance of the line. To this every piece of ironwork on the line is connected. The rope is in turn connected to earth-plates every 200 yards, and also to the large earth-plate at the generating station. The length of the double line is approximately 2¾ miles, and the length of the single line from Linton to Ellington about 1¾ miles. The present working pressure is 3,000 volts, but the line will probably have to work at 6,600 volts later on.

Horn type arresters are fixed at Ashington, Linton, and Ellington. These are placed on the wall in the two former cases and on terminal poles at Ellington. In the latter case connection is made underground from the terminal poles to the switchroom at the pit mouth by means of three-core cables, suitable for 6,600 volts working pressure, laid solid in Howard asphalt troughing. The dielectric of these cables consists of layers of Manilla paper impregnated with diatrine, over which a vulcanised bitumen compound is applied under pressure forming a solid tube upon each conductor. The cores are then laid up together round a core of similar bitumen compound, and sheathed over all with a tube of compound ribbed internally so as to fit the interstices of the laid-up cores. The cable is then taped, jute served, and protected with wire armour, and finally jute served and compounded over all. Each cable is in a separate trough filled with Trinidad bitumen covering the cables to a depth of ½ in., and a top layer of asphaltic concrete. Between the haulage engine house and the transformer chamber at the bottom of the shaft at Ellington, a similar cable is used, excepting that it is further protected with a double layer of galvanised steel armouring wires. The cables as well as the overhead line material were supplied by Messrs. W. T. Glover & Co., Ltd. (Trafford Park, Manchester).

Besides the supply to the colliery, this station, by arrangement with the Northern Counties Supply Co., feeds the local distributing network of that company, delivering continuous current for village lighting, and a small amount of power at 240/480 volts on the three-wire system. The cables are bitumen insulated, and are laid underground in wooden troughs. A large number of metal filament lamps are on these mains for street lighting and for private houses. This load is dealt with by two motor-generator sets by the British Westinghouse Co., each consisting of a 300-h.p. three-phase asynchronous motor with squirrel-cage rotor running at 575 r.p.m., and coupled to a 200-kw. D.C. compound-wound generator delivering current at 480-530 volts. These sets are started up from the A.C. side by means of an auto-transformer, and take a starting current of from 300 to 400 amperes. The rest of the plant comprises two balancers and a switchboard. Six meters are in use, three in series on each side of the system.

In conclusion, we should like to express our thanks to Mr. Ridley Warham, General Manager to the Ashington Coal Co., Mr. E. O. Southern, Manager at Ashington, Mr. W. J. Charlton, chief engineer at Ashington, and Mr. T. McKie, electrical engineer, to all of whom we are indebted for much assistance. Our representative was afforded facilities for inspecting the plant in the pits as well as that on the surface.

CAUSE AND PREVENTION OF ELECTRICAL BREAKDOWNS IN COLLIERIES

MR. H. J. FISHER (Electrical Engineer to the Lambton Collieries) read a Paper on March 9th on this subject before the Newcastle Branch of the Institution of Mining Electrical Engineers. Analysing a list of electrical breakdowns contributed by some of the members, he found that out of twenty-three recorded breakdowns on cables, four were caused by bad insulation, two by falls of roof, four by runaway sets, seven by water, and six by bad workmanship. With trailing cables, there were eight breakdowns due to falls of roof, and two by water. With motors, there were eighty breakdowns recorded, eleven due to bad design, three to overload, fourteen to defective insulation, one to careless operation, twelve to water, twelve to the rotor coming into contact with the stator, nine to collection of dust, eleven to oil-soaked windings, four to open circuit in field coils, and three to vermin getting inside the motor. With switchgear and controllers, there were sixty-five breakdowns. Thirty-five due to bad design, four being too small for the work; nine to careless operation, one to water, and thirteen to failure of the automatic trip gear to operate or to over-fusing. These breakdowns, which total 178, work out to the following percentages :—37·5 bad design or material, 37·5 bad work or faulty operation, 12·5 due to water, 12·5 purely accidental.

A common fault with multi-core cables lies in the jute packing used with rubber and bitumen cables becoming loaded with moisture. This can be avoided by using solid bitumen cable or rubber-insulated bitumen-covered cable. A fault sometimes found is that the armour is applied in a dry state and is acted upon immediately by water. The best practice is to compound the armour thoroughly as it is being applied, not with a brittle compound, but with one that is, and will remain, as sticky as possible.

After the cores are laid up and taped, soft compounded jute packing should be applied, and the first layer of armour applied and compounded. Another layer of soft compounded jute packing should be applied; the second armour should be applied over this and compounded, and after the final jute serving or Hessian tape, the whole should be again compounded. A cable made up in this way is absolutely waterproof, and will resist heavy falls of stone, as the jute packing will make it more resilient.

Paper-insulated and lead-sheathed cables are satisfactory, but should be double wire when suspended along main roads. Bitumen sheathing, unless it is soft and pliable, is apt to harden and crack and let in moisture. Vulcanised rubber insulated cable is more universally used than any other class, and where the rubber is of good quality is undoubtedly the best. It and vulcanised bitumen cable is perhaps best adapted for face-work. Paper cables are more liable to breakdown than the other classes, unless sufficient care is exercised in jointing and sealing ends and watching insulation resistance.

A large proportion of faults on cable systems occur at joint-boxes, and Mr. Fisher described his own design of box, of which full particulars and illustrations were given in ELECTRICAL ENGINEERING IN MINES, November 4th, 1909.

From the table of 80 breakdowns of machinery, 25 were due to defective design or insulation, and 36 to bad work or maintenance. The author has come across various instances of insufficiency of insulation on bar-wound stators and rotors.

Dampness is a frequent cause of breakdowns, but its effects could be avoided by more thorough impregnation of the windings and the use of closed tubes to carry the winding. Frequent troubles occur owing to the use of an inferior class presspahn. The author has found a special class of presspahn coming from Germany, and thoroughly impregnated with paraffin wax, which effectually prevents dampness entering the windings. Slip-ring troubles are often due to the fact that a class of insulation is used that readily absorbs oil and moisture, or that allows carbon or metallic dust to accumulate and to cause flash-overs on the rings. To prevent this, a thin slip of insulating material of larger diameter than the insulating bushes should be inserted between the rings.

There is room for a great deal of improvement in switchgear and controllers both as regards design and material, often caused by designers not being thoroughly versed in the conditions in mines. Greater accessibility is required. Cases are even known where it has been impossible to connect up switch-cases in place. The unsuitable use of wood, porcelain, and sulphur for cementing terminals are matters that require attention.

In conclusion, Mr. Fisher advocated the use of automatic cut-outs everywhere in place of fuses, and the more thorough standardisation of spare parts.

The discussion was opened Mr. H. W. CLOTHIER (Messrs. A. Reyrolle & Co.), who said that manufacturers had been in search of information of this description for many years, and that it was a difficult matter to obtain first hand from practical men details of the difficulties with which they had to contend.

Mr. G. G. L. PREECE (Messrs. W. T. Glover & Co.) said that in many cases manufacturers had already altered their designs in order to meet the requirements of practical mining engineers. It appeared to him remarkable, having regard to the poor insulation found on much of the mining machinery, that there were not more breakdowns.

Mr. WOOD (Messrs. Ernest Scott and Mountain, Ltd.) contended that the majority of breakdowns of mining plant were due to oil in the windings, particularly on direct-current machinery. He suggested that in order to cure such trouble the windings should be very thoroughly impregnated. He recommended more careful design in bearings, as in many cases the overflow to the oil-containing chamber was not sufficient. The question of circuit-breakers instead of fuses was a difficult problem in connection with portable machines.

Mr. LAYBURN wished to know whether motor breakdowns due to oil gathering between the stator and rotor were really caused by the rotor going to earth through failure of insulation properties, or to a collection of dust and oil in the air-gap causing mechanical heating. He emphasised the necessity for proper oil-throwers between the bearings and the electrical machinery. The dust problem could not be satisfactorily overcome by means of blowing, and his experience was that in order to clean mining machinery thoroughly, it was necessary to dismantle the whole of the apparatus periodically. The presence of coal-dust in such windings led to damage which was not altogether electrical. He knew of a case where mechanical friction on a short-circuit arrangement of slip-rings produced a spark which got on to the coal-dust in the windings, and would have caused serious damage if it had not been promptly noticed. With reference to the surging due to switching operations, he suggested the use of a choke coil on every machine to damp them down.

Mr. BAXTER (Messrs. Reyrolle & Co., Ltd.) agreed with Mr. Fisher as regards the insufficiency of the light cotton covering usually employed as insulation on rotor-bars. He believed that the Admiralty had substituted mica or micanite for presspahn for the purpose of insulating the slots of armatures. With reference to standardisation of colliery plant in order to keep down the number of spares, he suggested that colliery engineers limit themselves as much as possible to one make of machine, so that standardisation of one maker's plant would mean practically standardisation of the whole of the colliery equipment.

Mr. MORGAN said that he had used and approved the wax-impregnated presspahn referred to by Mr. Fisher, as it was cheaper than micanite and answered its purpose very well. Oil-throwing was greatly aggravated if the bearings were worn and if the rotor was slightly out of balance and a whip of the shaft occurred.

Mr. SHEARER suggested that where large motors ran the risk of being overloaded, it was well to mark the ammeter with a red line indicating the point of overload, so that an unskilled attendant could always tell what he was doing. With regard to the burning out of the first coils on an alternating-current motor on the instant of starting, it was the usual custom among transformer manufacturers to insulate the end coils and those near to them very much more heavily than the remainder to provide against this surging effect. It was the general practice, unfortunately, to start up the motor with its rotor open, but for a large machine it was essential to close the rotor circuit on switching in the motor. This would very largely obviate the burning out of the motor, inasmuch as at the instant of starting there was probably 100 per cent. excess voltage.

Mr. CLOTHIER said that the case of the switching in of an alternating-current machine raised a problem analogous to the switching in of high-pressure cables. It was at first thought that an ohmic resistance inserted in series and gradually cut out would overcome the difficulty, but having regard to the surges set up in a cable system by switching operations at a distance it was found that the ohmic resistance was not a sufficient remedy, and a use of choking coils and spark-gaps was therefore made. The question was one of pressure and not of current. Spark-gaps were not, of course, applicable to the present problem, inasmuch as the voltage developed in the rotor was not one between phases, but between individual turns upon each phase. With regard to the question of automatic overload arrangements for portable machinery, he said that it was quite possible to substitute these for fuses, inasmuch as a circuit-breaker could be arranged to have a heavy setting for switching-in purposes, while directly the machine got up to full speed the setting could be automatically changed over to a light one for tripping purposes on load.

Various other members contributed to the discussion, one remarking that it was extremely difficult to blow fine dust out from a motor on account of its extreme lightness; another mentioning that fibre wedges in the slots of the rotor (unless this fibre was thoroughly impregnated) led to the earthing of rotors. A third mentioned an insulation test which had been carried out upon the wax-impregnated presspahn referred to, in which it has stood a voltage of 4,000 satisfactorily. Another member wished to know the percentage of high-tension oil-immersed

Digitized by Google

transformers which broke down in mine practice, and how often the oil in such transformers should be changed.

In his reply, Mr. FISHER said that four cases of breakdown had been reported by the members of the Newcastle branch owing to the collection of dust causing flashing across bar-wound machines. In another case a pump motor armature had burned out owing to a non-technical man having put in a 200-ampere fuse on a 5-h.p. 200-volt motor. In another case water shooting out of the glands of a pump short-circuited the slots of the stator winding, which was remedied by total enclosure. Accumulation of dust behind the armatures of direct-current machines was a frequent cause of trouble. Frequent inspection of air-gaps prevented a considerable amount of touching of stator and rotor, and consequent flashing and burning out of the coils. In some instances induction motors were earthed because the micanite stator tubes were slit along the top of the slot to allow of former winding. This could have been overcome by laying strips of mica on the top of the conductor, bending the tube over and wedging in. A frequent cause of trouble was the settlement of dust on rotor windings at the point where the bars are carried out from the slots. The usual method is to insert a sheet of presspahn between the upper and lower layers of crossing bars. Dust settles in the slots thus formed, and it is very difficult to clean out. The overload rise of temperature in a motor did not melt the wax in the presspahn to which he had referred. In his experience they had been very free of oil-immersed transformer breakdowns. In four years only two out of forty-five transformers had broken down, and then only very slightly. It would be a very great convenience if circuit-breakers could be used instead of fuses for all portable machinery, as this would eliminate the temptation to use any old bit of wire for a fuse. A circuit-breaker would have to be periodically examined, but this applied also to fuses. There were, however, types of plug-fuse on the market so constructed that it was impossible, owing to the fit of the plug and socket, to put in a fuse of excess capacity to that intended for the circuit.

ELECTRICITY AND COAL DUST EXPLOSIONS

AT a meeting of the Newcastle Section of the Institution of Mining Electrical Engineers on Wednesday, February 23rd, Prof. W. M. Thornton (Armstrong College, Newcastle) and Mr. H. W. Clothier (Messrs. A. Reyrolle & Co.) repeated their experiments made previously on explosions of coal dust and gas before the Newcastle Section of the Institution of Electrical Engineers (see ELECTRICAL ENGINEERING IN MINES, March 3rd, page 25).

In the discussion which followed, it was suggested that there was more chance of ignition when breaking the three poles of a three-phase circuit simultaneously than on a d.c. system, although there were three points over which the flame would be distributed as compared with one or two in a direct-current supply. A member stated that he was impressed rather with the difficulty than with the probability of electrical ignition of coal dust, and pointed out that it was impossible for life to exist in any mixture of coal gas and air capable of forming an explosive mixture, and in the majority of cases the contamination of the air proceeded so slowly that it was possible to withdraw the miners from the pit before danger point was reached. Referring to Mr. Clothier's experiments, he remarked that the success of the wide flange in switch-boxes pointed to the fact that the plate ventilated motor was preferable to the totally enclosed machine. Another member had tried experiments upon boxes with rubber ring joints. In order to see whether there was any breathing action in the box due to changes of temperature, he placed such a box in a sulphurous acid atmosphere. Within a week reagents inside the box showed a distinct acid reaction. In answer to a question, Dr. Thornton said time of contact between the dust and the flame influenced the probability of ignition. A flash had an average duration of about one-tenth of a second or more in inductive circuits. For this reason the magnetic blow-out for quick break switches on direct-current work was useful.

Mr. H. J. Fisher inquired as to the degree of danger of coal dust lying in the box and remaining undisturbed until the apparatus operated. Dr. Thornton replied to this by stating that he had tried experiments in an ordinary small fuse box by sifting dust on to the interior, and then replacing the cover loosely and blowing the fuse. The result had been an explosion which lifted the lid of the box and a 4½ lb. weight placed upon it. He considered that powdered shale, as obtained from some mines in Scotland, was even more dangerous than dry coal dust.

Mr. Clothier drew attention to the importance of isolating the fault on a mining cable before the arc had an opportunity of getting outside the cable cover in the case of a two- or three-core cable, and advocated a well-armoured cable for dangerous parts of the mine. Dr. Thornton's experiments showed the possibility of an arc crossing from one metal conductor to another at different tensions in the presence of metal vapour, and he had experienced trouble on high-tension fuses where an arc passed across insulation surfaces, sufficient under normal working conditions of pressure and air to stop five times the normal working pressure. He had also seen in a 6,000-volt oil break switch a flame break out of a tank of oil, starting an arc across the terminals at the top of the switch, which were considered sufficient to insulate 20,000 volts. This pointed to the necessity of completely enclosing high-tension apparatus.

Another member drew attention to a curious incident which occurred on a cable placed under a wet roof and carrying direct current. The cable burned out, and at the point where the burn-out took place where it was in contact with the roof, a white solid substance was formed, which, when placed in water, exploded violently, indicating sodium. Mr. Preece said that the same thing had been noticed in direct-current street mains on breaking down, and was due to the electrolysis of soil of an alkaline nature.

SIGNALLING SYSTEM FOR WINDING PLANT

AN ingenious apparatus for the transmission of signals from the various levels to bank, and finally from bank to the engine-house, is being supplied in this country by the Adnil Electric Co., Ltd., and we recently had the opportunity of inspecting a complete working installation at their new showrooms in Artillery Lane, London, E.C. The system has been put into use in over twenty-five pits on the Continent, and, we are informed, is giving every satisfaction.

An instrument, illustrated in Fig. 1, which serves both as transmitter and as receiver, is installed at each level and at bank, and a similar instrument, without any transmitting handle, however, is situated in the winding engine-house. At each point there is also an acoustic signalling instrument—either an electric hooter or a single-stroke bell. The transmission of signals is carried out as follows. If a winding signal has to be given, say, from the third level, the miner on that level first presses the "level indicator" button, which causes all the

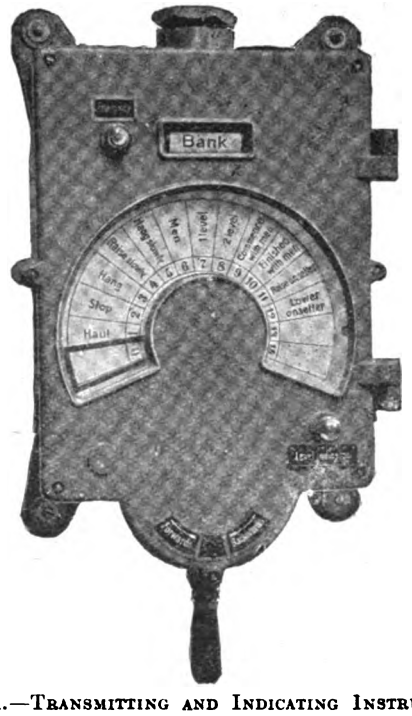

FIG. 1.—TRANSMITTING AND INDICATING INSTRUMENT.

instruments to register "third level" at the window above the dial. He then moves the lever of his instrument a certain number of times until the pointer is over the required signal. For instance, to stop the cage, he would move it twice to the left. (Should he accidentally move it three times, he immediately moves it once to the right, which causes the pointer to return one position.) This has the effect, as will be explained later, of placing the pointers of all the other instruments, with the exception of the receiving instrument in the engine-house, over position 2. Simultaneously the hooter or bell is sounded twice at each point, except in the engine-house. When the banksman considers that all is ready for the order to be carried out, he presses a "carry out" button on his instrument, and this causes the necessary signal to be transmitted to the engine-man. The level indicator in the engine-house then shows "third level," the dial pointer moves into the second position, and the hooter or bell sounds twice. At the same time the pointers on all the other instruments automatically return to the zero position unaccompanied by any audible signal. The signal remains, however, on the engine-driver's instrument until a fresh one is transmitted from bank. After any miner has set the system to his level by pressing his "level indicator" button, it is impossible to transmit any signals from any other level, and so no interference, malicious or accidental, is possible. Should it

Digitized by Google

be necessary, however, to send a signal from a different level to that shown by the indicator, the button is pressed, and all the indicators altered. By this means both the first miner who was sending his order, and the banksman, know that a more urgent order is to be carried out first, and consequently the latter is received and passed on to the engine-house first. In case of pressing danger, an audible signal (differing in tone from the others) can be given by pressing the emergency push. This signal is sounded simultaneously at bank and in the engine-house. The chief advantages claimed for the system are the simple and rapid transmission of the signals from the levels to bank, and that by pressing his button, the banksman can transmit to the engine-driver only the signal given from below.

The device, which works the dial pointers is illustrated diagrammatically in Fig. 2. This consists of three electromagnets, M_1, M_2, and M_3, with moveable iron cores. The electromagnets are arranged in a circle at 120° from each other round a centre crank, to which the cores are coupled. To turn the crank round once in the direction of the hands of a clock, current impulses would have to be sent through the three electromagnets in succession, in the order M_3, M_1, M_2. The crank is geared by a small pinion to a large cogwheel R, on whose shaft is the pointer. By giving the desired number of impulses in the right order, the pointer can be moved to any number on the dial, and by reversing the direction of the motion of the brush L (that is by moving the lever of the instrument to the right), the pointer is caused to move in the opposite direction.

An essential and ingenious part of the system is the

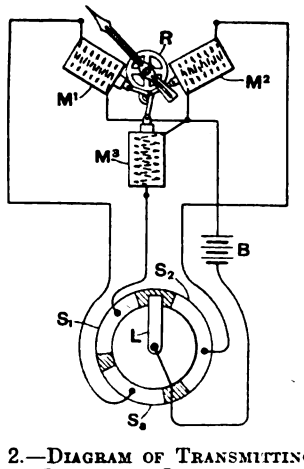

FIG. 2.—DIAGRAM OF TRANSMITTING AND INDICATING INSTRUMENT.

automatic switch, the function of which is to store up the signal given from any point and to pass it on to the engine-driver when the banksman depresses the "carry out" push. The principle on which this is done is illustrated by the diagram of Fig. 3. On this diagram the recorders on the bank and down the pit only and the corresponding bells or hooters are shown. At bank the "carry out" push only and in the pit the signalling lever only are in evidence. The apparatus inside the double dotted lines represents the automatic switch. M is a motor coupled to a shaft S, on which are fixed a pinion P and two discs D and D_1. The pinion P drives the signal storing disc SSD. A brush B bears on a piece of insulating material fixed on the edge of the disc SSD. Disc D has also a small segment of insulating material, on which a brush bears. Disc D_1 has a rim of insulating material except at one point where the brush bears on metal. Disc D_2 is stationary, so that when the shaft turns, the brush L is brought into contact with the segments S_1, S_2, S_3, and S_4 in succession.

Suppose the man in the pit wishes to give a signal corresponding to position 3 on the recorders. To do this he brings his signalling lever into contact with C three times. Each time this occurs, the following circuit is closed, and the following happens. A circuit is closed from the positive pole of the battery B through signalling lever, disc D_1, motor, armature K_1 of the relay, and back to the negative pole of the battery. The motor instantly turns the shaft and breaks the contact at disc D_1, but at the same time causes contact to be made at D, so that the current is kept flowing through wire W, shaft, disc D, K_2 of relay, and through the motor. The shaft therefore has to make a full revolution before the contact with the brush on disc D is broken again by the segment I. This one revolution of the shaft will have caused two distinct functions to have been performed :—(1) A current impulse will have been sent through the medium of brush L through each of the three coils of each recorder and through the bells or hooters. The pointers of the recorders will therefore have moved on to the next point on the dial, and the bells or hooters will have sounded once. (2) The pinion P will have turned the disc SSD round a certain distance. (The signal storing disc SSD is so geared as to make only one complete revolution when the shaft S has turned round the maximum number of times.)

The pinion P having been turned round three times through the signalling lever being brought into contact with C three times, the "carry out" push is now depressed by the banksman. A current will thus flow, which may be traced from the battery, through W_1, "carry out" push, winding W_4 of relay to battery. The armature springs K_1, K_2, and K_3 then come into contact with C_1, C_2, and C_3, and current commences flowing through winding W_3 to the motor. As the current is now sent through the motor in the opposite direction to that which flowed when the signalling lever was operated, the motor will turn back the shaft until the insulating segment on SSD comes under brush B again. That is to say, the shaft is now turned backward exactly the same number of times as it was previously turned forward, and the pointers on the recorders are also moved back to the starting point. When the current ceases flowing through the motor by virtue of disc SSD, the relay releases, and the springs K_1, K_2, and K_3 go back to their

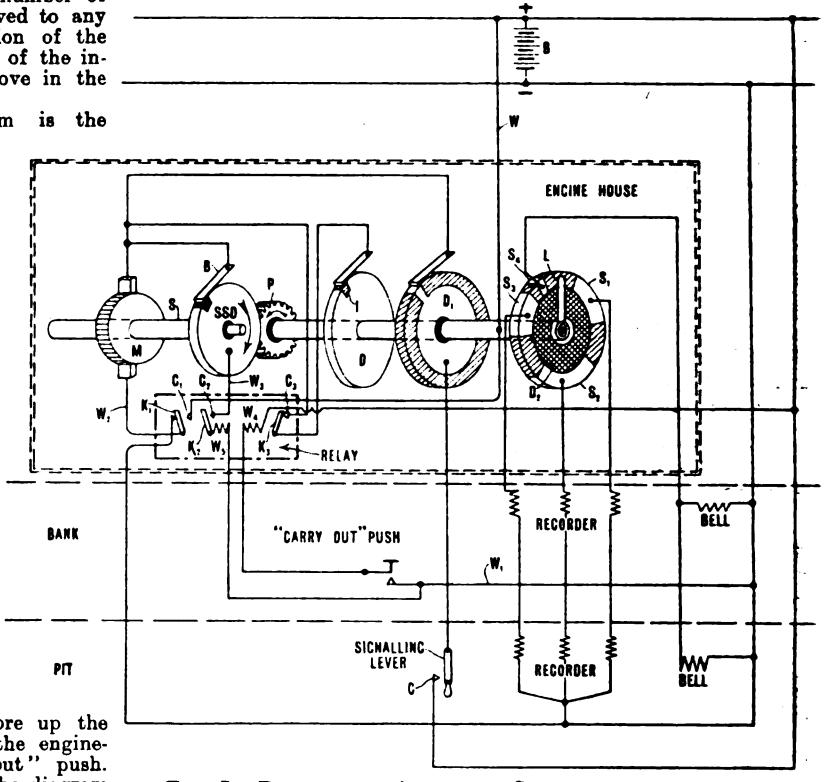

FIG. 3.—DIAGRAM OF AUTOMATIC SWITCH, SHOWING ALSO ONE LEVEL INSTRUMENT AND THE BANK INSTRUMENT CONNECTIONS.

normal positions. The instrument in the engine-room is so connected that its pointer moves forward exactly the same number of steps as the "bank" and "pit" recorders are moved backward. The only apparatus in the pit is the series of recording instruments; the more sensitive part, the automatic switch, is placed in the engine-house.

We understand from the Adnil Electric Co., Ltd., that they are willing to install this system in one mine on the understanding that it need not be paid for unless entirely satisfactory.

Nottingham Branch of the Institution of Mining Electrical Engineers.—Mr. Kirby has offered a prize of one guinea for the best Paper by a member of this branch on "The Management and Care of Electrical Plant in Mines."

Damages in Colliery Fatality.—Judgment was given in the Scottish Appeal Court last month in an action by W. Smith, a Loanend colliery engine-man, against A. Russell, Ltd., coal-masters, of Glasgow. The former claimed £500 damages in respect of the death of his son, a junior engine-man, who was killed by electric shock in December, 1907, in the Polmaise Colliery, Stirling, asserting that the electrical apparatus was not properly protected. It appears that a switch-box had become alive by leakage, and that the man had received a fatal shock. The defendants denied that the apparatus was faulty, but the court found that the box and conduit were inefficiently earthed, and that the defendants were therefore responsible for the accident. Judgment was given for £75 damages and costs.

CORRESPONDENCE

IMPULSE-REACTION TURBINES.

To the Editor of Electrical Engineering.

Sir,—With reference to the announcements which have been recently widely made, relative to the appearance on the market of a new pattern of turbine—the so-called "Disc and Drum" type—we think that, in fairness to the work of Messrs. Brown, Boveri & Cie., of Baden, it should be more widely known that this pattern of turbine has been regularly manufactured in our Swiss, German, and French works for some time. Among the large turbines of this type which are in hand at the present time we may mention a 5,000-kw. set for Essen, a 5,000-kw. set for Nancy, and a 10,000-kw. turbine for Paris, as well as a number of 12,000-h.p. and 14,000-h.p. turbines for the German and French navies respectively.

The Paris turbine—which will be capable of developing 20,000 h.p. continuously—is the largest yet ordered for electric power purposes in Europe. Its destination is the St. Denis station (in which ten 6,000-kw. sets of our manufacture are already installed), and under the steam conditions prevailing there, its steam consumption will be less than 8·8 lbs. per brake horse-power hour.

Yours faithfully,
Brown, Boveri & Co., Ltd.

Caxton House, Westminster, S.W.
April 2nd, 1910.

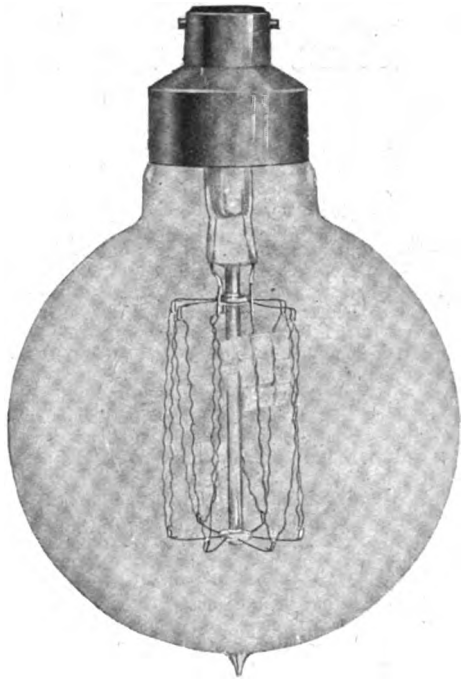
POWER SUPPLY FROM TRAMWAY CIRCUITS.

To the Editor of Electrical Engineering.

Sir,—In your issue of March 31st we notice an article by Mr. E. P. Austin on the above subject. This article undoubtedly calls attention to a very interesting subject, interesting not only to station engineers, but also to manufacturers of electrical goods. The reason that attention has not been given to the subject of taking power supply from tramway circuits has been due to the fact that the standard form of shunt motor did not give good results owing to the varying voltage, but with the advent of the inter-pole motor these conditions have been very much improved. But even thus, something more has been required to deal with momentary failures of supply which were restored before the ordinary starter no-voltage release could deal with them. Particularly is this the case with printing machines and saw-mills.

We have produced a starter for use under such circumstances. On a failure of supply, or even with a serious reduction of voltage, we open the circuit of the motor on a special automatic switch; the operation of this switch is extremely quick, and is so interlocked with the starting resistance that it is impossible to again restore current to the motor without first inserting all the starting resistance in series with it.

We shall be very pleased to give any interested parties more information on this subject, which is one which we have studied with a great deal of care.



Yours, &c.,
Adams Manufacturing Co., Ltd.
(A. H. Adams, Managing Director).

London, April 1st, 1910.

THE NEW SIEMENS "ONE WATT" LAMP

A Drawn Tungsten Filament

We are now able to give some further particulars of the new lamp with a filament of drawn tungsten wire, which Messrs. Siemens Brothers Dynamo Works, Ltd., are now placing upon the market. The lamp illustrated herewith is a 100-c.p. 120-volt lamp, and, as will be seen, the filament is mounted in very much the same way as that of the tantalum lamp. It is not, like tungsten lamps with squirted filaments, made in a separate piece for every bend, although an inspection of a sample lamp reveals one joint. The efficiency is given as 1·1 watts per British candle-power (or one watt per hefner c.p.). The lamps at present are made in the 100-c.p. size for 100–130 volts and 200–250 volts, sizes particularly suited to both street and shop lighting, and will be listed at 4s. 6d. in spherical bulbs, 5 in. diameter. A range of "one-watt" battery lamps, of which an 8-volt 2-c.p. lamp is an example, will also be placed on the market very shortly. These lamps are of considerable interest, as being the first actual lamps with drawn tungsten filaments to appear on the market. It is to be anticipated that by this method of producing the filament the firm will be able to combine the high efficiency obtainable by the use of tungsten with the strength and durability that has been associated with that of the wire-drawn tantalum filament, which, of course, the company will still supply, as heretofore, in sizes up to 50 c.p.

100-c.p. 120-volt "One Watt" Lamp with Drawn Tungsten Filament.

"ELECTRICAL" FIRES IN 1909

The report of the Fire Brigade Committee of the London County Council for 1909 sets out in great detail the causes of the 3,197 fires which occurred within the County of London last year. The most serious outbreak of the year was the fatal fire at Messrs. Arding and Hobbs, Lavender Hill, Battersea, in December, where, unfortunately, eight lives were lost, due to a fire which originated in a window temporarily lighted by electricity, and dressed, for the Christmas season, with very inflammable material. The report calls attention to the danger attending the use of cotton-wool in this connection.

Looking down the summary of causes of fire in 1909, it is seen that 95 are said to be due to defective electric circuits, one to an overheated electric iron, four to "overheat of electric lamps," one to "overheat of electric light," one to an overheated electric motor, one (Messrs. Arding and Hobbs) to the bursting of an incandescent electric lamp, one to a cinematograph film coming into contact with an electric lamp, and two to spirit-vapour coming into contact with an electric spark. This makes a total of 106. Those who are familiar with the oft-repeated warnings against the dangers of electricity may be interested in the following official figures as to fires in which gas has played the leading part during the past year. The total number of fires due to gas was 334, and the fact that these are classified under no less than 24 headings is certainly strong evidence that fire risks from gas are more widespread than risks from electricity.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 31st, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

6,051/09. **Electric Coal-cutter.** Mavor & Coulson, Ltd., S. M. Mavor and H. A. Mavor. This machine is described under "Electrical Mining Patents of March," in the Mining Supplement.

6,770/09. **Storage Battery Plate.** H. W. Twaites. To prevent warping and disintegration with the consequent short-circuiting, the plates consist of lead boxes or tubes of circular or rectangular section. These are filled with the active materials, and are perforated all over to allow the acid to reach the material. Lead plugs or caps are inserted at top and bottom after the boxes have been filled. Three claims, five figures.

8,212/09. **Cartridge Fuse.** J. Ford and E. E. Bonshor. A tube of vulcanised fibre or other suitable material is formed with a screw thread at each end to engage with internally screwed caps with slotted lugs for sliding into the contact-blades of the fuse box. The fuse wire is threaded at each end through holes in a flanged washer which fits on the end of the tube. When the caps are screwed on, they make good contact with the turned over ends of the fuse wire, which are pressed against the washers. Soft metal washers may be placed between the wire and the caps. Being air-tight, this fuse is said to be particularly suitable for use in mines. Three claims, seven figures.

10,594/09. **Aluminium Cell Protective Devices.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). In order to equalise the voltage across a number of cells connected in series, the electrolytes of the successive cells are electrically connected by glass tubes filled with the electrolyte and placed in shunt to the aluminium electrodes. The tubes are made U-shaped, and form siphons from cell to cell. To prevent bubbles of gas from breaking the connection, each tube is provided at the top with a gas chamber. Four claims, two figures.

12,507/09. **Furnace Electrodes.** M. Ruthenburg. A high-conductivity electrode which will not contaminate the metal in the furnace consists of carbon with a core made of the same metal as that under treatment. The core is protected from the furnace gases except at the lower end where the carbon is consumed. One claim.

13,655/09. **Switchboard Construction.** British Thomson-Houston Co. and G. Richardson. In a switchboard for H.T. distribution systems, the 'bus-bars are arranged in sets one above the other, with the feeder switch terminals between. The latter are provided with throw-over isolating switches, which bridge across to 'bus-bar terminals situated above and below the feeder terminals, and connected to the upper and lower sets of bars respectively. Either set of bars can thus be completely isolated for cleaning by inserting insulating barriers between the feeder terminals and the 'bus-bar terminals. Two claims, two figures.

29,582/09. **Locking Plug and Socket Connections.** A. P., G. C., and P. A. Lundberg. In wall and floor plug connections, the socket part is provided with a hinged flap with a hole in it, and the plug has a laterally projecting pin which enters the hole in the flap when the latter is approximately at right-angles to the socket face. This prevents the plug from being pulled out accidentally. One claim, two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Heimann and Schaffer [Working arc lamps in series with incandescent lamps] 748/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Crouch and Etchells [Distributing systems] 27,242/08; Walker [Lighting plant] 6,916/09; Kemble [Insulators] 13,612/09.

Dynamos, Motors, and Transformers: British Thomson-Houston Co. (*Allgemeine Elektricitäts-Ges.*) [A.-C. machines] 694/09; Bruce Peebles & Co. (*Bragstad and La Cour*) [Motor-converters] 6,069/09; Parsons, Stoney and Law [Electric power transmission] 6,177/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Motor control] 6,564/09, 7,114/09, and 7,230/09; Hydraulic Engineering Co. and Ellington [Electric capstans] 7,408/09; Allgemeine Elektricitäts-Ges. [Electric power transmission] 11,400/09, and 13,798/09; Siemens Bros. Dynamo Works (*Siemens Schuckertwerke-Ges.*) [Rotary converter] 29,088/09; Allmänna Svenska Elektriska Aktiebolaget [Field systems] 30,176/09; Siemens Bros. Dynamo Works, and Kloss (*Siemens Schuckertwerke-Ges.*) [Cooling rotor windings] 1,404/10.

Electric Ignition: Siemens Bros. & Co., Riber and Ireland [Hand-operated magneto] 6,877/09; Braud [Magneto gear] 13,908/09.

Electrometallurgy and Electrochemistry: Reid [Furnaces] 6,820/09; Johnson (*Badische Anilin & Soda Fabrik*) [Silicon-nitrogen compounds] 15,641/09; Hay [Furnaces] 27,972/09.

Heating and Cooking: Christian [Fluid heating vessels] 18,940/09; Hearson [Incubators and bacteriological ovens] 27,909/09.

Incandescent Lamps: Saftig [Lamps for illuminated signs] 7,069/09; Kuzel [Metal filament lamp] 17,627/09.

Instruments and Meters: British Thomson-Houston Co. and D'Arcy [Meters] 6,565/09.

Switchgear, Fuses, and Fittings: Grote [Automatic switch-gear] 6,405/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Resistance units] 6,674/09; Allom [Reflectors] 6,836/09; Hawker [Switches] 9,456/09; Lundberg [Switches] 22,897/09; Morse [Switches] 25,132/09.

Telephony and Telegraphy: Huth [Oscillation generator for wireless telephony] 15,891/09; Romer [Intercommunication telephones] 17,107/09; Boult (*Maxwell*) [Telephone transmitters] 1707/10.

Traction: Thomas [Point control] 11,884/09; Bluhm [Third-rails] 12,254/09; Meranville de Sainte-Claire [Clutches for electric automobiles] 13,407/09; Houghton, Allman and Gray [Collector shoes] 15,371/09; Mitchell [Signalling] 16,542/09.

Miscellaneous: Bryant and Ivinson [Electro-medical apparatus] 7,193/09; Thomson [Coal-cutting machines] 10,334/09; Trautmann [Burglar alarm] 28,638/09; Gibbons and Rosenthal [Fan oscillator] 29,968/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: Siemens Schuckertwerke-Ges., 5,452/10.

Electric Ignition: C. Roth A.-G. [Primer for Ordnance] 4,449/10; Delage and Wood [Igniting gas burners] 6,154/10.

Storage Batteries: Marseille and Gouin [Alkaline cell plates] 3,733/10.

Switchgear, &c.: Franz Meguin & Co., 6,212/10.

Telephony, &c.: Fessenden [Wireless apparatus] 28,577/09.

Opposition to Grant of Patent

19,466/09. **Arc Furnace for Treating Gases.** Saltpetersäure Industrie-Ges. Opposition has been entered to the grant of this patent, which covers a furnace with two auxiliary electrodes for re-striking the arc should it be blown out. (*See* Electrical Engineering, February 17th, 1910, p. 128.)

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

7,783 of April 13th, 1896. **Electrodeposition of Gold.** W. P. Thompson (*E. Wohlwill, Hamburg*). Chemically pure gold is obtained by electrodeposition at high-current densities up to 2,000 amps. per sq. m. of anode surface with a hot electrolyte consisting of gold chloride containing an excess of hydrochloric acid. The impure gold is employed as the anode, which must be mechanically cleaned at intervals when it contains silver or lead.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: E. T. Greenfield [Cable armouring] 8,045/99.

Dynamos, &c.: C. Rieder [Auto-transformer for lamps] 28,071/02; A.-G. Brown, Boveri & Cie. [Ventilation of machines] 26,274/03; L. J. Hunt and Sandycroft Foundry Co. [Control of induction motors] 27,722/03; Siemens Bros. & Co. (*Siemens Schuckertwerke-Ges.*) [Driving reversible rolling mills, &c.] 27,199/04.

Electric Ignition: A. Foster [Commutator] 27,574/03.

Electrometallurgy, &c.: P. M. Justice (*C. Davis, U.S.A.*) [Electric hardening furnace] 25,671/01; E. A. Carolan (*General Electric Co. U.S.A.*) [Resistance furnace] 27,755/02.

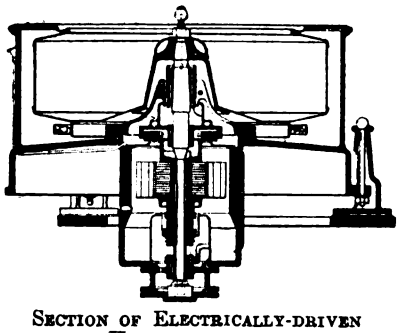
Heating, &c.: F. W. Schindler-Jenny, 29,821/97.

Instruments, &c.: E. Wilson [Electrostatic wattmeter] 27,201/04.

Storage Batteries: H. Leitner [Frame for plates] 27,399/03; J. Y. Johnson (*Elektricitäts A.-G.*) [Starting plant in storage-battery stations] 27,736/03.

Switchgear, &c.: E. A. Carolan (*General Electric Co., U.S.A.*) [Arc-rupturing device] 27,752/02, and [Automatic voltage regulator] 27,772/02; Otis Elevator Co. (*Otis Elevator Co., U.S.A.*) [Lift control gear] 27,921/03; A. Eckstein and A. J. Krause [Water-tight tumbler-switch] 27,444/04.

Traction: W. H. Loggey and F. Hewer [Section insulators] 25,901/01.



Miscellaneous: A. Smith and A. Browne [Advertising signs] 25,532/01; O. Rennert [Thermostatic indicator] 25,614/01.

ELECTRICITY IN LAUNDRIES

THE various washing and drying machines employed in laundry-work can be readily adapted to electric drive, and laundry machinery should prove a useful addition to the day power-load of the local supply stations. The machines known as centrifugal hydro-extractors are especially suitable for individual electric drive. This machine comprises a circular "basket," in which are placed the materials to be dried. The basket has a wall of perforated metal and is rotated at a high speed, so that most of the water in the materials is thrown out by centrifugal force. A self-contained machine of this pattern, and several with belt-drive, are exhibited at the Laundry Exhibition now being held at the Agricultural Hall, and open until Saturday evening.

The self-contained hydro-extractor we refer to is exhibited by Messrs. Thomas Broadbent & Sons, Ltd. (Central Ironworks, Huddersfield). A section of the machine is given in the accompanying figure, from which it will be seen that the 48-in. perforated copper basket is mounted on a vertical spindle supported above and below in ball-bearings. The armature is built upon a sleeve surrounding the vertical spindle, and the field magnets are built into the framework of the machine. The whole is supported by four bolts with cup and ball joints, as shown in the figure; this ensures that the drum will run concentrically with the frame, and renders heavy foundations unnecessary, as any out-of-balance effects due to unequal distribution of the materials in the revolving drum merely cause the whole frame

Section of Electrically-driven Hydro-extractor.

to swing slightly. The normal speed of the drum is 900 r.p.m. To avoid the use of a heavy starter, an automatic friction clutch is interposed between the motor and the drum. The motor armature is mounted on a sleeve which can revolve round the central spindle, and leather-covered friction shoes attached to this sleeve fly out by centrifugal force and gradually grip an outer ring attached to the central spindle and the drum. The weight of the shoes is adjusted so that, at normal speed, the friction is exactly sufficient to transmit the normal power of the motor. The motor runs up to full speed almost instantly, but the drum is brought up to speed gradually. Starting up is therefore quite automatic, and the current taken by the motor can never be very excessive. The motor, which can be either for continuous or alternating current, is well protected from water. For the 48-in. extractor referred to, a 4-h.p. motor is required; various sizes, from a 26-in. drum machine with a 2½-h.p. motor to a 72-in. drum machine with an 8-h.p. motor, can be obtained. All machines are fitted with a hand brake for bringing the drum quickly to rest.

A number of electrically driven machines with belt drive between the motor and the drum are exhibited by Messrs. Watson, Laidlaw & Co., Ltd. (Glasgow). This firm also makes a machine of the self-contained pattern, but in this case the motor is arranged on the vertical spindle *above* the drum. As in the machine described above, there is a friction clutch between motor and drum to enable the drum to be brought up to speed slowly without using a heavy starter. This firm has manufactured a machine of this type with a drum 84 in. in diameter and a capacity of 90 cubic feet.

Besides the pure power applications in laundry-work, there are a few other exhibits of electrical interest. Messrs. Ernest Grether & Co. (Manchester) had on view an electrolytic bleaching apparatus suitable for use in laundries. This consists of a brine tank, an electrolyser, and a liquor tank. Common salt is dissolved in water in the first tank, and the solution is passed through the electrolyser, which consists of a series of cells with carbon electrodes. In an electrolyser suitable for dealing with 140 gallons a day, a current of 8 amps. is passed at a pressure of 110 volts. The resultant liquid, which contains a quantity of free chlorine and is therefore a powerful bleaching liquor, is passed into the liquor tank. For laundry purposes a small quantity of this liquor is mixed with the water in the washing machines. This liquor is neither acid nor alkaline, but neutral; it is said to prolong the life of the clothes and to save the launderer time, soap, and steam. As soon as the washing has dissolved the fats and grease which combine with the dirt, the latter is removed by the electrolytic liquor, together with all stains; thus rubbing or turning in the machine is reduced to the minimum, and with it the wear.

A small water-purifying plant is exhibited by the Electropura Co. of Mexico. This comprises an electrolytic cell containing aluminium electrodes, and a filter. The passage of the water through the cell is claimed to effect a precipitation of impurities, which are then left in the filter. Further, the electrolysis which goes on in the cell increases the amount of free oxygen present in the water, and gives it an agreeable taste. The process is also claimed to effect the destruction of all bacteria, and to have several beneficial properties, the exact reasons for which are not apparent.

PENDING ELECTRICAL LAW SUITS

The L.C.C. Surface-contact Tramways Again.

TWO "electrical" cases are included in the list of those which will, in the ordinary course, be heard in the Law Courts between now and midsummer. One of these will arouse a considerable amount of general interest, as it arises out of the experimental surface-contact system of electric tramways laid for the London County Council in the Mile End Road, and afterwards rejected and taken up again. The action is being brought by Mr. W. Griffiths, one of the patentees of the G.B. (Griffiths-Bedell) surface-contact system, not against the London County Council, but against Messrs. Edward Lloyd, Ltd., proprietors of the *Daily Chronicle*. Mr. Griffiths alleges that certain articles published in connection with the matter contained libellous statements. It is reasonable to anticipate that this case will revive the contention as to whether the G.B. surface-contact system as installed in the Mile End Road was suitable for the traffic conditions of a heavy urban tramway system, or whether the technical defects which appeared on its first installation, and were gradually dealt with by the contractors' engineers, were sufficiently serious to warrant its rejection.

The second case is an action by the British Thomson-Houston Co., Ltd., against the Midland Railway Co., which was first put down for hearing before Mr. Justice Warrington, and was then transferred to Mr. Justice Parker, has now been returned to Mr. Justice Warrington's court, where it will be heard with witnesses. The British Thomson-Houston Co. allege that the Midland Railway Co. have infringed their patents covering the multiple unit control system for electric traction. The equipments in question were supplied by Siemens Bros. Dynamo Works, Ltd., in connection with the conversion to electric traction on the single-phase system of the Heysham-Morecambe section of the Midland Railway Co.'s system.

In addition to these, there will be the usual number of actions against tramway and railway companies for damages for personal injuries.

There is also an action pending which is an application for an injunction brought by the Electrical Contractors' Association against the Leicester Corporation, to restrain them from selling fittings or wiring houses, &c., for electric light and power. The Leicester Corporation are working under an ordinary Provisional Order, which entitles them only to supply current, and the Electrical Contractors' Association hold that they have no power to do house wiring or sell fittings in competition with local firms. It has not been possible to advance matters sufficiently to enable the case to come on for hearing in the present sittings as has been anticipated, but it will doubtless appear in the list of cases to be heard after the Midsummer vacation.

Death from Electric Shock.—An apprentice of the Glasgow Iron & Steel Co., Ltd., Wishaw, received an electric shock on Saturday from the effects of which he died. He was working on an electrically operated furnace charger, and received the shock whilst replacing a fuse without the current having been switched off.

ELECTRICAL POWER COMPANIES IN SOUTH AFRICA

THE draft of a Bill, regulating electric power companies in the Transvaal, has been published. According to *The Times* Pretoria correspondent, this will be one of the principal measures of the forthcoming short session of the Transvaal Government. The Bill, which has special reference to the undertaking of the Victoria Falls and Transvaal Power Company, is, it is presumed, based on the report of the Commission which sat last year to investigate the whole question of the position of electric power companies in South Africa.

Large discretionary powers are left to the Minister concerned. It provides for an advisory board composed of Government officials, upon whose recommendations, however, the Minister is not compelled to act. Every power company, existing or contemplated, can only work on licence from the Minister, who is empowered to insert such conditions as in England are usually laid down in a private Bill. The Government may give two years' notice of expropriation, after 35 years, on specified conditions which exclude any allowance for goodwill or possible future profits. In addition, the Government may expropriate on the basis of a going concern at the end of ten years, and thereafter at intervals of five years. The profits of power companies are in effect limited by a provision enabling the Minister to fix conditions regarding price and compelling the uniform treatment of consumers and the division of surplus profits.

Owing to the fact that the Victoria Falls & Transvaal Power Co. has already been granted certain concessions, provision is made for safeguarding their position. Thus, though they are compelled to come under the Bill, and the conditions of their original concessions are, consequently, varied, the period for expropriation is made long enough to cover the unexpired portion of their concession, while a special clause protects contracts already made by existing power companies.

NEW ROTARY PUMP

A NEW pattern of rotary pump for water, oil, and other liquids is being introduced by Messrs. Lacy-Hulbert & Co., Ltd. (91 Victoria Street, London, S.W.). This pump, which is manufactured at the company's works at Beddington, Surrey, has been given the name of the "Boreas" rotary pump, and is claimed to be one of the simplest on the market. As shown in the accompanying figures, the pump consists of a narrow cylindrical casing, with inlet and outlet apertures diametrically opposite. The cover (on the right of Fig. 2) has a dowel pin fixed eccentrically, and this enters a collar which has a limited movement in the metal block seen in the

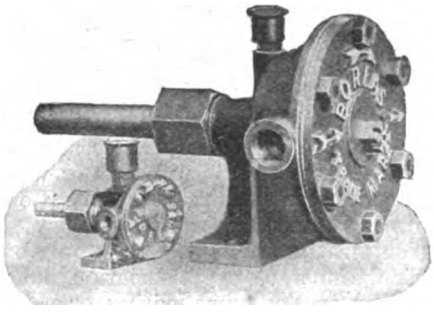

Fig. 1.—"Boreas" Pumps of 10 and 270 Gallons per hour Capacity.

centre of the pump casing. This block is held loosely between two segment-shaped pieces on the face of a disc attached to the shaft. The central block rotates with the shaft, and is also given a reciprocatory motion in a line parallel to the segment pieces on account of the restraining action of the fixed dowel pin. From each aperture there is a peripheral passage running in a direction opposite to that of the rotary motion. It will be seen that as the space between the block and the casing approaches the inlet aperture, it increases in size and sucks in liquid through the inlet passage along the periphery from the position depicted in the illustration for the next half revolution, when the parts are again in the position shown in the figure. Directly the space moves past this position, it is put in connection with the upper peripheral passage connected to the outlet aperture, and, as it decreases in volume as the shaft rotates, the liquid is forced out. These two operations are, of course, going on simultaneously.

It will be noticed that valves are entirely dispensed with, and that no gear or vanes of any kind are used. There are only two moving parts and two bearings. The standard sizes range from

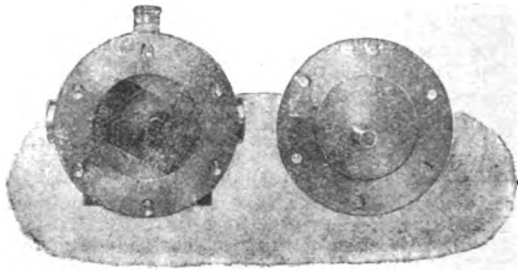

Fig. 2.—Interior of "Boreas" Rotary Pump.

a small pump with a capacity of 10 gallons per hour, and running at 500 r.p.m., up to a 1,000 gallon per hour pump running at 235 r.p.m. Larger sizes can be obtained to order. The small sizes are suitable for forcing lubricants, while the larger sizes, we are informed, are being used with considerable success as circulating pumps in condenser plant. The chief advantages of this type over the centrifugal pattern are the positive suction, the fact that the pump will work at any speed, and the high pressures attainable. The smaller sizes up to a capacity of 270 gallons per hour are constructed entirely of gunmetal, while the larger sizes have cast-iron bodies.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

ELECTRIC DRIVING OF MACHINERY.—A pamphlet from the Electric & Ordnance Accessories Co., Ltd. (Cheston Road, Aston, Birmingham), gives a good deal of information, illustrated by photographs of actual examples, on the subject of electric driving of machinery and its advantages over other forms of drive. The company also announce that they are prepared to supply motors on a hire-purchase system, with monthly or quarterly payments spread over one, two, or three years.

IGNITION BATTERIES, &c.—A price list of ignition cells, small accumulators, and 25-volt batteries for metal filament lamp installations has been issued by the Brockie-Pell Arc Lamp Co. (Wimbledon, S.W.).

TRAIN AND CAR LIGHTING AND HEATING, &c.—A list from Messrs. Siemens Brothers Dynamo Works, Ltd. (Caxton House, Westminster), deals with lighting and heating apparatus for electric trains and tram cars, &c. The fittings and accessories section contains numerous special designs of ceiling fittings, wall brackets, &c., for railway carriages, glass shades, testing lamps for detecting a dead lamp in a series. For this purpose, all the fittings are provided with special test contact sockets into which the plug of the testing lamp can be inserted. A water-tight form is also made, which can be used either for this purpose or as an ordinary hand lamp. Other rolling-stock fittings include canopy lamps for carriages and locomotives, signal lamps, head lamps for illuminating destination boards, &c. Car radiators, switches, and coupling cables and plugs are also dealt with, and a separate leaflet gives particulars of a cable coupling more particularly intended for electric braking connection between motor-cars and trailers on tramways.

CABLES.—A new descriptive catalogue and price list of cables for electric lighting, power, and traction purposes (mains section list, No. 4), has been issued by Messrs. W. T. Glover & Co., Ltd. (Trafford Park, Manchester). A variety of patterns of cable are listed, including the company's special "Diatrine" paper lead-covered cables and bitumen cables. The catalogue contains nearly three hundred pages, and gives full specifications of each class of cable listed, and a full telegraphic code for ordering. There are also over 50 coloured illustrations showing details of typical cables.

GENERATORS, MOTORS, AND SWITCHGEAR.—The Electric Construction Co., Ltd. (Bushbury Engineering Works, Wolverhampton), have sent us a collection of some 120 leaflets and price lists relating to D.C. generators and motors, A.C. motors, and switchgear. The leaflets are bound up loosely with an index, in a substantial cover. Among those only recently issued are a list of oil and open-type rotor-starters for induction motors, and three leaflets (dated Feb., 1910) relating to the firm's electric haulage gears for mines. Prices of single-drum, main and tail, and endless rope haulage gears of 25, 50, and 75 h.p., are given, together with some particulars and illustrations.

LOCAL NOTES

ACCRINGTON: *Public Lighting.*—The Electricity Committee have offered to carry out public lighting in the parish of Altham at £4 per lamp per annum for a minimum period of five years. This sum is to cover the erection, maintenance, and lighting during that time. The arrangement has been agreed to.

ARDROSSAN (N.B.): *Electric Supply.*—The Hon. T. H. W. Pelham conducted a local inquiry last week into an application by Mr. G. Balfour, of London, for a provisional electric lighting order for Ardrossan and Saltcoats. There were a large number of opponents, mostly on small points. The chief objectors were the Ardrossan Council, who appeared as owners of the local gas works, but Mr. Pelham said he could not recommend the Board of Trade to refuse the order merely on the ground of competition with the gas supply.

BATH: *Electric Lighting Area.*—In connection with the proposed extension of the Council's electric lighting area, the Board of Trade have inserted several clauses at the instance of the Bath Gas Co. These include the "Northumberland" or "Bermondsey" clause, with revisions of charges every three years in order to prevent any loss falling upon the ratepayers, the first revision to take place at the end of five years; the long-period contracts should be similarly revised every three years, and that the charges for street lighting shall not be higher than the prices to consumers for similar purposes, and the like hours of supply. The Electricity Committee recommend that the Town Clerk should instruct his Parliamentary agents to submit objections to the clauses, and in any case to request the Board of Trade to omit the provision requiring special contracts to be revised every three years, and to urge that the period of five years referred to in the first clause be extended to ten years. Subject to the committee being satisfied as to the result of these representations the Council is recommended to proceed with the Provisional Order.

BELFAST: *Tramway Receipts.*—Mr. Andrew Nance, the tramway manager, reports that the tramway receipts for the year to March 31st amounted to £203,856, compared with £195,043 in the previous year. He anticipated a net profit of about £10,000 on the year's working.

BIRMINGHAM: *Trams to Harborne.*—A house-to-house canvass is being carried out in the Birmingham suburbs of Harborne and Quinton in favour of the Corporation extending the tramways to these districts. Three years ago, the Corporation promoted a Bill for the extension of the tramways to Harborne, but opposition was offered by residents along the proposed route, and also by the London & North-Western Railway, and the proposal was rejected by Parliament. Since then, however, the district of Quinton has been added to the City of Birmingham, and considerable building has taken place on the further side of Harborne and in Quinton.

Tramway Committee's Profits.—It is anticipated that the Tramways Committee will be in a position to transfer the sum of £25,000 to the relief of rates for 1909-10. The receipts for the year just ended show an increase of about £12,000, but against this has to be set the cost of reducing the hours of the employees from 60 to 54 hours per week, which is estimated at £9,000 per annum.

BRADFORD: *Tramway Accounts.*—The receipts for the year to March 31st amounted to £253,844, an increase of about £15,000 over the previous year.

DOVER: *Tramways and Electricity Undertakings.*—Messrs. Balfour, Beatty & Co., who have been retained by the Corporation to advise upon the weak spots in their tramway and electricity undertakings, have now presented their report. This is being discussed by the Corporation privately, but the local papers have evidently seen a copy. According to the *Dover Express*, a very strong advocacy is made that the town should carry out the whole of its street lighting with electricity. It is pointed out that the town spends close on £5,000 a year on gas lighting, and that if the Corporation electricity works were utilised to their full extent by doing the lighting it would be possible to reduce the cost of current, and largely increase the number of private consumers. Another recommendation that is understood to have been made is that the control and working of the tramway and electricity undertaking should be amalgamated, and by utilising one staff only large savings could be effected. It is further understood that the report criticises the cost of the tramway current, and maintains that as a result of the economies proposed that it should be reduced. A suggestion is made also that the tramway and electricity undertaking might jointly be leased, with lighting contracts for the town, to a company who would run it at a saving of about £3,000 to the town. The greatest stress, however, is laid on the fact that the whole of the town should be lit by electricity.

DUBLIN: *Workhouse Lighting.*—After a long period of negotiation and indecision, the South Dublin Board of Guardians have passed a resolution in favour of accepting the offer of the Dublin Corporation to supply electricity for the lighting of the workhouse, at 3d. per unit.

New Lighting Committee.—Some new standing orders are to be discussed under which a Lighting Committee will be constituted, with an Electricity Supply Committee as a special committee.

EDINBURGH: *New Electric Tramway.*—Messrs. Dick, Kerr & Co., the contractors for the first electric tramway in Edinburgh, have commenced the constructional work. The line, which will connect the cable lines at Ardmillan Terrace with the New Markets at Gorgie, is about 1¼ miles long, and will cost £12,000.

GLOUCESTER: *Tramway Working Expenses.*—At the last meeting of the Corporation it was stated that the working expenses per car mile on the tramway system last year were less than 5d. The Chairman of the Light Railways Committee stated there was little doubt that Gloucester would be at the head of all municipal tramway undertakings in that respect for 1909.

HARROGATE: *Street. Lighting.*—Considerable opposition seems likely to be offered to the proposal to substitute electric for gas lighting in a number of roads where mains are laid. So far a definite scheme has not been adopted, but the opponents are waiting for their opportunity at the Local Government Board's inquiry regarding the necessary loan.

HULL: *Tramway-rail Corrugation.*—In connection with the work of the Special Committee of the Municipal Tramways Asscciation to investigate the cause of corrugation on tramway rails, the City Engineer and the Electrical Engineer have been authorised to conduct experiments.

New Plant.—The contractors for the supply and fixing of pipe work, fittings, &c., in connection with the large generating set at the electricity works, Messrs. Foster Bros., failed to complete the contract to time, and were liable to penalties amounting to £444. An arrangement has been come to for settling the matter by deducting £174 from Messrs. Foster's account.

ITALY: *Supply of Electrical Goods.*—In a British Consular report on the trade and commerce of Venice for the year 1908-9, it is stated that most of the electrical equipments in use in the province are of foreign origin. An advance has recently been made in the manufacture of such apparatus in Italy, and some foreign firms have considered it advisable to establish branch offices and open workshops in Italy.

LEEDS: *Proposed Tramway Extension.*—A proposal has been made to extend the Corporation tramways from Guiseley to Otley, a distance of 3½ miles, linking up with Leeds. A conference took place recently between the Leeds Corporation and the Otley Council, and the estimated cost of the extension is put at £45,000. Otley has been asked to contribute £350 per annum for 10 years, the Leeds Corporation maintaining the track.

LLANDUDNO: *Sunday Tramways.*—A ballot of the ratepayers is to be taken on Saturday on the question of running the tramcars on Sundays.

LONDON: *Islington: Balls Pond Road Trams.*—The Borough Council are offering considerable opposition to the proposal of the L.C.C. to construct electric tramways through the Balls Pond Road without any widening of that thoroughfare. A petition has been signed by 3,000 residents in the district, supporting the action of the Borough Council.

MANCHURIA: *Mukden: Electric Light.*—An electric lighting plant has been installed by the Chinese local government. At first the plant had a capacity for dealing with total connections amounting to 5,000 8-c.p. lamps, but the demands have necessitated extensions capable of dealing with 15,000 lamps. The plant has been mostly supplied from America, and was erected under the supervision of an American electrical engineer. A system of charging at a fixed rate per lamp per month has been instituted, as an alternative to meters. The total cost of the plant amounts to about £33,000.

OLDHAM: *Mails by Tramcar.*—At the request of the Lees and Springhead Councils, the Oldham tramway manager recently approached the Postmaster-General with regard to conveying mails by special tramcar to these two districts, in order that they might be delivered earlier than at present. It was suggested that the Post Office should pay for the actual working expenses of the car, except wages, but the Postmaster-General has been unable to agree. The Oldham tramway manager is now inquiring whether the Lees and Springhead Councils will bear this cost.

WARRINGTON: *New Plant.*—The Electrical Engineer has submitted a preliminary report on the tenders received for the 1,000-kw. turbo-alternator, rotary converter and switchgear, recently advertised for. The Committee have decided to apply to the Local Government Board for sanction to borrow £7,420, the estimated cost of the above plant and the necessary buildings, foundations, &c.

Tramway Profits.—The Tramway Committee have transferred £2.000 from the tramway profits to relief of rates.

Extension of Supply Area.—Application is to be made to the Board of Trade for a provisional order for the supply of electricity within the limits of supply for gas purposes outside the borough.

WEYMOUTH: *Fixed Price Light.*—With reference to the note in our last issue to the effect that the Electricity Committee were to give a trial to the fixed price system of charging for electric supply to small houses, we now understand that the charge is to be 2½d. per week per lamp for the first six lamps, and 2d. per lamp in excess of that number. This includes the complete installation of the wiring and lamps, as well as the supply of electricity.

Digitized by Google

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ACCRINGTON.—The Electrical Engineer has been authorised to lay distributor cables on the easterly side of Whalley Road from the borough boundary.

ECCLES.—A high-tension feeder is to be laid in connection with supply to Messrs. Nasmyth, Wilson & Co. at an estimated cost of £1,200.

EDINBURGH.—The Electric Lighting Committee recommend the installation of cooling towers at the Dewar Place Electricity Works. By this means it is estimated that the output of the works can be increased from 3½ to 10½ million units per annum, with a reduction in the coal bill of £3,500.

GRIMSBY.—The Electricity Department invite tenders for a small three-wire balancer and a two years' supply of continuous-current motor meters. Particulars from the Borough Electrical Engineer. (See an advertisement on another page.)

HALIFAX.—The Tramways and Electricity Committee require a 300 kw. rotary convertor, transformers, and switchboards. Particulars from the Borough Electrical Engineer, and tenders to the Town Clerk by April 18th.

INDIA.—The Director-General of Commercial Intelligence at Calcutta notifies that a scheme is under consideration for deriving electrical energy from the falls of the Bari Doab canal, in the Punjab, for the following purposes:—(1) driving the machinery of the canal workshops at Amritsar; (2) working pumps for raising water from the subsoil for irrigation purposes; (3) working the pumping plant of the Amritsar water works; (4) pumping operations connected with the disposal of sewage. The names of persons interested in the scheme may be obtained by British firms on application to the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

The Ooregum Gold Mining Co. require additional electrical machinery.

JAPAN.—According to the "Japan Weekly Mail," the Odawara Electric Railway Co. propose to extend the Kozu-Yumoto line to Miyanoshita and reach Gotemba *viâ* Gora, Sengoku, and Otome-toge. The cost of construction is estimated at about £439,000.

LITTLEBOROUGH.—Tenders are invited for (1) high-tension feeder cables, low-tension distributors, &c.; (2) transformer kiosk with equipment and switchgear in substation. Particulars from Messrs. Hawtayne & Zeden, 9 Queen Street Place, London, and tenders to the Clerk to the Council by May 2nd.

MANCHESTER.—The Electricity Committee invite tenders for the supply, delivery, and erection of five 600 kw. motor converters or rotary convertors, and static transformers. (See an advertisement on another page.)

ST. HELENS.—An application is to be made for sanction to borrow £3,930 for the extension of the boiler house plant. A new 1,000 kw. turbo-generator is also to be installed at an estimated cost of £6,300.

SHREWSBURY.—The Local Government Board have sanctioned loans of £770 for mechanical stokers, £2,700 for mains, £900 for services, and £200 for public lighting. They have withheld consent to an application for a loan of £800 for an additional boiler, and £153 for mechanical stokers until they hear that the Corporation actually intend to install the plant.

WALTHAMSTOW.—The Council require tenders for a switchboard at the electricity works. Particulars from the Borough Engineer, and tenders to the Clerk by April 22nd.

WARRINGTON.—The Local Government Board have sanctioned a loan of £500 for transformers.

Miscellaneous

CANADA.—It is proposed to incorporate the Montreal Underground & Elevated Railway Co., with a capital of about £4,000,000, for the construction of underground and elevated electric railways in Montreal.

DOVER.—An electrically-operated jib crane is required by the Harbour Board. Particulars from the Harbour Board Offices, Castle Street, and tenders by April 16th.

RUSSIA.—It is announced that the Central Telephone Administration of St. Petersburg has been authorised to expend a sum of £300,000 upon extensions of the telephone system and enlarging the central exchange to serve 34,000 subscribers. It is probable that the sum authorised will be increased to £510,000, as the Administration wishes to make provision for 45,000 subscribers.

SOUTHEND.—The Council propose a small extension of their tramways in the direction of Leigh at an estimated cost of £730.

SPAIN.—An application has been lodged with the "Dirección General de Obras Públicas, Ministerio de Fomento," Madrid, by Don José Paredes Pastrana, for a concession for the construction and working of an electric tramway in Cadiz from the Plaza de Loreto to the Barrio de San Seneriano, and that a period of one month from the date of publication of the "Gaceta" is allowed for the presentation of competing offers at the "Dirección." Local representation is necessary.

TRANSVAAL.—The Agent-General for the Transvaal, 72 Victoria Street, London, invites tenders by April 18th for 119 miles of covered telegraph wire.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

PROVINCES.

ASHTON-UNDER-LYNE.—School (1,000 places). D. H. Wall, Secretary, Ashton-under-Lyne Education Committee.

BECKENHAM.—An application is to be made by the Council for a loan of £225 for the wiring and fitting of the Alexandra Schools.

CHESTER.—Alterations and additions to school, Victoria Road (£5,140). Architect, P. H. Lockwood, St. Werburgh Street, Chester.

CHISWICK.—Theatre. Architects, Meakin and Archer, 32 Nicholas Lane, London.

DONCASTER.—Additions to Infectious Diseases Hospital. Architect, F. O. Kirby, Doncaster.

DUBLIN.—A Local Government Board inquiry was held last week into an application by the South Dublin Board of Guardians for a loan of £3,000 for the wiring and fitting of the workhouse premises for electric light.

GRAVESEND.—Public baths, Gordon Recreation Grounds (£2,000). F. T. Grant, Surveyor, Gravesend Town Council.

LINCOLN.—Enlargement of Westgate School (£1,500). R. C. Mintin, Secretary, Lincoln Education Committee.

LIVERPOOL.—Extensions and alterations, St. James's Church School (£10,591); and additions. St. Augustine's School (£5,534).

LONDONDERRY. — Rebuilding, Guildhall (£24,000). Builders, H. Laverty & Son, Belfast.

MANCHESTER.—School, Chorlton-on-Medlock (£26,000). J. H. Reynolds, Secretary, Manchester Education Committee.

NUNEATON.—Factory. G. Sheppard, New Bridge Street, Nuneaton.

SHEFFIELD.—Additions to school (£7,806). Architect, Education Committee.

SPENNYMOOR.—Higher Grade School (£8,000). Builder, Mr. Hilton, Bishop Auckland.

TENDERS RECEIVED AND ACCEPTED

BELFAST.—The tender of Messrs. Willan & Robinson, at £10,172, for the supply of a 1,500-kw. c.c. turbo-dynamo and condensing plant has now been accepted by the Corporation, subject to the condition that the Corporation shall have the option of purchasing a duplicate plant within twelve months for £8,433. We referred to this plant in some detail in our issue for March 17th.

LEYTON.—The Council have provisionally accepted the tender of Messrs. S. Hammond & Co., at £115 17s. 6d., for the installation of telephones at the public offices extension.

NORTHAMPTON.—The Council have accepted the tender of Messrs. Dick, Kerr & Co., Ltd., for two new tramcars with inter-pole traction motors, at £555 each.

SALFORD.—The Council have accepted the following tenders for two years' supply of the undermentioned articles:—Special car accessories, Tramway Supplies, Ltd.; car accessories (electrical), J. Hall, Liverpool Electric Cable Co., Manchester Armature Repair Co., British Westinghouse Co., British Thomson-Houston Co., General Electric Co., L. Andrew & Co.; overhead equipment materials, G. Hill & Co., Watlington & Co., British Insulated & Helsby Cables, Ltd., Tramway Supplies, Ltd., H. E. Buck & Co.; ears, frogs, pull-offs, &c., G. Hill & Co., Tramway Supplies, Ltd., E. Dewhurst, British Insulated & Helsby Cables, Ltd., Watlington & Co.

The following are for annual supplies:—Cable Protectors and cable bearers, Albion Clay Co., Ltd.; maximum demand indicators, Reason Manufacturing Co., Ltd.; wood troughing, casing, and capping cleats for meter boards, C. Jennings & Co.; ammeters, Eckstein, Heap & Co.; arc lamp globes, City Glass Co.; glow lamps, General Electric Co., Ltd.; carbon brushes, H. G. Mayer & Co.; arc lamp carbons, Crompton & Co., Ltd.; meter boards and blocks, starter boards and wood cable bearers, J. Wheeldon & Sons; cables, W. T. Glover & Co., Ltd.; meters, Ferranti, Ltd., Chamberlain & Hookham, Ltd., General Electric Co., Ltd., British Westinghouse Co., Ltd. (trial order); motor starters, Verity's, Ltd.

WARRINGTON.—The Council have accepted the tender of Messrs. Chamberlain & Hookham, Ltd., for keeping the tramway meters in repair at 3s. 3d. per meter per annum.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £60 10s. to £61 per ton (last week, £61 to £61 10s.).

CANADIAN AGENTS WANTED.—A London firm manufacturing electrical generators, motors, fans, switches, arc lamps, cables, fittings, accessories, bells, telephones, &c., one of the directors of which is shortly visiting Canada, wish to enter into correspondence with some first-class Canadian firms with a view to appointing a representative in the Dominion. Further particulars from the High Commissioner for Canada, 17 Victoria Street, London, S.W.

FOSTER METALLIC LAMPS.—The following reductions in the price of Foster metal filament lamps have been made. These came into force on April 1st, and are subject to exceedingly liberal discounts to the trade. A revised price list will be sent to any of our readers on application to the Foster Arc Lamp & Engineering Co., Ltd., Worple Road, Wimbledon. 100-135 volts, 16-, 25-, 32-, and 50-c.p., 2s. 9d.; 200-260 volts, 25- and 32-c.p., 4s.; 50-c.p., 3s. 9d.

WESTINGHOUSE COMPANY'S NEW PREMISES.—In consequence of the increase in business, the British Westinghouse Electric & Manufacturing Co., Ltd., have taken larger premises, and the supply department formerly carried on at 27 Chancery Lane will in future be carried on at 3 West Street, Charing Cross Road, London, W.C. At the new premises has been arranged a special showroom, in which a large and varied selection of electric light fittings and accessories, together with heating and cooking appliances, will be on view.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—A meeting of the creditors of A. H. Gibbings, electrical engineer, 17 Gambier Terrace, Liverpool, was held last week. The unsecured debts amount to £3,234, with a further partially secured debt of £500, the value of the security being estimated at £10. The debtor commenced business in North John Street as a consulting engineer in February, 1906, in partnership. This connection was dissolved in June, 1908, and a considerable part of the indebtedness consisted of moneys due to the outgoing partner. The debtor continued the business, and obtained several important engagements, including the North British Electrical Power Syndicate, and a large Yorkshire enterprise. These, however, were all cut short by the passing, last session, of the Electric Lighting Act, which terminated most of his contracts by cutting off, or largely limiting, private enterprise as opposed to municipal undertakings. It may be recalled that the former enterprise was the cause of an agitation by Scottish municipalities owning electricity works, it being proposed to lay cables alongside railway tracks, and to supply electricity to works en route without statutory powers. The agitation by the Scottish authorities led to the drafting of clause 23 of the Electric Lighting Act, 1909, which prohibits unauthorised undertakers from competing with statutory undertakers. The assets, according to the statement of affairs, consisted only of furniture, valued at £42 15s.; but some time back debtor had given a bill of sale on his furniture to a brother-in-law resident in the Transvaal for £200. The administration of the estate was left in the hands of the official receiver.

The first meeting of creditors of W. C. Ellis, electrical engineer, Applegate Street, Leicester, was held last week. The statement of accounts shows a deficiency of £190 13s. In a report, the Official Receiver states that the debtor started business in March, 1909, without any capital. The bulk of the debts are for goods supplied; a deficiency account has been lodged, but it throws very little light on the insolvency. The books are insufficient and explain nothing.

OSRAM LAMPS.—We have received from the General Electric Co. an excellent view of the interior of the Maida Vale Roller Skating Rink, which is lighted entirely by Osram lamps. An illustration and particulars of the fittings employed were given in Electrical Engineering, March 10th, page 161.

Accident on the Cascade Tunnel Line.—Further particulars are now available of the accident which occurred at the western end of the Cascade Tunnel of the Great Northern Railroad, Washington, U.S.A., on March 1st last. According to the *Electric Railway Journal*, the avalanche swept off the tracks two trains, including four electric and three steam locomotives and a steam snow plough. One of the electric locomotives was in the inspection shed, which was also carried away by the avalanche. A considerable part of the three-phase overhead equipment was also destroyed. The electric locomotives were not carried very far, and it is thought that the mechanical damage is slight. The effect of the snow on the motor windings and contactors may be serious, however, and if much of the apparatus has to be rewound, it will be some months before the electric service can be resumed, as the locomotives will in that case have to be taken to Seattle for repair. These locomotives were described in Electrical Engineering, January 20th, 1910, page 44. Each weighs 103 tons, and develops 1,900 h.p. The electrical equipment consists of four 600-volt 25-cycle 475-h.p. three-phase slip-ring motors, supplied from the 6,000-volt contact line through two transformers.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—Mexican Light & Power Co., one per cent. on the ordinary shares for March quarter.

Anglo-American Telegraph Co., 15s. per cent. on the ordinary shares, and £1 10s. per cent. on the preferred stock for March quarter.

MORTGAGES AND CHARGES.—Particulars of the following have been filed:—Consolidated Electric Works & Appliances: Second mortgage-debenture, dated February 22nd, 1910, to secure £1,340, charged on the company's undertaking and property, present and future, including uncalled capital (subject to first mortgage debentures securing £2,500). Electric Landaulet Co.: Satisfaction in full of debenture dated June 2nd, 1909, securing £5,000. British Columbia Electric Railway Co., Ltd.—Issue on Feb. 22nd of £530,000 debentures, part of a series of which particulars have already been filed. Ferranti, Ltd.—Trust deeds dated Feb. 25th, 1910 (supplemental to trust deeds dated Feb. 24th, 1905, and June 13th, 1907, securing £125,000 debenture stock). Trustees: H. R. Boyce, Winchester House, Old Broad Street, E.C.; and W. Jones, Manager of Parr's Bank, Manchester.

APPOINTMENTS AND PERSONAL NOTES

Mr. C. Furness, Borough Electrical and Tramways Engineer to the Blackpool Corporation, has been appointed to the additional post of general manager of the tramways, rendered vacant by the death of Mr. John Lancaster. Mr. Furness is to have his salary increased from £600 to £700 per annum.

Accrington Electricity Committee have agreed to the following increases of salary:—J. P. Hall, outdoor mains superintendent, from 32s. 6d. to 35s. per week; G. Kirk, draughtsman, from 35s. to 37s. 6d.; H. Taylor, switchboard attendant, from 25s. to 27s. 6d., and afterwards from 27s. 6d. to 30s.; James Wilding, overhead linesman, from 50s. to 55s. (to include all overtime); S. E. Ogden, chief clerk in tramway manager's office, from 35s. to 40s. per week.

Mr. R. B. Leach, who recently resigned his position as chief electrical engineer to the Farnworth Council to engage in consulting work, was presented last week with a silver rose-bowl, which was subscribed for by the staff. Mr. A. J. Hutchinson, hitherto chief assistant, succeeds Mr. Leach.

Mr. W. H. Hall, late borough electrical engineer at Morecambe, has been presented with a kit-bag by the staff.

The St. Helens Electricity Committee recommend an increase in the salary of the Borough Electrical Engineer, Mr. E. M. Hollingsworth, from £400 to £500 per annum, by two annual increments of £50 each.

Telegraph Traffic.—Another quiet week has passed in the telegraphic world. The cable between Zante and Corfu was interrupted on the 29th ulto., but was restored on the 31st ulto. On the 31st March also, the Dakar-Conakry cable which has been down since the 19th August last, was restored to working order.—The German South American Co. is proceeding with its Brazilian cable, and the Western Telegraph Co. will shortly have completed the laying of the Ascension-Buenos Ayres cable.—The Government of Jamaica propose to reduce the inland telegraph rate from 1s. for 20 words to 6d. for 12 words. The loss of revenue in the first year is estimated at £1,100 to £1,200.

Wireless Telegraph Notes.—It is reported that an American Company is asking for a licence for the sole right to conduct a wireless telegraph business for twenty-five years, giving the Government the privilege of purchasing the business at the end of 10, 15, 20, or 25 years. They propose to instal at Hong Kong a station equal to their station in New York, which will be capable of communication with Yokohama and Shanghai on the north, and Singapore on the south.

A wireless telegraph service between Monte Video and Buenos Ayres has been inaugurated.

A *Reuter* telegram from Berlin states that the Nauen wireless telegraph station recently succeeded in maintaining wireless communication with a Woermann liner during the entire voyage from Hamburg to Kamerun. The greatest distance signalled was over 4,000 miles.

It is announced that a tender by the Australian Wireless Telegraph Co. for the construction of a wireless telegraph installation at Fremantle (W.A.) and Sydney at £8,300 has been accepted. The plant must be capable of communicating with British warships and mail and other steamers up to 1,250 miles, and it is stipulated in the contract that only British subjects may be employed upon the construction work. We gave some details from the specification in our issue for January 13th.

According to the *Standard* Paris correspondent, the Department of the French Marine is equipping the two battleships *Justice* and *Vérité* with apparatus for communication by means of wireless telephony. The system employed is the invention of Captain Colin and Lieutenant Jeance. With this system it has been possible to communicate between Toulon and Port Vendres, in the Mediterranean, a distance of more than 150 miles.

An Admiralty wireless telegraph station is to be erected at Rosyth.

Digitized by Google

PARLIAMENTARY INTELLIGENCE

LONDON ELECTRIC SUPPLY BILL.—When this Bill, which provides for the purchase in 1931 of the West End London Electric Supply Companies, comes up for second reading in the House of Commons, Mr. Tennant, the Parliamentary Secretary to the Board of Trade, will move that it be referred to a Select Committee of five members, three to be nominated by the House, and two by the Committee of Selection. The committee will hear evidence in the ordinary way.

L.C.C. (TRAMWAYS AND IMPROVEMENTS) BILL.—The Metropolitan Railway Co. and the Paddington Borough Council have withdrawn their opposition.

NORTH & SOUTH SHIELDS ELECTRIC RAILWAY.—The second reading of this Bill in the House of Commons, which was down for Thursday last, has been postponed until to-day (Thursday).

TUBE RAILWAY AMALGAMATION BILL.—A House of Lords Committee will to-day commence consideration of a number of London electric railway Bills, the first being the scheme for amalgamating the Great Northern, Piccadilly & Brompton, the Baker Street & Waterloo, and the Charing Cross, Euston & Hampstead Railways.

CAVEHILL & WHITEWELL TRAMWAYS.—The Bill of the Belfast Corporation, in which powers are sought to purchase the undertaking of the Cavehill & Whitewell Tramways Co. on arbitration terms, has been referred to the Standing Orders Committee. The Bill has been held not to comply with Standing Orders on account of deposit after the statutory period.

PROGRESS OF ELECTRICAL BILLS.—All opposition to the Nottingham Corporation Bill has been withdrawn, and the Bill has been referred to the Unopposed Committee of the House of Lords.

The Farnham Gas and Electricity Bill, and the Mersey Railway Bill were read a second time in the House of Commons on Monday.

The second reading of the North-East London Railway, London United Tramways, and the Cavehill and Whitewell Tramways Bills has been postponed until Monday.

DEVONPORT AND DISTRICT TRAMWAYS.—A Select Committee of the House of Commons commenced consideration of this Bill yesterday, and a report will appear in our next issue. The Bill has created exceptional local interest for the reason that it proposes to modify an existing Parliamentary agreement between the company and the Corporation for the running of the tramways. The company have found that the terms of the original agreement have become too onerous to enable the tramways to be worked at a profit.

COMPANIES' MEETINGS AND REPORTS

GATESHEAD & DISTRICT TRAMWAYS CO.—At the meeting last week, the decline in receipts of £715 during 1909 was attributed to the closing down of an engineering works in Gateshead, the transfer of employés from the North-Eastern Railway Works to York, and the opening of a railway station at Dunston. The expenditure, however, had been decreased. Considering the disturbed state of trade in the Tyneside district, the directors did not regard the result of the year's trading as unsatisfactory. In accordance with their Act of last year, which postponed the purchase by the Corporation of the lines in Gateshead until 1930, a contract had been entered into for the extension of the Bensham route and the doubling of the Low Fell section.

SOUTH WALES ELECTRICAL POWER DISTRIBUTION CO.—The report for 1909 states that the arrangement for the construction, by the Treforest Electrical Consumers Co., Ltd., of a connecting cable between the generating station at Treforest and the Cwmbran area, has been duly carried out. The connection was completed in May last, and since then the supply to the Cwmbran area has been entirely taken over by the Treforest Company. This arrangement has enabled the Cwmbran generating station to be shut down, and the expense of working it as a separate unit to supply the consumers in that area has thus been saved to the South Wales Co. The Treforest Co. has made steady progress during the last twelve months, the cost of production having been materially reduced, and the output increased. Some new consumers have been connected, and negotiations are proceeding with others who are contemplating taking a supply. To meet the growing demand for current, the Treforest Co. are considering the question of providing further capital for an increase of the generating plant. On the whole the directors consider that the position of the company has appreciably improved as compared with that in 1907, when they took office. The company does not now work any power station.

BATH ELECTRIC TRAMWAYS CO.—The gross profit for 1909 amounts to £16,107, including £2,493 brought forward. Interest on mortgage debenture stock and loans amounts to £7,393, and preference dividend £3,750. After adding £1,000 to sinking fund for debentures, a balance of £3,964 is carried forward, against £2,495 in the previous year. At the annual meeting last week, Sir James Sivewright said that although there were sufficient funds to declare a dividend on the preferred ordinary shares for 1909, the directors had thought it best not to do so owing to the fact that they owed the bank £25,650. When they had wiped this debt out, either by an issue of new debentures or preference shares, there would be nothing in the way of paying dividends on this stock. For the first three months of the present year, the revenue was £1,094 in excess of that for the same period of 1909.

EVERED & CO.—The accounts for 1909 show a loss of £2,283, after allowing £2,000 for depreciation and meeting debenture interest.

TELEPHONE COMPANY OF EGYPT.—A dividend at the rate of 10 per cent. for 1909 is announced, carrying £500 to reserve for a contemplated pensions scheme, and £42,326 forward.

RHONNDA TRAMWAYS CONSTRUCTION SYNDICATE.—The net profit for 1909 was £20,044. The sum of £3,500 is placed to reserve and renewals, and a final dividend at the rate of 3 per cent. per annum is recommended.

WILLANS & ROBINSON.—At the half-yearly meeting on Tuesday, Mr. J. C. Peache, the managing director, who presided, asked the shareholders not to be discouraged by the present state of the profit and loss account. The works were better equipped than before, and the staff was certainly no less efficient. Given reasonable improvement in trade there was every expectation of profits being earned again. At present there was some evidence of improved trade, although there was no indication of improvement in the miserable and inadequate prices which had to be accepted if work was to be obtained. Until the political horizon cleared and some measure of confidence was restored to commercial enterprise, he did not think they would find a purchaser for the Queen's Ferry works. There has recently been a well-marked increase in the number of orders received. Mr. Leslie S. Robertson, in seconding the adoption of the report and accounts, thought that many of the troubles had been inherited when the reorganisation took place. He did not think this had been so drastic as it ought to have been. Mr. Frederick Davenport was elected assistant managing director at a salary of £1,500 per annum, to undertake the commercial control of the business.

Obituary.—We regret to record the death on March 29th, St. Leonards-on-Sea, of Mr. T. Musgrave Heaphy, who from 1874 till 1904 was engineer and electrical adviser to the Phœnix Fire Office. Mr. Heaphy, who was sixty-seven years old, was responsible for the first set and many subsequent revisions of the famous Phœnix Fire Office rules relating to electric lighting, which in themselves constituted almost a text-book on electrical wiring, and indicated the best practice to be followed in this class of work. Mr. Heaphy was always a strong advocate of the wood-casing system of wiring. The funeral took place on Saturday at Brookwood.

We regret to announce the death, on March 22nd, at St. Anne's-on-Sea, of Mr. A. G. Thornton, at the age of sixty-two. Mr. Thornton was the founder and managing director of the firm of Messrs. A. G. Thornton, Ltd., scientific instrument makers, Paragon Works, Manchester.

We also regret to note the death of Mr. P. Storey, who had been borough electrical engineer at Torquay since the Corporation Electricity Works were opened in 1898.

SUMMARY

A SPECIAL illustrated article on fans and ventilation includes particulars of some new designs of electrically driven fans and ventilating plant. A description of the "Ozonair" system of ventilation is given, and some interesting ceiling fan equipments in India are described and illustrated, in addition to several novelties in small fans. (Page 241.)

IN our monthly illustrated article on new electrical supplies and accessories, we describe a new form of tantalum lamp with improved distribution of light in a downward direction, and a new double-carbon arc lamp. Particulars are also given of an adapter for converting an ordinary lampholder into a switch holder, a combined wall plug and adapter to enable portable apparatus to be connected either to a wall socket or a lampholder, and a combination base for switches, bell pushes, and plugs specially intended for shipboard use. A new electric toaster is illustrated, and other novelties include a collapsible advertising sign and a combined paper knife and bell push. (Page 244.)

SOME new and interesting designs of automatic and other control gear are being introduced by the Adams Manufacturing Co. These include a motor starter, in which the successive resistance steps are cut out according to the rate of acceleration of the motor, a line of remote control switches for currents up to 10,000 amperes, and an ingenious starting switch suitable for motors in mines. We were enabled to inspect the works of the firm at Bedford last week, and see the apparatus in various stages of manufacture. (Page 247.)

ALUMINIUM rod for machine connections or feeder connections in switchboard work can be jointed by butt welding on site with a blow-pipe. In inaccessible places, screwed couplings are suitable. Heavy 'bus-bars are constructed of aluminium bars, clamped together with spacing pieces between the individual bars. (Page 248.)

IN a Paper read before the Institution of Electrical Engineers in London on Thursday last, Mr. A. Gerrard described some experiments made on the Glasgow tramway system with magnetic track brakes. It was found that on braking at high speeds, the motor pressure rose to twice the normal, and various methods of reducing this pressure and the heavy braking currents were tried. The method finally adopted consists in shunting the motor fields in two successive steps by means of solenoid switches, and is found to prevent abnormal pressure rise and intermittent skidding, and further to reduce the braking current very considerably. In the discussion of the Paper, Mr. E. H. Cockshott described similar tests made at Leeds, but with different results. Mr. A. W. Maley, the inventor of one of the brakes referred to in the Paper, called attention to tests on other tramway systems which had given better results from those given in the Paper. Mr. W. H. Booth also spoke, and Mr. H. M. Sayers suggested that the different condi-

Digitized by Google

tions rendered it difficult to compare tests in different towns. (Page 249.)

A LONG Paper by Mr. W. Pollard Digby and Mr. D. B. Mellis, read on March 18th, before the Manchester Local Section of the Institution of Electrical Engineers, described a series of researches into the properties of switch and transformer oils. (Page 251.)

A BILL for amalgamating the Great Northern, Piccadilly & Brompton, Baker Street & Waterloo, and the Charing Cross, Euston & Hampstead Railway Companies, has been passed by a House of Lords Committee. A Bill by the Baker Street & Waterloo Railway Co. for the construction of a moving stairway at their Oxford Circus station has also been passed. A proposal by the Charing Cross, Euston & Hampstead Railway Co. for the construction of tunnels at Charing Cross to allow through running with the District Railway was rejected, but the Committee afterwards decided to allow the promoters an opportunity to come to an arrangement with the opponents of the scheme. (Page 252.)

A REPORT by Mr. W. W. Lackie (Chief Engineer to the Glasgow Corporation electricity department) recommending the immediate acquisition of a site for a new generating station, has been approved by the Electricity Committee. (Page 253.)

THE Lancashire Electric Power Company are applying for a Provisional Order enabling competition in Radcliffe with the Radcliffe District Council, who at present supply electricity under an ordinary Provisional Order. (Page 253.)

THE Bill of the Devonport and District Tramways Co., which proposed important modifications of an agreement with the Corporation, has been rejected by a House of Commons Committee. The proposals of the Metropolitan District Railway Co., for the extinction of the arrears of the guaranteed stock of dividends by distributing new guaranteed stock, has been passed by a House of Lords Committee. A new electric railway from Wimbledon to Sutton is under consideration. (Page 253.)

INQUIRIES are being made by the Grimsby Corporation in relation to the purchase of the local tramways.—A vote in respect to Sunday tramways has been rejected by a substantial majority at Llandudno.—Leading tradesmen in Regent Street have petitioned the Westminster Council against accepting a tender for gas lighting.—The Local Government Board have refused a new loan to meet the loss on the Pemberton power station of the Wigan Corporation.—A new tramcar shed to accommodate 49 cars has been erected at Bolton.—The Clyde Navigation Trustees have decided to instal an independent generating plant at the Rothesay Dock.—Rearrangement of the street lighting at St. Helens is to take place. (Page 254.)

COLCHESTER Corporation propose to borrow £8,000; Battersea Council, £8,900; and the Wednesbury Council, £3,000, for electrical extensions. A gas producer generating plant is contemplated by the Leith Dock Commission. Large extensions are proposed at Wolverhampton. The Nuneaton Council require a water-tube boiler; Sheffield Corporation and Dartford Council, cables; and the Whitwood Council, cables, switchboard, instruments, &c. A scheme for electrically driving some Indian railway workshops is under consideration, and a 15 miles tramway is proposed between Tokio and Yokohama. (Page 254.)

THE North Metropolitan Electric Power Supply Co. pay a dividend of 6 per cent. on the ordinary shares; the Metropolitan Electric Tramways Co., 5 per cent.; Calcutta Tramways Co., 4½ per cent.; and the Merthyr Electric Traction Co., 5 per cent. (Page 256.)

THE second annual meeting of the Electrical Trades Benevolent Institution was held last week. During the year, the funds have been increased by nearly £1,000. Five cases of relief were dealt with by the Committee last year, and all the applicants are now in work again. (Page 257.)

AT the last meeting of the Marylebone Borough Council, the appointment of a Special Committee to investigate the methods adopted in connection with the management of the Electricity Sales Department was decided against, only four members voting for it. (Page 257.)

ARRANGEMENTS are being made for installations of the Telefunken system of wireless telegraphy in the German colonies. Negotiations are being carried on by the Post Office in regard to a new wireless telegraph station on the east coast between Norfolk and Newcastle. (Page 257.)

AMONG the specifications published by the Patent Office on Thursday last was one by Bruce Peebles & Co. for the provision of special compensating windings in the pole shoes of motor-converters to improve the commutation and to alter the main field on load so as to obtain a compounding effect.—A system of electrical marine propulsion with generators and motors interwound so as to avoid high pressures is described by C. A. Parsons, G G. Stoney, and A. H. Law.—Resistance grids with means for adjusting the resistance after stamping, are patented by the British Thomson-Houston Co.—C. B. Walker describes a battery plant for country house lighting, with arrangements for starting up the generating set when the battery requires recharging.—A method of supporting metal filaments so as to prevent short-circuiting of the loops, and also to allow for the gradual contraction of the filament, is patented by H. Kuzel. (Page 258.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, APRIL 14TH.

Illuminating Engineering Society.

8 p.m. At Royal Society of Arts. Continuation of discussion on "The Measurement of Light and Illumination."

Rontgen Society.

8.15 p.m. At 20 Hanover Square, London. "Some Methods of Using the Alternating Current Mains for Rontgen Ray Work," by Dr. G. B. Batten.

FRIDAY, APRIL 15TH.

Institution of Mechanical Engineers.

8 p.m. At Storey's Gate, St. James's Park, London. "A Research on the Hardening of Carbon and Low-Tungsten Tool-Steels," by S. N. Brayshaw.

SATURDAY, APRIL 16TH.

Institution of Mining Electrical Engineers.

4.30 p.m. Cumberland Branch. At Grand Hotel, Whitehaven. "Direct Current Plant and the Distribution of Current to Outside Pits," by J. Glynn Williams.

6.30 p.m. Lancashire Branch. Further discussion on the Special Electrical Mining Rules.

TUESDAY, APRIL 19TH.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. Annual General Meeting at Municipal School of Technology. "The Application of the Cradle Dynamometer to the Testing of Electrical Machinery," by F. Shaw and J. Davies.

WEDNESDAY, APRIL 20TH.

Institution of Electrical Engineers: Yorkshire Section.

7.15 p.m. Annual General Meeting at Leeds University.

THURSDAY, APRIL 21ST.

Institution of Electrical Engineers.

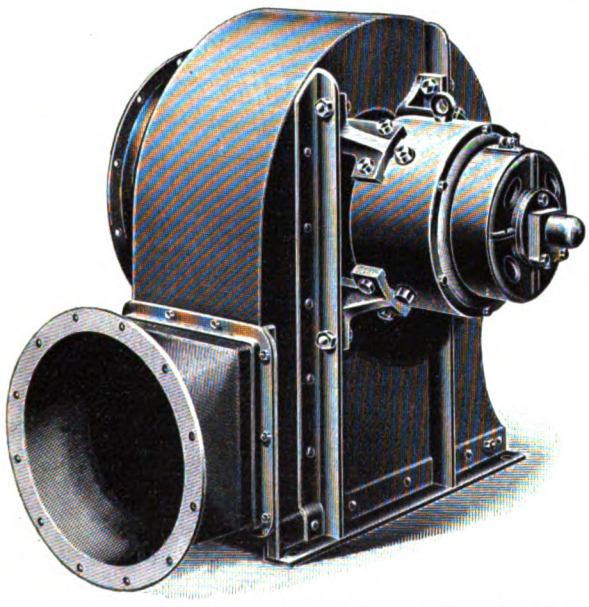
8 p.m. At 25 Great George Street, Westminster. "Hydro Electric Installations of Sweden," by A. V. Clayton.

FRIDAY, APRIL 22ND.

Physical Society.

5 p.m. At Imperial College of Science. "The Magnetic Balance of Curie and Cheneveau," by C. Cheneveau and A. C. Jolley.

Royal Institution.

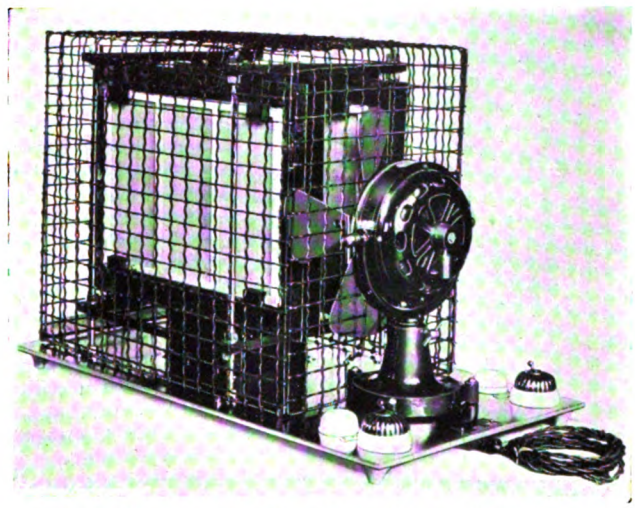


9 p.m. Evening discourse by T. Thorne Baker on "The Telegraphy of Photographs, Wireless and by Wire."

Digitized by Google

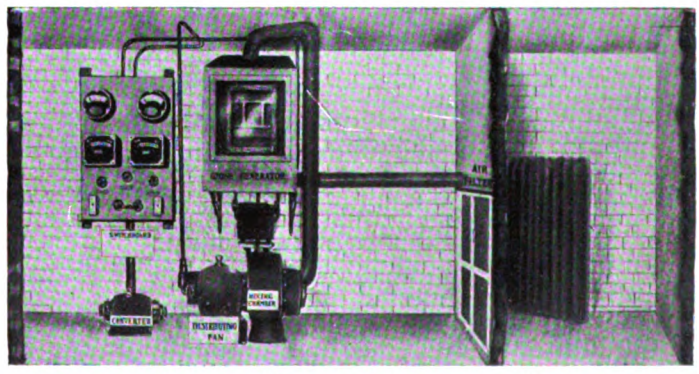
FANS AND VENTILATION

THERE is no doubt that the comfort, as well as the hygienic importance of well-ventilated rooms is becoming appreciated by the public to an increasing extent, and it is to this, as well as to the greater complexity of modern buildings, that the rapid growth in the demand for fans and ventilating apparatus is due. In practically all large halls, shops, and steamships of recent construction, a more or less elaborate system of ventilation, with arrangements for cleaning, purifying, heating, or cooling the air, and in some cases enriching it with ozone, is installed. Apart from these larger equipments, a considerable number of desk and other small fans are in use, especially in offices, restaurants, and basements, and much ingenuity is being expended in their design. For domestic purposes and in public buildings electricity is the only convenient driving power for fans, and even in factories and other places where mechanical power is available, electric fans are more often employed than belt-driven fans. For the smaller fans, the very high speed which one is tempted to employ for the sake of cheapness is somewhat of a disadvantage, but for the larger apparatus the electric motor is certainly admirably adapted to the work, and can be designed to suit any conditions. With regard to the mechanical design of the fan itself, the shaping and arrangement of the blades to obtain the highest efficiency under any given conditions of speed, pressure, and volume, has been the subject of much research and experimental work, and a number of special designs have been evolved. The following notes give an idea of the latest steps in this direction taken by some of the leading makers.



Messrs. James Keith & Blackman Co., Ltd. (27 Farringdon Avenue, London, E.C.), may be cited as one of the foremost firms engaged in the manufacture of ventilating apparatus. Besides being the makers of the famous "Blackman" open type fans which are used the world over for ventilating halls, rooms, and factories, &c., this firm is responsible for the "Keith" enclosed pressure fan. This type of fan is especially designed

New Design of Electrically-Driven "Keith" Fan. (James Keith & Blackman Co., Ltd.)



for supplying a large volume of air with a considerable pressure as is required in induced draught systems for steam-raising plant, and in ventilating equipments in which there is a length of piping or conduit on the exhaust side of the fan. The accompanying illustration shows a new design of "Keith" fan with electric drive. The motor armature is mounted on the fan spindle, and the casing is bolted up to the frame of the fan, thus giving a most compact and rigid construction. Ball-bearings are fitted to these fans except in the case of those for forced draught and similar work, which are supplied with water-cooled automatic ring oil bearings. The normal fans deliver at pressures up to 6-in. water-gauge, but the fans for mine and other special ventilating work deliver at higher pressures. Electrically-driven fans of this type are displacing all other kinds for ship ventilation on the thermo-tank system, as they can deal quickly and efficiently with a large volume of air and occupy little space. A new design of high-pressure centrifugal blower for forge and cupola work, with a motor built into the blower casing, has also just been placed on the market by this firm.

An important development in ventilating engineering is the provision of apparatus for artificially bringing up the proportion of ozone in the air to the amount present in sea or mountain air under natural conditions, viz., about one and a half parts in a million. When present in this small degree, ozone imparts to the air a most agreeable and refreshing odour, and, as it is a most powerful sterilising agent, its presence is highly desirable

New Type of Self-Contained Ozone Generator. (Ozonair, Ltd.)

A most convenient method of producing ozone (that is, causing oxygen molecules to take up a third atom of oxygen) is by means of the electric discharge. It is highly important, however, that the air should not be overheated, as injurious nitrogen compounds are then formed, and an apparatus which has been proved to generate ozone without the slightest trace of these nitrogen compounds is that designed and supplied by Ozonair, Ltd. (96 Victoria Street, Westminster, S.W.). This consists of

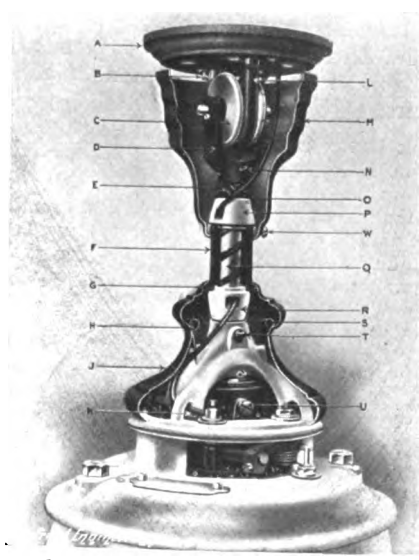
Complete "Ozonair" Ventilating Plant.

a series of generating units, each comprising a thin plate of insulating material with a sheet of metallic gauze on either side. The gauze sheets are connected across the secondary of a transformer delivering current at about 5,000 volts, and an innumerable number of minute discharges occur all over the opposing surfaces of the plates. The efficiency of the apparatus is dependent upon the concentration, and it is better to produce a small percentage of ozone in a large quantity of air

Digitized by Google

than it is to produce a strong mixture and then add that to the main volume of air. In large equipments, however, such as that in Messrs. D. H. Evans & Co.'s new premises in Oxford-street (*see* ELECTRICAL ENGINEERING, Feb. 10th, 1910, p. 95), it is more convenient to produce a comparatively strong mixture, which is conveyed to the main ventilating fan, and there diluted by the main supply. Thus, in the equipment referred to, the main fan passes some three million cubic feet of air per hour. To preserve the proper proportion, the generator has to supply about 4½ cubic feet, or 250 gms. of ozone per hour. This it does with a total expenditure of 500 watts. The latest design of self-contained generator for use in halls, factories, schools, &c., is illustrated herewith. The fan produces a continuous current of air between the plates, and its armature is supplied with slip-rings from which is fed the transformer (visible under the plates). The whole apparatus is constructed of metal, principally aluminium, and has a wire cover. Other forms of self-contained apparatus, including some in handsome cabinets for domestic use, can also be obtained. The figure below illustrates a complete "Ozonair" ventilating plant for a large building. On the extreme right is the inlet chamber for the fresh air, which may be either heated or cooled. From this chamber it is drawn through a felt filter kept moist, which cleans it of all suspended matter and absorbs such deleterious gases as ammonia and sulphurous acid. From the second chamber it passes to the mixing chamber, through which it is drawn, together with a quantity of treated air from the ozone generator, by the distributing fan. Where only a D.-C. supply is available, a small converter is employed to feed the transformer. The proportion of ozone and the volume of air circulated can be regulated from the switchboard. The treated air is distributed to the various rooms in the building by means of ducts. Where the climate is hot and damp, as in India, refrigerating and drying apparatus is added. It may be mentioned that the recent installations by Messrs. Ozonair, Ltd., include equipments at His Majesty's Theatre and at the Law Courts, London.

Messrs. CROMPTON & Co., LTD. (Salisbury House, London Wall, London, E.C.), make a speciality of low-speed ceiling fans, of which they have supplied large numbers for use in Government and other buildings in India. The accompanying illustrations show an equipment of sixty-four Crompton ceiling fans as installed in St. Thomas' Cathedral, Bombay, and a group of fans combined with electroliers in the Connemara

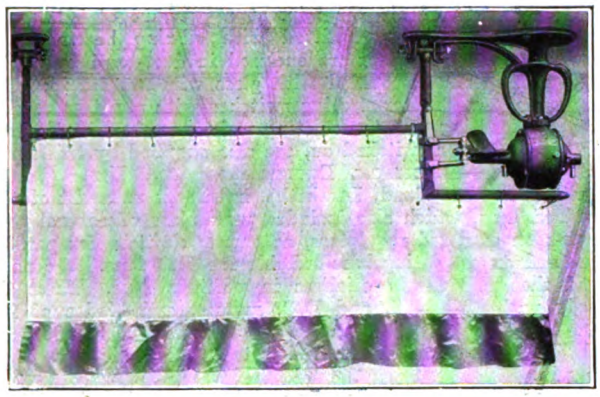


CEILING FANS AT ST. THOMAS'S CATHEDRAL, BOMBAY. (CROMPTON & CO., LTD.)

Hotel, Madras. Ceiling fans are largely displacing punkahs in India and other countries with hot climates for keeping the air in a continual state of motion, and though the fans may have a curious appearance in a cathedral, they are a distinct improvement on the punkahs originally used, which darkened and obscured the interior. Further, the design of the fans and their brackets is such as to bring them into harmony with the surroundings. Each fan has a sweep of sixty inches, and the aluminium blades are curved after a pattern adopted after an exhaustive series of experiments, as affording silent running and high efficiency. The speed is about 140 r.p.m. The Cathedral fans are run off a 230-volt D.-C. supply, and each consumes some 85 watts. Dust-proof, self-lubricating ball-bearings are used. The suspension consists of a ½-in. steel rod covered by a polished brass tube 4 ft. long. The aluminium or wood blades may be two, three, or four in number, and are fastened to the carrier by means of screws working in slots. The blade angle is easily adjusted, but it is impossible for the blades to fly off. The

ELECTROLIER CEILING FANS IN THE CONNEMARA HOTEL, MADRAS. (CROMPTON & CO., LTD.)

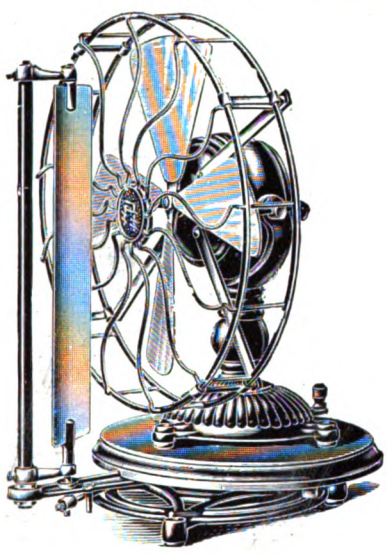
standard suspension, illustrated herewith, consists of the steel rod *Q* and brass tube *F* referred to above, a suspension shackle *D* hanging from the porcelain insulator *C*, a spring washer *E* and leather washers *O* and *S*, porcelain insulators *P* and *R*.



CEILING FAN SUSPENSION DETAILS. (CROMPTON & CO., LTD.)

The connecting leads come up from the motor casing at *K* and are wound two or three times round the rod *Q*. The rubber ring *G* ensures a good dust-proof joint between the tube *F* and the lower spinning *J*.

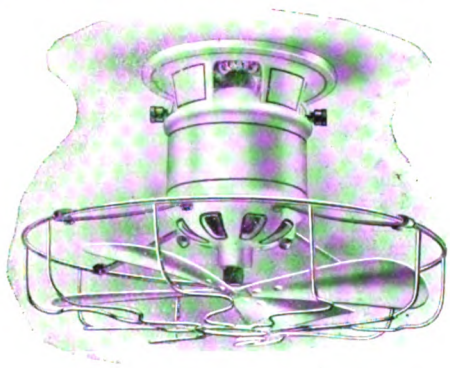
Electrically-driven punkah fans are preferred by some to ceiling propeller fans, and the GENERAL ELECTRIC CO., LTD. (71 Queen Victoria Street, London, E.C.), include in their lists the well-known "Bandy" patent electric punkah to supply this demand. It is stated that the varying air-displacement is more agreeable than the constant flow of air produced by a fan. The latter also lacks the peculiar flick at the end of the stroke which is said to have a pleasant cooling effect. The "Bandy" apparatus, illustrated herewith, consists of a rigidly suspended motor, with conical pulley on the under side and a swinging frame to which the curtain is loosely strung. Attached to the upper side of the frame is a quadrant, pivoted on a substantial bearing-pin and controlled by springs. This quadrant is pressed to one side or the other of the coned pulley on the motor with which it engages. When the pulley revolves, the quadrant is carried out of the vertical, and a sufficiently strong pull is given to the quadrant to shoot it some distance. On the return stroke the quadrant will strike the pulley on the upper side, and the punkah will be swung in the opposite direction. The "flick"



Digitized by Google

is of equal strength in both directions, unlike the hand-pulled punkah, which only gives the "flick" in one direction. The General Electric Co. have a large assortment of propeller fans

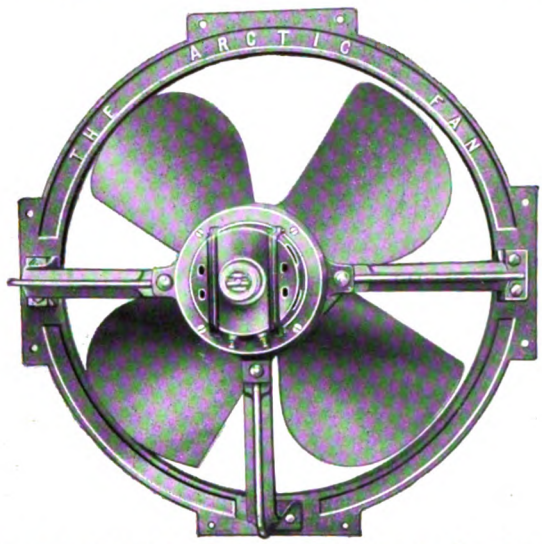
Electrically Operated Punkah.
(General Electric Co., Ltd.)



to suit various requirements. Among the novelties are a compact little desk fan, called the "Liteweight" type, weighing only 10 lbs. complete. The accompanying illustration shows a

Fan on Oscillating Base.
(General Electric Co., Ltd.)

fan on an oscillating base for spreading the draught of air over a wide area. This can be used with any make of fan and works automatically.



Messrs. Simplex Conduits, Ltd. (Garrison Lane, Birmingham), have just introduced a new type of ceiling fan for use on board ship. It is especially designed for ships' cabins, but will

Ceiling Fan for Ships' Cabins.
(Simplex Conduits, Ltd.)

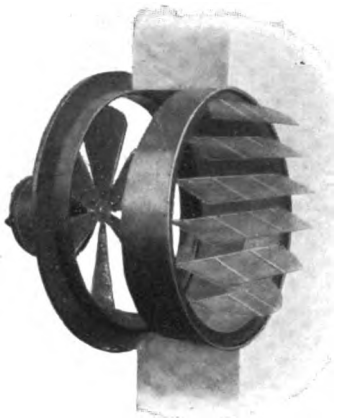
also be found useful in restaurant work. The overall diameter is 12 in. The blades are of nickelled steel or brass as required, and the standard finish is white enamel relieved with gold lines. This fan consumes only 45 watts, and is capable of moving over 700 cubic feet of air per minute when running at the full speed of 1,500 r.p.m. It is very light, weighing only 6 lbs. complete. In the smaller Simplex fans, automatic grease lubrication is provided, but in the large fans ring lubrication is adopted. In all patterns, except porthole and ceiling fans, regulators are provided in the base. The range of fans listed by this firm includes desk fans of various patterns, bracket fans adjustable so as to direct the air current in any direction, small porthole fans for ventilating ordinary sized rooms, and large porthole fans for public buildings. These fans can be fitted with ordinary or box type blades as required.

The next figure illustrates one of the "Arctic" porthole fans of the Wilson-Wolf Engineering Co., Ltd. (Thornton Road, Bradford). No alterations have been made of late in the design of these fans. They are provided with a combined thrust and journal ball-bearing which enables them to be fixed in any position. Owing to the special design of the blades, the tips do not baffle the air by being curved in upon themselves, and the outputs at standard speeds are claimed to be 50 per

Porthole Fan (Wilson-Wolf Engineering Co., Ltd.).

cent. above those of fans with ordinary box-type blades. The motors are former wound and made quite impervious to moisture, so that they are particularly suitable for use in damp places. Special patterns are supplied for working in positions where acid fumes are present. A line of A.-C. fans of the induction-motor type with squirrel-cage rotors has just been introduced by this firm.

The Davis Electrical Co., Ltd. (17 Moor Street, London, W.), have a large assortment of electric fans, and, besides the



Universal Fan with Gymbal Support.
(Davis Electrical Co., Ltd.)

more usual designs, are pushing a few novel patterns. The accompanying illustration shows a so-called "Polar" fan by

Digitized by Google

this firm. This fan has a gymbal support similar to that of a gyroscope, except that the supports can be fixed, thus holding the fan at any desired angle. The illustration shows the fan in use as a ceiling fan, but it is equally suitable for use as a desk, trunnion, or bracket fan. The firm also supplies a variety of porthole fans for insertion in walls, windows, or ceilings, and several patterns of ceiling fans for both A.C. and D.C. circuits. Battery desk fans and miniature lamp-holder fans for fitting direct into lamp-holders without plug or cord, can also be obtained.

The next figure illustrates an automatic shutter for fans of the ring and porthole type by the British Central Electrical Co. (17 Hatton Garden, London, E.C.). The aluminium shutters fall back automatically when the fan stops, and thus prevent any back draught. In a modified form of this arrangement

Automatic Shutter for Porthole Fan.
(British Central Electric Co.)

the shutters are made adjustable, by means of a cord passing over pulleys to the interior of the room. This firm lists a large selection of fans of all types, including a useful bracket fan with universal joint and three-speed regulator, and a neat design of cabin-fan.

Among the firms specialising in ventilating is that of Messrs. John Gibbs & Sons (72 Duke Street, Liverpool), who have evolved a number of special designs of blowers and fans, direct-driven by totally enclosed motors. A blower of this firm's make and driven by a 1¾-h.p. motor was found on test to discharge 2,600 cubic feet of air per min. at a pressure of 1½in. water gauge. The machine was fitted with oil-ring bearings. The motors of this firm's fans are enclosed in dust- and water-tight sheet metal casings provided with glass windows for inspecting the brush gear. Motor-starting switches with a patent arrangement for ensuring that the starting resistance shall be in circuit when the motor is switched on, are also supplied by this firm.

The Brush Electrical Engineering Co., Ltd. (Victoria Works, Belvedere Road, Lambeth), have sent us a list of their standard fans, which also includes particulars of several accessories such as speed regulators, automatic shutters for port-hole fans, and an oscillating base suitable for desk fans. We understand that this firm specialises in porthole fans. These they supply with both A.C. and D.C. motors, and blades of from 9 in. to 16 in. diameter. They consume from 20 to 100 watts, and drive a volume of some 400 to 1,000 cubic feet of air per min.

Messrs. Davidson & Co., Ltd. (Sirocco Engineering Works, Belfast), the makers of the well-known "Sirocco" fans, have called our attention to a catalogue they have just issued on dust removal, a subject closely allied to ventilation. After referring to the importance of removing dust in factories, and particularly in the case of paint and accumulator works where the dust is of a poisonous nature, the pamphlet describes the use of the centrifugal fan for this purpose in conjunction with a system of hoods and piping. Several photographs of equipments in textile mills, paper mills, and engineering works are given, and a plant installed in the works of the Tudor Accumulator Co., Ltd., at Dukinfield, to remove dust from a mixing machine and barrels handling salts of lead, is also described.

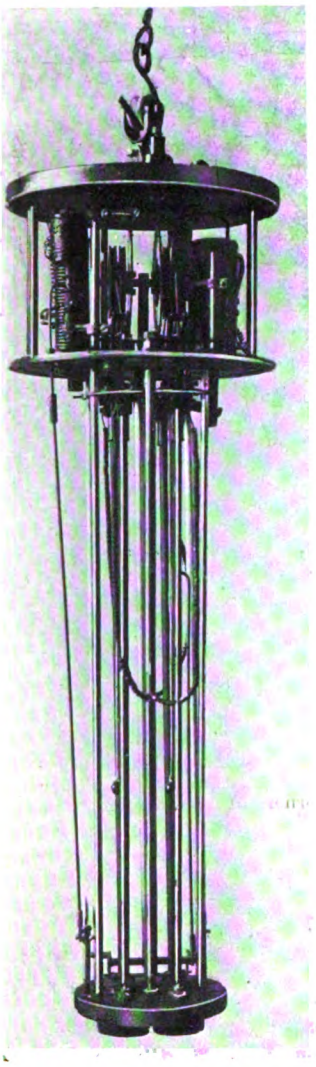
Messrs. G. N. Haden & Sons (Lincoln House, Kingsway, London, W.C.) inform us that they are at present equipping St. Paul's Cathedral, London, with a ventilating plant. This consists of two large electrically driven centrifugal blowers installed in specially constructed rooms built underground adjacent to the crypt at the extreme corners of the building. The air is drawn through horse-hair filters kept moist by a stream of water, and is further charged with moisture by a special form of atomiser. Two large heating batteries are provided. The large blowers are supplemented by a number of propeller fans situated in various parts of the Cathedral.

NEW ELECTRICAL SUPPLIES AND ACCESSORIES

Incandescent Lamps.

The accompanying illustration represents a new design of tantalum lamp, which Messrs. Siemens Brothers Dynamo Works, Ltd., are putting on the market with a view to overcoming the drawback which many metal filaments have of weak "end-on" candle power as compared with that in a horizontal direction. The new pattern will be known as the tantalum focus-

Tantalum "Focussing" Lamp.



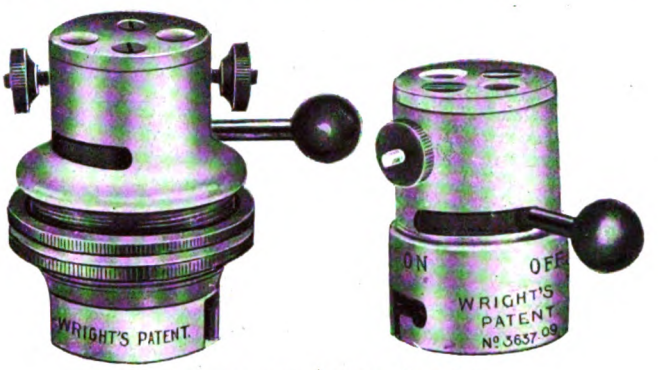
sing lamp, and has an entirely new arrangement of filament by which a much increased end-on candle power is obtained. The spider on which the filament is wound is constructed in a conical shape, with the apex pointing downwards. The light is distributed very evenly except towards the cap of the lamp, where it is not required. These lamps are now being supplied for 100-130-volt circuits in 25 c.p. sizes, in spherical bulbs of approximately 75 mm. diameter. They are especially suited for places where it is desired to obtain a strong and even light without the aid of special reflectors, and should prove useful for stage lighting, ceiling lighting, and decorative purposes. They are listed at the price of 3s. each, and are of the same efficiency as the ordinary standard type of tantalum lamp, which they resemble in every particular except in the arrangement of the filament. A revised price-list of tantalum lamps, including these as well as the ordinary standard spherical and candle tantalum lamps, has been issued.

Arc Lamps.

A new double-carbon flame arc lamp with long burning hours is being introduced by the Abbey Electric Co. (17 Victoria Street, London, S.W.), whose latest design in single-carbon lamps was described in Electrical Engineering, February 10th, 1910, page 92. The new lamp, as will be seen from the accompanying illustration, has two pairs of carbons, each pair being supported by copper cords passing over a drum. The feeding mechanism is the same as in the single-carbon Abbey lamp, each drum being attached to a large ratchet wheel with a double-toothed pawl controlled by the solenoids. The two pawls, which are rocked by means of a single pin, are so arranged that when the lamp first commences to feed, only the pawl of the mechanism controlling the first pair of carbons is affected, and consequently these carbons are fed down until the holders reach the stops at the bottom. The lengthening of the arc after the last feed causes the shunt solenoid to lift the rocking lever further than before, with the result that the pawl of the second mechanism is brought into action. This causes the second pair of carbons to descend and the arc is transferred to them. Feeding then proceeds as before. Though the shunt solenoid plunger is evidently working in a slightly

Digitized by Google

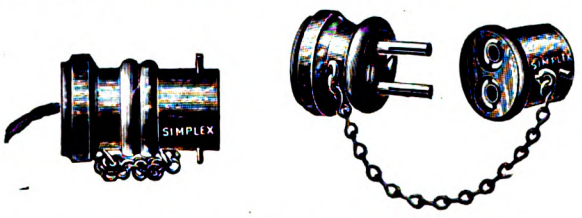
different part of its travel when controlling the second mechanism, the voltage at which the arc burns is not different, owing to the fact that the friction against which the plunger has to work is different. In order that the tips of the second pair of carbons shall not be covered with ash while the first pair are burning, the cast-iron economiser is constructed with two separate furnaces. The nature of the feed, which causes the carbons to drop suddenly together and not to approach gradually as in lamps with clockwork mechanism, also ensures the second pair of carbons striking an arc in spite of a small deposit of insulating ash on their tips.



Abbey Double-Carbon Lamp.

A lamp of this pattern, measuring 37 in. overall with the globe, and taking 16 in. 9 and 10 mm. carbons, gives over 25 burning hours on one trim, or just double the burning hours of the corresponding single-carbon lamp. A second size, measuring 48 in. overall, and burning 24 in. carbons, gives from 40 to 45 burning hours on one trim. The lamps can be obtained for either alternating or direct-current circuits. The arc is said to be maintained right through the run without going out, even when the change over from one pair of carbons to the other occurs. Should the second pair of carbons be touching when the lamp is switched on, the arc will commence across them, but as the arc lengthens, the feeding mechanism of the first pair only will be operated, so that the arc will be transferred to the first pair automatically shortly after the lamp is switched on. As in the case of the former patterns of Abbey lamp, an auxiliary device is fitted to ensure that the feeding will continue until the arc is struck in the case of a badly trimmed lamp. This device also cuts out the shunt coil when both pairs of carbons have been consumed. For a full description of this device, the reader is referred to the previous article mentioned above. A recent improvement in the construction of these lamps consists in substituting two rotatable brackets or catches on the bottom plate in place of the usual chains for supporting the outer cover while trimming. It was found that the chain tended to rub the enamel off the cover when the lamp was swinging in the wind.

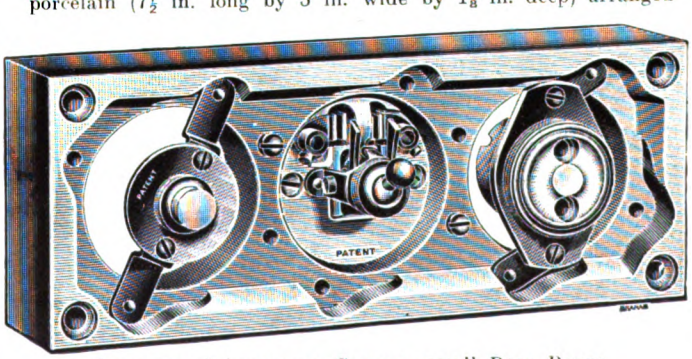
Fittings, Switches, and Accessories.



The General Brass Fittings Co., Ltd. (Holbeck Road, Leeds) are placing on the market a device for converting an ordinary lamp-holder into a switch holder without altering the wiring or detracting from the neat appearance of the fitting. This device, called a switch-adapter, is the invention of Mr. E. B. Wright, and consists of a tube or barrel having a plug portion with pins for insertion into the bayonet socket of the lamp-holder, and a bayonet socket to take the lamp. Within the plug portion is arranged to rotate a porcelain cylinder. This has spring contact plungers within the socket communicating with depressed contact studs, which engage with the spring plungers of the lamp-holder. A handle projecting through slots in the barrel permits of rotation of the porcelain cylinder through 90°, thus breaking the circuit at four points. In the "on" position the switch is lightly held by the contact plungers being pressed into the depressed contact plates, while in the "off" position this is effected by providing blind depressions in the porcelain cylinder. The accompanying illustrations show the adapter in two forms, with and without shade carrier respectively. It should be useful for isolating lamps which have been connected to wall brackets, electroliers, or cluster fittings, the wiring of which is arranged so that more than

Lamp-holder Switch Adapter.

one lamp is controlled by one switch. The plain adapter increases the length of the lamp-holder by about half an inch only. Standard lamps which have not switch-holders may be fitted with this adapter, thus avoiding the bad practice of pulling out the wall plug or adapter connecting it to the fitting, to turn out the light.



Simplex Conduits, Ltd., have introduced a novel form of combined wall plug and adapter suitable for use in connection with electric table standards, floor standards, kettles, irons, and so on, which should solve the difficulty experienced by contractors in the sale of the afore-mentioned by uncertainty as to whether the client requires a two-pin wall plug or a lamp-holder adapter. By means of the simple appliance illustrated

Simplex Combined Wall Plug and Adapter.

herewith, connection to either can be arranged. The type so far put on the market is suitable either for the 3-amp. wall socket or for a lamp-holder as desired. A further type suitable for 5-amp. wall sockets is at present in course of development. The apparatus is made in two halves, the two parts being attached together by means of a stout brass chain, so that there is no possibility of that portion which is not in use being lost.

It is often convenient, especially on board ship, to be able to group switches, bell pushes, wall sockets, &c., together; but the lack of uniformity of such apparatus generally makes this difficult. Messrs. A. P. Lundberg & Sons (477 Liverpool Road, N.) have introduced for this purpose the "adaptable combination" base illustrated here. This consists of a block of glazed porcelain (7½ in. long by 3 in. wide by 1⅝ in. deep) arranged

Lundberg "Adaptable Combination" Base Block.

with three suitable recesses to take the firm's well-known standard types of switches, wall connections, bell pushes, &c. Fronts of various materials can be fitted, and the arrangement can be adapted either to surface or flush work, the only difference being that in the latter type the covering plate is

Digitized by Google

necessarily of slightly larger dimensions. Metal straps of suitable shapes have been standardised, and these support the various accessories in a substantial manner, the fronts being screwed on in the usual way by threaded rings.

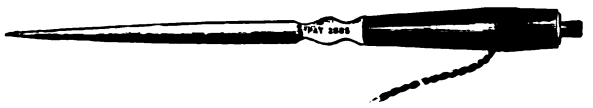
The Sun Electrical Co. (118-120 Charing Cross Road) have brought out a new list of reflectors for concealed lighting, which contains several additions to the various forms of reflector for lines of tubular and other lamps, which they have had on the market for some time under the names of "Sunlite" and "Sunline" reflectors. These are arranged in a variety of forms and sizes in both straight and curved strips suitable for for every conceivable situation. A convenient design intended for Osram "Olive" or full-size lamps is made, in which the lamp-carriers are arranged to be swung out for cleaning the reflector. Another variety has a curved strip reflector which can be tilted to any required angle after the lamp-holders are fixed. Numerous other shop-window lighting fittings, signs, &c., are included, as well as a range of ornamental picture-lighting reflectors.

Heating and Cooking Apparatus.

Several new electric heating and cooking appliances have been put on the market by the General Electric Co. (71 Queen Victoria Street, E.C.). One of these is the electric toaster illustrated here, by which four slices of bread can be toasted at the same time in two or three minutes, with a consumption of only 500 watts. The side doors swing outward

Electric Toaster.
(General Electric Co., Ltd.)

and downward to allow of bread being put in and taken out without risk of burning the hands, and when closed retain the heat. The low price (32s. 6d.) of this simple piece of apparatus should make it a popular method of obtaining really hot toast. Other novelties consist of an electric hat pad and a large-sized electrically heated pad for use as a bed-warmer; a new pattern 800-watt combined electric grill, hot plate, and toaster, and two new patterns of water boiler.



Miscellaneous.

The accompanying illustration shows a simply arranged folding sign, complete with thermal flasher, which the Sun Electrical Co. are introducing. The extreme portability of this inexpensive device should render it extremely useful for shop window and other advertising purposes.

"Sun" Collapsible Sign.

A useful article has just been put on the market by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), in the shape of the combined paper knife and bell push shown in the accompanying illustration. The combination of the two,

Combined Paper Knife and Bell Push.
(*General Electric Co.*)

besides providing a convenient bell push ready to hand, effectively cures the wandering tendency of most loose paper knives. The handles can be obtained of red, blue, white, or green non-inflammable material, or in sterling silver.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

HOLOPHANE REFLECTORS.—A new catalogue from the Holophane Co. (12 Carteret Street, Westminster) contains particulars of a number of designs of cluster fittings for use with these well-known ribbed glass reflectors. By using a group of lamps in this way, very even distribution of light is obtained with a better decorative effect, and less glare than with some fittings for single powerful lamps. A useful feature of the list is a series of rules for the spacing of these fittings to obtain the best effect in various circumstances.

CLIPS FOR WIRING.—The various forms of the "Buckle Clip" originally introduced by the Sun Electrical Co. (118-120 Charing Cross Road) for fixing "Kalkos" and other conduit tubes are described in a new leaflet. These well-known clips can, of course, also be used for the fixing of almost every kind of tube, cable, or wiring, and they are now made in six sizes.

WIRES AND CABLES.—Two new supplements to the cable and wire catalogues of Messrs. Siemens Brothers & Co., Ltd. (Caxton House, Westminster), deal respectively with bell wires, including single and twin cotton-covered wires and silk-covered twin flexible cord, and high- and low-tension motor-car ignition leads. The latter contains revised prices on account of the present high price of rubber.

TRAMCAR TRUCKS.—A comprehensive catalogue of tramcar and other trucks on the Peckham "new system" is being issued by the Peckham Truck Co. (Queen Anne's Chambers, Westminster), and contains full information as to the latest types of the pendulum and radial arrangements which the company have developed during the last few years. Among the special features are the pendulating radial gear for long wheel base trucks capable of adjusting itself to a 30-ft. radius curve, and applicable also to various other forms of trucks. This method of suspension gives remarkably easy riding, owing to the way it protects the car body from all sudden shocks by reason of the freedom for sideways movement between the axles and the truck itself. A number of designs of the Peckham patent radial truck are also dealt with, and it is clearly shown by means of diagrams how, owing to the absence of a fixed pivotal point connecting the sub-truck with the cross members of the main truck, the former are free to follow the movements of the wheels on curves, and to enable them to take up their correct position. Considerable ingenuity has also been exercised in the arrangement of the brake mechanism to ensure that it does not interfere in any way with the radial movement. Reports from various well-known tramway engineers are given which confirm the advantages claimed for these methods of tramcar truck construction.

DRY CELLS.—Messrs. Siemens Bros. & Co., Ltd. (Caxton House, Westminster), have just issued a new dry-cell catalogue to supersede that published in August last. Full particulars of the Siemens-Obach, Hellesen, Dura, and Transport cells are given, and ignition coils specially suitable for use with the Siemens-Obach dry cells are now included. An adjustable resistance for use with dry cells in ignition equipments for motor-cars, &c., is also described.

TIME SWITCH.—A new illustrated pamphlet describing the "Venner" time switch for combined arc and incandescent lamp street-lighting has been issued by Messrs. Venner & Co. (6 Old Queen Street, Westminster, London, S.W.). The types described are those for changing over circuits carrying up to 15 amps. on the first, and 5 amps. on the second circuit, at 250 volts. Some have "off" positions, while others are merely change-over switches. A selective attachment for rendering the switch inoperative on any day or days during the week, and another for varying the hour at which the switch works, can be provided if required. The devices are fitted with either 45- or 14-day clocks.

MOTOR CONTROL GEAR

A Visit to the Works of the Adams Manufacturing Co.

ON Friday last we paid a visit to the works of the Adams Manufacturing Co., Ltd., at Bedford, and were enabled to see the well-known "Igranic" automatic and other control gear supplied by this firm in the successive stages of manufacture. Several new pieces of apparatus were also on view, and these are briefly described below.

The works are of the most modern construction, and are divided into two portions, the electrical and automobile shops respectively. The former have a floor space of over 22,000 sup.

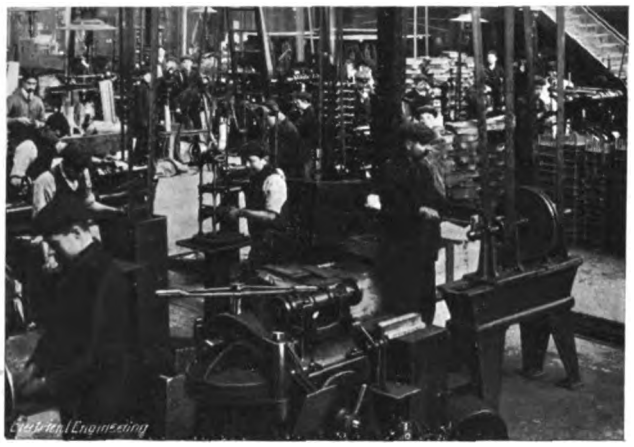

Fig. 1.—View of Portion of Electrical Shop.

feet, of which 4,000 sup. feet is provided by a gallery. Fig. 1 shows a portion of the electrical shop with grinding and drilling machinery in the foreground. The raw materials are issued as required on stock orders, and return after machining to the "finished part" stores. These finished parts, when required for assembling, are taken to the assembling shop, which occupies the gallery, and is divided into two sections, one devoted to the fronts or switch-parts of the rheostats, and the other to the resistances. The former, after being assembled, inspected, and

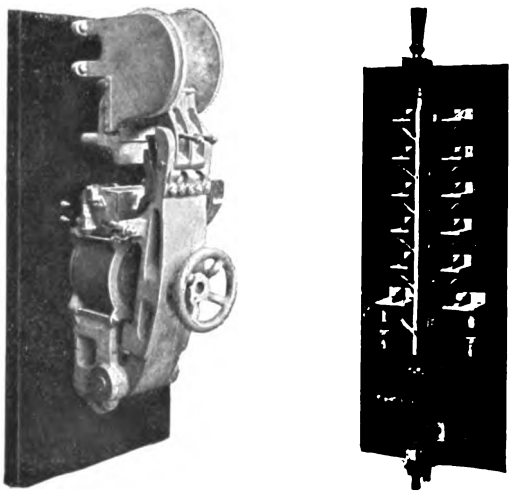

Fig. 2.—Contactor Type Remote Control Switch and Straight-line Multiple Switch Starter.

tested, are returned to the "finished part" stores, and there remain till required. The rheostats, when completed, pass over an inspection bench, where mechanical details are carefully examined, and thence to a test-room in the same gallery, where each is tested before going into the warehouse as finished stock. The number of complete rheostats in stock seldom falls below 1,000. This refers only to small size standard starters, varying from ¼ to 50 h.p. Large apparatus, such as automatic starters, of large h.p., lift controllers, printing press controllers, switchboard panels, &c., is not handled on the gallery, but on the main floor of the shops. This is divided into several sections devoted to Admiralty apparatus, automatic controllers, drum or tramway type controllers, large switchboard panels, &c., respectively. The completed apparatus passes into the ground floor test room—which is equipped with A.-C. and D.-C. supply—and thence to the packing department. The whole of the works is driven by a single gas engine running on producer gas. Over one hundred and thirty men are employed in the electrical shops alone, and an average of some fifty pieces of apparatus are dispatched from the works per day.

A feature of the company's work has been the consistent adoption of standardisation in the manufacture of motor starters and other rheostats, all the various types and sizes of which are

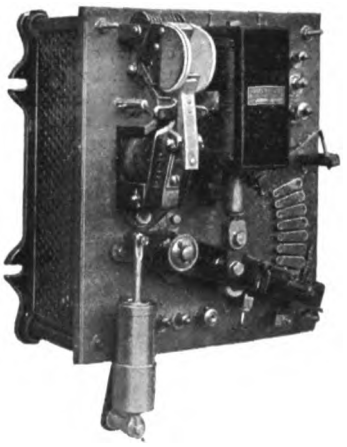

Fig. 3.—Combined Auto-Starter and Main Switch.

built up of a number of units common to all. Thus the rheostat portions of small shunt regulators and the series resistances for solenoids are made up of a number of units, each consisting of a length of bare resistance wire wound on a porcelain former, the whole being pasted over with cement and baked, to protect the wire. For the smallest sizes, the bare wire is wound on mica strips, and these are insulated with mica and enclosed in cast-iron pockets ribbed to assist cooling. The rheostat portions

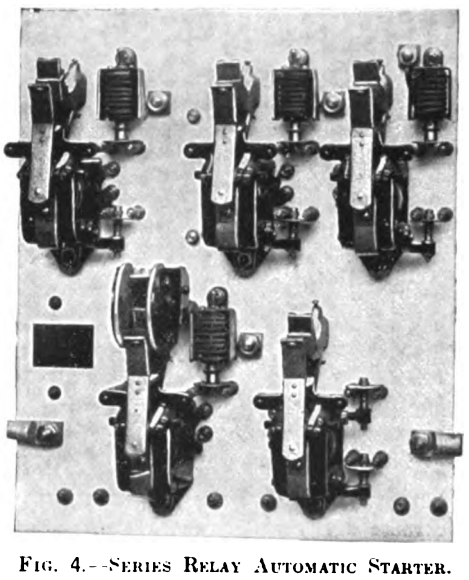

Fig. 4.—Series Relay Automatic Starter.

of motor starters up to those of 50 h.p. capacity consist of a set of units, each comprising a length of bare resistance wire wound on a tube of asbestos millboard from one to two feet long. The wire is fastened by means of eyelets at each end of the tube, and the ends are taken into the tube and through porcelain caps. The units are connected in series by passing the two wires into a short copper tube, which is then pinched by means of a special pair of pliers. This ensures a good electrical contact while avoiding the use of soldered connections. The units are arranged vertically side by side, so that they are cooled by the rising air, and threaded through a perforated

Digitized by Google

metal sheet at each end. No insulated wires are used, and the connections are easily got at. For ordinary work panels of treated slate are employed, but several examples of a special pattern to withstand shock, such as that of gun-fire on warships, were shown us. The panels in this case are of sheet iron, faced and backed with micanite; all the bolts, studs, &c., are bushed with micanite also. For very large motor starters, a new type of resistance unit is used. This consists of a strip of resistance metal wound zig-zag over the arms of two star-shaped supports at the extreme ends of a metal rod. One support is pressed out by a spring, thus keeping the strip in tension.

Among the new apparatus on view was a 1,500 ampere remote control switch of the pattern illustrated in Fig. 2. A series of switches of this type have been designed for circuits carrying currents of from 5 to 10,000 amperes on pressures up to 600 volts. The current is carried by laminated copper brushes, and the make and break is taken on copper and carbon arcing tips, easily renewable and under the influence of a powerful magnetic blow-out. The other switch illustrated in Fig. 2 is known as a straight-line multiple-switch starter, and has been designed for enclosing in dust and watertight covers, oil immersing, &c. The switch contacts are closed in succession by means of an up-and-down motion of the handle shown at the top. The first or bottom switch is held in by a no-volt release magnet, and is provided with carbon break and magnetic blow-out. When desired, this switch is fitted with an overload circuit breaker, interlocked with the first switch, and this protects the motor against heavy overloads during starting. Fig. 3 illustrates a combined automatic starter and electrically operated main switch especially suitable for the automatic operation of pumps, air compressors, accumulators, lifts, &c.

The automatic starter illustrated in Fig. 4 has been designed for use with motors, the starting duty of which is heavy, such as pumps, air compressors, machine tools, lifts, &c. The salient feature is, that the starting current controls the rate of acceleration of the motor. The timing of the acceleration depends upon current relays in the armature circuit, which operate in such a manner that they prevent the further cutting out of the starting resistance until the motor has accelerated properly. The current relays can be so adjusted that the starting current may be limited to a certain value, and the time of acceleration predetermined. The starting resistance is cut out step by step by the adjacent switches, controlled by current relays. A main clapper switch, with carbon break and magnetic blow-out, is provided for making and breaking the motor circuit, this switch being interlocked with the resistance cut-out switches, so that the motor circuit cannot be closed unless all starting resistance is in the armature circuit.

Before being conducted round the works, we were shown a number of photographs of heavy electrical control gear installed by the Adams Manufacturing Co. and by the allied firm in America, the Cutler-Hammer Manufacturing Co. These included two 350-h.p. crane motor controllers in the Sheffield works of Messrs. Cammell, Laird & Co., and a controller for a 6,000-h.p. motor driving a rolling mill in Indiana Steel Works, Gary, U.S.A. Photographs were also shown of the totally enclosed water-tight electro-magnets made by the Cutler-Hammer Co. for the purpose of recovering sunken iron and steel cargoes.

JOINTING ALUMINIUM

Much has been published regarding the use of aluminium for overhead transmission lines, but in consequence of the limited experience in handling the metal, reliable information in connection with its use for other purposes is scarce. The following practical suggestions with regard to methods of jointing aluminium 'bus-bars, machine and feeder connections, which have just been issued in pamphlet form by the British Aluminium Co., Ltd. (109 Queen Victoria Street, London, E.C.), are therefore of considerable interest.

Aluminium round rod, such as has already been employed for feeder bars in switchboard work, may be readily butt-welded on site. The rods to be joined should be held firmly a few millimetres apart in the flame of a powerful blow lamp, con-

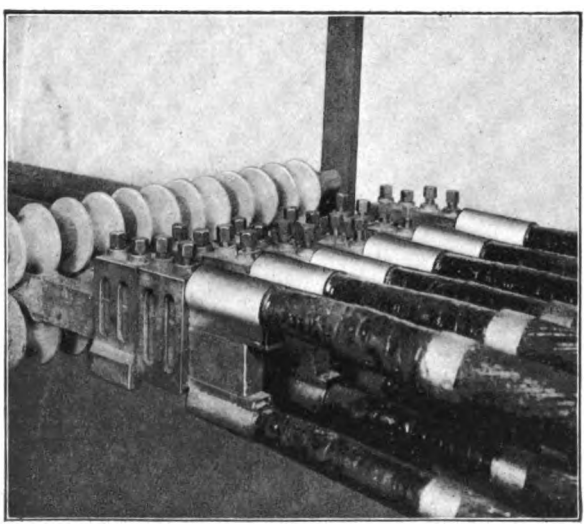

Fig. 1. Coupling between Aluminium Bars and Insulated Copper Feeders.

centrating the flame on the ends to be jointed by the use of two or three fire-bricks or an asbestos shield, until the metal begins to run, when end pressure should be exerted. The lamp should not be removed until the metal flows all round, and the pressure should be maintained until the joint has set; the extruded metal can then be trimmed off if desired. Much depends upon the rods being held firmly in line, and upon even pressure being exerted in bringing them together. In all cases it is advisable to use guides. In welding rods of over $\frac{1}{2}$ in. diameter, suitable clamps for keeping the rod in alignment and for exerting the end pressure are necessary. For jointing rod in inaccessible positions where butt welding would not be convenient, screw couplings having right- and left-handed threads are frequently employed. For a simple sleeve coupling, the ends of the rods should be cut off squarely and screwed right home until they butt rigidly together. No lubricant should be used, but the threads should be an easy fit. For connecting copper feeders to aluminium bars or rods, a special clamp of phosphor-bronze or copper with thimbles cast on, is

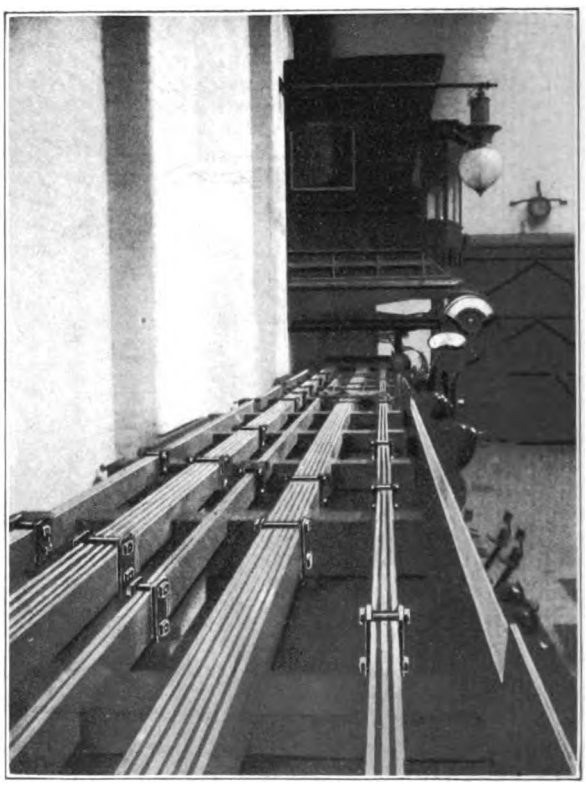

Fig. 2.—Laminated Aluminium 'Bus-bars at Birmingham.

used. The cable ends are sweated into the thimbles in the ordinary way as shown in Fig. 1.

When flat bars are to be jointed, it has been found in practice that clamps and other common forms of mechanical joints used in the erection of copper 'bus-bars and switchboard connections, are equally suitable when aluminium is employed. For heavy currents such bars are usually built up in laminated form

Digitized by Google

and clamped together with aluminium spacing pieces between the individual bars to increase the cooling surface, as shown in Fig. 2. A fine example of such work is to be seen at the Manchester Dickinson Street station, where the 'bus-bars of the switchboard erected in connection with the new 12,000 ampere-hour storage battery are of aluminium. The contact surfaces at joints in such bars should be liberally proportioned, and must be perfectly flat and free from grit or other foreign matter. Before clamping up, the surfaces should be rough filed in opposite directions; the smallest trace of vaseline improves the contact. When bending bars of ¼ in. thickness and upwards, it is advisable to heat the bar at the bend with a blow lamp, care being taken not to overheat the metal. If the clamps and bolts are of metal other than aluminium, it is desirable, especially in damp atmospheres, to paint both clamps and joints with an acid-resisting compound or paint, so as to exclude moisture.

Insulated aluminium cable is now being employed with considerable success by various undertakings, and several special methods for jointing and tapping have been devised. In the case of standard joint boxes in which it is usual with copper cables to employ mechanical clamps, it is found that similar aluminium clamps can be used with equal success for aluminium cables. It is important, however, that the clamps should be screwed up rather firmer than usual. This offers no difficulties in single-core cable, but in concentric cable it is advisable to place a thin aluminium sleeve between the inner layer of insulation and the outer layer of conductors in order that the latter shall not cut into the insulation when tightening up the clamp. We understand that some joints made in this manner actually gave a lower resistance than the equivalent copper joint.

In jointing bare annealed stranded aluminium cable, and even insulated cable where the insulation can be stripped several inches, a cast joint will be found most satisfactory. This joint is made by melting pure aluminium in a crucible, and pouring it into a sheet or cast-iron mould, into which the ends of the cables are inserted. The mould and cable ends should be heated so that the metal may not be chilled on entering. To connect to a copper cable, an aluminium lug is cast on the aluminium cable and bolted to standard copper connections. In all cases where there is a junction between aluminium and copper, care should be taken to exclude moisture by painting over the joint with an acid-resisting compound.

For overhead lines, the following is a type of joint which has been adopted on many important copper and aluminium lines now in operation. The two ends of the cable are straightened out and passed in opposite directions through a pure aluminium sleeve of ∞ section until each protrudes a few inches on either side, care being taken that the cables and sleeve are clean and free from grease or dirt. Hard wood clamps, cut to fit the sleeve, are securely bolted together over each end of the sleeve so as to prevent any movement between cables and sleeve. The clamps are then rotated by hand in opposite directions until the joint contains four to six complete turns, according to the diameter of the cable. To keep the cable ends and sleeve in alignment during twisting, it is advisable, especially with heavy cable, to place them in a wooden trough or guide. It is advisable to bevel off the inside edge of the clamps where they come up against the first twist in the finished joint, in order to prevent damage to the sleeve, and with cables of large diameter the entering angle of the clamp should be shaped to the contour of the commencing twist. The sleeve increases the stiffness of the joint, excludes moisture, adds to the cross-section, reduces any tendency to untwist, and renders unnecessary the application of heat which would soften the hard-drawn metal.

The pamphlets from which the above information is taken contain also a list of standard aluminium 'bus-bar sections, with resistances and weight per foot, and a list of hard-drawn aluminium cables with similar particulars, including the nearest corresponding standard hard-drawn copper cables.

ELECTRIC BRAKING

A PAPER dealing with the progress of electric braking on the Glasgow Corporation tramway system by Mr. A. Gerrard was discussed by the Institution of Electrical Engineers at last Thursday's London meeting, and also by the Glasgow Local Section on Tuesday. In outlining the history of electric braking at Glasgow, the author referred to early experiences in 1898 with rheostatic and disc electric brakes, and passed on to a description of the Westinghouse magnetic rail brake designed by Mr. F. C. Newell in 1899. As is well known, this is provided with magnets suspended by springs from the truck just clear of the rail, which, when energised by current from the moving motor acting as generator, tend to adhere to the rail and drag, falling behind their normal or central position on the truck. This backward motion or lag is utilised to apply the wheel-shoes through the medium of connecting rods and levers. The magnets lag behind their normal position until all the slack motion has been taken up, and the wheel-shoes are tightly pressed against the wheels. The leverage exerted on the shoes of the leading wheels is more than that on the shoes of the trailing wheels, to compensate for the unequal distribution of weight between the leading and trailing wheels when a fast stop is being made, or even when stopping slowly on an incline. Brakes of this kind were fitted to some of the Glasgow tramcars in 1901, and, after satisfactory trials, adopted on the whole system. It was, however, realised after a while that their action put undue strain upon the motor armatures, and when the matter was gone into it was found that when running at 18 to 20 miles per hour with 10 ohms in the brake circuit, the voltage was as high as 1,000 to 1,200. It was also found that at about this speed intermittent skidding took place. Both from a braking point of view, therefore, as well as from a desire to protect the equipment, it was decided to weaken the field by introducing a resistance in parallel with it. A permanent shunt resistance was first experimented with, but it was found that when a low resistance, such as 0·25 ohm, was inserted in the shunt circuit, the motors would not excite, while on the value of the shunt resistance being increased to 0·5 ohm, the braking effect was improved and the voltage kept low, but the machines would not excite quickly enough for an emergency stop. The next move was to introduce the shunt automatically, as required, by means of a solenoid operated switch. After some further experimenting, the double-barrelled form of solenoid switch shown in Fig. 1. was evolved.

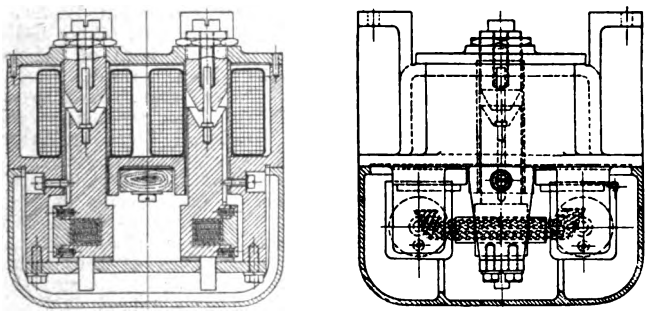

Fig. 1.—Solenoid Switch for Preventing Abnormal Voltage and Skidding with Westinghouse Magnetic Brake.

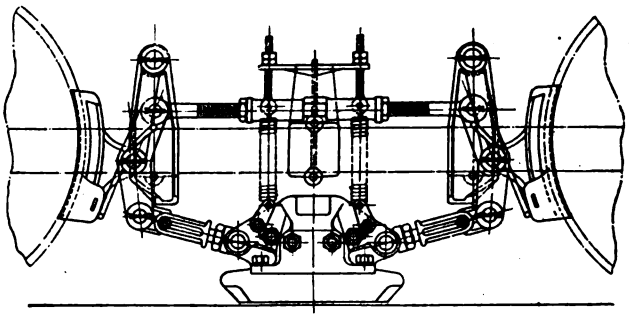

Fig. 2.—Westinghouse Magnetic Brake on Brill Single Truck (with 26c Magnet).

The low-speed solenoid operated at 30 amperes, bringing in a shunt resistance of 0·2 ohm, and the high-speed solenoid at 80 amperes, bringing in another shunt resistance of 0·2 ohm in parallel with the first. In the event of a motorman running his car at, say, 18 miles per hour, and, through excitement or carelessness, passing over the first on to the second brake-point of his controller, both solenoids will operate, and thereby bring a shunt resistance of 0·1 ohm in parallel with the fields. This gave excellent results without skidding, and without the voltage ever rising above 600 at any speed.

In order that the very best braking results might be obtained

Digitized by Google

in conjunction with solenoid control, two sets of more powerful track magnets were tested. These new magnets are quite different in design from the old Newell magnet, on which the poles follow each other in series on the rail. On the new type the poles are placed side by side and parallel to each other. The magnets (known as the Westinghouse 26c and 25b magnets) were not only found to give a far greater maximum pull, but their effect with a current of 5 amperes is greater than that of the old magnet with 50 amperes. The arrangement of the ordinary Westinghouse brake with 26c magnet is shown in Fig. 2.

Another type of brake adopted in 1908 is shown in Fig. 3

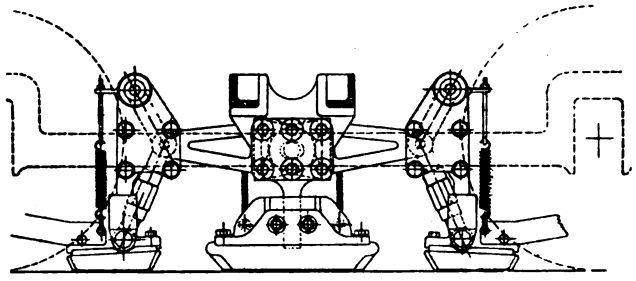

Fig. 3.—"1908" Brake with Westinghouse 25b Magnet.

The chief feature is that the motion obtained from the movement of the magnets was utilised in pressing auxiliary track-shoes down on the rail, instead of applying auxiliary wheel-shoes. The idea of substituting auxiliary track-shoes in place of wheel-shoes was to relieve the wheels of the braking effort of the auxiliary wheel-shoes, and thereby reduce the risk of skidding when making fast stops.

The remainder of the Paper gives the result of a lengthy series of tests with all these types of brake in considerable detail, from which and from the general experience in practice the following conclusions are drawn:

(*a*) Rheostatic braking is destructive in its action on motors, due to the added heating effect from the high braking currents, and to the excessive voltage generated by the motors acting as generators during service and emergency stops at high speeds. This high voltage causes flashing at the brushes and insulation breakdowns. Rheostatic braking permits smooth coasting, but the current is high, and skidding occurs when braking at high speeds. The retardation is much lower than with the magnetic brake.

(*b*) The Newell brake with the old type of magnet is greatly superior to the rheostatic brake, both in retarding power and in the current consumption, but the current is still high; the voltage generated by the motors during high-speed braking is excessive, and skidding occurs unless the controller is handled with great care. While much easier on the motors than the rheostatic brake, it is severe enough under the best conditions, and when not carefully handled is responsible for a large part of the trouble with motors and controllers.

(*c*) The 1908 brake, with auxiliary rail blocks and parallel shoe magnets, is a powerful one, and requires comparatively little current from the motors, but the voltage rise is excessive, and the skidding serious when braking at high speeds, while the surging during coasting is prohibitive. The retardation obtainable is very high but very uneven, probably due to the tendency of the track blocks to grip the rails. The excessive voltage rise might be reduced by means of the solenoid control, but it seems doubtful whether skidding and uneven retardation would be prevented.

(*d*) The Newell brake with parallel shoe-magnets requires little current from the motors, gives good results when coasting, and high retardation under ordinary braking conditions, but the voltage generated by the motors when braking at high speed is excessive, and with emergency stops from high speed, skidding may occur if the controller is not properly handled. This brake is much easier on the motors than the Newell with the old type of magnet, on account of the decreased current required, and for the same reason it is better than the 1908 brake. It would be quite satisfactory were it not for the high voltage and the skidding at high speeds.

(*e*) The Newell brake with parallel shoe-magnets and solenoid controlled shunts to the motor fields possesses all the advantages of the brake described under (*d*), while the possibility of obtaining high voltage on the motors is eliminated and there is no longer any necessity for careful manipulation of the controller to prevent skidding. Exhaustive tests have shown the brake to be skid-proof and the motors to be free from any excessive voltage rise, and it is hoped that actual experience at Glasgow will entirely confirm these tests.

The Glasgow Corporation Tramways Department is at present engaged in fitting to each car an automatic sanding apparatus, the component parts of which are a solenoid and a continuous flow sand valve. The coil of the solenoid is inserted in the main braking circuit, and its armature is connected to the continuous flow sand valve, so that, when the solenoid operates, the sand valve is opened, and a copious supply of sand is projected on the rail without any effort from the motorman. A spiral spring is attached to the valve in such a way as to work against the action of the solenoid, and adjusted so that if the electric brake is applied for an ordinary service stop, or for coasting, the solenoid is prevented from opening the valve and serving out sand when it is not required; but in the event of the motorman making an emergency stop, the current flowing through the circuit is sufficient to operate the solenoid and automatically to supply sand at a most opportune moment.

Discussion in London.

Mr. J. S. Peck (British Westinghouse Electric and Mfg. Co.) urged that greater attention should be paid to the effect of the braking apparatus upon the rest of the equipment. The author had succeeded in diminishing very considerably the heavy current taken during the braking period. This current must have added materially to the heating of the motor, and consequently to the deterioration of the insulation. But the Glasgow tests also revealed another circumstance, viz., that when braking at very high speeds or on emergency, the voltage across the armature terminals was at least twice the normal. Probably it was even higher than this owing to the voltmeter not being rapid enough to measure the instantaneous rise which appeared to take place. The shunted field device appeared to have eliminated this entirely. It was far better to instal thoroughly efficient apparatus in order to avoid accidents, than to do so under compulsion after an accident had taken place.

Mr. E. H. Cockshott (Leeds Corporation Tramway Department) said that experiments had been made in Leeds both with the Newell brake and the Maley brake, and his results did not agree with the author's. He had found that without the solenoid device the Westinghouse brake was liable to skid, and had known this to take place for a distance of 130 yards on a gradient of 1 in 11. He agreed that the solenoid device would reduce this tendency and also the voltage, but he failed to see why the same effect should not be produced with the 1908 brake referred to by the author, viz., the Maley brake. With regard to the voltage and current required on braking as compared with the Westinghouse brake, the real test was to separately excite the magnets from the trolley-line and then draw the car along through some kind of spring balance, and thus arrive at exactly the force required to move the car when the brake was fully applied, and without any retarding torque due to the motors acting as generators. They had tried this in Leeds with both types of brake, and the drag was practically the same in the two cases. If anything, there was a bigger drag with the Maley than with the Westinghouse brake. He thought it would have been useful if the author had given results of trials with the Westinghouse brake and solenoid device at speeds exceeding 20 miles per hour. He had made a large number of experiments with the Maley brake up to 28 miles per hour, and had never exceeded a voltage of 890 volts on any occasion. The highest speed given in the Paper was only 20 miles per hour. He had not noticed the surging effect, referred to in the Paper, on the Leeds cars, in connection with which some thirty Maley brakes were used. Indeed, in the Brakes Report of the Tramways and Light Railways Association, the uniform effect of braking with the Maley brake was commented upon. These brakes had now been in use for three years, and no surging effects had been noticed.

Mr. A. W. Maley, inventor of the Maley brake, failed to see any reason why the Paper should have been written at all, seeing the Committees of both the Municipal Tramways Association and the Tramways & Light Railways Association were still continuing their investigations into brakes. The main object of the Paper seemed to be to institute comparisons between the Westinghouse brake and his own; but he had not been consulted in the matter, neither had he even heard that the tests were being carried out. The conclusions of the author seemed to be mostly unfavourable to the Maley brake, and this was in very strange contrast to the results obtained at Leeds and Birmingham, where his brake was in daily operation. He felt he was suffering under an injustice in this matter, for the author had carefully suppressed the name of the Maley brake, whilst giving prominence to the name of the Westinghouse Co. Reading the Paper, he could not help feeling that the author's tests were very rough ones; it was surely necessary that the recording instruments should be of the most exact character for a really exhaustive series of tests.

The President interrupted Mr. Maley and asked him to refrain from discussing the personal side, and to confine himself to the technical side of the Paper.

Mr. Maley, continuing, made further complaints as to the manner in which the tests on his brake had been carried out by the author, and went on to give details of the tests made at Leeds (Electrical Engineering, November 28th, 1907, Vol. II., p. 851), where on greasy rails, a retardation of 8¼ ft. per second per second were obtained, thus establishing his claim that the working of his brake was independent of the condition of the rails.

Digitized by Google

The President eventually stopped Mr. Maley, and asked him to communicate some criticisms of the technical points raised in the Paper, for publication in the *Journal*.

Mr. W. H. Booth said it was generally admitted that electric brakes caused a good deal of injury to the car equipment, and it was also admitted by many engineers that it was desirable to put in some mechanical stand-by to an electric brake. In this connection he showed diagrams of a brake with a toggle arrangement for transferring the whole weight of the car on to the track blocks, which had been tried upon the Yorkshire (Woollen District) tramways. He suggested the use of a brake working off the trolley-wire, and capable also of being worked mechanically.

Mr. H. M. Sayers said that no mechanical brake could give anything approaching the 8 ft. to 10 ft. per second per second retardation obtainable with the magnetic track brake. The Newell brake was a good instance of the development of a crude and destructive device into an economical and practical piece of apparatus, for when it first made its appearance he would have nothing to do with it. The author was the first to publish actual figures of the voltages obtained when braking at high speeds with the magnetic type brake. When it was seen that they were subjected to 1,000 or 1,200 volts, it was not surprising that tramway motors flashed over occasionally. Personally, he thought it was a very proper Paper to bring before the Institution, and speaking as a member of the Council of the Tramways & Light Railways Association, he would have welcomed it before that Association. The difference between the tests made with the Maley brake at Leeds and Glasgow showed that there must have been some difference in the conditions which was not revealed by the data given in the Paper. He was present at the Leeds tests, and could vouch for them. At Glasgow the brake was tried under unstable conditions, while the relationship between the motors, the brake windings, and the resistances in the circuit were such that surging was set up in a sort of resonant fashion. At Leeds the motors were of a different type, and there were slight differences in the circuit which gave better retardation. He did not think Mr. Maley's invention was to be judged by the Glasgow results; at the same time, he did not think Mr. Gerrard had wilfully acted unfairly in any way. He thought the result of the investigations showed that the magnetic type brake with solenoid control was the best under conditions of frequent stops and heavy traffic, both passenger and vehicular; in fact, it was as nearly perfect as they could hope to get. At the same time, it was very complicated. On urban services with few stops, and even those with steep gradients, he thought a mechanical track brake was the best and most useful; and it was a great deal cheaper than a magnetic brake. If, however, a magnetic track brake were used, there should be means of applying it mechanically.

Mr. Gerrard, replying briefly, said the paper was written to show the advantage of the solenoid control. He did not think, however, that this device would prevent skidding with the Maley brake, as this was designed to transfer a portion of the weight of the car on to the brake blocks. The electrical load in the armatures was still retained, whilst the mechanical load was removed from the wheels. Consequently there must be skidding. He had not been able to make tests at higher speeds than 20 miles per hour, for the reason that he had no hill to enable him to do so, but he understood that speeds of 36 miles an hour had been attained in London with the solenoid control with perfectly satisfactory results. With regard to Mr. Maley's remark, he had been requested to write the Paper by the Glasgow Local Section after the tests had been made. He had no intention of publishing them at the time, and the tests were necessarily roughly made. At the same time, he claimed that the results were quite conclusive. He had not mentioned the name of the Maley brake, because the results were unfavourable to it.

A hearty vote of thanks was accorded the author at the conclusion of the discussion.

SWITCH AND TRANSFORMER OILS

A LONG Paper on the physical properties of switch and transformer oils containing results of tests of a variety of qualities of oil, by Mr. W. Pollard Digby and Mr. D. B. Mellis, was read before the Manchester Local Section of the Institution of Electrical Engineers on Tuesday, March 22nd. The authors point out the great influence of very small amounts of impurities in oils on their electrical properties, and the need for greater care in testing. The following properties are regarded as requisite for a transformer oil :—Absence of moisture; good dielectric strength; a low viscosity to facilitate the heat transfer from the core and windings to the case; a flash-point expressed by a figure which is two to three times the designed temperature limit of the transformers in degrees C.; an absolutely neutral reaction; complete absence of vegetable oils or resinoid material; and freedom from metallic salts. The requirements of switch oil are similar, except that the flash-point might be put at six times the expected engine-room temperature in degrees C.

The grading of oils according to their specific resistance gives a fair indication of their purity. For the determination of specific resistance, the authors have employed a pair of metal disc electrodes, the distance between which could be regulated by a micrometer screw making the measurements by a "Megger" or other form of ohmmeter. The specific resistance is found in all cases to vary with the applied voltage according to a parabolic law. For a series of six typical oils tested, it was found to vary from about 600,000 to 6·5 million ohms per cubic centimetre.

Tests for dielectric strength were carried out by immersing two electrodes at a known distance apart and applying a gradually rising voltage till arcing took place. The distance between the electrodes was varied, and a limiting voltage found for a variety of distances. As might be expected from a consideration of the distribution of the electrostatic lines of force, the shape of the electrodes has a considerable influence on the results. In making comparative tests with different samples of oil, it is advisable to choose the terminals which give the lowest possible puncturing voltage, over a given distance, and the most consistent set of results with any one oil. After a considerable amount of experiment, it was found that a point and disc arrangement answers these requirements best. At each puncture a certain amount of oil is decomposed, and carbon is thrown down, but even when the amount of carbon produced by repeated punctures renders the oil as black as ink, the dielectric strength is not appreciably affected; in fact, as a rule, after a few punctures, the dielectric strength improves.

Another point to be investigated was the influence of baking at a temperature of 240° F. for 24 hours. The effect of this, as revealed by subsequent tests, may be summarised as follows :—An increase in the disruptive voltage where this was less than 10,000 volts over the test distance. No increase in specific resistance for oils of high specific resistance, but an increase of specific resistance in those cases where decreases in specific gravity indicate the expulsion of moisture. Increase in specific gravity and viscosity, and a raising of the flash-point, due to the evaporation of the more volatile constituents. Darkening of the oil. A tendency to emphasise the indications of any traces of alkali. Irregular behaviour in regard to the indications of the presence of resinoid matter.

Other physical properties to be examined are specific gravity, viscosity, and flash-point. A special balance, known as the Westphal balance, is recommended for the first determination in place of a hydrometer, and the importance of attention to temperature is emphasised. A description is given of the Redwood viscosimeter, in which the flow of oil through an orifice is timed, and the Martin-Pensky apparatus is recommended for the determination of flash-point.

Passing on to chemical examination, the authors remark that the oil should be pure mineral oil, free from moisture or any notable proportion of oils of low boiling-point, alkali, acid, sulphur and its compounds, resin, fatty oils, tarry matter, and metallic soaps, and methods of detecting the presence of all these impurities are described.

The fact of the variation of specific resistance with temperature suggested to the authors the advisability of studying the relation between temperature and dielectric strength, and tests were made of the point and disc method on samples of the same series oils as used in the previous experiment.

It was seen from these tests that for all oils the dielectric strength increases with increasing temperature, but that consistent readings on the ascending and descending temperature curves are only obtained by oils of high specific resistances, *i.e.*, pure oils. This fact of increase of dielectric strength with temperature throws a grave doubt on the soundness of the general practice of nearly all makers of oil-cooled transformers, who apply lower test pressures to the transformer when heated at the end of a test run, than when it has been allowed to cool down.

The test of viscosity shows that all oils become "thinner" the higher the temperature, but to a varying extent with different oils. Also, as a rule, the viscosity of Russian mineral oils is greater than that of American mineral oils of the same specific gravity.

The viscosity of transformer oil should be low enough to ensure free convection with a moderate rise of temperature, above 60° F.; nevertheless, an allowance for the lowering of the viscosity when the oil becomes warm may be made in deciding on the suitability of an oil for use in transformers.

Digitized by Google

The viscosity at 60° F. should be regarded as the index. Taking 130° F. as the temperature, which is frequently attained in a transformer under average conditions in the English climate, it is manifest that an oil which would not quite afford free play to convection currents below 100° F. might be as satisfactory as one possessing the requisite degree of mobility at 70° or 80° F. Of course, the heating of transformers varies with the working conditions, and it is therefore difficult to fix the maximum viscosity permissible. As a rule, however, a viscosity higher than 70 or 75 is undesirable unless atmospheric temperature, load, and duration of running are such that high temperatures are inevitable. Where such conditions do not arise, a viscosity not exceeding 45 to 50 is to be preferred. Given equality in other respects, oils having the lowest viscosity should be selected for transformers.

For switches, too, the use of an oil having a viscosity sufficiently high to prevent or seriously to impede the subsidence of suspended matter is to be avoided. Considered electrically, the authors have not yet satisfied themselves as to whether—other factors being equal—thin or thick oils are to be preferred. So far as temperature is concerned in well-designed switchgear with no local heating and infrequent opening, the temperature of the switchboard gallery alone calls for consideration. The function which the oil has to serve is either that of preventing the formation of or of quenching the arc when struck. In effecting this the decomposition of the oil should be as small as possible. From the theoretical point of view, a heavy oil should hinder the formation of an arc owing to its molecular tenacity, while a thin oil with a more rapid rate of flow would probably be quicker in extinguishing the arc.

A series of tests were made to investigate the changes in physical and chemical properties of oil in the tank of a switch which was opened under a known current and voltage 200 times in succession, but the results were quantitatively inconclusive, although they showed that with good oil, and protection from the ingress of dust or moisture, such a switch might be tripped a great many times before the physical properties of the oil fell below those of a number of the inferior oils only too often used. Determinations of the amount of carbon liberated by prolonged arcing under the oil were also made, and further experiments were carried out upon the effect of temperature upon specific resistance, which was found to vary a good deal with the grade of the oil. It is suggested, however, that specific resistance measurements might be used to ascertain (by comparison of a series of heating and cooling curves, with a progressive increase in temperature), the point at which a certain molecular regrouping of the hydro-carbon constituents appears to take place, a matter of interest in the selection of oils for engines using superheated steam.

Discussion.

The discussion was opened by Mr. C. J. Beaver, who said that his own experience was that alkaline, acid, and resinoid substances were not the most usual impurities met with in mineral oils, but that moisture was by far the most predominant source of variation in electric properties. It could be eliminated by filtration through beds of calcium chloride. He also pointed out the difference in the behaviour between solid dielectrics and oil as regards the influence of temperature, and, contrary to the authors' view, advised lower test pressures for transformers when hot than cold.

Mr. J. S. Peck (British Westinghouse Co.) said that freedom from deposit under working conditions was almost as important as a high fire test or high dielectric strength, and it was difficult to obtain oils which did not throw down a deposit when worked at a high temperature. Great precautions were necessary to prevent absorption of moisture by the oil during shipment.

Mr. J. E. Southcombe said it was a rare thing to find alkaline impurities in oils. In his opinion it was in not chemical impurities but minute traces of moisture difficult to detect chemically, which explained most discrepancies in dielectric strength. Success had attended drying the oil by electrical resistances immersed in the oil, but it would appear to be a better investment to pay an experienced oil manufacturer an increased price and demand from him an anhydrous oil.

Mr. J. Lustgarten (Manchester Municipal School of Technology) referred to various causes of variation in the sparking voltage under oil, and favoured Dr. Russell's way of expressing the dielectric strength of an insulating material by the maximum potential gradient at breakdown. He had dried oil for experimental purposes by the means of sodium.

The authors replied briefly.

Institution Students' Section.—The annual general meeting of the students' section of the Institution of Electrical Engineers will be held at 92 Victoria Street, S.W., on May 4th, at 7.45 p.m. Nominations of extra-collegiate students to fill three vacancies on the students' committee should be sent to the Hon. Assist. Sec. of the Students' Section on or before April 24th.

LONDON UNDERGROUND RAILWAYS

Amalgamation Scheme and Through Running at Charing Cross.

Moving Stairway at Oxford Circus

THE scheme for the amalgamation of the Great Northern, Piccadilly & Brompton Railway Co., Baker Street & Waterloo Railway Co., and Charing Cross, Euston & Hampstead Railway Co. was passed by a Committee of the House of Lords on Thursday, there being no opposition.

The general case for the amalgamation of these three companies rests upon the advantages arising from unity of interest and unity of management, and on the advantages to shareholders from a consolidation of their stocks. So far as possible, unity of administration is maintained in the conduct of the business of the three railways at the present time. There is, however, a good deal of complication, especially in the accounting, owing to there being three boards of directors with individual rights and obligations, which necessarily impairs efficiency and involves considerable expenditure which will be saved by the amalgamation. Another important factor in the scheme is the important growth of exchange traffic between the three lines in question (and, also, with the other tube railways), and it is felt that the amalgamation will give facilities for this expansion, which is looked to as the main development in the future.

The financial proposals of the scheme, of course, form its chief characteristic, and these are set out below :—

(1) To consolidate the debenture stocks (£3,791,106) issued by the three separate companies into one stock of the amalgamated company of the same nominal amount, adding thereto a sum of £408,894 required for the purposes of the amalgamated company.

(2) To exchange the 4 per cent. preference shares of the Piccadilly and Baker Street companies for 4 per cent. preference stock of the amalgamated company at par, and to exchange the £298,030 ordinary shares of the Baker Street company held by the public for 4 per cent. preference stock of the amalgamated company in the ratio of £75 of new stock for £100 of existing shares, thus absorbing £1,240,563 out of a total issue of £3,150,000 new 4 per cent. preference stock.

(3) To exchange the £10,837,380 ordinary shares of the three companies, held by the Underground Electric Railways Company of London (of which £1,442,960 consists of ordinary shares of the Piccadilly company, convertible into preference shares of that company), into £1,909,437 4 per cent. preference stock and £8,927,943 ordinary stock of the amalgamated company, making together £10,837,380 as above.

The company proposes to carry out certain improvements in the Baker Street & Waterloo Railway and the Charing Cross, Euston & Hampstead Railway as provided for in separate Bills promoted by these companies, and for which the additional £408,894 debentures mentioned in paragraph 1 above is required. For the first completed year of the amalgamated company it is estimated that after meeting the debenture interest and preference dividends there will be a sum of £89,500 available for ordinary dividend and reserves.

The Committee next considered the Bill of the Baker Street & Waterloo Railway Co., the main proposal in which is to construct a passenger subway from the Oxford Circus station into Oxford Street. In this subway, which will have a diameter of 17 feet, will be fitted a moving stairway or "escalator," divided into two parts, one going up and the other down. These will be worked electrically, and each will have a carrying capacity of 150 passengers. The estimated cost is put at £17,000. There was some opposition from landowners, but the preamble of the Bill was found proved.

A Bill by the Charing Cross, Euston & Hampstead Railway Co., which was also considered by the same Committee, proposes to make physical connection with the District Railway at Charing Cross for the purpose of running through trains. Opposition was offered by the Gordon Hotels, Ltd., who alleged that the tunnelling works proposed would endanger the safety of the Hotel Metropole. It was asked that the promoters should be put under an obligation to have 10 ft. of London clay between the top of their new tunnels and the foundations of the hotel. On Monday, the Committee, after hearing the case against the proposed connection at Charing Cross, decided that it was not expedient that the Bill should proceed. On an application by counsel for the promoters, however, the Chairman agreed to restrict this decision to the line at Charing Cross, leaving the remaining portion of the Bill, which is unopposed, to go forward. Later on, the Committee, on a further application by the promoters, agreed to withhold their report on the Bill, in order to see if, by a re-arrangement of the new line, an agreement could be come to with the Gordon Hotels, Ltd.

PROPOSED NEW GENERATING STATION AT GLASGOW

AN important report on the capacity of the two principal generating stations of the Glasgow Corporation electricity supply department, has been submitted to the Electricity Committee by Mr. W. W. Lackie, chief engineer to the department.

Mr. Lackie points out that the maximum load during the last winter amcunted to 21,650 kw., whereas the plant at the Port Dundas and St. Andrew's Cross stations, neither of which have space for extensions, can only deal safely with a maximum load of 23,600 kw., so that in view of the increasing demand, which before the advent of the metal filament lamp was rising at the rate of 3,000 kw. per annum, further plant capacity is urgently required. He first discusses the possibility of replacing one or two small generating sets at Port Dundas by larger ones, but dismisses the idea of plant extensions at this station on account of the unsatisfactory supply of water from the canal for condensing purposes, and the high price which has to be paid for coal delivered there, amounting to about 10d. per ton more than at St. Andrew's Cross, owing to lack of railway siding accommodation. Nor would this expedient be more than a temporary measure, as it would not meet the demand five or ten years hence. A similar objection as regards condensing water stands in the way of additional plant at the Pinxton station. Mr. Lackie, therefore, recommends the acquisition as soon as possible of a site for a new works, and reports that the most favourable site of any he has examined is an area of 53,314 sq. yards on the west side of Dalmarnock Road, with a river frontage of 250 yards, and a branch of the Caledonian Railway running along its western boundary. This site is also within 300 yards of an existing sub-station, to which it could be connected up inexpensively. The chairman announced that an offer from the proprietors of the piece of ground mentioned had been received, to sell the whole site at a rate of 8s. per sq. yard, and at other rates for a portion of the site. The Committee agree generally with the report, and suggest the acceptance of the offer for the whole or part of the site after further examination of the suitability of the land for the purpose.

MUNICIPAL v. COMPANY SUPPLY AT RADCLIFFE

Proposed Competition by Lancashire Power Co.

AN inquiry of considerable importance to electric power companies and municipal electricity undertakings was opened at Radcliffe last week, in connection with an application to the Board of Trade by the Lancashire Electric Power Co. for a provisional order, authorising them to supply electricity in the Borough of Radcliffe. The Radcliffe District Council is at present supplying under a provisional order, and the company is prohibited by its Act from supplying in Radcliffe, but it appears that several applications have been made to the company by Radcliffe firms for a supply, in preference to taking a supply from the Council, presumably on the question of price. The company contend that there is a large demand for electric power in Radcliffe, which the Council is quite unable to meet, and their proposal is to allow the company to come into the district and compete with the Council for consumers above 50 h.p. They also agree not to canvass the present customers of the Council. It was alleged that a "Development Committee" had at one time been formed to bring industries into the town, but that in consequence of this Committee holding views in favour of allowing the Power Company to enter the district, the Council had disbanded it. Representatives from a number of large works in Radcliffe were called in support of the application, the view they expressed being that to allow competition in Radcliffe would be to the interest of power users and the ratepayers generally. Mr. C. D. Taite, the Engineer and General Manager of the Power Company, referred to the fact that the company is supplying firms in Bolton and Prestwich with the consent of the local authorities, and that at Farnworth the District Council had found it advantageous to scrap their plant and take all their supply from the company.

For the Council, it was stated that the undertaking was making a profit of £600 per annum after setting aside sufficient for depreciation, which latter it was contended the Power Company did not do. Mr. F. E. Lacey gave evidence against the proposal of the Power Company, and Mr. S. J. Watson, Borough Electrical Engineer at Bury, pointed out that when the new works of his Corporation were completed, the Radcliffe Council would be able to obtain a supply in bulk at very cheap rates. The inquiry is proceeding.

PARLIAMENTARY INTELLIGENCE

HANDSWORTH TRAMWAYS.—The tramway clauses in the Omnibus Bill of the Handsworth Urban District Council were passed by a Committee of the House of Lords on Thursday. Next year the whole of the tramways in Handsworth will fall into the hands of the Council, and consequently it is sought to borrow the sum of £203,875 in this connection, which includes the cost of certain new lines to accommodate the large population in the Birchfield Road district. As there is a question of Handsworth being incorporated with Birmingham, the latter Corporation asked that a decision on the tramways should be postponed until the question of incorporation has been settled, but the Committee refused to adopt this proposition.

PROPOSED NEW LONDON ELECTRIC RAILWAY.—The consideration of a Bill authorising the construction of an electric railway between Wimbledon and Sutton was commenced by a House of Lords Committee on Friday. The line will be worked by the Metropolitan District Railway Co. as an extension of their line to Wimbledon, although no definite arrangement has yet been come to with the company promoting the new railway as to the running of through trains over the two lines. The capital of the new company is £350,000, and the engineers' estimate for carrying out the works is £511,554. Opposition is offered by the London, Brighton & South Coast Railway Co. and the London & South-Western Railway Co. on the ground of competition, but only two landowners appear against the Bill. The local authorities concerned are strongly in favour of the new line. The engineers to the Metropolitan District Railway Co. support the estimates of the engineers to the Bill.

METROPOLITAN DISTRICT RAILWAY.—A House of Lords Committee passed this Bill on Monday. The main proposal of a constructive nature was the laying of an additional pair of tracks between Hammersmith and Twickenham Green Junction. To this the opposition was not of a serious nature, relating merely to the taking of land for the purposes of the new line. The financial proposals of the bill were unopposed. The company will raise £187,500 additional 4 per cent. guaranteed stock. The Bill also provides for the extinction of the arrears of guaranteed stock dividends by distributing new guaranteed stock to the extent of £184,375.

PROGRESS OF ELECTRICAL BILLS.—The Belfast Corporation Bill, which seeks to purchase the Cavehill & Whitewell Tramway Co.'s undertaking, has been allowed to proceed by the Standing Orders Committee, and was read a second time in the House of Commons on Friday.

The Reading & District Electric Supply Bill is now unopposed, and has been referred to the Unopposed Committee of the House of Lords.

The Bishop's Stortford, Harlow & Epping Gas Bill was read a second time in the House of Commons on Tuesday.

PERSONS IN CHARGE OF MACHINERY.—A private member's Bill has been presented by Mr. J. Haslam, providing for the granting of certificates to persons in charge of steam and motor engines, boilers, and steam and motor cranes. It will be read a second time in the House of Commons on April 22nd.

DEVONPORT & DISTRICT TRAMWAYS BILL.—This Bill came before a House of Commons Committee, presided over by Sir J. Compton Rickett, on Wednesday last week, and its consideration was continued until Friday, when the committee rejected it, without calling upon the Corporation to state their case in opposition. As stated in our last issue, the Bill has created exceptional local interest, for the reason that it proposed to modify an existing Parliamentary agreement between the company and the Corporation for the running of the tramways in Devonport. The company have found that the terms of the original agreement have become too onerous to enable the tramways to be worked at a profit. Among the modifications proposed was that, instead of the fixed annual rents provided for by the agreement under the Act of 1898 in respect of the lines leased from the Corporation, the company suggest that the Corporation should be paid the net revenue from these lines. It was also proposed that the price for electrical energy paid to the Corporation should be cost price (this to be determined by arbitration) plus 5 per cent. Further, that the period for working the lines, which is stipulated in the Act of 1898 as for twenty-one years from that date, should be extended to twenty-eight years. There were also a number of provisions relating to the conduct of the service, &c. An effort to arrive at a compromise during the committee proceedings failed.

LONDON UNDERGROUND RAILWAYS.—We report the proceedings in connection with these Bills on page 252.

LOCAL NOTES

ALDEBURGH: *Electric Supply.*—Mr. G. A. Bruce, Borough Electrical Engineer at Lowestoft, has reported in favour of a proposal by the Rural Electricity Supply Co., Ltd., the prospectus of which is referred to in our City Notes. In this case the Council are advised to apply for an electric lighting provisional order and to enter into an agreement with the company for working it.

ASTON: *New Electricity Charges.*—The recommendations by the Electricity Committee to change the present rates of charge for electricity supply have been adopted. The maximum charge for lighting is to be 3d. per unit instead of 3⅛d. for consumptions under 1,000 units per quarter, varying to 2½d. per unit with larger consumptions; for heating and cooking the charge is to be 1d. per unit instead of 1½d., with a charge for meter rent if the consumption is less than 5s. per quarter. The maximum charge for power purposes is to be 1½d. per unit instead of 2d., varying down to ¾d. per unit according to the consumption.

BIRKENHEAD: *Tramway Depreciation.*—It was stated at the last meeting of the Corporation that £10,000 had been drawn from the tramway profits for relief of rates. The Chairman of the Tramways Committee stated that the undertaking had not been in existence sufficiently long to estimate the amount of depreciation, but when it had to be met it would come out of the rates.

BIRMINGHAM: *Proposed Tramways to Harborne.*—Petitions in favour of extending the tramways to Harborne and Quinton were placed before the Corporation at its meeting last week, 13,026 votes being in favour of the tramways, and only 802 against.

BOLTON: *New Tramway Shed.*—A new tramway shed was opened last week. The feature of the building, which provides accommodation for 49 cars, and is 208 feet long by 85 feet wide, is that it is in one span without columns. The structure has cost about £10,000 to erect.

BRADFORD: *Tramway Receipts.*—The tramway receipts for the year to March 31st were £259,728, an increase of £15,493 over the previous year. The number of passengers carried was 50,518,816, an increase of 2,858,805.

CARMARTHEN: *Electric Lighting.*—A scheme is in hand for forming a company to instal an electric supply undertaking in the district.

COLINTON (N.B.): *Tramway Scheme.*—The work of constructing the Colinton electric tramways has been commenced. The consulting engineers are Messrs. Leslie & Reid, of Edinburgh, and the estimated cost of the line is about £4,000.

COOKSTOWN (IRELAND): *Electric Lighting.*—At the last meeting of the Council a proposal that the Council should promote an electric supply scheme was defeated.

DARWEN: *Proposed Tramway Purchase.*—The recent offer by a company to purchase the municipal tramways was discussed at the last meeting of the Corporation. Several members were in favour of proceeding with the negotiations, seeing that the undertaking had sustained losses amounting to £29,000 in three years, and that there was a probability of a further loss of £7,000 for the year to March 31st. A vote was taken on the question, with the result that the recent decision not to proceed with the negotiations was confirmed.

DOWLAIS: *Street Lighting.*—A Board of Trade inquiry was recently held concerning a scheme by the Merthyr Electric Traction Co. to light the streets of this district, using overhead wires. The Dowlais Chamber of Trade strongly opposed the proposition, and the company have now agreed to light all narrow areas and thoroughfares by underground cables, and not to use overhead wires in any street less than 22 feet wide.

FINCHLEY: *Electric Supply.*—During the year to March 31st, 12,079 8-c.p. lamps have been added to the connections of the Electricity Department, and 120 new public lamps have been erected. The total indebtedness of the undertaking is at present £93,259.

GRIMSBY: *Proposed Tramway Purchase.*—There has been considerable discussion in Grimsby recently concerning the desirability of purchasing the undertaking of the local tramway company. The Town Clerk and Borough Engineer have now been instructed to obtain information from other towns where a similar position has existed or at present exists.

HULL: *Underground Telegraph Cables.*—The Postmaster-General has informed the Hull Chamber of Commerce that provision will be made in the estimates of 1910-11 to lay an underground telegraph cable between Leeds and Hull.

KIRKINTILLOCH: *Tramway Extension.*—A proposal has been made to the Glasgow Corporation for the extension of their tramways to Kirkintilloch.

LLANDUDNO: *Sunday Tramcars.*—The poll taken by the Llandudno & Colwyn Bay Electric Railway Co. to ascertain the views of the ratepayers on the question of running tramcars on Sundays has resulted in a majority of 403 against.

LONDON: *London County Council: King's Cross Tramways.*—A commencement is shortly to be made with the construction of a bridge across the Metropolitan Railway at King's Cross, in order to connect the tramways in Gray's Inn Road with those in Pentonville Road serving Finsbury Park and Highgate. Without such a bridge a circuitous route would be involved. The agreements in connection with the matter provide for a 60-ft. roadway, the works being executed by the railway company, who will also undertake the maintenance of it, being reimbursed by the County Council. The Council will also make the company a payment of £33,000.

Westminster: Street Lighting.—A number of leading tradespeople in Regent Street have petitioned the Westminster City Council to postpone accepting a tender for the gas lighting of Regent Street, Pall Mall and Piccadilly until the matter has been more fully considered by the ratepayers in these districts.

NEWCASTLE: *Tramway Receipts.*—The receipts from the tramways for the year to March 31st, 1910, were £209,678, an increase of £138 over those of the previous year.

ROTHESAY: *Dock Equipment.*—After considering reports by the Dock Engineer upon the cost of generating electricity by additional plant, and the cost of taking electrical energy from the Clyde Valley Electric Power Co., the Clyde Navigation Trustees have decided in favour of the former. In our "Tenders Received" column it will be noticed that Messrs. Siemens Bros. & Co. have the contract.

WIGAN: *Electric Light Extensions.*—With reference to the recent Local Government Board inquiry into the Corporation's application for further borrowing powers, the Inspector has expressed the opinion that the Local Government Board will not give their sanction to further borrowing powers in regard to an item of £4,472, loss on the Pemberton station, until that amount had been wiped out of the capital account. Consequently, the accountant has been instructed to transfer this sum, at present charged against electric light capital account, to profit and loss account, so that it can be liquidated during the current year.

ST. HELENS: *Street Lighting.*—In consequence of complaints as to the inefficient lighting of the main streets in the centre of the town, the Electricity Committee have decided on a scheme of electric lighting.

SHEFFIELD: *Electricity Supply in Tinsley.*—The Corporation and the Yorkshire Electric Power Co. have come to an arrangement whereby the former is to be allowed to supply electricity to certain premises in Tinsley on the understanding that the consumer will be transferred to the company when the latter is in a position to give the necessary supply itself. The terms of the transfer of the supply are to be agreed, or, failing agreement, are to be determined by the Board of Trade.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

COLCHESTER.—A Local Government Board inquiry will shortly be held concerning a loan of £8,000 for electrical purposes.

DARTFORD.—The Council invite tenders by April 20th for paper-insulated and lead-covered cable, and an arc feeder pillar. Particulars from the Borough Electrical Engineer.

HONDURAS.—Concessions have been granted to J. W. Grace and to Manuel E. Lardizabel for the supply, to the towns of Puerto Cortez and Baracoa and of San Pedro-Sula respectively, of electrical energy for lighting and other purposes. Companies have been formed, under the names of the "Puerto Cortez and Baracoa Electric Company," and the "Empresa de Luz Electrica de San Pedro-Sula," to make use of these concessions.

LEITH.—The Leith Dock Commission are considering the desirability of installing an electric generating plant, or of taking a supply in bulk. It is probable that if the Commission decide to generate for themselves they will use gas-producer plant.

LONDON: *Battersea.*—The Committee reports that the scheme for supplying the Nine Elms district should be put in hand. The cost with auxiliary works will be £8,895. A 0·5 square inch concentric feeder cable is also to be provided at an estimated cost of £650.

NUNEATON.—The Electricity Committee require a water-tube boiler and accessories, and a boiler feed pump, &c. Particulars from the Borough Electrical Engineer, and tenders by April 25th.

WEDNESBURY.—An application is to be made to the Local Government Board for a loan of £2,925.

WHITWOOD.—The Council invite tenders for cables, service connectors, meters, fuses, switchboard, instruments, switches, steel poles, wooden poles, supports, arms, insulators, &c. Particulars from Mr. H. Marsden, Electricity Works, Honley, nr. Huddersfield, and tenders to the Town Clerk by April 28th.

Digitized by Google

WOLVERHAMPTON.—An important report has been submitted by Mr. C. E. C. Shawfield, the Borough Electrical Engineer, in which he recommends additional plant being installed at an estimated cost of £23,000. The new plant will include a 2,000-kw. alternator, a 500-kw. rotary converter, and a 500-kw. mixed-pressure turbo-alternator.

Miscellaneous

AUSTRALIA.—Tenders are invited by June 8th by the Deputy Postmaster-General, Brisbane, for the supply of common battery telephones and small switchboards and protectors. Forms of tender, &c., may be obtained at the offices of the High Commissioner for the Commonwealth of Australia, 72 Victoria Street, London. Local representation is necessary.

BERMUDA.—The Bermuda Electric Light, Power & Traction Co. are considering the question of putting their traction powers into force. A traction expert was recently in the colony in this connection.

INDIA.—It is stated that the Indian Railway Board have approved schemes for the conversion to electric traction of the Ranchrapara and Saidpor workshops of the Eastern Bengal State Railway. Detailed estimates, however, have yet to be prepared.

JAPAN.—It is reported that a company has been formed to construct an electric tramway between Tokio and Yokohama. The line is to have a length of about 15 miles, and a branch line nearly four miles long is to be built to Kamata. The line will be double track, and its gauge will be 3 ft. 6 in. The cost of construction is estimated at about £357,300. The name and address of the president of the promoters of the company may be obtained by British firms on application to the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

PERTH.—The Borough Surveyor has submitted estimates of the cost of certain proposed extensions of the tramways amounting to £8,759.

RUSSIA.—It is stated that the Perm Town Council have decided to grant to a group of English capitalists the concession for the construction of tramways. The total expenditure is estimated at £318,750. Mr. Pavolvsky is the local representative.

SHEFFIELD.—Mains extensions are to be carried out for supplying certain firms at Tinsley at an estimated cost of £990.

TORQUAY.—The public lighting is to be reorganised.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

PROVINCES.

ABERDEEN.—Tinplate factory, Roslin Place (£2,000). J. Rush, 224 Union Street, Aberdeen.

Catholic church (£4,000). C. J. Menart, 241 West George Street, Glasgow.

AYR.—School, Green Street (£8,000). D. Cowie, Alloway Chambers, Ayr.

DAWLISH.—Public hall (£1,800). Architect, S. Dabell, Queen Street, Exeter.

DURHAM.—School, Byers Green (£3,000). Architect, W. Rushworth, Durham.

GLASGOW.—Additions, W. White & Sons, engineers' premises (£2,000). White & Galloway, 121 Bath Street, Glasgow.

Extensions of Messrs. Carson's chocolate factory, Bridgeton (£2,750). Architects, Duncan & Copeland, 146 West Regent Street, Glasgow.

Workshop buildings, for John McDonald, builders (£2,000). R. C. Douglas, 121 Greenhead Street, Glasgow.

Shop and warehouse buildings, High Street and Bell Street (£28,000). A B. McDonald, city engineer, Glasgow.

HALIFAX.—Electric theatre (£2,200). Architects, R. Horsfall & Sons, 22a Commercial Street, Halifax.

HOVE.—Ward block at sanatorium (£2,546). H. H. Scott, borough surveyor.

LEICESTER.—Extensions and alterations at Museum and Art Gallery (£6,901). James Chapman, builder, Rutland Avenue, Leicester.

SHEFFIELD.—Infants' school, Earl Marshall Road, for the Corporation.

TUNSTALL.—St. Mary's Church Schools and new infants' school (£4,000). Architect, H. Dain, Tunstall.

Osram Lamps on Board Ship.—One of the White Star liners, upon which Osram lamps are fitted throughout, has just returned to port after a five months' cruise, and the engineers' report states that only one lamp has failed throughout the whole period of absence, although the average life of the lamps in question is already over 700 hours. As we go to press we learn that this liner is again leaving for another cruise with identically the same lamps, and are taking only half the usual number of spares on account of the satisfactory results of the previous voyage. The economy and long life of these lamps render them particularly suitable for ship lighting.

TENDERS RECEIVED AND ACCEPTED

CARLISLE.—The Corporation have accepted the following tenders: Boiler, economiser, and pumps, Stirling Boiler Co., £3,359; condensing plant, Korting Bros., £398; engine, dynamo, &c. Browett, Lindley & Co. £4,460.

CLYDE NAVIGATION.—The tender of Messrs. Siemens Bros. & Co., Ltd., has been accepted at £6,442 for additional generating plant at the Rothesay Dock.

COLCHESTER.—The tender of the Standard Cable Co., Ltd., at £242 has been accepted for cables for the Parsons Heath and Port Lane districts.

GRIMSBY.—The Council have accepted the tender of the Jandus Arc Lamp & Electrical Co., Ltd., for 80 flame arc lamps with spares, &c., for £360 13s. 4d., provided that the company will give a two years' guarantee as to the working of the lamps.

LONDON: *Battersea.*—The Council have accepted the tender of the General Electric Co. for the annual supply of carbons for lamps, and of Callender's Cable & Construction Co., Ltd., for the annual supply of cables.

Marylebone.—The Council have accepted the following tenders for annual supplies:—Lucy & Co., cut-outs (the firm whose tender was previously accepted having withdrawn); Le Carbone, Ltd., carbon brushes; British Electric Trade Supply & Bitumen Co., bitumen, £14 per ton. The Council have further accepted the tender of Messrs. Babcock & Wilcox for two internal superheaters at £500.

Shoreditch.—The Council have accepted the tender of Evered & Co., at £207, for the supply and erection of an additional feeder panel.

Among the recent orders received by the D.P. Battery Co., Ltd., are a large storage battery for the Guildford Electricity Supply Co., which will be maintained for 10 years, and storage batteries for the Leek District Council and Letchworth Garden City.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—Oriental Telephone & Electric Co., Ltd., announce a dividend at the rate of 6 per cent. per annum on the preference shares for the half-year ended December 31st, less tax, and a final dividend of 5 per cent. on the ordinary shares, free of tax, making a total of 8 per cent. for the year.

Babcock & Wilcox, final dividend on the ordinary shares, making a total of 24 per cent for 1909. Rio Janeiro Tramway, Light & Power Co., 1 per cent. for the March quarter.

MORTGAGES AND CHARGES.—Particulars of the following have been filed:—Metropolitan Electric Tramways: Particulars of debentures amounting to £100,000, ranking *pari passu* with £200,000 second debenture stock already issued. Property charged—the company's undertaking and property, present and future, including uncalled capital. Trustees, Metropolitan Trust Co., Ltd., 8 Crosby Square, E.C. Holsworthy Gas & Electric Supply Co.: Debenture, dated March 11th, 1910, to secure £1,000, and mortgage of even date as collateral security thereto, charged on the company's undertaking and assets, including any uncalled capital, and land and buildings at Holsworthy, Devon. Holder, W. Harris, Ratherton, Holsworthy.

RURAL ELECTRICITY SUPPLY CO.—An issue is being made of 9,500 participating preferred shares of £1 each. The company has been formed for the purpose of establishing electric light and power undertakings in country towns and the larger villages in the rural districts of England. In order to minimise expense, the company propose to dispense with Parliamentary powers, and substitute arrangements with the various local authorities. It is stated in the prospectus that several local authorities have given their sanction to undertakings on these lines.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—Associate Members: A. Angers, R. Bruce, W. S. Burge, C. F. Button, J. P. Chisholm, J. Crane, W. Cruickshank, H. C. Eagar, A. J. Eames, G. Gollicz, W. R. Groom, H. S. Hohne, E. J. Morrell, S. T. Pemberton, C. H. Phillips, A. R. Powell, H. Skelton, W. H. Starkey, J. P. Thomas, A. E. White.

Electrical Section of the London Chamber of Commerce.—At the annual meeting of the London Chamber of Commerce on April 7th, the Electrical Trades Section presented their report, which stated that in regard to electricity in mines the Section considered the advisability of arranging for a witness to give evidence before the Committee as to the working of the existing special rules, but a representative has not yet been appointed. The Council of the Chamber was requested to urge his Majesty's Government to introduce a Bill requiring that all such passenger ships should be fitted with wireless telegraph apparatus. It was reported to the Section that the Council had appointed a Special Committee in connection with the question of misrepresentation in trade, and would be willing to receive suggestions as to any points affecting electrical manufacturers. Mr. Leon Gaster was appointed to give evidence on behalf of the Section before the Special Committee.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £60 to £60 10s. per ton (last week, £60 10s. to £61).

CANADIAN AGENTS WANTED.—A London firm of designers and manufacturers of electric light fittings wish to get into communication with architects and decorators in Canada.

A Montreal firm desires to get into touch with British manufacturers of insulators for electrical purposes. Further particulars from the High Commissioner for Canada, 17 Victoria Street, London, S.W.

SIEMENS BROS. SUPPLIES DEPARTMENT.—Owing to increased business in the Supplies Department at 39 Upper Thames Street, London, E.C., Messrs. Siemens Bros. Dynamo Works, Ltd., have found it necessary to provide additional telephone facilities. There are now four lines, the telephone number being London Wall 8,270.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—Mr. H. K. Barham, Electrical Engineer, 60 Fratton Road, Portsmouth, has been adjudicated bankrupt.

Mr. G. E. Corfield, Balfour House, Finsbury Pavement, London, E.C., has been appointed trustee in the bankruptcy of J. A. Bauer, trading as Electrical & General Engineering Co., 17 Gracechurch Street, London, E.C.

A meeting of creditors of W. H. Durrant, Electrical Engineer, 53 Tolling Street, Lowestoft, was held last week. The deficiency is £72 6s., and the failure is attributed to excessive competition, want of capital, and ill-health. The matter was left in the hands of the Official Receiver.

The public examination of A. McAlpine, Electrical Engineer, Cank Street, Leicester, took place last week. The liabilities amount to £2,067, there being a deficiency of £804. The debtor, who had carried on a general electrical engineering business, attributes the loss to errors in estimating for fitting premises for lighting and power purposes. The examination was closed.

INCREASE IN PRICES.—Messrs. Siemens Brothers & Co., Ltd., Caxton House, Westminster, S.W., inform us that they have been compelled further to increase the prices of their india-rubber tapes and solution, as from the 8th inst.

ADVANCE IN PRICES OF WIRES AND CABLES.—Owing to the continued abnormal increases in the cost of rubber and other raw materials, the Sun Electrical Co., Ltd., 118 Charing Cross Road, London, are compelled to make the following advances in prices, forthwith :—V.I.R. insulated wire cables, &c., as under : Class N. and N.A. cable, 15 per cent. ; Class N.F. and C.F. cable, 10 per cent. ; bell wires, 10 per cent. ; multiple telephone cables, 10 per cent. ; flexibles, 10 per cent. ; electrolier wires, 10 per cent. Pure I.R. strip, 13s. 6d. per lb. net; I.R. solution, list price net.

The General Electric Co. (67 Queen Victoria Street, E.C.) announce a further rise of 10 per cent. in the prices of cables as from April 1st, in addition to the advance of 10 per cent. made recently, owing to the continued high price of rubber. The rise affects all rubber-covered wires, cables, flexibles, and materials containing rubber.

REDUCTION IN PRICE OF M.S. LAMPS.—The M.S. Lamp Co. announce important reductions in the prices of some of their metal filament lamps. The 100-125 volt 10-c.p. lamp is reduced from 3s. 6d. to 3s. 3d., and the 25-, 32-, and 50-c.p. 80-135 volt lamps are now 2s. 3d. each, instead of 2s. 6d., 2s. 9d., and 3s. respectively. The 25-50 c.p. 135-160 volt lamps and the 25-50 c.p. 160-260 volts are now 3s. each instead of 3s. 3d. and 3s. 9d. respectively. The above prices relate to pear-shaped bulbs. With spherical bulbs, all sizes from 16-50 c.p. 100 130 volts are reduced to 2s. 9d. each. Trade terms remain unaltered.

APPOINTMENTS AND PERSONAL NOTES

Mr. J. E. Kingsbury has changed his address from Norfolk House, Victoria Embankment, to 7 Serjeants' Inn, Temple, London, E.C. Telephone No., Central 2,418. Telegraphic address, "Rexinter, London."

The Sheffield Electric Light Committee recommend that the salary of Mr. S. E. Fedden, the General Manager of the Electricity Department, be increased from £800 to £900 per annum by two annual increments of £50 each.

Applications are invited by April 22nd for the position of Assistant Electrical and Mechanical Engineer in the Swindon Corporation Electricity and Tramways Departments at a salary of £120 per annum. Particulars from the Town Clerk.

Messrs. Webster, Steel & Co., agents to the Durban Corporation, invite applications for the post of switchboard attendant. Applicants must be accustomed to single-phase high-tension working, and also tramways. The salary is £240 per annum.

Mr. Justus Eck, Engineer-in-Chief to the Union Electric Co., Ltd., of Park Street, Southwark, sailed on April 9th, by the s.s. *Lusitania*, for New York, with the intention of visiting the principal cities of the United States for the purpose of studying the latest American developments in street, shop, and railway lighting, and in the applications of electricity to manufacturing and mining.

The appointment of Mr. R. B. Leach, Borough Electrical Engineer of Farnworth, as Consulting Engineer to the Council at a salary of £50 per annum, was opposed at the last meeting of the Council. An amendment was moved that Mr. Leach be appointed at a retaining fee of £5 per annum, with payment for any services which he might render. The amendment was, however, lost.

The wages of the following staff at the Nelson Electricity Works have been increased : Jas. Stanworth, shift engineer, from 31s. to 33s. per week; W. G. Coates, shift engineer, from 26s. to 28s.; and W. Lawson, fireman, from 29s. to 31s.

Mr. E. S. Taylor, of the Watford undertaking, has resigned. Mr. J. E. Walley, Engineer-in-Charge, has been appointed to the vacant position at a salary of £110 per annum, rising by annual increments of £10 to £130. Mr. R. S. Savory (improver) has been appointed Assistant Main Superintendent, and Mr. J. B. Dent has been appointed Engineer-in-Charge.

The Town Council of Torquay invite applications for the post of Borough Electrical Engineer at a salary of £250 per annum, rising to £300 per annum. Particulars from the Town Clerk.

COMPANIES' MEETINGS AND REPORTS

AMERICAN TELEPHONE & TELEGRAPH CO.—The report for 1909 shows a net revenue of £6,040,000, and a net balance, after meeting interest and interim dividend, of £1,212,000. The capital of the company is to be increased from £6,000,000 to £10,000,000, but none of the increase is required in connection with the estimates for the coming financial year. During 1909 the company acquired a substantial interest in the Western Union Telegraph Co. The number of stations now constituting the "Bell" system in the United States is 5,142,692, an increase of 778,063 during the year. The report mentions the introduction shortly of a "night letter" service.

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.—The report for 1909 shows that the revenue, viz., £88,925, was increased by £14,051, whilst the expenditure was only £1,290 in excess of the previous year. After providing for debenture, loan and mortgage interest, and transferring £2,000 to reserve fund for redemption of debentures, there remains an available balance of £34,315. It is proposed to place £7,000 to depreciation, to write £3,500 off preliminary expenses, and to recommend a dividend on the ordinary shares of 6 per cent. per annum, carrying forward £837. The total number of units sold during the year was 16,402,447, an increase of 2,332,836 units. The Willesden Urban District Council have decided to continue to take from the company a supply of energy in bulk for a further period of 7 years upon the expiration of the present agreement in February, 1911.

RHONDDA TRAMWAYS ELECTRIC SUPPLY CO.—After providing for debenture interest, the accounts for 1909 show a profit of £577, which is transferred to debenture redemption fund, increasing it to £1,323.

RHONDDA TRAMWAYS CONSTRUCTION CO.—At the meeting last week it was stated that, with the exception of Stockport and Belfast, the cost for electrical energy on the Rhondda tramways was the lowest in the kingdom, viz., 0·91d. per unit.

CALCUTTA TRAMWAYS CO.—The profit for 1909 amounted to £67,085. The directors propose to pay 4½ per cent. on the ordinary shares for the year, adding £7,000 to depreciation fund, and carrying forward £435. The Howrah portion of the company's system shows a profit for the first time.

METROPOLITAN ELECTRIC TRAMWAYS.—The report for 1909 states that the traffic receipts, which amounted to £326,441, show an increase of £26,428. There is a surplus of £50,437, making, with the £3,707, the balance brought forward from the last account a total of £54,144. The directors recommend £6,000 being placed to reserve, and a dividend on the ordinary shares of 5 per cent. per annum, and carry forward £3,578. Four additional sections of light railway in the County of Middlesex were opened for public traffic during the past year, bringing the total length of line to 51½ miles. The remaining 4¼ miles of the authorised light railways of the Middlesex County Council are in course of construction, and will probably be completed before the end of the present year.

NORTH OF SCOTLAND ELECTRIC LIGHT & POWER CO.—The report for 1909 shows a gross profit of £4,107, and after meeting interest on debentures and loans, and writing off £406 for loss on free wiring and motors dismantled, balance of cost of street lighting alterations and depreciation on meters, &c., there remains a net profit of £1,825. It is proposed to carry £1,600 to renewal reserve account and the balance of £225 forward.

Telegraph Traffic.—The list of cables awaiting repair is now much smaller. Those in need of attention are between Assab and Perim (down since July 8th, 1909), and the Western Telegraph Co.'s cable between Para and Maranham, which failed only recently. The line between Rome and Constantinople was interrupted on the 7th inst.—The German South American Cable Co. have published their rates, and no doubt when they reach Brazil they will make every effort to gain a share of the valuable traffic of the Western Co

Digitized by Google

ELECTRICAL TRADES BENEVOLENT INSTITUTION

AT the annual general meeting of this Institution, which was held at the Hotel Cecil on Wednesday last week, the report and accounts for the year to December 31st, 1909, were adopted. Mr. W. B. Esson presided, in the absence of Mr. E. Garcke, who had consented to take the place of the Chairman of the Committee, Sir William Preece, but who was also unable to be present.

The report states that during the year considerable progress has been made by the Institution, both in the direction of securing financial support and in granting relief to desirable cases. The first Festival Dinner of the Institution in 1909 resulted in a net direct gain to the funds of about £300. The second Festival Dinner, held this year, produced equally satisfactory results, but the receipts from it do not appear in the present balance-sheet. Several cases came before the Committee for consideration, and five separate grants to the amount of £51 were made. This is an increase in the number and amount over those made the previous year. No pensions have been granted, as under the Rules no applicants are eligible at the present time. In the year 1909 the dividends on the investments amounted to £62 19s. 5d. The Committee have decided to inaugurate a system of collecting amongst the staffs of large electrical undertakings by means of House stewards, in order to secure support from such quarters, where many small sums can undoubtedly be obtained. The report refers to the unstinted and continued support given by the Electrical Press. Without this co-operation, the Institution would find its funds still more severely taxed for printing, postage, and other similar expenses. The following members of the Committee retire in accordance with Rule 3, and are available for re-election, namely, Messrs. Grainger, Johnson, Lundberg, Nalder, Northcote, Oppenheimer.

The balance-sheet shows that dividends, subscriptions, and donations amounted to £749 13s. 8d., and receipts from Manchester Electrical Exhibition £364 19s. 3d., making, with £129 16s. 6d. in hand, a total of £1,244 9s. 5d. After meeting grants to the amount of £51, printing, &c., and secretary's salary, a balance of approximately £1,000 has been invested in Cape of Good Hope 3½ per cent. stock, leaving £63 11s. 9d. in hand. The total invested now amounts to £2,089 8s., which, together with £63 11s. 9d. in hand, represents the assets of the Institution after only two years' existence.

In putting the report to the meeting, Mr. Justus Eck (Union Electric Co., Ltd.) said that although the sum distributed was small, yet every case that had come before the Committee had been adequately dealt with, and all the men concerned were now in work. Furthermore, the applicants were satisfied. Mr. Theodore Rich commented on the smallness of the sum distributed in view of the generally recognised fact that the electrical industry was in a by no means flourishing condition. Mr. Davenport, the secretary, pointed out in this connection that the policy of the committee was that only subscriptions should be distributed, and not donations, these latter being invested for the purposes of pensions. Consequently, the amount available for distribution as assistance was not very large. The report and accounts were then adopted.

The six retiring members of the Committee, Messrs. Grainger, Johnson, Lundberg, Nalder, Northcote, and Oppenheimer, were re-elected. As the Committee only consists of 18 members out of 30, Messrs. F. B. O. Hawes, B. Longbottom (Electromotors, Ltd.), and S. D. White (General Electric Co., Ltd.), were added.

THE MARYLEBONE SALES DEPARTMENT
Committee of Enquiry Refused

AT the meeting of the Marylebone Borough Council on Thursday, Councillor Duncan Watson moved that a committee be appointed, composed of the chairmen of the Standing Committees, to inquire into the methods of the sales department of the electricity undertaking. He said he put forward his motion in no spirit of hostility to the undertaking, but in order to ventilate a grievance held by a large section of the ratepayers who were electrical contractors, against the continuance of the sales department. In the first place he contended that the department was unnecessary, and, further, that the work carried on by it was hazardous and speculative, and detrimental not only to the interests of the electricity undertaking, but to the ratepayers. Sales departments had been tried all over the country, and had been proved to be disastrous to the success of the particular electrical undertakings. Shoreditch some years ago abandoned such a department on account of its non-success, and such cities as Manchester, Glasgow, and Edinburgh had all tried and abandoned them. The Marylebone department was nothing more or less than an importation from West Ham, which he contended had been unsuccessful. Finally, Mr. Watson criticised the method of carrying on the sales department. He said that only half the salaries of the manager and the assistant manager were debited against the general expenses. This, of course, was unfair competition with local contractors. He further criticised the manner in which the estimates were sent in by the electricity department, irrespective of whether the consumer had a contractor or not.

ALDERMAN DEBENHAM, Chairman of the Electricity Committee, said that in the first place the Council had decided, and he did not imagine it would go back upon that decision, that there was to be a sales department. It was absolutely necessary for the success of the department that the sale of electricity should be pushed in every way. The department at Marylebone did not cut prices and never would do, and they did not approach consumers when they knew there was a contractor engaged. Figures showed that the existence of a municipal sales department was not detrimental to the electrical contractors in the district.

COUNCILLOR HELSDON expressed the opinion that when the Council sanctioned the formation of a sales department they were not aware that it was to undertake wiring of private premises. The speaker, apparently ignorant of the fact that the Marylebone Council have special powers to undertake this work, and also that the London County Council (General Powers) Act of 1906 authorises London Borough Councils to carry on such work, foresaw the possibility of the members of the Council being surcharged in respect of such work.

COUNCILLOR HOPKINS said that he had asked for the names of cases in which complaints had been made, and had only been supplied with three, and on investigation there was not a shadow of truth that the department had taken work away from the contractor in any one of them. As a matter of fact, in one case the gas company got the job.

A vote on the motion was taken, but only four members voted for it, and it was consequently lost. Some members refrained from voting. This discussion and voting indicates the fact that the internal management of the electricity undertaking in Marylebone is coming to be regarded as outside the scope of politics, for the bulk of the members of the Marylebone Council cannot be accused of being ardent municipal traders.

WIRELESS TELEGRAPHY

AT present there is no wireless telegraph station on the east coast between Caister, in Norfolk, and Cullercoats, near Newcastle, where, by the way, no permanent watch is kept. The shipping interests on this portion of the coast have suggested that the Post Office should erect a station somewhere between these two points. The cost of working such a station is put at £650 per annum by the Postmaster, and he has expressed his willingness to erect one, if he is guaranteed against loss in working.

An interesting experiment was made recently in fitting several Netherlands steam trawlers with wireless telegraph apparatus, thereby enabling them to communicate with the State wireless station at Ymuiden. The experiment seems to have been thoroughly successful. During the strike that occurred in the autumn of 1909, steam trawlers at sea were warned not to return to Ymuiden harbour, but to proceed to British or German ports with their catches. It has also been found possible for the owners on shore to direct their trawlers at sea towards shoals of fish, from the information received from the numerous craft that arrive at Ymuiden.

The United Wirelers Telegraph Co. of New York (de Forest system) have closed contracts during the past month for equipping forty-six ships. These include some very large passenger and cargo vessels of the Pacific Mail Steamship Co., who, after making exhaustive tests with their s.s. *Korea* between San Francisco and the Orient and establishing the world's record between ship and shore—*i.e.*, over 4,000 miles—have given orders that the balance of their trans-Pacific fleet be equipped. Similarly, the Lloyd Brazileiro SS. Co., after testing the system on three vessels, have arranged to equip a further eighteen vessels. In addition, a number of cargo and tug boats of various American steamship companies are being equipped with this system. The H. & W. Nelson (London) line are having nine vessels equipped.

The experiments carried out by the German Government with the Telefunken system between Germany and the German colonies have been so successful that wireless stations are to be erected in German East Africa; German South-West Africa, and in the Cameroons.

Obituary.—The death is announced of Sir Walter Scott, of Messrs. Walter Scott & Middleton, the firm who constructed the City & South London Railway, and also portions of the Central London & Great Northern, Piccadilly & Brompton Railways.

Central London Railway Extension.—It is stated that tenders have been received for the extension of the Central London Railway from the Bank to Liverpool Street, and that the contract will shortly be awarded. The estimated cost is about £500,000, and the shareholders, as foreshadowed at the last general meeting, will be asked to sanction the raising of additional capital.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 7th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

6,053/09. **Motor Converters.** Bruce Peebles & Co., Ltd. (*O. S. Bragstad and J. L. la Cour*). Compensating windings are provided in the pole shoes of motor converters in order to improve the commutation and to regulate the voltage. These windings carry the whole or a proportion of the armature current, and are unequally and unsymmetrically distributed over the pole arc. This gives a compounding effect, as, besides neutralising the armature reaction, the windings effect a displacement and either increase or decrease the main field flux in proportion to the load. Commutating poles may be used as well, and these may be wound or not, according to the strength of the compensating windings. Four claims, eight figures.

6,177/09. **Electrical Marine Propulsion.** C. A. Parsons, G. G. Stoney, and A. H. Law. Owing to the presence of salt and moisture in the air on ships, it is difficult to maintain the quality of insulation, especially for high pressures. To avoid the use of high pressures for electric drive with polyphase motors, the generators and motors are interwound so that portions of the motor winding are connected with corresponding portions of the generator winding, so that only small differences of potential have to be dealt with. Thus, for a 2,000-volt winding, the voltage is generated and used in, say, 20 steps of 100 volts each. Various means of effecting this and of obtaining the required speed ratios are described. Eight claims, four figures.

6,674/09. **Resistance Grids.** British Thomson-Houston Co., Ltd. (*General Electric Co., U.S.A.*). Resistance units for flat-irons, hot-plates, &c., are constructed by stamping out a grid in any desired form from sheet metal. The sheet should be preferably of a resistance material which insulates itself by oxidation on heating. In order that the total resistance of the zig-zag path may be adjusted after cutting or stamping, some of the slits are only partially cut, so that short pieces of metal short-circuit some of the loops. Any number of these are then filed or cut away as desired to adjust the resistance. Two claims, four figures.

6,935/09. **Picture Reflector.** G. F. Allom. A lamp fitting for illuminating pictures and tapestries comprises a long reflector of a special channel section with tubular incandescent lamps, and two longitudinal metal strips, which are so arranged as to shade the eye of the observer from the direct rays from the lamps and upper part of the reflector and to prevent the glare on the top of the picture. Two claims, five figures.

6,916/09. **Automatic Generating Plant.** C. B. Walker. A combustion-engine generating plant suitable for lighting country houses, and provided with automatic arrangements for starting up the generating set when the battery is discharged, is described. The set is stopped automatically when the cells are fully charged, and automatic regulation by cutting cells in and out is also effected. The engine is started with compressed air or by running the dynamo as a motor. Five claims, two figures.

17,627/09. **Metal Filament Lamps.** H. Kuzel. Long filament loops are supported at three places, namely, at the extremities of the arms, at the bend of the loop, and in the middle by arms projecting from the stem to a greater distance than the end supports. The loop support is resilient, and puts such a tension on the filament that only those portions between the loop and the middle supports are prevented from sagging. The friction of the filament over the middle support prevents the tension from reaching the portions between the leading-in and middle supports, in order that the sag of these portions may be gradually reduced on burning, so as to compensate for the contraction of the filament. Three claims, one figure.

18,940/09. **Hot-water Bottles.** H. W. Christian. Hot-water bottles and other fluid heating apparatus containing a resistance heater are provided with a bi-metallic automatic switch for short-circuiting a portion of the heating coil or a series resistance until a certain temperature is reached. When the switch opens, the current is reduced to that sufficient to maintain any desired temperature. Three claims, three figures.

29,968/09. **Fan Oscillating Device.** R. G. Gibbons. A ventilating fan is oscillated in a direction at right-angles to the spindle by providing the latter with an extension at the back, which rolls along the upper and under surfaces of a fixed support, or along the upper or lower slides of a slot. Gearing may be interposed between the rolling spindle and the fan axle. Three claims, five figures.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: H. Leitner and R. N. Lucas [Train-lighting dynamo] 28,487/02; Phœnix Dynamo Manufacturing Co. and R. Pohl [Field coils] 28,156/04.

Instruments, &c.: H. G. Kunkelmann, C. E. Francois, and C. R. Loubery [Prepayment and other electricity meters] 27,269/98; S. Matthews [Mercury motor meter] 28,044/04.

Storage Batteries: N.S. Electric Storage Co. and J. T. Nibleit [Cell and plate construction] 27,986/04.

Switchgear, &c.: Otis Elevator Co. (*Otis Elevator Co., U.S.A.*) [Push-button lift control system] 26,395/01; H. Leitner and R. N. Lucas [Mercury switch] 28,486/02 and [Automatic regulator for train-lighting dynamo] 28,487/02.

Telephony, &c.: E. Weintraub [Vapour lamp detector for wireless telegraphy] 27,887/04.

Miscellaneous: R. Pearson [Fusible alloy for fire-alarm] 23,586/00; A. Favarger [A.-C. clock mechanism] 28,539/02; W. T. Munro and W. W. Lumsden [Mercury fire-alarm switch] 27,956/03; J. L. Movelle (*W. J. Morrison and J. C. Wharton*) [Electrically driven and heated sweet-making apparatus] 28,162/04.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Siemens Bros.' Dynamo Works, Hird and Grimston [Search-lights] 27,960/08.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Handcock, Dykes, Rawlings and Dieselhorst [Sheathing of conductors] 7,187/09; Handcock, Dykes, and Rawlings [Jointing conductors] 7,593/09; Newton (*Farbenfabriken vorm. F. Bayer & Co.*) [Insulation of wires and strip] 18,193/09.

Dynamos, Motors, and Transformers: Allgemeine Elektricitäts Ges. [Motor control] 6,566/09; Childs and Hill [Wind-power generating sets] 6,752/09; Crompton & Co., Macfarlane and Burge [Rotary transformers] 7,060/09; Maxaner [Combined centrifugal fan and motor] 15,659/09; Holdsworth [Motor] 18,511/09; Blathy [Turbo-alternator rotors] 27,252/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Control of A.C. motors] 5,044/10.

Electric Ignition: Fuller and Moore [Dual ignition apparatus] 19,601/09.

Electrometallurgy and Electrochemistry: De Martis [Primary cells] 4,034/09; Cowper-Coles [Electro-plating tubes and rods] 12,469/09; Fuller [Primary cells] 19,914/09; Foster [Pyrometers] 30,478/09.

Instruments and Meters: Wilson [Meter] 6,504/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Speed indicators for motors] 6,673/09.

Storage Batteries: J. Stone & Co. and Darker, 7,424/09; Accumulatoren-Fabrik A.-G. [Plates] 27,221/09.

Switchgear, Fuses, and Fittings: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Speed indicators for motors] 6,673/09; Allgemeine Elektricitäts Ges. [Polyphase relays] 6,675/09; Durant [Portable safety lamp] 7,141/09; Cochrane [Electro-magnetic control gear for train-lighting] 10,729/09; Gray (*Seabolt*) [Lamp fittings] 21,854/09; Waterhouse [Ceiling roses] 24,769/09; Soc. Anon. Ateliers Jaspar & Meller [Automatic regulators] 1,087/10.

Telephony and Telegraphy: Brown [Telephony] 4,162/09; Williams [Enumerating telephone calls] 6,447/09; Sharman [Oscillation discharge gap] 8,111/09; Aitken and British Insulated & Helsby Cables, Ltd. [Telephone switchboards] 16,642/09; Neuhold [Automatic telephone exchanges] 22,596/09; Rossi [Wave detector] 23,628/09.

Traction: Christie and Henderson [Air-brakes] 19,397/08; Treiheway and Bennett [Signalling] 4,992/09; Rizzo [Solenoid brakes] 6,849/09; Metcalfe [Vacuum brakes] 7,294/09; Stern and Doob [Signalling] 7,556/09; Köhler [Current collector] 26,907/09.

Miscellaneous: Green [Cathodes for X-ray tubes] 23,316/09; Siemens Bros. & Co. and Riber [Electrical condensers] 23,821/09; Ozonair, Ltd., and Joseph [Production of ozone] 24,945/09; Nourney and Niemeyer [Alarm thermometers] 30,003/09; Marshall [Electric hoists] 457/10; Siemens Bros.' Dynamo Works (*Siemens Schuckertwerke Ges.*) [Rotary pumps] 2,291/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: Könecke [Three-phase lamp] 6,868/10.

Electric Ignition: Soc. Aubert Frères [Ignition of gas burners] 286/10.

Electrometallurgy: Stora Kopparbergs Bergsslags Aktiebolag [Electric furnaces] 6,768/10.

Incandescent Lamps: Wolfram Lampen A.-G. [Supports for filaments] 6,397/10; Salzer [Supports for filaments] 6,658/10.

Telephony: Siemens & Halske A.-G. [Semi-automatic telephone exchange] 6,875/10.

Miscellaneous: Gebr. Siemens & Co. [High-temperature resisting material] 5,161/10.

ELECTRICAL ENGINEERING

No. 173 [Vol. VI., No. 16] THURSDAY, APRIL 21, 1910. [Price One Penny.
All rights reserved. *Registered as a Newspaper.*

To Our Readers:—The circulation of "Electrical Engineering" is now equally wide among the employers and the rank and file of the Electrical Industry, but up to the present insufficient advantage has been taken of this by those requiring **additions to their staff** or those **seeking situations.** When next you have an advertisement of this nature to place, please send it to "Electrical Engineering."

ELECTRICAL ENGINEERING.

The Engineering Journal of the Electrical Industry

Published every Thursday. Price **1d.**

SUBSCRIPTION RATES.

United Kingdom. 6s. 6d. per Annum.
Canada. 8s. 8d. per Annum.
Other Colonies and Abroad. 13s. per Annum.

Small prepaid Advertisements for Situations Vacant and Wanted, Articles for Sale and Wanted, &c., are inserted at the rate of One Penny per word, minimum One Shilling, three insertions for the price of two.

Official Notices and Technical College Announcements are inserted at the rate of Ninepence per line (column width).

Other Advertisement Rates on Application.

Latest Time for Receiving
Letters for Insertion, *Tuesday first post.*
Small Advertisements and Official Announcements, *Wednesday first post.*
Displayed Advertisements, *Tuesday first post.*
orrections in Standing Advertisements, *Monday first post.*

All letters to be addressed to "Electrical Engineering," at the Editorial and Publishing Offices: 203-206, Temple Chambers, London, E.C.

Telegrams: "Circling, London." Telephone No.: 5509 Holborn.

Cheques to be made payable to The Kilowatt Publishing Co., Ltd., and to be crossed London and Westminster Bank (Temple Bar Branch).

A Supplement "Electrical Engineering in Mines" is included (gratis) in "Electrical Engineering" on the first Thursday of every month.

SUMMARY

Among the novelties exhibited at the "Ideal Home" Exhibition are a new pattern of electrically-driven knife cleaner for hotels, an electrically operated refrigerator without any moving parts, and a neat polishing set comprising a small motor and a selection of brushes, &c. A system of electrical control for gas burners was also exhibited. (Page 261.)

The new 12,000-ampere-hour battery plant at the Dickinson Street Station of the Manchester Corporation is now at work. This comprises a Tudor battery of 210 cells of unusual size, three reversible boosters, and the necessary switchgear. The latter is especially interesting on account of the heavy currents dealt with. Aluminium bus-bars are employed, and the connections with the switch contacts and with the cables are on quite new lines. The battery will run in parallel with the traction generators during the day, and take in the surplus power automatically. During the early hours of the morning it will take the whole traction load, and in the evening the lighting load peak. (Page 261.)

At a meeting of the British Constitution Association on Monday, Mr. Balfour-Browne, K.C., read a Paper on State and municipal trading, in the course of which he mentioned that in New Zealand the school children were carried free on the tramways. (Page 266.)

A slight fire which occurred last week at the Anti-vivisection Hospital, Battersea, was caused by the electrical installation, which had been allowed to get into bad repair. (Page 266.)

We publish the list of nominations for vacancies upon the Council of the Institution of Electrical Engineers. Mr. S. Z. de Ferranti is proposed as the new President. (Page 267.)

Much dissatisfaction has been caused by the acceptance by the Westminster City Council of the Gas Light & Coke Company's tender for lighting Regent Street, Piccadilly, and neighbouring thoroughfares, in spite of the fact that the electric lighting of Regent Street had been a pronounced success from every point of view. The Gas Light & Coke Co. tendered an extremely low price, which, it is thought, must be considerably under cost, when everything is taken into account. (Page 267.)

In a lecture before the Association of Engineers-in-Charge, Mr. R. J. Wallis Jones described the various

Digitized by Google

methods of electric welding. The heavy current method had been adopted for softening portions of hard steel armour-plate previous to drilling. An electrolytic method, in which the resistance of a film of hydrogen caused the metal to heat up, had been used for the continuous annealing of wire. (Page 268.)

THE President of the Board of Trade does not think it necessary to promote legislation to compel the installation of wireless telegraph apparatus upon ocean-going steamers at the present time. The Marconi Co. announce the opening of a permanent wireless telegraph service between Europe and America on Saturday. (Page 268.)

THE Bill authorising an electric railway between Wimbledon and Sutton has been passed by the House of Lords Committee. The Charing Cross, Euston, & Hampstead Railway Co. have withdrawn their proposal for the through running of trains from their line at Charing Cross to the District Railway. A proposal by the Leeds Corporation to adopt trolley omnibuses has been passed by a House of Commons Committee. A similar proposal by the Bradford Corporation is now under consideration. (Page 269.)

THE Birmingham Electricity Committee propose to hand over £10,000 to relief of rates.—A Dublin resident questions the legal powers of the Corporation to meet a £14,000 deficit on the electricity undertaking out of the rates.—It is stated that the cost of the new power station of the Dundee Corporation, namely, £103,000, is within £3,000 of the estimate. The Tramways Committee propose to insure for third party risks instead of maintaining an insurance fund as hitherto.—The Manchester tramway receipts for the year just ended show an increase of £3,185. (Page 270.)

LEEDS Corporation require 5¼ miles of 6,600 volt cable; Newport Corporation a 1,000 kw. double-current turbo-generator, or a similar size turbo-alternator; and the Lanark County Council, steam dynamo, switchboard, cable, &c. Extensions are proposed as follows: Ashton-under-Lyne (£48,424); Bacup (£3,000); Eastbourne (£2,000); Edinburgh (£45,000); Gillingham (£3,000); Manchester (£40,000); Whitehaven (£2,500); Wolverhampton (£23,000); and Yarmouth (£3,500). The estimates of electrical work to be carried out in the Netherlands and Dutch East Indian colonies during the next few years amount to many millions of pounds. (Page 270.)

ALTHOUGH the accounts of the London United Tramways Co. for 1909 show a net balance of £21,950, no dividend on the preference shares is to be paid. The accounts of Messrs. Babcock & Wilcox show a net profit of over £400,000. (Page 271.)

A CORRESPONDENT criticises some of the formulæ in Mr. H. H. Harrison's recent article on Central Battery Telegraph Circuits.—Mr. W. P. Durtnall protests against the allegation by Mr. C. A. Parsons that a short circuit on a large generator in the engine-room of an electrically-driven ship would cause all the engine-room staff to be killed by copper poisoning.—An appeal is made to exhibitors at the Japan-British Exhibition to have their exhibits ready before the opening of the exhibition. (Page 273.)

AMONG the specifications published by the Patent Office on Thursday last was one by S. G. Brown covering the use of osmium-iridium alloys in place of carbon powder in microphone transmitters.—A combined transformer and meter for small A.-C. lighting consumers is described by Prof. E. and W. H. Wilson.—J. G. Childs and T. S. Hill have protected a system of automatic regulation for wind-power generating plants. The wind-turbine is enabled to run always at the most efficient speed by reducing the excitation of the dynamo as the speed increases.—A compact centrifugal fan, in which the blades are fixed to an armature rotating round a fixed field system, is described by K. Maxaner.—L. M. Waterhouse covers a ceiling rose with a spring-supported clip for taking up any vibration. (Page 274.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, APRIL 21ST.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, Westminster. "Hydro Electric Installations of Sweden," by A. V. Clayton.

FRIDAY, APRIL 22ND.

Physical Society.

5 p.m. At Imperial College of Science. "The Magnetic Balance of Curie and Cheneveau," by C. Cheneveau and A. C. Jolley.

Royal Institution.

9 p.m. Evening discourse by T. Thorne Baker on "The Telegraphy of Photographs, Wireless and by Wire."

MONDAY, APRIL 25TH.

Institution of Electrical Engineers: Newcastle Section.

8 p.m. At Armstrong College. "Earthed *versus* Insulated Neutrals in Colliery Installations," by W. W. Wood.

TUESDAY, APRIL 26TH.

Faraday Society.

8 p.m. At Institution of Electrical Engineers, 92 Victoria Street, London. Papers on water and aqueous solutions.

WEDNESDAY, APRIL 27TH.

Institution of Electrical Engineers: Birmingham Section.

7.30 p.m. At the University. "Magnetic Oscillations occurring in D.-C. Machines," by G. W. Worrall.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. At 92 Victoria Street, London. "Some Notes on Current Central Station Design in Germany," by J. C. Connan.

Faraday Society.

7.45 for 8 p.m. Dinner in Honour of Professor Walden of Riga, at Trocadero, London.

THURSDAY, APRIL 28TH.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, London. "Earthed *versus* Insulated Neutrals in Colliery Installations," by W. W. Wood.

Telegraph Traffic.—The 13th inst. brought news of the interruption and the repair of the Fao-Bushire cable; and on the 15th inst. the "El Arich" route was restored to working order.—The land-line between Saigon and Bangkok was down on the 18th inst. for a short time.

The Iron and Steel Institute.—We are asked to state, in connection with the programme of the annual meeting of the Iron and Steel Institute, that the Lancashire & Yorkshire Railway is included among the railway companies who have joined in granting a reduction in return fares, from May 3rd to 6th inclusive, to members of the Institute travelling to London to attend the annual meeting.

Cross-Channel Telephony.—It is announced that, in addition to the new London-Paris telephone cable which was recently described and illustrated in our columns (see ELECTRICAL ENGINEERING, March 17th. p. 179), arrangements are being made at Dover for laying an additional telephone cable to Belgium. It is expected that the new cable will be laid between St. Margaret's Bay (Dover) and La Panne, near Ostend.

The International Committee on Electrical Units and Standards.—An article in the *Electrical World* by Prof. E. B. Rosa gives an account of the work of the International Committee which is to carry on the work of the International Conference on Electrical Units and Standards, held in London in 1908. The Committee arrived at the conclusion that it was impossible to select a more exact value of the Weston normal cell in terms of the ohm and ampere than had been done by the London conference, nor would it be possible to agree upon the specifications of the silver voltameter without further experimental investigation, and, in response to an offer from Prof. S. W. Stratton, Director of the Bureau of Standards, it was decided that a joint investigation should be carried out at the Bureau of Standards by representatives of the Bureau of Standards, together with one delegate from the Physikalisch-Technische Reichsanstalt, Berlin, one from the National Physical Laboratory, London, and one from the Laboratoire Central d'Electricité, Paris. These delegates, as appointed by the directors of the several institutions, are Prof. Dr. W. Jaeger, Mr. F. E. Smith, and Prof. F. Laporte. The representatives of the Bureau of Standards are Prof. E. B. Rosa and Dr. F. A. Wolff. In addition to the work on standard cells and the silver voltameter, a comparison is to be made of the resistance standards of the several national standardising institutions. The European delegates have now been in America for some weeks, and it is hoped that the investigations will be completed in about two months.

ELECTRICITY IN THE HOME

ALTHOUGH a large number of the domestic applications of electricity are only very poorly represented at the "Ideal Home" Exhibition now being held at Olympia, London, a few electrical contractors have taken stands and exhibit a selection of lighting fittings and heating and cooking apparatus.

Messrs. Lacy-Hulbert & Co., Ltd. (91 Victoria Street, Westminster, London) exhibit a self-contained electric polishing set, as illustrated in Fig. 1. This comprises a small motor with an assortment of buffing wheels, brushes, and mops for cleaning

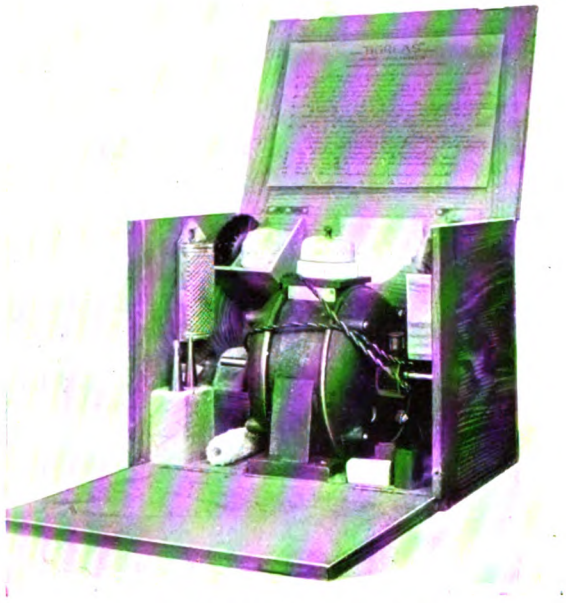

Fig. 1.—"Boreas" Polishing Set.

silver and other metal articles, boots, knives, &c. A flexible and an adapter for connecting the motor to the lighting circuit is provided. An ingenious starting switch is provided for the A.-C. motors.

A most attractive display including all the latest novelties has been arranged by Messrs. Rashleigh Phipps & Co. (147 Oxford Street, London, W.), who also give frequent demonstrations of electric cooking. The most interesting item here is a large electrically-driven knife-cleaner, suitable for hotels, schools, &c. The four polishing wheels are of rubber with leather rims, and these are mounted so as to exert pressure on the blade. The wheels are rotated through gearing by a ⅓-h.p. motor, and by means of a simple clutch the grinder and buffing brush can be quickly thrown into gear also. The machine polishes sides, back and shoulders in one operation, and is capable of dealing with 24 knives per minute. The leather rims can be readily removed when worn out. Another interesting device shown on this stand is an electrically-driven horse-clipper and sheep-shearer. An electrically-operated refrigerator is also exhibited. This is manufactured by Messrs. Werner Pfleiderer & Perkins, Ltd. (Westwood Works, Peterborough), and comprises a vessel containing a solution of ammonia in water and heated by a resistance coil consuming 1,000 watts. The anhydrous ammonia gas evolved is liquefied in a cooling tank and delivered into a vessel immersed in a brine tank. When all the gas is evolved, the temperature of the solution rises, and the heater is automatically cut out; then, as the solution cools, it absorbs the gas, causing rapid evaporation of the liquid ammonia and consequent cooling of the brine. The heating period is about one hour, and after an hour or an hour and a half after the heater is cut out it must be switched in again by hand if it is desired to maintain the low temperature. The temperature can easily be lowered sufficiently to make ice. Among the other items exhibited by Messrs. Rashleigh Phipps & Co. is an electric clock, in which an impulse is given to the oscillating wheel only once in every 2 or 2½ minutes. A lamp-holder with magnetic attachment for use when repairing and cleaning motor-cars, and a small portable drill, are also shown. An attractive feature of the display is an electrically worked and illuminated fountain, with the motor and pump hidden in the lower portion of the basin.

An interesting device for controlling and igniting gas-lamps electrically is exhibited by Telephos, Ltd. (16-20 Farringdon Avenue, London, E.C.). As shown in Fig. 2, this consists of a valve controlled by an electromagnet, and a platinum igniting spiral. The former consists of a perforated toothed wheel, which is rotated tooth by tooth by the magnet. The holes in the wheel coincide with corresponding holes in the base every alternate tooth. The controlling circuit consists of the magnet coils, the platinum spiral, and a push-button switch connected in series with a 6-volt dry battery and from 10 to 20 yards of No. 22 S.W.G. wire. When the circuit is closed, the magnet pulls up its armature and moves the wheel one tooth forward, thus opening the valve, and simultaneously the platinum spiral is caused to glow and ignite the gas. To turn out the gas, the push-button is pressed again, and this causes the wheel to move another tooth forward and close the valve. The spiral glows again, of course, but this does not matter. For inverted burners a modified form of the device is used. In this case there is an auxiliary gas-tube conveying gas down to the outside of the burner just above the mantle. When the circuit is completed, both the main valve and an auxiliary valve are opened, so that gas is led down to the outside of the burner and there ignited by the platinum spiral. This auxiliary jet ignites the main jet, and on releasing the switch the auxiliary valve is closed. As in the case of the upright burner, a second push of the button turns off the gas. These devices can be connected so that several work off one battery, and several may be controlled by one switch. We understand that an installation of 160 burners in the Technical College of Galashiels, and other large installations, have already been fitted with this system of control. For street lighting a plug-socket is provided in the lamp-post, and a man goes round with a battery and a plug to insert in the socket.

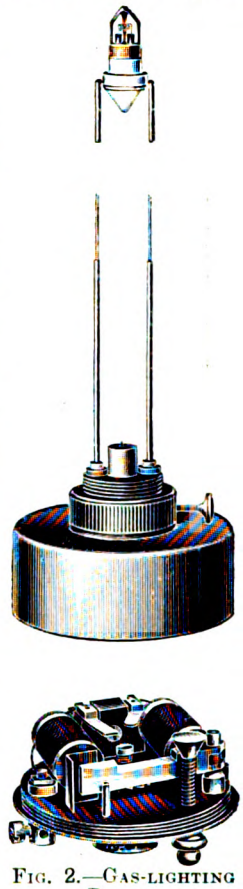

Fig. 2.—Gas-lighting Device.

Among the other exhibits of electrical interest are country-house lighting installations by Messrs. F. A. Glover & Co., Ltd. (Vine Street, Clerkenwell Road, London), and Messrs. Tredegar & Co. (56 Victoria Street, London). The latter firm also show their well-known wooden lighting fittings. Other artistic lighting fittings are exhibited by several firms, including the Birmingham Guild, Ltd., Ratcliff & Evens, and Oliver, Clark & Co., Ltd. The last-named firm has a 1½-pint kettle taking 682 watts, and listed at 7s. The British Vacuum Cleaner Co., Ltd. (Parsons Green Lane, Fulham), and Messrs. Wallach Bros. (Royal London House, Finsbury Square, London) exhibit electrically-driven vacuum cleaners. The Dowsing Radiant Heat Co., Ltd., have a large selection of electro-medical apparatus on view.

12,000 AMPERE-HOUR BATTERY PLANT AT MANCHESTER

A 12,000-ampere-hour battery has been installed to take the peak load on the Manchester electricity works, and to level the load on the generating plant. It has been erected at the Corporation's Dickinson Street station, and is now being taken into use. This battery is the largest storage battery yet put down in this country, and particular interest also attaches to the way in which it is designed to effect economies by being employed partly on the lighting and partly on the traction load. Through the courtesy of Mr. S. L. Pearce, Chief Electrical Engineer to the Manchester Corporation, we have been permitted to inspect this addition to the electricity supply system of that city, and Mr. Pearce and the various manufacturing firms concerned have kindly placed the fullest possible information at our disposal, which has enabled us to publish a complete description of the plant.

A brief description of the previous equipment of the

Digitized by Google

Dickinson Street and Bloom Street stations, will assist the reader to follow the details of the new arrangements. There are four reciprocating sets at Dickinson Street, viz., two Musgrave-Siemens 1,500 kw. machines, and two Ferranti-Westinghouse 750 kw.

Fig. 1.—Part of the Batiery.

compound-wound traction sets. In addition, there are also two Parsons 1,800 kw. D.C. turbo-generators and two Parsons-Siemens D.C. 750 kw. turbo-generators. The latter turbo-sets are used on the traction as well as the lighting load. The Bloom Street plant is used principally for traction supply in the city, and consists of four Musgrave-Westinghouse 1,800 kw. reciprocating sets. These two stations are adjacent, and are interconnected so that all the plant runs in parallel. The battery will take the lighting peak load throughout the year, and the early morning traction load, and will at other hours assist the traction plant in both stations. This will render it generally unnecessary to take power for the central city area for the peak loads from the large Stuart Street three-phase station, which has hitherto supplied a portion of the Dickinson Street lighting load through La Cour converters at the latter station. These converters, however, still act as the necessary interconnecting link between the two stations. During the day the battery is charged from the surplus output of the traction generators at Dickinson Street and Bloom Street, which will thus be under practically constant load, and during the night from the lighting generators.

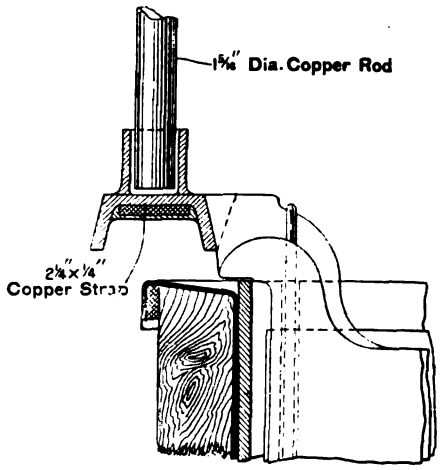

Fig. 2.—Arrangement of Connection to the End Cell of Each Row.

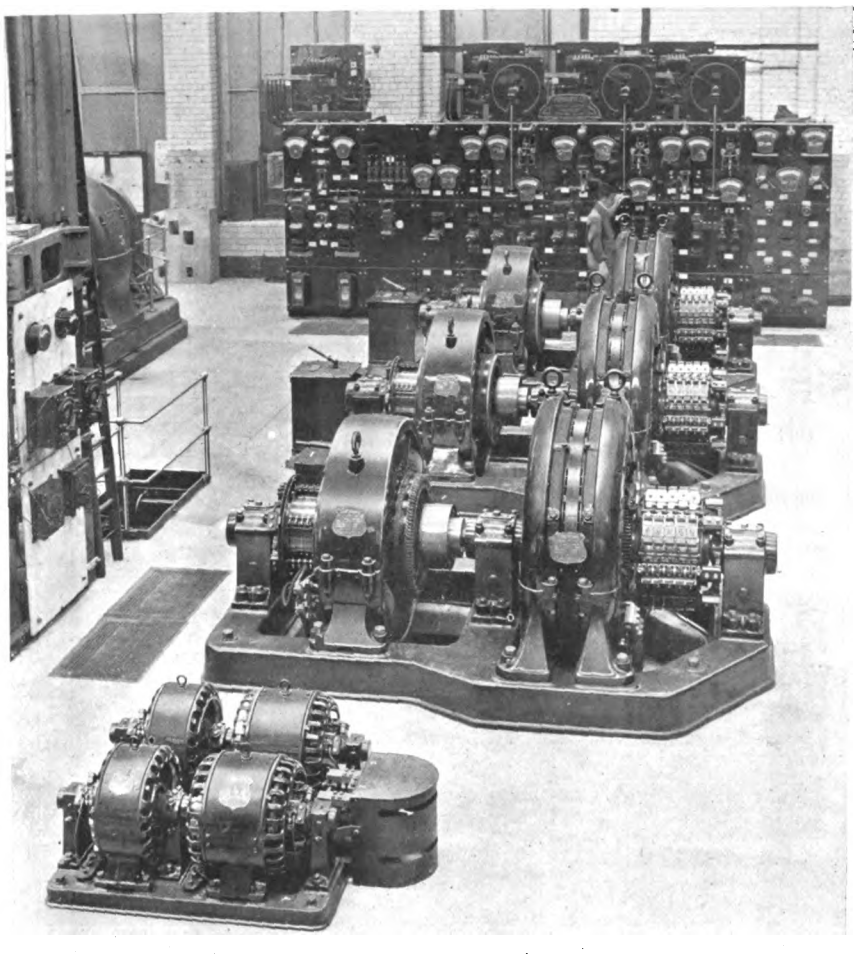

Fig. 3.—General View of Booster Sets and Switchboard.

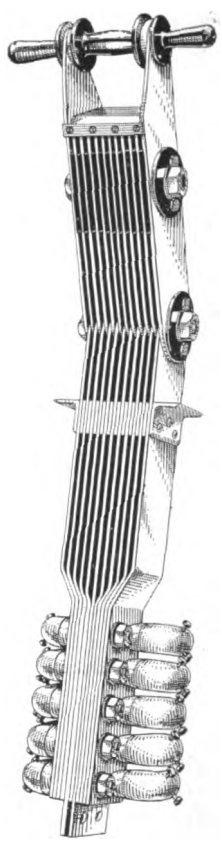

Fig. 4.—15,000-ampere Change-over Switch.

Digitized by Google

The contract for the supply and erection of the battery and automatic reversible boosters was carried out by the Tudor Accumulator Co., Ltd., of London. The battery was manufactured throughout at the company's works, at Dukinfield, near Manchester, and consists of 210 cells in series, and can maintain with one of the boosters a voltage of 450 across the lighting 'bus-bars. Charging is carried out from the 525-volt

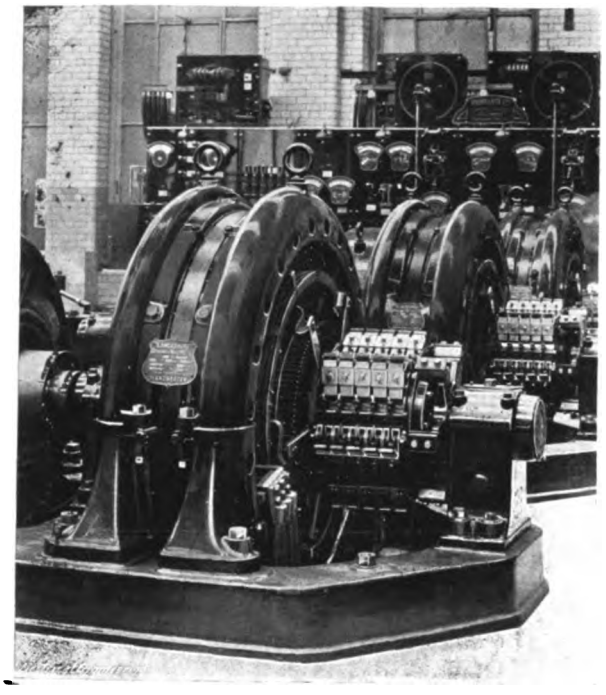

Fig. 5.—Generator of Booster Set.

traction 'bus-bars under the conditions outlined below. The following discharge rates are guaranteed:—8,400 amperes for 1 hour, 5,000 amperes for 2 hours, 3,900 amperes for 3 hours, and 11,200 amperes for half an hour. It is further to withstand a maximum discharge rate of 15,000 amperes. The normal charging rate is to be 4,100 amperes, and the maximum charging rate 6,500 amperes. The service will be rather severe, as the battery may be called upon for two complete discharges per day. A view in the battery-room, showing some of the cells, is given in Fig. 1. Both the positive and negative plates of the cells are of the standard Tudor construction, but of an unusually large size, the outside dimensions of the cell being 6 ft. 1½ in. long by 2 ft. 2½ in. wide by 3 ft. 4½ in. deep.

The containing boxes are constructed of pitch-pine, panelled and dove-tailed and pinned together with antimony-lead dowels; no screws or nails are used. They are lined with sheet-lead, and coated inside and out with acid-proof paint. Each cell contains 77 plates, the dimensions of which are 29 in. by 20¾ in. The positive plates are 0·4 in. thick and weigh 71 lbs. each, while the negative plates are 0·3 in. thick and weigh 31 lbs. each when finished. As shown in Fig. 2, the plates are suspended by their lugs, which rest on ⅜-in. vertical glass plates. Wood separators strengthened by longitudinal ribs are placed between the plates. A space of 8 in. is left beneath the plates for the accumulation of deposit, which need be cleaned out only at long intervals. The weight of each cell complete is about three tons.

The stands on which the cells are placed consist of four runners of pitch-pine, tied together at intervals and supported on large porcelain oil insulators. Each cell rests on twelve glass oil insulators placed on the runners. The woodwork is coated with acid-proof paint, and no metal fastenings of any kind are used. The whole rests on acid-proof flooring laid by J. Dickinson & Co., of Bolton. Connections are made from cell to cell by burning the lugs on to the lead connecting bars in the usual manner. The connections from row to row consist of six copper rods (each 1·4 sq. in. in section) in parallel. In order that the current shall be evenly divided, the rod from the extreme outside socket of one cell goes to the innermost socket of the other cell, and so on, so that all the rods are of equal length. The manner in which this is effected without the rods crossing each other is shown in Fig. 1. A copper strip, 2¼ in. by ¼ in. in section, is cast in the lead bar, from which the row to row connections are made, so as to reduce and equalise the resistance of the paths from the lugs to the rods. The copper rods are sweated into sockets, in the form of lead cups. The solder only reaches to within 3/16 in. of the top of the cups, and the remaining space is filled with vaseline to prevent corrosion of the copper at the junction.

The battery has been installed in a specially constructed room over the boiler-house, and is arranged on two floors, with only a few cells, however, on the upper floor. Above the latter is a platform on which is a "Normandy" distilling apparatus, supplied by the Thames Ironworks & Shipbuilding Co. for providing distilled water for the cells. The total floor-space covered by the battery is about 5,800 sq. ft. The room is lighted by 200-volt 25-c.p. Osram lamps in porcelain fittings, with hermetically sealed glass globes by the General Electric Co. The wiring consists of uninsulated lead-covered copper wire strung along the ceiling on porcelain insulators, and the connections from these wires to the switches and fuse-boxes are of lead-covered paper-insulated cable, the joints being well coated with acid-resisting insulating paint.

The Tudor Company have entered into an agreement to maintain the battery at 100 per cent. of its rated output for a period of ten years on the basis of 7½ per cent. of the purchase price. An efficiency of 85 per cent. in ampere-hours or 75 per cent. in watt-hours, when the total output is not less than three-quarters of its rated capacity, is guaranteed.

Fig. 3 is a general view of the booster sets, showing the switchboard in the background. The motor-driven booster sets were manufactured by the Lancashire Dynamo & Motor Co., Ltd., and are of the well-known Turnbull & Macleod automatic reversible type. Each set consists of an interpole shunt-wound motor driving a separately excited booster also fitted with interpoles. The boosters have laminated yokes and main magnet-

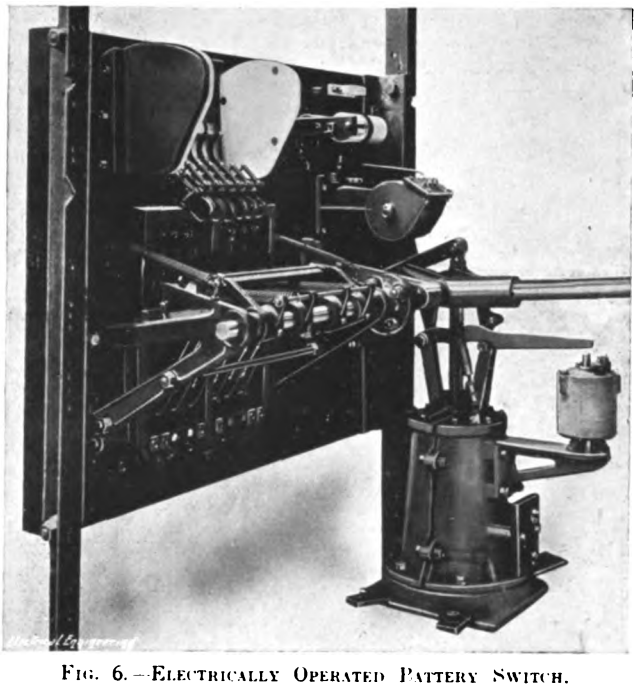

Fig. 6.—Electrically Operated Battery Switch.

poles to allow of rapid reversal of the field. The wrought-iron interpoles of both motor and booster are wound with copper strip on edge, and the connections are also of copper strip. The armature of the booster is parallel wound with equalising connections to every turn in the winding. A view of one of these machines showing the large commutator and substantial brush-gear is given in Fig. 5. Copper-gauze brushes with carbon tips are used on account of the heavy current to be dealt with.

Digitized by Google

As shown in the illustrations, the sets have each three pedestal bearings mounted on a single bedplate. The motors run off the traction 525-volt 'bus-bars or

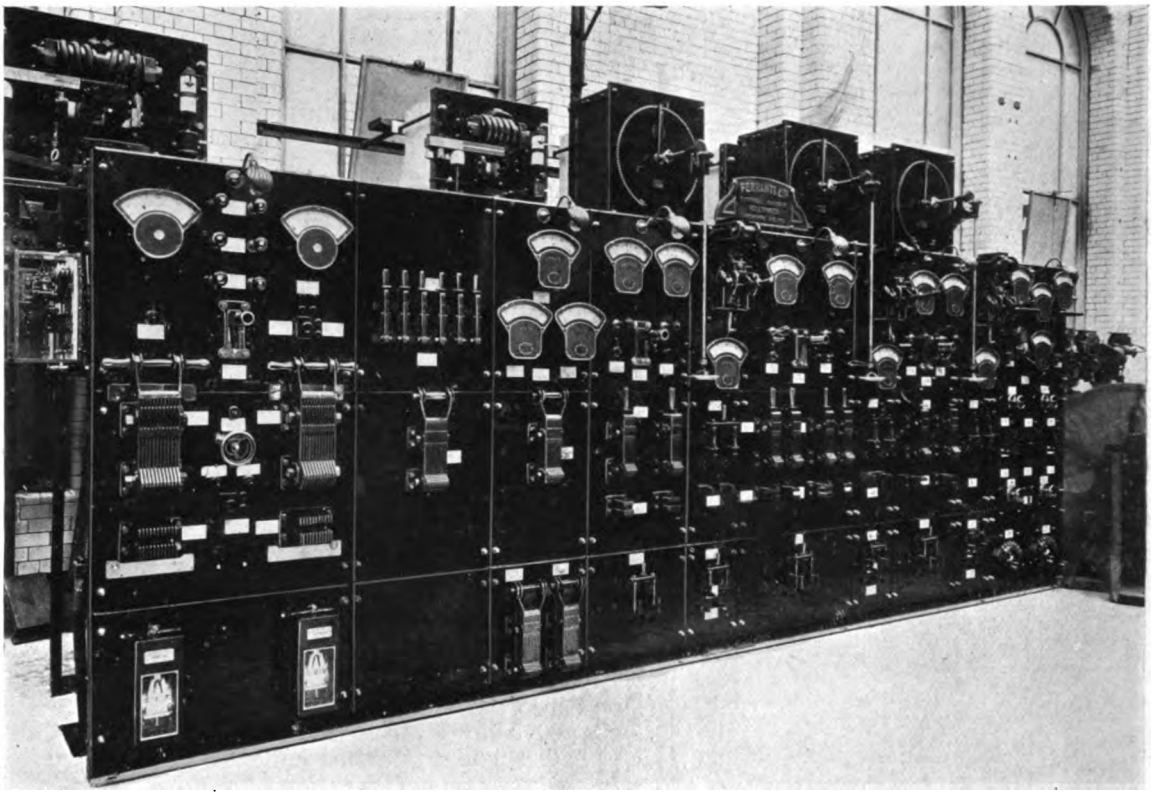

Fig. 7.—The Switchboard.

the lighting 425/450-volt 'bus-bars, and the capacities of the boosters are specified as follows:—2,000 amperes at 80 volts for 4 hours; 2,800 amperes at 60 volts

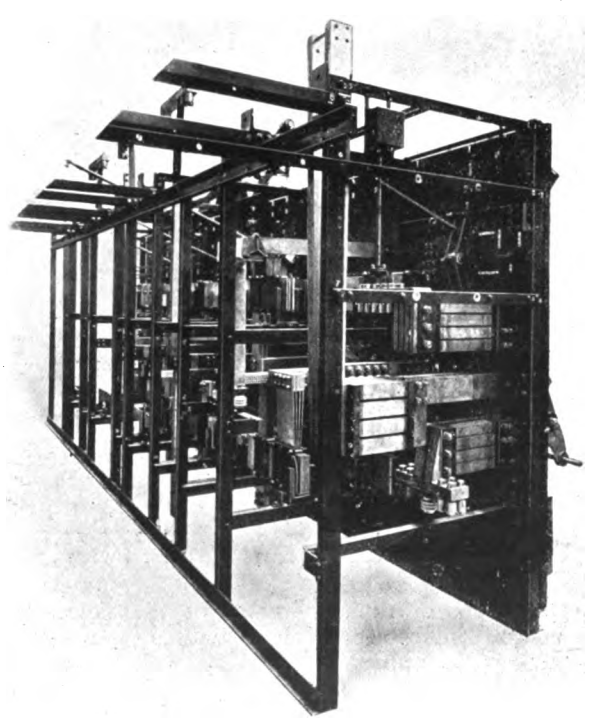

Fig. 8.—Back of Switchboard.

for 1 hour; 2,700 amperes at 80 volts for half an hour; 2,800 amperes at 100 volts for 15 minutes; and 5,600 amperes at 80 volts for from 3 to 5 minutes.

When the battery is on the traction load, any one (or two in series) of the boosters may be put in series with the battery, and in this case the regulation is automatic. When the output of the generators exceeds the traction load, the excess current is fed into the battery. When, however, the output of the generators for the time being is less than the load, the excess is supplied by the battery. Thus the generators are adjusted to supply the average load continuously. The method of bringing this about is as follows:—

In the traction negative bar, a diverter is inserted, consisting of six resistances in parallel, each of 0·002 ohms. Any number of these resistances can be inserted by an arrangement of six knife-switches, seen on the second panel of the switchboard. The series windings of each of the small generators for exciting the boosters are connected in parallel with the diverter, so that the current passing through the series winding is proportional to the load. These exciter generators, of which there are two, one being spare, can be seen in the foreground in Fig. 3. They are driven by shunt motors connected to the traction or lighting 'bus-bars, and will deliver 5 amperes at any pressure up to 450 volts. Besides the series winding, each exciter generator has two independent shunt windings, one connected across the terminals of the booster and including in its circuit a field switch and rheostat, and the other connected across either the lighting or the traction bars, with a potentiometer form of resistance inserted. The pressure across the first shunt winding is the difference between the battery and 'bus-bar volts, and consequently this winding causes the booster to balance all variations of the battery volts. The second winding is constantly excited in such a direction that the main generators tend to charge the battery. The series windings are opposed to the latter coil, and when the load increases beyond a certain value, these windings wipe out the shunt excitation, the boosters reverse, and the batteries discharge. For operation on the traction system the potentiometer and shunt-field resistance are adjusted, and the generator takes up the average duty required of it, and the fluctuations of the load are then dealt with by the booster automatically.

When the battery is on the lighting load, the boosters are connected singly, or two or three in parallel, according to the load. The regulation is then not automatic, but is effected by hand in the fields of the auxiliary exciter generator by means of either a shunt or a potentiometer regulator. Provision is made for the further possibility of exciting the boosters direct from the 'bus-

Digitized by Google

bars by hand regulation and dispensing entirely with the motor-generator exciter.

The switchgear, which has been supplied by Messrs. Ferranti, Ltd. (Hollinwood, Lancashire), is particularly worthy of notice, since it embodies a number of novel features of design. The emergency currents which have to be dealt with are enormous, and the designers have fully taken this into consideration when constructing the switchgear. There is a natural tendency among designers who have already developed satisfactory standard apparatus for certain sized units, merely to modify dimensions all round when called upon to supply similar apparatus capable of dealing with currents considerably greater than have hitherto been handled. It frequently happens, however, that gear which is entirely suitable for dealing with a certain amount of power cannot be enlarged so as to deal with still greater quantities of power satisfactorily; on the other hand, radical modifications to the design are necessitated to render it suitable to deal with an increase of power, and in the switchgear under discussion the departures from hitherto recognised practice which have been necessitated by the exceptionally heavy currents to be dealt with form a striking example of this. In the first place, with a battery of 12,000 ampere-hours' capacity at a maximum voltage of 600, it was deemed advisable to insert two substantial circuit-breakers in the main leads connecting the battery to the switchboard and as close as possible to the battery-house. These circuit-breakers, one of which is illustrated in Fig. 6, are of the magnetic blow-out type, and are capable of carrying 15,000 amperes continuously. Each is enclosed in a separate concrete cubicle just outside the battery-room so as to shield it entirely from all other parts of the station, and each is independently operated electrically from the switchboard by means of solenoid control. They are non-automatic, and are provided with a suitable controller to show by means of signal lamps on the operating panel whether they are closed or open. The main cables connecting these switches to the automatic circuit-breakers on the main board are carried along under a gallery and the iron stairs, being supported in porcelain clamps suspended on iron straps. The automatic circuit-breakers on the main switchboard are of a similar type, but are mechanically operated from the front of the panels. They are also enclosed in concrete cubicles.

Fig. 7 shows a front view of the switchboard as erected at the manufacturers' works.

It consists of ten panels. The first (on the left of Fig. 7) is the main battery panel, in the centre of which is the socket for the operating handle of the main 10,000-ampere automatic circuit-breaker; just below this are two 15,000-ampere single-pole change-over switches for changing over from the traction to the lighting 'bus-bars, or *vice versa*. On the same panel are the indicating lamps for the solenoid-controlled battery circuit-breakers, an ammeter reading 5,000—0—15,000 amperes, a voltmeter for connection to the battery, lighting or traction bars, recording ammeter and voltmeter, and (on the side of the board) two watt-hour meters for measuring the energy supplied to the lighting and traction bars respectively. The second is the diverter panel, and comprises simply the six 500-ampere knife-switches for adjusting the value of the diverter resistance, and a 6,000-ampere switch in the series field circuit of the exciters. On the third panel are three 4,000-ampere switches for short-circuiting the boosters, the three voltmeters above them being connected across the three switches respectively. The next six panels are alternately generator and motor panels for the three booster sets. The generator panels each include two 3,000-ampere change-over switches connecting alternately with the traction or lighting bars; a 4,000-ampere automatic circuit-breaker (these are placed in concrete cubicles behind the board, and only the socket of the operating handle can be seen), a voltmeter and an ammeter, and a small change-over switch at the base of the panel for connecting the booster field either to the bars off which the main motor is run, or to the auxiliary exciters.

The automatic circuit-breakers on the generator panels are electrically interconnected with the motor circuit-breakers, so that the former come out if the latter do; this is necessary, as otherwise the boosters would be driven from the battery and would run up to a dangerously high speed. Each motor panel comprises a 500-ampere double-pole change-over switch for connecting to either traction or lighting bars, a 700-ampere automatic circuit-breaker, a starting rheostat above the board and operated through bevel gearing, and an ammeter. The remaining panel is allotted to the two exciters, and contains three double-pole 50-ampere change-over switches, two 50-ampere automatic circuit-breakers, two motor-starters, field and potentiometer regulators, ammeters, and a voltmeter. One of the double-pole switches connects the exciter bars to one or the other of the exciter-generators, while the other two are in the motor circuits.

Fig. 8 is a view of the back of the board before the concrete structure was put in, and is worthy of careful inspection in view of the unusually heavy construction. The bars and connections are of aluminium strips interleaved and firmly bolted together. They are carried on a very substantial iron framework, and the design is such that the various 'bus-bars are separated and enclosed in concrete troughs. The positive and negative bars are supported on cast-iron brackets lined with porcelain with an insulating bedding of sheet rubber.

The two 15,000-ampere change-over switches on the first panel are of a special design to avoid serious heating.

The principle used in smaller switches, say, those up to 1,000 amps., cannot be employed for larger sizes by merely increasing the dimensions all round. For the smaller switches, for instance, it is not unusual to employ for the hinged contact a substantial copper block, into which are let two or more jaw pieces to form the hinged contact. These jaw pieces are not only let into the main contact block, but are usually sweated and riveted. A round stem is then screwed into the contact block, which stem passes through the main panel, current being

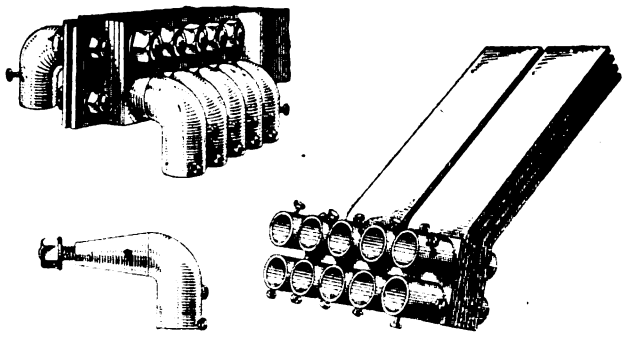

Fig. 9.—Cable Connectors on Switch and Circuit-breaker.

taken from the stem by means of surface contact nuts clamped up on each side of a cable socket. The current, therefore, passing from the movable member of the switch, enters first into the jaws, then through the surface contact between the jaws and the contact block, through a second surface contact between the contact block and the round stem, through a third surface contact between the round stem and the surface nuts (which, by the way, is a screw thread), and finally by a fourth surface contact between the surface nut and the cable socket. However carefully these surfaces are prepared, heating it bound is occur, and in the large sizes of switches this heating is a very serious consideration indeed.

Messrs. Ferranti, Ltd., however, avoid all intermediate surface contacts between the jaw pieces and the cable sockets or corresponding connectors. The construction is illustrated clearly in Fig. 4. A number of parallel copper strips are clamped together with suitable distance pieces between, and at each side is riveted an angle bracket by which the whole is attached to the panel. The distance pieces and angle brackets are, it will be noticed, at the back of the panel, so as to give maximum flexibility to the jaw pieces where the movable member enters. The jaw pieces are thus carried right through in one continuous length, and in the case of cable connections they are drawn together, riveted and soldered into a solid mass, and then drilled with taper holes, for conical plug cable sockets, as shown in Fig. 9. Where, however, the connection from the switch is by means of copper or aluminium strips, the same are interleaved between the back ends of the various jaw pieces so as to form a junction of very extensive contact area, as shown in Fig. 9. It will be noticed that in each case no screw threads are depended upon for taking the current from one link of the circuit to another, but that accurately trued up surfaces of exceptionally large cross-section and bolted together are provided. After the movable member or the blade of the change-over switch has been closed, the bolts passing through, not only the hinged, but also through the upper or lower contact, as the case may be, are tightened by means of an insulated detachable

Digitized by Google

ratchet spanner. It is found that with this construction the total drop over the entire switch, with 10,000 amperes flowing through it, does not exceed 5·5 milli-volts.

The same principle has been adopted in the large circuit breakers. A number of copper strips are taken and separated by distance pieces of copper, and the whole are drilled through longitudinally, sweated and riveted up, when the upper surface is machined, accurately planed, and brought to a fine bedding surface. The distance pieces between the separate copper strips are of considerable depth, and so securely riveted together that the contact block thus formed is in all respects equivalent to a single block of forged copper, with the exception, however, that the greater proportion of the current entering the block from the laminated brushes of the circuit breaker passes direct into the copper strips which, being extended at the back, form a connection for the bus-bars or elsewhere, and thus again intermediate surface contacts are eliminated. As stated, the circuit breakers supplied are of the magnetic blow-out type, and in view of the fact that the distance between the cheeks of the blow-out coil is very great, most careful experiments were made to determine the shape of the magnetic field in the intervening space. The effect of the iron portions of the circuit breaker, as well as the current-carrying conductors which form part of the circuit breaker, in deflecting the magnetic field in the blow-out space were also experimentally determined. The final rupture is exceedingly quick, and is effected in the following way. The circuit breaker consists essentially of two independent movable elements, the one carrying the main laminated brush, and the second carrying the blow-out finger contacts. Both are operated by toggles, but in such a way that on releasing the switch the main brush opens first, and after it has travelled quite clear of the main contact, it releases the toggle of the second element, which, being of relatively small inertia, opens with a quick action and without excessive jar.

MUNICIPAL AND STATE TRADING

AT a meeting of the British Constitution Association at the Whitehall Rooms, London, on Monday evening last, Mr. J. H. Balfour-Browne, K.C., read a Paper on the subject of State and Municipal trading. The chair was occupied by the Earl of Hardwicke. Mr. Balfour-Browne asserted that though municipalities always showed a marked desire to get hold of paying concerns with which to relieve the rates, the risks of new enterprises were always left to be taken by private individuals. When tramway companies asked for powers to run trams, the conditions were made far too onerous. Thus, it was often made a condition that the company should bear the expense of any street alterations. When a municipality carried out street alterations for their own tramways, however, only one-third or less of the cost was charged to the tramways accounts. In 1907 the London County Council only charged one-eighth part of the cost to tramways accounts, the remainder being charged to the rates as town improvements. The State monopoly of the telegraph system had meant a loss to the country of ten million pounds; in 1906, for example, the deficit was £489,000. Now, the State was shortly to take over the telephone system, after crippling its early progress. Meanwhile the National Telephone Co. was, he said, not in a position to develop and improve the system, and the public suffered in consequence. The Post Office was already overburdened with work, and the addition of the telephone service would not help matters. After referring to the cases of the Water Board and the Port of London Authority, the lecturer asserted that the enterprise, ability, and initiative of private work would soon be destroyed by State encroachment. In most State or municipal undertakings the policy was still to make a profit, but it would soon be otherwise. In New Zealand, for instance, school children were already carried free on the tramways. Profit was the driving wheel of all individual enterprise, but all profit was now looked on with suspicion.

The Textile Institute.—The inauguration of the newly formed Textile Institute will take place at a meeting on Friday next at the Midland Hotel, Manchester, and after the meeting a reception and banquet will be held. The President is Sir William Holland, and Sir William is Vice-President of the Engineering Section. Several electrical engineers and specialists in electric driving of textile factories are included in the list of supporters. Further particulars can be obtained from the Hon. Sec., Mr. G. Moores, 12 Exchange Street, Manchester.

Manchester Students' Section of the Institution of Electrical Engineers.—The last meeting of the session was held on Tuesday evening last, at the Municipal Technical School, Manchester, when a Paper was read by Messrs. F. Shaw and J. Davies on the application of the cradle dynamometer to the testing of electrical machinery. At the annual general meeting held the same evening the following members were elected for the committee, to hold office for two years:—Representative members: R. G. Parrott (British Westinghouse Electric & Manufacturing Co.); A. R. Stelling (Mather & Platt, Ltd.); W. Parry (Manchester School of Technology). General members: H. A. Carney, J. N. Hindle, T. G. Travis.

ELECTRIC LIGHTING AND FIRE RISK

AN outbreak of fire occurred one evening last week at the Anti-Vivisection Hospital, Battersea Park Road, and on investigation proves to have been due to the electrical installation having been defective. Fortunately, the outbreak was discovered before it had attained any serious proportions, and was practically extinguished by the hospital staff before the arrival of the Fire Brigade. The circumstances are such that we feel it our duty to call attention to the case. It appears that, not only was the installation in bad repair, but this fact was known to the hospital authorities, the contractors, and the Electricity Department of the Metropolitan Borough of Battersea, who supplied the electrical energy.

The fire broke out under the flooring of the first floor in the oldest part of the building, and just above a distribution-box, from which all the circuits of the whole institution are taken. This box is situated on the wall of a corridor on the ground floor, and some twenty 7/20 vulcanised rubber cables are led up from it to the ceiling in wood casing. The casing stops short at the ceiling, and the cables pass through a hole in the lath and plaster (about 1½ in. by 6 in. in size). They are all bunched together above this hole, and pass along loosely to wood casing laid on the joists under the floor. It was in this bunched portion (about 3 ft.), between the ceiling and the casing on the joists, that the fire broke out. As all the insulation was burnt off the wires just at this part, the state of the cables before the fire could not be ascertained, but it appears that the building is unusually damp, and that there were several T- joints in the bunched portion of the wires. Our representative inspected the wiring near where the fire occurred, and found both the casing and cable in a very bad condition. The installation is about 8½ years old, and the building was uninhabited some time previously to its being put in.

Our representative was informed that both the Battersea Corporation Electricity Supply authorities and the contractors called in to do small repairs had repeatedly warned the hospital authorities that the installation was unsafe. The contractors, we understand, had been called in on more than one occasion because a fuse would not hold, and had found that this was due to bad earths in the wiring, but although they had recommended rewiring, the hospital authorities had not seen their way to have this done. Now, however, they have decided to rewire the whole building.

It seems fairly obvious that the wiring of the installation was not suited to the nature of the building, which called for a screwed barrel system and the very best workmanship. We cannot but think, however, that considerable blame rests with the Battersea Borough Council if it is true that they were informed of the bad condition of the installation. Immediately there is a suspicion that the electric wiring of a building of this character is in an unsafe condition, it is the duty of the supply authority to test it, and if, as must have been the case here, the leakage current is greater than one ten-thousandth of the maximum supply current given to the premises, they are authorised to disconnect it from the mains. As apparently the hospital authorities were not in a position to enable them to incur the cost of rewiring, this should have been done.

The Institution of Post Office Engineers.—The Dublin Section of the Institution of Post Office Engineers are holding a meeting on Tuesday, April 26th, in the theatre of the Royal College of Science, when an address, with lantern illustrations, on "Modern Wireless Telegraphic Methods" will be given by Mr. J. E. Taylor, of the Engineer-in-Chief's Department, General Post Office, to which the members of the Dublin Section of the Institution of Electrical Engineers have been invited.

THE NEW COUNCIL AND COMMITTEES OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE Council of the Institution of Electrical Engineers have nominated their candidates to fill the vacancies on the Council created by the retirements which will take place at the end of the session in accordance with article 45 of the Articles of Association. The President, two Vice-Presidents, five Members of Council, and one Associate Member of Council will retire. These nominations will be announced this evening, prior to the ordinary business of the meeting.

The retiring members are the President, Prof. Gisbert Kapp; two Vice-Presidents, Colonel H. C. L. Holden, R.A., F.R.S., and Sir H. H. Cunynghame, K.C.B.; and Messrs. W. Rutherford, J. H. Rider, W. H. Patchell, J. W. Jacomb-Hood, and Dr. E. Hopkinson, and Mr. H. Human (Associate Member).

The new Council will be constituted as follows, if the candidates nominated are duly elected (the new nominations are in italics):—

PRESIDENT: *S. Z. de Ferranti.*

VICE-PRESIDENTS: *W. H. Patchell, J. H. Rider,* W. Duddell, F.R.S., S. Evershed.

ORDINARY MEMBERS OF COUNCIL: *H. Dickinson, J. E. Kingsbury, P. V. McMahon, R. K. Morcom, S. L. Pearce,* W. W. Cook, G. K. B. Elphinstone, W. Judd, Professor T. Mather, F.R.S., W. M. Morrison, Major W. A. J. O'Meara, C.M.G., J. F. C. Snell, G. Stoney, A. H. Walton, C. H. Wordingham.

ASSOCIATE MEMBERS OF COUNCIL: *S. Morse,* E. Russell Clarke, J. E. Taylor.

The Honorary Treasurer, Mr. R. Hammond, and the Honorary Auditors, Messrs. H. Alabaster and Sidney Sharp, are eligible for re-election.

If there are any alternative nominations, these must be made by two members, supported by eight other members, and sent in to the Secretary by Thursday next, together with the written consent of the nominee to accept office if elected. In the event of no alternative nominations being received by Thursday next, the Council's nominees will be declared duly elected at the annual general meeting on May 26th.

At the annual general meeting of the Manchester Local Section on March 22nd, the following Committee was appointed, the names of new members being given in italics:—

CHAIRMAN: *J. S. Peck* (British Westinghouse Co.)

VICE-CHAIRMAN: *W. Cramp* (Manchester School of Technology).

COMMITTEE: *C. J. Beaver, Dr. F. H. Bowman, A. A. Day* (Chief Electrical Engineer, Bolton Corporation), A. P. M. Fleming (British Westinghouse Co.), J. Frith, *Prof. E. W. Marchant* (Liverpool University), *T. L. Miller, S. L. Pearce* (Chief Electrical Engineer, Manchester Corporation), *Dr. E. Rosenberg* (British Westinghouse Co.), Prof. A. Schwartz (Manchester School of Technology), C. D. Taite (Chief Engineer Lancashire Electric Power Co.), and A. P. Wood (Lancashire Dynamo and Motor Co.). Hon. Secretary and Treasurer: Mr. H. W. Wilson.

The following are the nominations for the Glasgow Committee:—

CHAIRMAN: *Sam Mavor.*

VICE-CHAIRMAN: *J. A. Robertson* (Burgh Electrical Engineer, Greenock).

COMMITTEE: *W. McWhirter, T. B. Murray* (Albion Motor Car Co.), *T. C. Parsons* (Burgh Electrical Engineer, Govan), *John Ferguson* (Chief Engineer, Glasgow Corporation Tramways), J. C. McMillan (Burgh Electrical Engineer, Falkirk), W. C. Martin, Robert Robertson, Prof. Magnus MacLean (Glasgow and West of Scotland Technical College), Dr. J. T. Bottomley. Hon. Sec. and Treasurer: J. E. Sayers.

The Committee of the Yorkshire Local Section have made the following nominations:—

CHAIRMAN: *T. Harding Churton.*

VICE-CHAIRMEN: *Wilson Hartnell* and *W. B. Woodhouse* (Chief Engineer, Yorkshire Electric Power Co.).

COMMITTEE: H. Visger, J. D. Bailie (Messrs. C. A. Parsons & Co., Ltd., Leeds), *H. H. Wright, G. Wilkinson* (Chief Engineer, Harrogate Electricity Works), *W. N. Y. King, W. F. Mylan* (British Westinghouse Co., Sheffield), *E. A. Barker* (Chief Engineer, Barnsley Electricity Works), *R. Pohl* (Phœnix Dynamo Manufacturing Co.), and *J. Fawcett.* The Honorary Secretary is H. Dickinson.

The following nominations have been made for the Dublin Section Committee, and as no further nominations have been received, the Committee's nominees will be elected in due course on May 8th:—

CHAIRMAN: *W. Tatlow.*

VICE-CHAIRMAN: *S. L. R. Price.*

COMMITTEE: *G. F. Pilditch* (Chief Engineer, Rathmines Electricity Works), *P. H. Stewart* (Messrs. Guinness, Son & Co.), *Professor W. Brown* (Royal College of Science, Dublin), *Major Roberts, R.E.* (Superintendent P.O. Telegraphs, Dublin), *L. G. Kettle* (Chief Assistant, Dublin Electricity Works), S. T. Land (Chief Assistant, Rathmines Electricity Works), M. Ruddle (Chief Engineer, Dublin Electricity Works), R. N. Tweedy (W. Coates & Sons, Ltd.). The Honorary Secretary is Mr. T. Tomlinson.

STREET LIGHTING IN REGENT STREET AND PICCADILLY

CONSIDERABLE dissatisfaction is expressed in electrical engineering circles by the decision of the Westminster City Council to accept the tender of the Gas Light & Coke Company for the lighting of Regent Street, Piccadilly, St. James's Street, Pall Mall, Coventry Street, and part of Shaftesbury Avenue by high-pressure gas instead of by electricity. The decision was come to last Thursday, after some discussion, at which Mr. Jacques Abady, Chairman of the Works Committee, who recommended the acceptance of the Gas Company's tender, spoke very strongly in favour of gas lighting.

The dissatisfaction at this decision is shared by the residents and tradesmen in the district, particularly in Regent Street. Hitherto, Regent Street has been lighted by sixteen 12-ampere "Excello" flame lamps, giving, according to a test made by the Westminster City Engineer, Mr. J. W. Bradley, a candle-power of 3,575 each. The lamps are fitted with clear globes and dioptric diffusers, and this arrangement is so successful that the light given by the single 12-ampere lamps compares favourably with that given by the pairs of 10-ampere "Excello" flame lamps in Oxford Street, for which ordinary opalescent globes are used.

The St. James's and Pall Mall Electric Light Co., Ltd., proposed to continue the use of these lamps, as they were tendering to the Westminster City Engineer's specification for 3,000 c.p. lamps. In Piccadilly and the other streets it was proposed to use four 8-ampere flame lamps of the same make and with similar arrangements, giving from 1,800 to 2,000 c.p. each. Four of these lamps are now in use in St. James's Street, and the circuit would have been extended to 50 lamps. Piccadilly is at present lighted by 10-ampere ordinary arc lamps, giving somewhat over 900 c.p., and the replacement of these by 8-ampere flame arc lamps would, of course, have been a considerable improvement.

No prices were published by the Council, and the only information with regard to this important point was that the Gas Co.'s tender was the lowest. So far as we have been able to ascertain, however, the price quoted by the Gas Company was an extremely low one, and there can be little doubt that the contract will be carried out at a loss. Apparently the lamps supplied will be somewhat similar to the 1,000 c.p. high-pressure incandescent gas lamps used in Fleet Street, although, in a report made by Mr. Bradley, the Westminster City Engineer, it was pointed out that for certain reasons street lighting by these was distinctly inferior to that by flame arc lamps. He pointed out, for instance, that there are very great variations in candle-power, due to the condition of the mantles, and that, in addition to the difficulty of keeping the mantles in good order, the effective candle-power from any lantern does not increase in the same ratio as the number of mantles.

In a case such as this it is greatly to be regretted that the decision of the City Council should have been

Digitized by Google

made merely on the question of price, and, moreover, that no announcement should have been made of the price quoted. In the case of the electric lighting company, the difficulty in quoting must have been aggravated by the fact that the specification called simply for prices per lamp of various candle-powers in stated districts, so that at the time of tendering it could not have been clear to what extent the existing mains and standards could be utilised, and to what extent new mains would be required. It is obvious that either the gas company or the electric lighting company are encouraged in the case of street lighting to quote a price actually below cost, in view of the advertising value of street lighting. This is particularly the case with gas lighting, as a result of the successful competition of electric lighting in the central districts of London. We cannot accept the suggestion made to us by a correspondent that the electric lighting company, in the case of competitive tenders, should deliberately tender below cost price in order to retain the electric lighting, and that the other supply authorities in London should assist in indemnifying it from loss. An electric lighting company which has given absolute satisfaction in its method of street lighting, and could prove that its tenders for a continuance of lighting was not excessive, should meet with more generous treatment by a public body.

ELECTRIC WELDING

A VERY interesting lecture on the subject of welding was delivered by Mr. R. J. Wallis-Jones on Wednesday of last week before the Association of Engineers-in-Charge. Welding could be defined, he said, as the union of metals under pressure at the temperature of incipient fusion. As iron, steel, and platinum were practically the only metals which did not pass rapidly from the solid to the liquid state, they were the only metals which could be welded by the old forge methods. The more recent methods, chief among which were the electrical processes, had increased the number of weldable metals to a large extent, and it was now possible to weld copper and its alloys, aluminium, and other metals with ease. This was on account of the rapidity with which the two pieces of metal to be welded could be brought to a high temperature and pressed together. The great advantage of the electrical methods was the ease with which the heat could be controlled and localised. The development of the various electrical processes was then described by the lecturer and illustrated with a large number of lantern slides. Among these were some illustrating the "Prescot" welder, of the British Insulated & Helsby Cables, Ltd. One of these machines, in use for welding tyres at a London wheelwright's shop, was described in Electrical Engineering, March 25th, 1909, Vol. V., p. 279. The electrical processes could be placed into two classes : first, those in which the electric arc was used to bring about the required temperature for welding; and, secondly, those in which the heating effect was produced by the passage of the current through the metal itself. In the Benardos arc process, only one carbon was used, the arc being formed between it and the work. This method was specially suitable for repairing broken castings. Some very interesting slides illustrating examples of work done by this method were shown. Electric welding was now used to a large extent in the manufacture of barrels and tubes, and some examples of work done by this method were on view.

In Germany, continued the lecturer, electric welding had been used for tramway rail joints for some time, and was now being introduced into this country by the Tudor Accumulator Co. Current was taken from the trolley wire at 550 volts or thereabout, and by means of a motor-generator set reduced to from 60 to 90 volts. The current required for welding was from 300 to 350 amperes. After the weld was made, the joint was ground done to the contour of the rail by means of special rail-grinding apparatus. The whole process occupied about one hour. A trouble with electric arc welding was the intense light of the arc, but this could be minimised by the use of a special form of glass screen, in which a yellowish-green coloured glass was compounded with a glass of spectrum blue colour. Another method of electric welding which had been successfully used was an electrolytic one. A metal plate formed the +pole and the metal pieces to be welded the −pole. The hydrogen evolved at the −pole formed a high-resistance film over the parts to be welded, and the passage of the current through it generated a large amount of heat, which was transferred to the metal. This method had been successfully used for continuously annealing wire. With a pressure of only three volts, only ordinary electrolytic effects were produced, but when raised above this, hydrogen was rapidly evolved and considerable heating took place. The pressure was then raised to 100 volts or more until the required temperature was reached. The usual method of obtaining the heavy currents required for welding was to use a special step-down transformer. This method was devised by Elihu Thomson in 1881, and was that employed in the "Prescot" welders. The welding current was regulated on the primary side of the transformer. This method had been adopted for softening parts of Harveyised armour plate for drilling. The secondary of the welding transformer was of heavy section copper, water-cooled, and the two ends were brought down over the plate a short distance apart. A current of some 40,000 amperes per sq. in. was passed, and the heat generated annealed the plate at the portion between the two points. The current in the primary would be from 75 to 90 amperes only. The Thomson process for the manufacture of tubes was then described and illustrated by means of slides, and the lecturer also described some non-electrical processes, including the oxy-acetylene, water-gas, and fusion methods.

WIRELESS TELEGRAPHY

IN answer to a question in the House of Commons on Thursday, the President of the Board of Trade stated that his attention has been directed to the legislation on the subject of compulsory wireless telegraph installations on ocean steamers which is contemplated in certain foreign countries. A large and increasing number of British vessels are voluntarily fitted with radio-telegraphic apparatus, and compulsory legislation at the present moment would be premature. The matter, however, will be carefully watched.

The Marconi Wireless Telegraph Co. announce that a permanent service between Europe and America will be opened on Saturday. The company will maintain a 24-hours' service for commercial and other purposes, and messages will be received at the company's offices, Watergate House, York Buildings, Adelphi, London. For Eastern Canada the rate will be 7½d. per word for coded messages, with a minimum of ten words, and 6d. per word for non-coded messages. For distant parts of Canada the rates will be 4½d. per word less than the existing telegraph rates.

According to *South Africa*, preparations are being made for getting the Durban wireless telegraph station to work, and there is every prospect of the service being available within two or three months. The site of the station is at the top of the Bluff, a height of 260 ft. above sea-level. The station will have practically a range of 300 miles. It is expected that within a year or two all the important towns round the South African coast will be similarly equipped.

Edison Storage Battery on Tramcars.—According to the New York correspondent of the *Standard*, the car equipped experimentally with a battery of Edison cells has proved so successful that the tramway company has ordered sixteen more. The running costs are stated to have been slightly less than ½d. per mile.

Agreements under the London Electric Supply Act, 1908.—In our issue for October 21, 1909 (Electrical Engineering, Vol. V., p. 919), we reported certain agreements between the London Electric Supply Corporation and the St. James and Pall Mall Electric Light Co., and between the London Electric Supply Corporation and the Westminster Electric Supply Corporation, under the London Electric Supply Act of 1908. The London County Council at the time took exception to the agreements, mainly on the ground that some of the Companies in question were not yet purchasable by them, and they requested the Board of Trade, in the event of it deciding to approve of the agreements, to arrange that they should cease in 1915, unless in the meantime legislation should be passed constituting the Council purchasing authority of the Companies in question. They also suggested the insertion of clauses to ensure that the interests of the consumers in the areas affected by the agreements should be safeguarded. The Board of Trade, whilst having made certain amendments on the latter point, have not fallen in with the view of the Council that the agreements should be terminated in 1915, on the ground that legislation constituting the Council the purchasing authority of the Companies not scheduled to the Act of 1908 was being proceeded with. The Highways Committee now report upon this correspondence, and adhere to their original suggestion, and recommend that the Board of Trade be informed to this effect.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[*Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."*]

METAL FILAMENT LAMPS.—A new leaflet from Messrs. Siemens Brothers' Dynamo Works, Ltd., gives particulars of the "one watt" drawn tungsten filament lamp, which was described and illustrated in Electrical Engineering, April 7th, page 231. The lamp is made in the 100-c.p. size only, for 100–130 and 200–250 volts, and is listed at 4s. 6d.

CRANES.—An illustrated leaflet from the London office of the Maschinenfabrik Augsburg-Nürnberg A.G. (M.A.N.), 219 Caxton House, Westminster, S.W., gives particulars of a number of special forms of electric cranes for iron and steel works and rolling mills, including ingot transporting cranes with revolving tongs, ladle cranes, transporters for pig iron, iron bars, &c. Another leaflet calls attention to the system of "double drive" employed on some of the firm's cranes, in which two hoisting motors are used to produce extensive variation of hoisting speeds on the controller alone without mechanical gear change. By this means rapid movement of the empty hook or of light loads can be obtained, as well as slow raising and accurate setting down of heavy loads. The need for an auxiliary hoist for light loads is obviated, and the duplication of the motors provides a stand-by feature.

ELECTRICAL DRIVING OF SPINNING MACHINERY.—An illustrated pamphlet from the British Department of the Maschinenfabrik Oerlikon contains a description of the firm's system of individual drive for ring spinning frames, in which single-phase commutator motors are used, and the tension on the thread is kept as constant as possible by variation of the speed of the drive in accordance with the diameter of the portion of the cap on to which it is being wound.

TECHNICAL EDUCATION.—We have received a prospectus of the Working Men's College, Melbourne (Australia), containing full particulars of the technical classes carried on at this institute, including those in electrical technology, &c.

CENTRAL STATION ADVERTISING.—The Electricity Supply Department of Hanley have prepared a most useful series of circulars of information, calling attention to recent developments in the utilisation of electrical supply, giving particulars, for example, of metal filament lamps, flame arc lamps, and heating and cooking apparatus. Illustrated booklets for the use of prospective consumers also deal with electric lighting and electric motors, and numerous illustrations show the manifold uses to which the latter may be put with economy.

AIR COMPRESSORS AND PORTABLE TOOLS.—A new catalogue of pneumatic tools and appliances from Messrs. Balcke & Co., Ltd. (27 Clement's Lane, E.C.) describes a series of "Empire" compressed-air hammers, drills, sand-rammers, hoists, riveters and accessories which the firm are putting on the market in this country, as well as electric-driven and other air compressors, &c., for use with pneumatic installations.

CORRESPONDENCE INSTRUCTION.—We have received from the International Correspondence Schools, Ltd., the current issue of the *I.C.S. Student*, a monthly journal dealing with subjects of interest to the students of that institution. A number of appreciative references to the work of the schools by the heads of industrial and engineering concerns are included.

FANS.—A new list is to hand from the Wilson-Wolf Engineering Co., Ltd. (Thornton Road, Bradford). This gives particulars and prices of the firm's "Arctic" propeller ventilating fans for direct-current circuits. A feature of these fans is that the motors are fitted with a combined thrust and journal ball race at the commutator end, and a long gun-metal bush with Stauffer lubrication at the fan end.

ELECTRIC LIGHT AND POWER IN COUNTRY HOUSES

AN interesting book entitled "Electricity Applied to Light and Power," and forming a treatise on the application of electric current to every phase of country-house and estate requirements, has just been published by Messrs. Drake & Gorham (66 Victoria Street, Westminster). This contains just the sort of information which will be useful to owners of large or small houses in enabling them to realise the great possibilities open to them by the employment of electric light and power. Some most effective illustrations of various styles of lighting are included, and many examples of the applications of electric power, heating, &c., for domestic and estate purposes. Particulars are also given of the various ways in which the supply can be derived for isolated installations, and details of actual water-power, oil engine, suction gas, and steam plants are given. The concluding portion of the work gives a list of some hundreds of installations carried out by the firm, with many interesting photographs. The work is published at the price of 1s. 6d., but we have at our disposal a certain number of copies which we shall be glad to send free to any of our readers who would be interested in the contents. Applications should be made to the Editor, 203-206 Temple Chambers, Temple Avenue, E.C.

PARLIAMENTARY INTELLIGENCE

A NEW LONDON ELECTRIC RAILWAY.—The House of Lords Committee, which has been considering the proposed electric railway between Wimbledon and Sutton, which is to be worked as an extension of the District Railway Company's line to Wimbledon, passed the preamble of the Bill on Thursday. A junction is to be made with the London & South Western Railway at Wimbledon, and access is to be arranged for the public between the London, Brighton & South Coast Railway station at Sutton and the proposed station of the new company. In addition, the London & South Western Railway Co. is to receive a sum not less than the amount received at present from the District Railway Co. for the use of the terminal station at Wimbledon. The Committee inserted this provision in order that the London & South Western Co. should not suffer loss by the termination of the present agreement with the District Co.

THE CHARING CROSS, EUSTON & HAMPSTEAD RAILWAY.—As stated in our last issue, the opposition of the proprietors of the Hotel Metropole to the scheme for constructing junctions so that trains from the Charing Cross, Euston & Hampstead Railway may run through on to the District line at Charing Cross was successful, but the Committee allowed the promoters to confer with the hotel authorities to see if an arrangement could be come to. On Friday it was announced on behalf of the railway company that, although an agreement has been come to between the Hotel Metropole and themselves, the new scheme, which avoided the Hotel Metropole, would come under the foundations of the South Eastern Railway Company's bridge, and as an immediate agreement was not likely to be come to with that company, the Bill was withdrawn for the present year.

THE TROLLEY 'BUS.—Two proposals by municipalities for powers to spend money upon the installation of trolley omnibuses have been before the House of Commons since our last issue, viz., by the Leeds and Bradford Corporations. In both cases the Bills have been considered by the Local Legislation Committee. The evidence in support of both propositions was to the effect that the capital cost of the system was 20 to 25 per cent. less than tramways, whilst the working expenses were estimated at one penny per car mile less than tramways. The proposed route in Leeds is from the City Square along Wellington Street, Aire Street, Whitehall Road, and terminating at the boundary of the city at Drighlington. Borrowing powers are sought to the extent of £5,000, repayable in ten years, for the provision of omnibuses, and £9,000, repayable in twenty years, for electrical equipment. There was some opposition to this Bill by the railway companies, but eventually this was disposed of, and the Bill was ordered to be reported for third reading.

There was, however, more opposition to the Bradford Bill by the railway companies and the local carriers. In this case it is proposed to construct new tramways, to use the trackless trolley system, and to supply electricity in bulk to districts outside the borough boundaries. Powers are taken to borrow £81,632 for the construction of the tramways specified in the Bill, to be repaid in thirty years, and £42,748 for other tramway purposes. It is also proposed to borrow £22,800, repayable in twenty years, for feeder cables, switchboard plant, and apparatus for tramway purposes. Among the other clauses in the Bill is one providing for the erroneous registration of electricity meters. When any error is detected, this is to be taken as having commenced from the preceding quarter unless the error is proved to have arisen during the current quarter. On the proposal to use the trolley-'bus system, evidence was given in favour by Mr. J. M. McElroy, of Manchester, Mr. A. R. Fearnley, of Sheffield, Mr. J. Hamilton, of Leeds, and Mr. C. J. Spencer, general manager of the Bradford tramways. Col. Yorke, of the Board of Trade, expressed the opinion that the powers possessed by that body as to sanctioning routes were sufficient, in his opinion, for the safeguarding of the public. The greatest opposition to the tramway clauses was from the carriers in Bradford, who objected to powers being granted for the carrying of goods and minerals upon the Bradford tramway system generally.

YORKSHIRE ELECTRIC POWER.—The Unopposed Committee in the House of Lords passed the Yorkshire Electric Power Bill last week. The Bill seeks power to issue new capital in the form of preference shares, and to invest moneys not exceeding £100,000 in industrial or municipal undertakings to which the company supplies electrical energy.

PROGRESS OF ELECTRICAL BILLS.—The London Electric Railway Amalgamation Bill and the Yorkshire Electric Power Bill were read a third time in the House of Lords on Monday.

The Reading and District Electric Supply Bill and the Metropolitan District Railway Bill were read a third time in the House of Lords on Tuesday.

On the second reading of the Bishop's Stortford, Harlow, and Epping Gas and Electricity Bill, Mr. Wardle has given notice of his intention to move that it be an instruction to the committee to insert a clause limiting the interest on capital, and directing that the profits in excess of such interest shall be applied to a reduction in the price of gas and electricity.

LOCAL NOTES

BIRMINGHAM: *Electricity Profits.*—It is stated that the Electricity Supply Committee are prepared to hand over £10,000 to the relief of rates.

DERBY: *Electricity Extensions.*—A Local Government Board inquiry was held last week concerning a loan of £5,203 for electrical extensions. There was no opposition to the application. A tender has already been provisionally accepted for the work.

DUBLIN: *Price of Electrical Energy.*—In view of the decision of the Council to meet the large deficit on the electricity undertaking from the rates, a resident has sent a letter to the Corporation questioning whether the Council have the legal power to do this until they are charging the maximum price for electrical energy laid down in their provisional order. The correspondent in question states that, should the Council make a rate for the purpose of covering the deficit, he will be forced to take proceedings in the matter. At the meeting of the Corporation last week, a motion to meet the whole £14.000 deficit on the undertaking out of the rates was abandoned, and a resolution passed to meet only £4,000.

DUNDEE: *Cost of New Power Station.*—It is estimated that the cost of the new power station at Carolina Port has been £103,000, compared with an estimate of £100,000. The closeness of the actual cost to the estimate is interesting in view of the statements which have been circulated in Dundee to the effect that the excess of expenditure over the estimate had been enormous.

Charge for Tramway Energy.—A Sub-Committee has been appointed by the Tramways Committee to confer with a Sub-Committee of the Electricity Committee as to the charge made for tramway energy. The Tramway Committee complain that whereas private consumers have had reductions in recent years amounting to 38 per cent., the price to the Tramways Committee has only been reduced by 25 per cent. On the other hand, the Electricity Committee state that the price for tramway energy in Dundee is as low as in any other town in the country, and very much cheaper than in many.

Tramway Third Party Risks.—Hitherto the Tramways Committee have maintained a fund for dealing with third party risks, but it is now proposed to insure with a company to the extent of £10.000. It is stated that the premium on this amount will be less than one-third of the sum now paid into the insurance fund annually.

GLASGOW: *Valuation of Tramways.*—The Corporation have appealed against the valuation for the year to May, 1911, of the tramways undertaking for purposes of assessment, viz., £278,070. They claim it should be £230,573. The valuation is based on revenue, and in previous years the assessor has allowed as a deduction from the gross revenue not only one-half of the cost of maintenance of the permanent way and electrical equipment of the line, but also one-half of the sum annually set aside for renewal thereof. He now proposes to allow no deduction whatever in respect of such renewal, but to continue to allow one-half of the cost of repairs. As one-half of the sum set aside for renewals amounted last year to over £57.000. the alteration proposed is a very serious one. The appeal will be heard at an early date.

MANCHESTER: *Tramway Receipts.*—The traffic revenue from the Corporation tramways for the year to March 31st amounted to £777,220, an increase of £3,185 over the previous year. The number of passengers carried was 159,049,096, an increase of 4,037,212.

MOLD: *Public Lighting.*—A Leeds firm have submitted a scheme of public lighting, and it has been referred to the Lighting Committee for consideration.

NEWPORT: *Tramway Renewals.*—At the last meeting of the Corporation a proposal to increase the fares was negatived. The Tramways Committee, in putting forward the proposition, pointed out that the renewals fund was very inadequate, only £5.000 standing to its credit, whilst £10.000 would have to be spent during the next two or three years.

RENFREW: *Electric Lighting Order Revoked.*—The Board of Trade have revoked the Renfrew Electric Lighting Order of 1905.

RUSSIA: *St. Petersburg Tramways.*—It is reported that the St. Petersburg Tramway Commission have decided to grant a concession to a firm for the construction at once of 37 miles of tramway. The city authorities will receive in consecutive periods of five years 4, 6, 8, and 10 per cent. of the gross revenue. At the end of the 20 years the municipality has the right to purchase. The name of the concessionaires may be obtained at the Board of Trade, 73 Basinghall Street, London.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ASHTON-UNDER-LYNE.—A Local Government Board inquiry has been held concerning a loan of £48,424 for electric lighting extensions. It was stated that during the past two or three years there had been applications for several thousands of horse-power, which the Council had been unable to supply.

BACUP.—A Local Government Board inquiry has been held into an application by the Council for a loan of £3.000 for electric lighting. The Council will lay the necessary mains and take current from the Rawtenstall Council.

EASTBOURNE.—A Local Government Board inquiry was held last week concerning an application by the Council to borrow £2.000 for additional condensing plant.

EDINBURGH.—The Town Council have adopted the Electricity Committee's recommendation to instal three cooling towers and exhaust steam turbines at the Dewar Place Electricity Works at an estimated cost of £45.000.

GILLINGHAM.—A Local Government Board inquiry was held last week concerning a loan of £3.000 for new generating plant. Mr. H. R. Hooper, the inspector, complained of the method of book-keeping adopted, and postponed the inquiry *sine die* for the accounts to be straightened out. He would then come down and conclude the inquiry.

LANARK.—The County of Lanark require tenders for a small steam dynamo, switchboard, and main cable, also complete wiring installation, at the Refuse Destructor at Bogs Brae, near Bellshill. Particulars from the Resident Engineer, Electricity Works, Bothwell Street, Cambuslang, and tenders to the Clerk, The Cross, Bellshill, by May 4th.

LEEDS.—The Council require 5¼ miles of 0·15 square inch three-core cable for a pressure of 6.600 volts. Particulars from the Manager of the Electric Lighting Department, and tenders to the Town Clerk by May 9th. (See an advertisement on another page.)

LONDON: *Hammersmith.*—The Council invite tenders for concentric cable, ducts, and prepayment meters (see an advertisement on another page).

Stepney.—The Finance Committee of the London County Council recommend sanction being given to loans of £7.150 and £40.500 for generating plant and accessories.

MANCHESTER.—The Electricity Committee have asked permission to borrow £40.000 for electrical extensions.

NETHERLANDS.—According to a British Consular report, the cost of engineering works likely to be undertaken in the Netherlands and the Dutch East Indian colonies during the next few years is estimated as follows:—Netherlands: Electrification of light railways and extension of steam tramways, £2.000.000; erection of about ten electric power stations, £500,000. Colonies: Electric lighting and power works in twelve Java towns, high-tension transmission in three provinces, and two electric motor-bus services, £5,000,000; electrification of the Java State Railway, £15.000,000.

NEWPORT.—Tenders are invited for a 1.000-kw. double-current turbo-generator, or alternatively a 1.000-kw. or 1.500 turbo-alternator with surface condenser. Particulars from the Borough Electrical Engineer, and tenders to the Town Clerk by May 2nd. (See an advertisement on another page.)

ROUMANIA.—The Municipal Authorities of Vaslui invite tenders for an electric supply installation. Tenders to the Conseil Municipal, Vaslui, by May 25th.

TURKEY.—Tenders are invited by the Turkish Ministry of Commerce for a concession for the supply of electrical energy in Constantinople. A deposit of £9.000 is required. Tenders by May 28th to Ministère Impérial Ottoman des Travaux Publics, Adjudication de la Concession d'Electricité de Constantinople. Local representation is essential in the case of Turkish Government contracts, and a list of British commission agents established in Constantinople may be seen at the Board of Trade, 73 Basinghall Street, London.

WEST BROMWICH.—A 750-kw. direct-current turbo-generator and surface condenser is required. Tenders to the Clerk by May 2nd.

WHITEHAVEN.—The Electricity Committee recommend the installation of an economiser, mechanical stoker, switchboard, and motor converter at an estimated cost of £2,500.

WOLVERHAMPTON.—The Corporation have adopted the scheme of Mr. C. E. C. Shawfield for spending £23,000 upon extensions of plant at the Electricity Works, and the provision of distributing mains.

YARMOUTH.—Application is to be made to the Local Government Board for sanction to borrow £500 for high-tension mains, and £3.000 for low-tension mains.

Miscellaneous

DALMARNOCK.—The Glasgow Corporation require electrically driven travelling lime mixers, valves, &c., for their sewage works at Dalmarnock. Particulars from the Public Works Office, 64 Cochrane Street, and tenders to the Town Clerk by April 30th.

SOUTHAMPTON.—The Tramways Manager has been authorised to purchase controller regulators at an estimated cost of £137 10s.

Digitized by Google

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.—The L.C.C. invite tenders for the wiring of Fairclough Street School. Particulars from the Chief Engineer, and tenders by May 4th.

E.—Cinematograph theatre, 560 Mile End Road, Stepney, E. Saville & Martin, architects, Dacre House, Arundel Street, W.C.

W.—Alterations to fire station, Manchester Square (£1,197). Builders, J. & C. Bowyer, Ltd., Upper Norwood, S.E.

W.—The L.C.C. invite tenders for the wiring of the Amberley Road School. Particulars from the Chief Engineer, and tenders by May 4th.

W.—Cinematograph theatre, Oxford Street, W. (370 persons). Architect, F. W. Foster, 26 Bedford Row, W.C.

S.W.—Theatre, Fulham, S.W. Architects, Anher Stoneham, 32 Nicholas Lane, E.C.

S.W.—Cinematograph hall on site of Clapham Junction tramway depot, St. John's Hill, Battersea (830 places). Architects, Gilbert & Constanduros, 43 Finsbury Square, E.C.

N.W.—Overhaul of electric wiring at Madame Tussaud's Exhibition, Marylebone Road. B. H. Jenkinson, Consulting Engineer, 9 Gray's Inn Square, W.C.

PROVINCES.

ASTON.—Cinematograph theatre. Builders, Harrison & Smith, Birmingham.

BECKTON.—Factory and stores for the London Flambo Fuel Co. (£2,350). Architect, John Moir Kennard, 13 Railway Approach, London Bridge.

BLACKPOOL.—Public library and art gallery (£18,000). J. S. Brodie, Surveyor, Blackpool Town Council.

BOLTON.—Theatre. T. E. Smith & Son, Bradshawgate, Bolton.

BURY.—124 workmen's dwellings (£30,000). A. W. Bradley, Surveyor, T.C.

COVENTRY.—Cycle factory. Architect, H. E. Chattaway, Butcher Row, Coventry.

ERITH.—The Council invite tenders from wiring contractors in connection with their assisted wiring scheme for a period of three years. Tenders by April 25th.

HALIFAX.—Church (£7,000), for St. Paul's Parish.

HENDON.—Enlargement of Parish Church (£6,000). Architect, Temple Moore, 37 Old Queen Street, S.W.

HENDON.—The Council invite tenders by April 25th for the wiring of the Council offices. Particulars from the Clerk.

LIVERPOOL.—Printing works for Blake & McKenzie. Architects, W. & J. Burroughs, Vernon Street, Liverpool.

LEICESTER.—Factory and warehouse, Sanvey Gate (£4,682). Architects, Topott & Son, 15 Hotel Street, Leicester.

MOSSLEY.—Tenders are invited by May 2nd for the electric wiring of St. John's Church, Roughtown. The Vicar.

STOCKPORT.—Extension of isolation hospital (£16,000). J. Atkinson, Surveyor, Town Hall.

TENDERS RECEIVED AND ACCEPTED

ABERDEEN.—The tender of Mr. W. Tawse, of Aberdeen, has been accepted at £6,249 for relaying the tramway track on Woodside.

AUSTRALIA.—It is stated that a contract has been let for an installation to supply electric light and power to the fourteen Blue Mountains towns. The area will be divided into three parts, each having its own generating station, which will comprise three-phase fifty-cycle 2,200-volt gas-driven alternators. The name and address of the firm who have the contract can be obtained upon application to the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London.

CHICHESTER.—After keen competition and considerable discussion with the Council, a tender by the Chichester Electric Light & Power Co. to light the city for five years at £3 5s. per lamp per annum, has been accepted.

GRIMSBY.—The Corporation have accepted the tender of the Jandus Arc Lamp Co. for the supply of 80 flame arc lamps with line switches and resistances for the sum of £662. The lowest tender submitted was £307, the highest £789. The figures given last week were published in error.

LONDON: *London County Council.*—The tender of Messrs. Hurst, Nelson & Co. for brass fittings for electric cars at £186 11s., and £168 for window-operating gear, has been accepted.

The tender of Messrs. W. McGeoch, Ltd., for the supply of 545 roof light fittings for electric cars at 5s. 5d. each, less 2½ per cent. discount, has been accepted.

The tender of the Deptford Engineering Co., Ltd., for the supply of six conduit cleaning trucks at £152, has been accepted.

LOWESTOFT.—The Council has accepted the tender of W. G. Murrin, of Lowestoft, for free wiring up to a total of 200 lamps at 8s. 8d. per point.

PLYMOUTH.—The Town Council have accepted the tender of Willoughby Bros. for annual supplies of tramway brake blocks, at 6s. 6d. per cwt.; brake slides, 2d. each; steel slipper block bolts, 5d. each; and steel suspension bolts, 1s. 4d. each.

SHEFFIELD.—The Tramways Committee have accepted the tender of Hadfield's Steel Foundry Co., Ltd., to manufacture, supply, and deliver special work, comprising junctions, required for track renewals in Hounsfield Road, and from Fitzalan Square to the Wicker, at £1,000, plus £213 7s. 10d. for rails and fish-plates to be supplied by the Corporation. The Electricity Committee have accepted the tender of the Electric Construction Co., Ltd., for a rotary transformer and switchgear, at £302 15s. 10d.

COMPANIES' MEETINGS AND REPORTS

MERTHYR ELECTRIC TRACTION & LIGHTING CO.—After meeting debenture interest and placing £1,500 to renewals account, the balance sheet for 1909 shows a sum available of £4,498. The directors recommend placing £1,000 to depreciation, a dividend of 5 per cent. on the ordinary shares, and carrying forward £498.

BABCOCK & WILCOX.—The net profit for 1909 was £360,004, in addition to £43,279 brought forward. The directors recommend further dividends of 8 per cent. on the ordinary shares, together with a bonus of 8 per cent. The sum of £100,000 is placed to reserve; £25,000 to dividend equalisation fund, and £10,000 to staff pension fund, carrying forward £63,083.

MERTHYR ELECTRIC TRACTION & LIGHTING CO.—At the annual meeting last week it was stated that more electrical plant will be required about the end of 1911. The company had experienced difficulties with regard to overcrowding of cars at Dowlais, and double-deck cars were to be put on this route. Considering the unsettled condition of the steel and coal trades in the district, Mr. G. J. Summerville, who presided, thought the shareholders should not be dissatisfied with the result of the past year's working.

LONDON UNITED TRAMWAYS.—The report for 1909 shows that after meeting interest on debentures and loans and providing for income tax, there is a balance of £21,950. It is proposed to place £21,000 to reserve for renewals, and to carry forward the balance of £950. The gross receipts decreased by £30,164, whilst the working expenses show an increase of £6,334. The chief increase in expenses has been due to repairs to permanent way and rolling stock, but a considerable saving was effected in the cost of electrical energy. As will be seen, no dividend is paid on the preference shares.

METROPOLITAN ELECTRIC TRAMWAYS.—Mr. E. Garcke presided at the annual meeting last week, and commented upon the satisfactory position of the company compared with most other tramway companies in the kingdom. He attributed this to the special arrangements which had been made between the company and the Middlesex and Hertfordshire County Councils, which allowed fair play between all parties. With the extensions which had been opened during the year, they had practically completed the important system of tramways in the North Metropolitan area, and for the present they might consider the capital account closed. The payment of a 5 per cent. dividend upon their ordinary shares must be regarded as very satisfactory.

SOUTH WALES ELECTRICAL POWER DISTRIBUTION CO.—At the annual meeting last week satisfaction was expressed at the progress of the company. An agreement has been entered into with the Caerphilly Council for taking over their electric lighting order, and negotiations are proceeding with a number of other respective consumers. Mr. W. Gascoyne Dalziel thought it satisfactory that after only 2½ years work the Treforest Company were considering extensions of plant. The prospects for securing considerable increase in output were never more favourable than at present.

Tantalum Lamps.—Messrs. Siemens Brothers' Dynamo Works, Ltd., have sent us a reproduction of a postcard illustrating a tantalum lamp installation on a merry-go-round at St. Kilda, Melbourne, which well demonstrates the ability of these lamps to withstand vibration.

Discussion on Tariff Reform.—A meeting will be held on May 23rd, at 8 p.m., at Caxton Hall, Westminster, by the National Electrical Manufacturers' Association, to discuss the effect of Free Trade or Protection upon the electrical industry. The discussion will be opened by Mr. Hugo Hirst from the Protection point of view, and Mr. J. E. Kingsbury from the Free Trade point of view. The chair will be taken by Mr. H. W. Butler, of the Electric Power Storage Co., the chairman of this Association. No resolution will be placed before the meeting or vote taken. Only those who are directly connected with the electrical industry will be allowed to take part in the discussion. Any person desiring to take part in the discussion is requested to kindly send his name to the Secretary, Balfour House, Finsbury Pavement, E.C., before May 21st next. This Association will, as such, be in no way responsible for the views held by either of the openers of the discussion or the opinions expressed by its members individually or by others at the meeting.

Digitized by Google

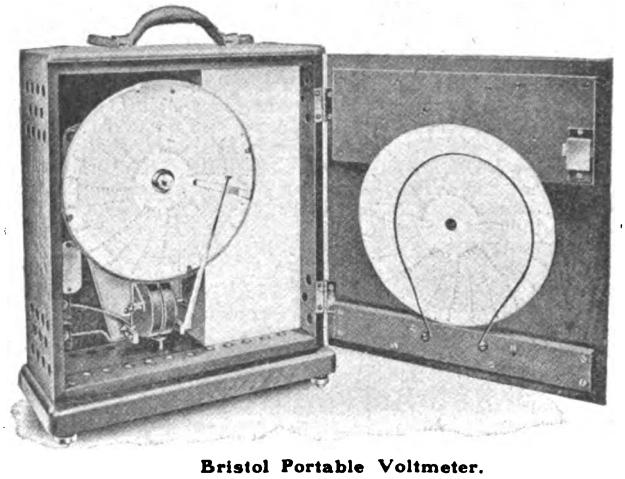
APPOINTMENTS AND PERSONAL NOTES

Mr. A. J. Thornton has been appointed managing director of Messrs. A. G. Thornton, Ltd., rendered vacant by the death of his father, Mr. A. G. Thornton.

Dr. J. Erskine Murray asks us to state that the rumour that he has been appointed technical adviser to a wireless syndicate is untrue and calculated to injure his position as an independent consultant. He has no pecuniary connection with, or interest in, any particular system, his relations with all his clients being on the same basis, namely, that of an occasional consultant.

The Devonport Corporation have increased the salary of Mr. W. F. Stamp, the Assistant Electrical Engineer, from £170 to £180 per annum. The following increases have also been made:—Junior assistant, 38s. to 40s. per week; chief clerk, £93 12s. to £100 per annum; second clerk, 20s. per week; mains assistant No. 1, 30s. to 31s. per week; mains assistant No. 2, 32s. to 33s. per week; switchboard attendant, to a maximum of 32s. per week; stokers, 27s. 6d. to 28s. per week; trimmers, 23s. 6d. to 24s. 6d. per week.

Mr. T. M. Colson, resident engineer at the Hamilton Electricity Works, has been presented with an inlaid Sheraton clock and a Sheraton aneroid barometer on leaving, to take charge of the Surbiton Electricity Works.



Mr. James Stott, Electrical Engineer to the Heywood District Council, has been appointed manager of the tramways in addition.

Mr. A. R. Sillar has resigned his appointment as Borough Electrical Engineer at Colchester. The senior Assistant Engineer, Mr. W. Frisby, and the second Assistant Engineer, Mr. P. H. Buzza, will be in charge of the undertaking pending the appointment of a successor to Mr. Sillar.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 15s. to £60 5s. per ton (last week, £60 to £60 10s.).

CANADIAN AGENTS WANTED.—A London firm manufacturing metal filament and carbon electric lamps wish to appoint agents at Montreal, Quebec, Ottawa, Toronto, Winnipeg, Vancouver, &c.—A Yorkshire firm manufacturing steam engines, independent condensing plants, mill gearing, &c., are desirous of getting into touch with Canadian importers.—Further particulars from the High Commissioner for Canada, 17 Victoria Street, London.

Bristol Portable Voltmeter.
J. W. & C. J. PHILLIPS, 23, College Hill, London, E.C.

MISCELLANEOUS CITY NOTES

BRITISH ALUMINIUM CO.—Subscriptions have been invited for an issue of £800,000 five per cent. prior lien debentures at 97, redeemable by drawings at 105 or by purchase or tender. The trust deed provides that no charge shall be created upon any of the properties of the company ranking in priority to, or *pari passu* with, the prior lien debentures.

DIVIDENDS ANNOUNCED.—Cuba Submarine Telegraph Co.: Six per cent. on the ordinary shares, carrying forward £7,221.

British Columbia Electric Railway Co., interim dividend at the rate of 8 per cent. per annum on the deferred ordinary stock for the half-year to December, 1909. Montevideo Telephone Co., interim dividend for the half-year to January 31st at the rate of 6 per cent. per annum on the ordinary shares.

Wycombe (Borough) Electric Light & Power Co., 2 per cent. on the ordinary shares, transferring £1,000 to renewals.

Kalgoorlie Electric Power & Lighting Co., 5 per cent. on preference shares for six months to March 31st. Brisbane Electric Tramways Investment Co., final dividend at the rate of 8 per cent. for 1909.

Electric Shock Fatality.—An inquiry was held at Bromford on Saturday last into the circumstances attending the death on the previous Wednesday of L. Evans, an electrical engineer, at the Birmingham Tame and Rea District Drainage Board's sewage disposal works. It appears that the deceased and two others were engaged in testing a newly installed induction motor running direct off the 6,000-volt three-phase supply. As it was not known what starting current the motor would take, the ammeter had been short-circuited. During the test it was decided to try the effect of allowing the full starting current to pass the instrument, and the deceased, forgetting that the main switch was closed, went to take off the short-circuit. He received a shock and fell unconscious; artificial respiration proved ineffective. The deceased was an experienced man, and had been chief operating electrical engineer at the works for over two years. Evidence was given to the effect that he knew that the instrument was alive, but must have forgotten for the moment. A verdict of accidental death was returned.

CORRESPONDENCE

CENTRAL BATTERY CIRCUITS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I have read with interest the article by Mr. H. H. Harrison on "Central Battery Omnibus Telegraph Circuits," published in your issue of March 17th last, and shall be glad if you will permit me to offer some observations in reference thereto.

Mr. Harrison states that (assuming v equal to unity), with the terminal out-station key depressed, the potential

$$v_1 = \frac{r}{x+r}.$$

In this assumption, Mr. Harrison has neglected to take into consideration the line insulation R, which must be considered as a parallel circuit to r.

The voltage would, I think, be more accurately expressed by the equation—

$$v_1 = \frac{Rr}{Rx+rx+Rr},$$

and in this event, the PD $(1-2)$ becomes—

$$\frac{R}{x+R} - \frac{Rr}{Rx+rx+Rr},$$

which is a maximum when—

$$x = \sqrt{\frac{R^2r}{R+r}}.$$

In the case quoted, the most efficient value of x would therefore appear to be 1,258ω instead of 1,340ω as stated.

It is not clear how the values 423ω and 4,200ω are obtained for r and R. Should not these values be 439ω and 4,000ω for r and R respectively?

Yours truly,

P. J. RIDD.

Woodcote, Elgin Road,
Wallington, Surrey.
April 12th, 1910.

APPLICATION OF ELECTRICITY TO SHIP PROPULSION.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—In the interest of the electrical engineering trades, I respectfully wish to draw attention to a statement that Mr. Charles A. Parsons made at the discussion on a Paper that I recently had the pleasure of reading before the Institution of Naval Architects, to the effect that: "If a short-circuit occurred on board of an electrically-driven ship, that all the men in the engine-room would be killed by copper poisoning, and therefore its adoption involved grave risks," &c.

This statement he again repeated in the reply which he gave to the discussion on his Paper the next day on the transmission of power by means of mechanical gears to slow-speed propellers from high-speed turbines.

In view of such a strange statement being made by Mr. Parsons before one of our Technical Institutions in which vast interests in the shipping world are represented, the writer appeals to the electrical engineering profession to ask Mr. Parsons to withdraw this statement publicly, as it is not only difficult of proof, but, embodied in a discussion on electrical power generation and transmission for ship propulsion, may mislead shipowners to the extent of overlooking the great advantages that are to be obtained by its adoption for the purpose named.

I have failed to find out a case in which anyone has been poisoned by means of a short-circuit on a generator of large power, and the matter is of some importance bearing in mind Mr. Parsons's patent specification (No. 6,177/09), published on the 7th inst. From this he appears to be following the ground over which I have gone years ago, as anyone can see by reference to my patent No. 17,248 of 1905. I might point out that it has no connection with my recent patents, which refer to what is now known as the "Paragon" system. Trusting that you will be so good as to find room for these few remarks, thanking you in anticipation,

Yours faithfully,

WILLIAM P. DURTNALL.

11 Bush Lane, Cannon Street, E.C.
April 14th, 1910.

JAPAN-BRITISH EXHIBITION.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Might I ask you, through the medium of your columns, to impress upon all participating in the British Section of the Japan-British Exhibition, the necessity of taking advantage of the facilities afforded by the administration in order to have their exhibits completely installed in ample time before the opening early in May.

The Japanese have already made great progress, and there is no reason why British manufacturers, who are on the spot, should be one whit behind their Far Eastern colleagues.

In the past many a valuable exhibit has been entirely passed over by both Press and public, because on the first visit to the Exhibition they had no opportunity of forming a judgment upon its merits.

As the advantages of preparedness are therefore so evident, I trust that all those taking part in the Japan-British Exhibition will do their utmost to ensure that no reproach shall attach to the British Section when the day of opening comes.

NORFOLK, President,
Japan-British Exhibition.

Shepherd's Bush, London.
April 14th, 1910.

The Osram Lamp Works.—The large scale upon which Osram lamps are now being manufactured in England is shown by a certificate from Messrs. Edmund Bull & Darton, chartered accountants, 10 Old Jewry Chambers, E.C., to the effect that on the pay roll of the Osram Lamp Works, Ltd., on March 30th the number of persons employed, including staff and managers, was set out as 946. This is a good illustration of the increasing employment of British labour in metal filament lamp manufacture.

Machine Mining.—Our attention has been called to a clerical error in our abstract of Mr. Sam Mavor's Paper on machine mining, read in November before the South Wales Institute of Engineers, published on page xiv. of our supplement on ELECTRICAL ENGINEERING IN MINES of February 3rd. In the tenth and eleventh lines from the end, "No other machine had so wide a field of application as the disc," should obviously have read "No other machine had so wide a field of application as the *bar*." One of the chief points of the Paper was to record the author's opinion that in most circumstances the bar coal-cutter is superior to the disc machine.

The Brussels Exhibition.—Among the exhibitors in the British Section of the Brussels Exhibition will be the following: Messrs. Applebys, Ltd. (58 Victoria Street, S.W.), Sir W. G. Armstrong, Whitworth & Co., Ltd. (Elswick Works, Newcastle-on-Tyne), The British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), The Cambridge Scientific Instrument Co., Ltd. (Chesterton Road, Cambridge), The Campbell Gas Engine Co., Ltd. (Halifax), Crossley Bros, Ltd. (Openshaw, Manchester), John Dugdill & Co. (Failsworth, near Manchester), Faraday & Sons (146-150 Wardour Street, W.), E. Green & Son, Ltd. (Phœnix Works, Wakefield), Holden & Brooke, Ltd. (West Gorton, Manchester), The Home Office (Whitehall, S.W.), J. Hopkinson & Co. Ltd. (Britannia Works, Huddersfield), Kelvin & James White, Ltd. (18 Cambridge Street, Glasgow), Kendall & Gent, Ltd. (Victoria Works, Hyde Road, Gorton, Manchester), Lacy-Hulbert & Co. Ltd. (91 Victoria Street, S.W.), Marryatt & Place (28 Hatton Garden, E.C.), Mavor & Coulson, Ltd. (47 Broad Street, Mile End, Glasgow), J. & H. McLaren (Midland Engine Works, Leeds), The Morgan Crucible Co., Ltd. (Battersea Works, S.W.), Nalder Bros. & Thompson, Ltd. (34 Queen Street, E.C.), The National Gas Engine Co., Ltd. (Ashton-under-Lyne), C. A. Parsons & Co. (Heaton Works, Newcastle-on-Tyne), R. W. Paul (Newton Avenue Works, New Southgate, N.), The Power Gas Corporation, Ltd. (39 Victoria Street, S.W.), Reavell & Co., Ltd. (Ranelagh Works, Ipswich), Hans Renold Ltd. (Brook Street Manchester), Ruston, Proctor & Co., Ltd. (Sheaf Iron Works Lincoln), Sheepbridge Coal & Iron Co., Ltd. (Sheepbridge Works, Chesterfield), The Sturtevant Engineering Co., Ltd. (147 Queen Victoria Street), The Synchronome Syndicate (32-34 Clerkenwell Road, E.C.), The Underfeed Stoker Co., Ltd. (Coventry House, South Place, Finsbury), R. Waygood & Co., Ltd. (Falmouth Road, S.E.), G. & J. Weir, Ltd. (Holm Foundry, Cathcart, Glasgow), Wellman, Seaver & Head, Ltd. (47 Victoria Street, S.W.).

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 14th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

19,397/08. **Air Brake Alarm Device.** N. C. Christie and W. Henderson. In order to sound an alarm bell if an angle-cock is left closed after coupling up the train pipe of a compressed-air brake system, wire conductors are woven into the hose pipe, and a circuit is completed through these wires, the hose couplings, and the cock handles. The turning of the cocks or attaching of the couplings is caused to rub and remove dirt or grease from the contacts. The alarm may be operated on either the open- or closed-circuit principle. Six claims, twenty-three figures.

4,162/09. **Metal Powder Microphone Transmitters.** S. G. Brown. Fragments of Osmium-iridium, osmium, or ruthenium are substituted for carbon powder in microphone transmitters, telephone relays, &c. As the resistance of such metals is low, the resistance of the rest of the circuit must be low. A microphone containing a single contact of an osmo-iridium alloy, and other constructions with powdered metal between hard iridium faces, are described. Seven claims, seven figures.

6,504/09. **Combined Transformer and Meter.** Prof. E. Wilson and W. H. Wilson. A wattmeter of the induction type is combined with an auto- or other transformer for supplying house circuits. The construction of the device is practically the same as that of a meter except that the shunt winding is made of sufficient section to take the full current from the mains, while a secondary winding is added or a portion of the primary winding thickened in the ordinary way to supply the load current at low pressure. The core plates are cut so as to preserve a closed magnetic circuit for transformer action, and yet to give sufficient leakage for the purposes of the meter. Six claims, nine figures.

6,752/09. **Wind-power Generating Plant.** J. G. Childs and T. S. Hill. In a plant comprising a wind-turbine, a dynamo, and a storage battery, the wind-turbine is arranged to run at its most efficient speed for all values of the wind velocity by causing an increase in the current supplied to the battery to effect a decrease in the excitation. A number of series relays are adjusted to put resistance into the dynamo field circuit in successive steps, so that for high velocities of the wind, the dynamo is running at a high speed with minimum excitation. A similar arrangement for switching in the ends cells of the battery when the current rises, is described. Alternatively the battery may be divided into two halves and connected in parallel for low speeds and in series for high speeds. An automatic switch effects the change-over, allowing a suitable interval for the pressure of the dynamo to increase. A double-commutator machine may be used, the two commutators being connected in either series or parallel. A wind-power plant according to this invention was described in Electrical Engineering, March 25th, 1909, Vol. V., p. 280. Seven claims, two figures.

15,659/09. **Pressure Fan.** K. Maxaner. In centrifugal ventilating fans of the pattern in which the air enters axially and is driven out tangentially, the driving motor has an annular armature rotating about a fixed field system. The fan blades are attached to the exterior of the armature, as is also a guiding cone to prevent the formation of eddies. Four claims, three figures.

18,193/09. **Insulation of Fine Wires.** P. A. Newton (*Farbenfabrik vorm. F. Bayer & Co.*). Wires or strips are first covered with thin tissue paper or cotton, and are then passed through a 10 per cent. solution of acetylised cellulose. The paper or cotton causes the insulating compound to adhere to the wire. Two claims.

19,914/09. **Porous Pot for Leclanché Cell.** G. Fuller. A cylinder of cardboard is wrapped round with a woven fabric such as butter-cloth, and one end is closed by a disc of wood. The carbon electrode is packed round with manganese peroxide and carbon, and top and base are treated with a bituminous compound. One claim, one figure.

24,769/09. **Ceiling Rose.** L. M. Waterhouse. The flex supporting the lamp fitting is attached to an insulating gripping piece, which is spring-supported from the base of the rose. Short lengths of flex lead from this gripping piece to the fixed terminals. Any vibration is taken up by the spring support. Four claims, four figures.

27,252/09. **Turbo-Alternator Construction.** O. T. Blathy. The shaft, hub portion, and magnet cores of a rotor for turbo-alternators, are forged in one piece, while the pole-pieces, which are provided with sleeve-like extensions, are pushed over the pole-cores and screwed on. The field windings are wound on the pole-shoe sleeves before these are placed on the cores. Two claims, five figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Jaburg, 15,880/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Taylor [Storage battery sub-stations on A.C. systems] 2,147/09; Brookes (*Thomas & Betts Co.*) [Cable connection] 7,576/09; Spencer [Distibuting systems] 8,165/09; British Insulated & Helsby Cables, Ltd., Cole and Shaw [Cable insulation] 11,135/09; Dane and Perks, Dane & Co. Proprietary, Ltd. [Drying cables] 19,368/09.

Dynamos, Motors, and Transformers: Shepherd [Constant-pressure dynamo] 7,058/09; Giglio [Current rectifier] 17,742/09; Siemens Bros. & Co. (*Siemens & Halske A.-G.*) [Rectifier for H.T. currents] 26,466/09; Siemens Schuckertwerke Ges. [Commutators] 1,292/10.

Electric Ignition: Unterberg & Helmle [Distributor for H.T. apparatus] 19,024/09; Ehrich & Graetz [Automatic gas lighting] 19,955/09.

Electrometallurgy and Electrochemistry: Johnson (*Chemische Fabrik Griesheim Electron*) [Arc furnace for treating gases] 11,060/09.

Instruments and Meters: Siemens Schuckertwerke Ges. [Pressure-indicating instrument] 17,620/09.

Storage Batteries: Taylor [Battery sub-stations on A.-C. systems] 2,147/09.

Switchgear, Fuses, and Fittings: Brookes (*Thomas and Betts Co.*) [Connector] 7,576/09; Mackay [Lamp-shade holders] 9,812/09; Marsh [Time switches] 10,940/09; Johnston [Wiring fittings] 11,773/09; Curtis, Mould and Adams Manufacturing Co. [Motor-starters and rheostats] 13,142/09; Baker [Switches] 17,561/09; Karolyi, Klupathy and Berger [Operating switches at a distance by sound and other waves] 17,932/09; Conradi [Connector plug] 18,228/09; Jakobsen and Jensen [Switches] 25,551/09.

Telephony and Telegraphy: Burstyn [Diaphragm condensers for wireless telephony] 7,906/09; Sharman [Telegraph signal recorders] 9,686/09.

Traction: Ellison [Emergency brake] 18,072/09.

Miscellaneous: Cowper-Coles [Smoke consumer] 4,906/09; Lake [Ventilating apparatus] 7,080/09; Turnbull [Coal conveyor] 7,977/09; Greener, Thompson and Morgan [Coal conveyor] 8,318/09; Thomson [Electric coal-cutter] 8,694/09; Freeman [Printing-press controller] 9,052/09; Spalazzi [Dial signalling device] 11,338/09; Zhaniel [High-frequency stage effects] 16,309/09; Moy and Bastie [Electric scenery-raising gear] 22,081/09; Page (*Coal & Coke By-products Co.*) [Centrifugal separators] 23,313/09; Carbonnelle [Telegraphic transmission of photographs] 229/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electric Ignition: Bellem and Brégéras, 6,962/10.

Telephony, &c.: Petersen and Sem [Long-distance telephony] 6,895/10; Siemens & Halske A.-G. [Semi-automatic telephone exchange] 6,964/10.

Traction: Siemens & Halske A.-G. [Automatic recording of intervals and speed of trains] 376/10.

Miscellaneous: Sherl [Gyroscopic apparatus] 27,590/09.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

8,644 of April 24th, 1896. **Prepayment Meter Mechanism.** J. Tourtel. This patent covers a mechanism suitable for slot meters.

The following are the more important Patents that have become void through non-payment of renewal fees.

Electrometallurgy, &c.: H. C. Harrison and J. Day [Depositing metals on rotating cathodes] 23,647/00.

Incandescent Lamps: F. W. Howorth (*J. H. Guest and C. I. Hills*) [Copper leading-in wires] 28,458/04.

Storage Batteries: J. W. Stover and N. H. Suren [Charging arrangements and automatic apparatus] 26,702/01 and 26,754/01.

Switchgear, &c.: R. Wallwork and C. H. Wallwork [Lamp bracket or pendant] 26,659/01; Bruce, Peebles & Co. and A. C. Peebles [Liquid motor-starter] 29,607/04.

Traction: W. H. Braim and J. C. Jamieson [Operating points and switches from car] 28,478/03.

Miscellaneous: H. Helberger [Electric chain-welding machine] 28,662/03; C. Geddes [Time-alarm apparatus] 28,460/04; F. W. Reed and Craven Bros. [Electric crane and hoisting gear] 28,678/04; W. List and F. Ritchie [Indicating extinction of vehicle lamps] 28,920/04; W. M. Llewellin [Time-checking apparatus] 29,215/04; H. W. Sullivan [Trembler-switch for induction coils] 29,368/04.

SUMMARY

A Paper describing some typical water-power installations in Sweden was read on Thursday last before the Institution of Electrical Engineers by Mr. A. V. Clayton,, formerly of the Magnet Co., Ludvika, Sweden. The Paper included particulars of the hydraulic work in connection with these stations, and some interesting alternators were described. Owing to extreme pressure on our space we are obliged to withhold the publication of our report of the meeting until next week.

We publish photographs and biographies of the members nominated for the vacancies on the Council of the Institution of Electrical Engineers. In addition to the nominations made by the Council for the five vacancies of ordinary members of Council, members in the West of England have nominated Mr. H. Faraday Proctor as their candidate, so that there will be a ballot. Mr. W. A. Chamen, who is proposing Mr. Proctor, made a short statement with regard to this at the meeting of the Institution of Electrical Engineers on Thursday. (Page 277.)

A new pattern of tramcar body is being adopted at Liverpool, with cross-seats on the lower deck as well as on the upper deck. (Page 279.)

A list of the papers to be read at the Annual Congress of the Tramways and Light Railways Association at Dublin next month is given on page 279.

A new metal filament lamp of British manufacture has been introduced. The bulbs of even the high-voltage lamps are quite small. To avoid the filament loops being too close together, they are arranged in two concentric rows. (Page 279.)

A large amount of the plant at the Shieldhall Sewage Works, Glasgow, is electrically driven, although some of the main pumps are steam-driven. Continuous-current generating plant is provided on the premises. We give in an illustrated article a detailed description of the electrical equipment. (Page 280.)

Considerable progress continues to be made in the supply of electricity in Shanghai. The house service connections now number over 3,200, and the charges for lighting vary between 3·7d. and 2·28d. per unit. Lamps are sold by the department at a small profit, and heating and cooking apparatus is to be let out on hire. It is proposed to institute a flat rate of 0·86d. for heating and cooking. The total working costs are 1·246d. per unit. (Page 282.)

In a lecture before the Royal Institution on Friday, Mr. T. Thorne Baker described the latest advances in photo-telegraphy. A portrait transmitted from Brighton to London by a portable apparatus was shown, and it was mentioned that Prof. Korn is constructing apparatus on his own system, using selenium cells with a view to transmitting photographs between New York and London. Mr. Thorne Baker also described his wireless apparatus, and showed some results. (Page 282.)

Digitized by Google

WE publish some further particulars with regard to street-lighting contracts in the West End of London, and also Correspondence we have received on the subject. (Page 283.)

THE meeting of the Illuminating Engineering Society on Thursday, April 14th, was devoted to a discussion on illumination photometry. Mr. A. P. Trotter described the characteristics of a practical photometer for street-lighting and similar measurements. Mr. Clarke, of the Gas Light & Coke Co., and Mr. Haydn Harrison emphasised the importance of light distribution curves as compared with single observations of mean spherical candle-power. (Page 284.)

SOME interesting figures are published relating to the number of licensed wireless telegraph stations in the United Kingdom and the traffic in connection with these. The Marconi Co. have restarted their wireless telegraph service across the Atlantic, and it is stated that long-distance stations in Italy, on the Red Sea, and on the east coast of Africa are approaching completion. (Page 285.)

THE Bradford Corporation have been authorised to adopt the trackless trolley system of electric traction experimentally on one line, but they must apply for special powers should they wish to extend the system. —The Rhondda Tramways Bill authorising an expenditure of £35,000 has been passed. (Page 285.)

THE Manchester Tramways Committee propose to contribute £60,000 to the relief of rates, and the Leeds Tramways Committee £55,000.—The Liverpool Electric Lighting Committee will contribute £20,000 to relief of rates and the Tramways Committee £27,450. —For the first six months' working of the Fleetwood Council's electricity station, there has been a net profit of £1,000.—The Bethnal Green Council are again considering the question of taking a supply of electricity in bulk from a neighbouring Council. (Page 286.)

A 250-KW. GENERATING SET and steam plant is required at Hounslow.—Extensions are contemplated at Leicester (£19,000), Felixstowe (£4,500), and Erith, where a 300-kw. set is to be installed.—The Arbroath Electric Light & Power Co. also propose extensions.—The L.C.C. require 250 new tramcars.—Electrical plant is required by the Prince Rupert (British Columbia) Council.—A scheme for lighting the new graving dock at Belfast is recommended.—Large quantities of telephone material are required in Australia. (Page 286.)

AT the meeting of the London United Tramways Co., last week, it was stated that considerable sums will have to be expended in the near future upon renewals of track, &c.—The Chairman of the Cork Electric Lighting & Tramways Co. stated at the meeting last week that a federation has been formed to prevent unreasonable strikes. The company suffered considerably last year in this connection. (Page 288.)

Two Bills, by the Bishop's Stortford and Farnham Gas Companies respectively, proposing to supply electrical energy, were considered by the Unopposed Committee of the House of Commons on Thursday. Mr. J. F. C. Snell and Mr. A. H. Dykes had been retained by the two gas companies. The Farnham Bill was passed, but a decision upon the Bishop's Stortford Bill was postponed for a week, in order that a resolution may be passed by the Council in favour of the proposal. (Page 289.)

AMONG the Specifications published by the Patent Office on Thursday last was one by A. M. Taylor for an arrangement of storage battery sets in sub-stations on A.C. distribution systems, whereby the synchronous motor-generators are over-excited when charging the batteries, thus compensating automatically for the lagging currents in the system.—The British Insulated & Helsby Cables, Ltd., protect an insulated cable with alternate layers of vulcanised rubber and bitumen.—An automatic device for use in conjunction with motor-starters to break the main circuit directly the starting lever is given a backward motion is patented by the Adams Manufacturing Co.—A wall-plug provided with a handle and shield, and in which the flexible passes out at right-angles to the axis of the pins is described by J. F. and E. S. Conradi.—Messrs. Siemens-Schuckertwerke Ges. protect a method of insulating commutator segments; the hard insulation extends below the radial wearing depth only, and short-circuiting by carbon dust in the gaps between the segments is prevented by varnishing the sides of the segments. (Page 290.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, APRIL 28TH.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, London. "Earthed *versus* Insulated Neutrals in Colliery Installations," by W. W. Wood.

SATURDAY, APRIL 30TH.

Institution of Mining Electrical Engineers.

4.30 p.m. Warwickshire Branch. At Imperial Hotel, Birmingham. (1) "Notes on Mining Switchgear," by Mr. A. Hall; (2) "The Earthing of Coal Cutting Machines," by J. R. English.

6 p.m. Lancashire Branch. At Victoria Hotel, Sheffield. "Is Flame-proof Gear Possible?" by H. Jenkins.

TUESDAY, MAY 3RD.

Electro-Harmonic Society.

4.30 p.m. Annual General Meeting at Institution of Electrical Engineers, 92 Victoria Street, London.

Iron and Steel Institute.

7 for 7.15 p.m. Annual Dinner at the Hotel Cecil.

WEDNESDAY, MAY 4TH.

Iron and Steel Institute.

10.30 a.m. Annual Meeting at the Institution of Civil Engineers, Great George Street, Westminster, London. (1) "On the Girod Furnace and the Electric Smelting Works of the Paul Girod System," by Prof. Dr. W. Borchers; (2) "On the Progress of Electro-Smelting," by Donald F. Campbell; (3) "On Developments in the Production of Electric Power: Its Application and Bearing upon the Iron and Steel Industries," by D. Selby Bigge.

Institution of Electrical Engineers: Birmingham Section.

7.30 p.m. Annual General Meeting at the University.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. Annual General Meeting at 92 Victoria Street, London, S.W.

THURSDAY, MAY 5TH.

Institution of Electrical Engineers.

8 p.m. At Royal Society of Arts. "A Telephone Relay," by S. G. Brown.

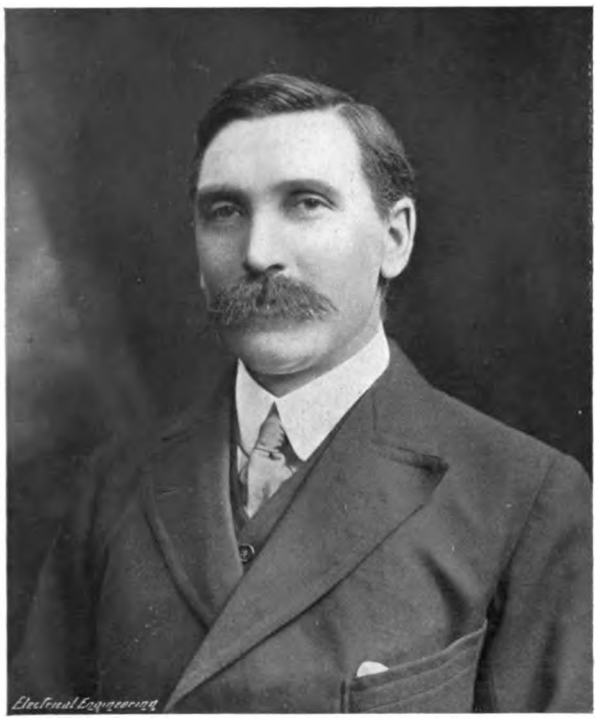
Institution of Electrical Engineers: Dublin Section.

8 p.m. Annual Meeting at Royal College of Science.

Röntgen Society.

8.15 p.m. At 20 Hanover Square, London. "Quantitative Measurements of the Conversion of Cathode Rays into Röntgen Rays by Antikathodes of different Metals," by J. H. Gardiner.

Victoria Telephone Exchange, Birmingham.—On April 16th the National Telephone Company transferred the subscribers in Birmingham connected to its Victoria Exchange to a central battery equipment installed in new premises (which have been specially designed) in Sandy Lane, Small Heath, Birmingham. The new equipment has been manufactured and installed by the Western Electric Co., Ltd., and is of the No. 10 C.B. type, consisting of six subscribers' positions, giving accommodation for 420 lines and three incoming junction positions, one of which is temporarily arranged as a plugging up position. The equipment is of similar design to that installed at the company's Crosby, Great Yarmouth, Greenock, and Rusholme exchanges, already referred to in our columns.



Alteration of Declared Pressure by the St. James & Pall Mall Electric Light Co.—The St. James & Pall Mall Electric Light Co. has obtained permission of the London County Council to alter its "declared" pressures to consumers from 107 and 214 volts to 110 and 220 volts, in order to enable it to use meters calibrated to these figures. Hitherto the supply has actually been given at 110 and 220 volts, but the ampere hour meters which have been in use are calibrated for 107 and 214 volts. It is proposed to adopt watt-hour meters in future, when the additional percentage of the recorded consumption will be charged to consumers. The permission for the change in declared pressure is given on the understanding that any variation shall be within the 4 per cent. on to 107 and 214 volts respectively prescribed by the regulations of the Board of Trade.

Digitized by Google

THE NEW INSTITUTION COUNCIL

We give below a portrait of Mr. S. Z. de Ferranti, who has been nominated as President of the Institution of Electrical Engineers for next session, and also photographs of the members nominated to fill the seven vacancies on the Council. The Council have nominated seven members (two vice-presidents and five ordinary members), and one independent member has been nominated up to the time of going to press. Balloting papers will be sent out to Members and Associate-Members of the Institution in due course.

Mr. S. Z. de Ferranti, the new President, who was born at Liverpool forty-six years ago, has, in spite of his comparatively young age, had a striking career in both the manufacturing and supply branches of electrical engineering. Mr. Ferranti was one of the pioneers of the electricity supply industry, and it was he who originated in 1887 the system now adopted in practically all large schemes of placing the generating eccentrically to the supply area at a point where coal and water are comparatively cheap, and transmitting the energy at high pressure

Mr. S. Z. de Ferranti.
(President-Designate of the Institution of Electrical Engineers.)

to the district to be supplied. When he first developed his scheme for supplying practically the whole of London from Deptford, transmitting the energy at 10,000 volts, a pressure then considered enormous, he was met with scepticism from all quarters, alike from other electrical engineers and financiers. Yet practically all the essential features which were derided at the time are now standard practice of the present day, and it has been recognised that the metropolis would be able to buy its energy more economically if it were generated from one or two large stations situated on the Thames than by a multiplicity of smaller stations as at present. Mr. Ferranti designed every detail of the scheme, and manufactured not only the generators, but even the high-tension trunk mains between Deptford and London. He was, we believe, the first to use concentric cables. Previously to the building of the works at Deptford, he supplied a portion of London from the famous Grosvenor Gallery station, from which 2,000-volt cables were originally led overhead to the consumers.

The manufacturing firm of Ferranti, Ltd. (then S. Z. de Ferranti & Co.), as is well known, has always made transformers, meters, and switchgear, in addition to generating plant and steam engines, but the manufacture of these two latter classes of plant was discontinued when the firm was reconstructed a few years ago.

Mr. Ferranti is still associated with Ferranti, Ltd., as Director, and is at present living near Sheffield. He has long held the opinion that electrical development in all directions will almost entirely depend on the cost of generation, and has recently devoted himself particularly, in conjunction with Messrs. Vickers Sons & Maxim, to the development of improvements in steam turbine design.

Mr. Ferranti served on the Council from 1895-98, and again from 1903-6, and was Vice-President from 1900-3.

The cordial reception of the announcement of the Council's choice for the new President at the meeting last Thursday indicated—if indication were necessary—the popularity of Mr. Ferranti among the members of the Institution.

Mr. W. H. Patchell, one of the new Vice-Presidents, is the late chief engineer to the Charing Cross, West End & City Electricity Supply Co., a position to which he was appointed in 1893 and resigned in 1906 to take up consulting work. During this period he was responsible for all the extensions of the company's undertaking, including the design of the Bow generating station. Since then Mr. Patchell has carried out a considerable amount of work in connection with the application of electricity to mines and the design of electric power stations. Mr. Patchell was a member of the Home Office Committee which in 1904 considered the drafting of rules governing the use of electricity in mines. He served on the Council of the Institution as Vice-President from 1900 to 1903, and as ordinary member of Council from 1895 to 1898, and 1907 to 1910.

Mr. W. H. Patchell.

Mr. J. H. Rider, the other nominee as a Vice-President has been chief electrical engineer to the London County Council tramways since 1901, and has supervised the electrical arrangements for the entire change over from horse to electric traction in the County of London. The large generating station at Greenwich has been built to his designs. Previously, Mr. Rider was with the Plymouth and Bolton Corporations as borough electrical engineer. He served on the Council of the Institution from 1901-4, and again last year. Mr. Rider was practically the founder of the Incorporated Municipal Electrical Association, and was President in 1902.

Mr. J. H. Rider.

Mr. H. Dickinson is manager of the Leeds Corporation Electricity Department. In 1888 he obtained an appointment with the London House-to-House Company (now the Brompton & Kensington Electricity Supply Co.), and later he was offered an appointment in Madrid by the Electricity Company for Spain, as assistant engineer. After eleven months' stay in Madrid he joined Messrs. Hammond & Co., to look after the laying down of the electrical plant for the Dublin Corporation Electricity Supply Station. In 1893 Mr. Dickinson became manager of the Yorkshire House-to-House Electricity Co., and transferred his services to the Corporation in 1898, when the company's business was taken over. He was first chairman of the Leeds Local Section of the Institution of Electrical Engineers in 1903, now the Yorkshire Local Section, and in 1906 became honorary secretary of that Section.

Mr. H. Dickinson.

MR. J. E. KINGSBURY.

MR. J. E. KINGSBURY has been interested in the development of the telephone, and has taken an active part in its exploitation since 1878, and he also took an active part in other electrical enterprises during this early period of the industry. In 1883 he entered the service of the Western Electric Co. as manager of their London branch, which was opened in that year. As recently announced in our columns, Mr. Kingsbury retired from the position early in the present year. He was a member of the Council of the Institution from 1900-1903, and again from 1906-1909, and was a Vice-President from 1903-1906. Our photograph was taken specially for ELECTRICAL ENGINEERING by Mr. Kingsbury's son, who is an ardent amateur photographer.

MR. P. V. MCMAHON.

MR. P. V. MCMAHON, Engineer to the City and South London Railway, the first tube railway to be constructed in this country, was appointed in 1896, upon the retirement of Mr. Basil Mott. Shortly after his appointment the extensions of the railway to Moorgate Street and Clapham Common were commenced, and he acted for the Company as consulting engineer in connection with the electrical equipment and rolling-stock for the above extensions, as well as for the extensions of the railway to the Angel and Euston which followed, and involved a change over to a three-wire continuous-current system of distribution, at 2,000 volts, with battery substations. During the years 1897-98 he conducted a number of tests and experiments on tractive resistance in tunnels and drawbar pull of locomotives in actual service. The results of these observations were embodied in a Paper read before the Institution of Electrical Engineers in 1899, and for which he was awarded the Institution Premium. In 1904 he read a Paper on the "Application of the Three-wire System to Electric Traction" before the same Institution, and for this and his former Paper he was awarded the Willans Premium.

MR. R. K. MORCOM.

MR. R. K. MORCOM is a partner in the firm of Messrs. Belliss & Morcom, Ltd., the well-known engine-builders of Birmingham, and a son of the founder. He has devoted himself particularly to the experimental and testing work of the firm. Mr. Morcom was chairman of the Birmingham Section of the Institution in 1909-10, and as such he was an *ex officio* member of Council.

MR. S. L. PEARCE.

MR. S. L. PEARCE, Chief Electrical Engineer to the Manchester Corporation, comes on to the Council for the second time, he having served previously in the year 1907-8. He was, of course, *ex officio* member of the Council during the year he served as chairman of the Manchester Section, viz., 1905-6. In addition to being City Electrical Engineer at Manchester, Mr. Pearce is also responsible for carrying out the extensions there. Two 6,000 kw. turbo-alternators have been put down to his specification and under his supervision, and, among other extensions, he has put down the 12,000-ampere-hour storage battery (the largest in the United Kingdom), a description of which, and the switchgear and boosters in connection with it appeared in our last issue. Mr. Pearce identified himself energetically with the work of promoting and organising the Electrical Exhibition in Manchester in 1908, and acted as Joint Consulting Engineer, and is a Past President of the Incorporated Municipal Electrical Association.

MR. SYDNEY MORSE.

MR. SYDNEY MORSE, who has been nominated for Associate Member of Council, is well known as the Solicitor to several important electrical companies, including the British Electric Traction Co. and its allied undertakings. He has taken a keen interest in the promotion of electric tramways, and has worked hard in endeavouring to secure the removal of the local authorities' veto under the Tramway Acts. He has previously served as Associate Member of Council from 1896 to 1899 and from 1902 to 1905, and will doubtless do further useful work on the Council.

The list of nominations made by the Council of the Institution of Electrical Engineers to fill vacancies on the Council was announced prior to the commencement of the ordinary business of the meeting on Thursday. At the close of the announcement, Mr. Chamen said he wished to nominate Mr. H. Faraday-Proctor (Chief Electrical Engineer to the Bristol Corporation) as a candidate for membership of the Council.

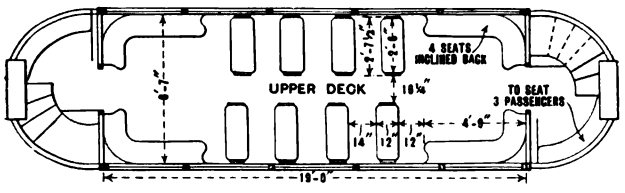
This nomination was seconded by Mr. W. W. Lackie (Glasgow), and was supported by the following: H. Collings Bishop (Newport, Mon.); A. Ellis (Cardiff); H. W. Munro (Exeter); E. G. Okell (Plymouth); H. T. Sully (Bristol); C. A. L. Prussman (Swansea); W. J. Bache (Cheltenham); R. A. Chattock (Birmingham); T. O. Callender (London); D. E. Roberts (Cardiff); T. Schontheil (Cardiff); A. J. Hodgson (Chelmsford).

MR. H. FARADAY-PROCTOR.

MR. H. FARADAY-PROCTOR has the distinction of being the first nominee for a Member of Council whose name has not been put forward by the Council itself. He has been Chief Electrical Engineer to the Bristol Corporation since 1892, prior to which he was Assistant Engineer to the Newcastle-on-Tyne Electric Supply Co. Mr. Proctor reflects with somewhat mixed feelings that he has provided from his chief assistants at various times, chief engineers to some half-a-dozen other important electrical undertakings. He is a past-President of the Incorporated Municipal Electrical Association, of which body he is a very energetic honorary secretary.

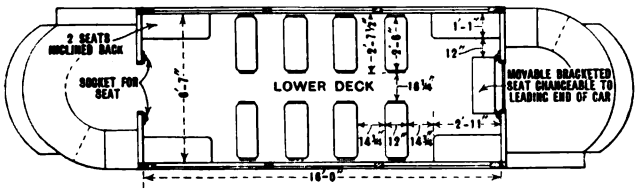
Mr. Chamen said he wished to explain that he did not make the nomination in any spirit of antagonism to the Council, but because he had found, with regret, that in various parts of the country, and certainly in the West, the Institution was not looked upon with that favour which he was sure they would all wish. There was a feeling—at any rate out of London—that no one had any interest in the election of members of Council except the members of the Council themselves. He wished to show by this action of his and his supporters that this was not the case, and that the members of the Institution, if they so wished, could share in the election of members of Council. Although Mr. Faraday-Proctor might not be known to all of the members, yet he was known to a great number, and he knew he would attend the meetings of the Council, and, furthermore, he thought there should be members from the provinces on the Council. He believed this would be the first time when there would have been a ballot for the election of members of Council, and he felt that the members of the Institution throughout the country would take a vastly greater interest in the Institution if they realised they could vote themselves. He knew that in many Institutions the Council themselves nominated a larger number of members than there were vacancies to fill, so that each year there was an election. This had been found a most desirable course, and he really hoped the Council of the Institution would see their way to take such a step in the future.

Mr. Chamen, whose speech was received with considerable enthusiasm by the large number of members present, then formally handed in his nomination papers to the secretary.



THE PRESIDENT (Prof. Gisbert Kapp) said they were all very much obliged to Mr. Chamen for the trouble he had taken in the matter. The only wish of the Council was to represent fully and fairly the wishes of the members. Mr.

Digitized by Google



Chamen's nomination would, of course, be sent round to the members to vote upon. He took the opportunity of reminding the members that it was within their province to send suggestions for new members of Council. It was always an assistance to the Council to know the wishes of the members, and if in future years names were suggested to the Council before the Council's nominations were published, they could be included in the Council's list. In voting on the present occasion, the President pointed out that it would be necessary to strike out one name, otherwise the ballot paper would be invalid.

NEW TYPE OF TRAMCAR

A FORM of car with increased accommodation is being adopted by the Liverpool Corporation Tramway Department, and one of the new cars is already in service on the old Swan route. The principal difference between it and the older cars lies in the increased width of the lower deck, which practically equals that of the upper deck, and thus enables rattan cross seats to be employed on both decks. The width of the new body inside, just above the seats, is now 6 ft. 7 in., as against 6 ft. in the older cars, and the outside measurement is 7 ft. 4¼ in., as compared with 6 ft. 9 in. The arrangement of seats is shown in the figure, which is from a drawing sent us

Arrangement of upper deck to seat 32 passengers under cover and 6 outside.

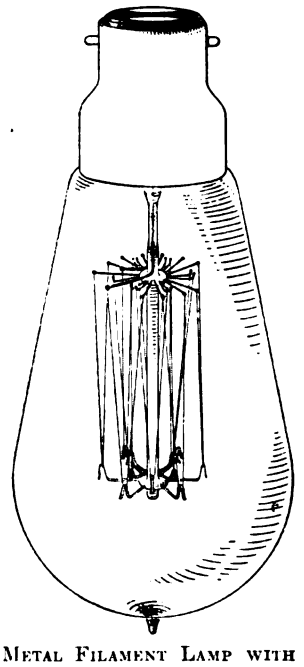
Lower deck with seats for 26 passengers.

Arrangement of Seating on New Car on Liverpool Corporation Tramways.

by Mr. C. W. Mallins, General Manager, Liverpool Corporation Tramways. The lower deck has accommodation for 26 passengers, as against 20 or in some cases 22 on the older type of car, without any increase in length. On the upper deck the seating arrangement has been changed in order to give better facilities for passengers entering and leaving the car, as shown on the above plan, and has accommodation for 38 passengers. The car is fitted with lifting windows of the noiseless type on the upper deck. It has a 7 ft. 6 in. wheel base, which gives it much smoother running than the cars with shorter wheel base at present in use.

Tramways and Light Railways Association Congress.—For the annual congress of the Tramways and Light Railways Association, which will be held on May 12th and 13th, the following programme has been arranged:—On Thursday, May 12th, the Papers down for reading are: (1) "Short History of the Dublin United Tramways Company," by R. S. Tresilian; (2) "Should the Act of 1870 be revised?" by Fred Coutts (Engineer and General Manager, Paisley District Tramways Co.); (3) "Railless Traction," by H. England (General Manager, Wakefield & District Light Railways Co.); (4) "Standardisation of Brake Blocks," by J. A. Panton (Superintendent, Rolling Stock, Liverpool Overhead Railway); (5) "Tramway Economics," by J. R. Salter (General Manager, Lancashire United Tramways, Ltd.). There will be a short discussion after each Paper. In the evening a dinner will be given by the Dublin United Tramways Co. On Friday, May 13th, a visit of inspection will be paid to the power house, &c., of Dublin Tramways. Pleasure trips in the district have also been arranged.

A STREET LIGHTING PHOTOGRAPH



THE General Electric Co., Ltd., has sent us the following reproduction of a photograph taken in a street in the West End of London to show the effect of street lighting. Each of the

lanterns contains two 110 watt Osram lamps with special reflectors. The existing gas lanterns fixed on to the sides of the houses have been utilised.

SMALL HIGH-VOLTAGE METAL FILAMENT LAMPS

THE accompanying illustration shows a new metal filament lamp, which is being placed on the market by Messrs. Galsworthy, Ltd. (15 Newman Street, London, W.). The chief features of the lamp are the small size and the special arrangement of the filaments, which prevents the short-circuiting of the arms of the loops in spite of their being enclosed in such a small bulb. The 40-watt lamp measures 5 in. long by 2¼ in. maximum diameter. In the lamp shown, which is a 40 watt (38 c.p.) 200 volt lamp, there are twelve filament loops arranged in two concentric rows of six each. The radial supports at the base of the pedestal are in one plane, the shorter arms being for the inner loops. The hooked supports at the top are in two planes. Besides being in two rows, the loops are arranged unsymmetrically as shown, thus giving the maximum distance between them. The few loops per row enables them to be spread wide apart at the base, and this gives a wide angle at the bend of the loop, preventing short-circuiting of the bend and consequent overrunning. Owing to the extreme fineness of the filaments, placing them in two rows has no appreciable effect on the amount of light emitted. By employing a larger number of short loops instead of a few long ones, a stronger construction is obtained. These lamps are made in all the standard sizes, and we are informed that an 18 c.p., 20 watt, 200 volt lamp can be supplied. The lamps are manufactured by Mr. S. Horvath at his works at 51 Standen Road, Southfields.

Metal Filament Lamp with Two Concentric Rows of Filament Loops.

The "James Forrest" Lecture.—The eighteenth "James Forrest" lecture will be delivered at the Institution of Civil Engineers, Great George Street, Westminster, London, on Wednesday, June 22nd, at eight p.m., by Sir John Gavey, C.B., the subject being "Recent Developments of Telegraphy and Telephony."

Electric Traction in Chile.—According to the *Financial Times*, the Chilian Government will shortly invite tenders for the conversion to electric traction of the main line railway from Santiago to Valparaiso and its branches. The total length of the line is 156 miles. It is further stated that the conversion of the remainder of the Chilian railways will follow.

ELECTRICAL EQUIPMENT OF THE SHIELDHALL SEWAGE WORKS, GLASGOW

THE outfall works at Shieldhall are some miles below the centre of the city, and are the completing link in the chain of works which form the important sewage scheme begun some years ago. The works, it may be explained, deal with the whole of the sewage collected in what is known as the southern section, which includes the whole of the municipal area of Glasgow on the south side of the river, the Burghs of Rutherglen, Pollokshaws, and Govan, and various parts of the counties of Renfrew and Lanark. The area drained approximates 14 square miles. A large amount of sewage, collected along the Glasgow riverside area, is pumped through the Kinning Park pumping station (opened on April 4th, 1910) up to a high-level sewer, and is delivered by gravitation into

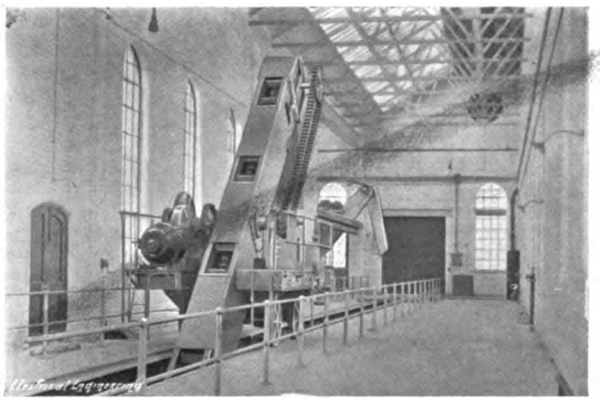

Fig. 1.—Dredger Elevator with Top and Shoot of High Level Screenings Elevator in Background.

the Shieldhall Works. The sewage drained from Govan and South Lanark is pumped up to a height of 21 ft. in the pumping station at Shieldhall. In the ensuing description of the plant the first sewer mentioned above is known as the high-level sewer, and the other as the low-level.

From the electrical engineer's point of view it is perhaps unfortunate that one is not able to say that the whole of the plant is electrically driven. The works are in such a position that it was not possible to come to a satisfactory arrangement with any of the suppliers of power in the vicinity. Consequently it was necessary to lay down a steam plant, with the result that the pumps dealing with the sewage discharged by the low-level sewer are all steam-driven. With the exception of the Weir feed and Edwards' air-pumps, however, all the auxiliary plant and all the various plant required for dealing with the sewage and its purifying process is driven electrically.

The boiler plant consists of a range of three Babcock & Wilcox water-tube boilers, constructed for 150 lbs. pressure, and fitted with superheaters giving a moderate degree of superheat. Chain-grate stokers capable of wide speed variation are employed in conjunction with automatic hoppers, which are fed from an overhead coal conveyor of the Babcock & Wilcox push-plate type; an ash hoist of Messrs. Lowden Bros'. & Co.'s make is also fitted. An economiser has been supplied by the Claycross Co., of Chesterfield. Three Weir feed pumps are provided. The main steam ranges in the engine and boiler room are constructed of wrought-steel piping, and are supported on roller bearings, and the main steam branches are all constructed with wrought-steel bends. Cast-iron exhaust pipes are used. Pockets are fitted at intervals in the main steam ranges in order to facilitate the draining arrangements. Baker oil separators are fitted in the main exhaust from the generating engines, and also from the various sections of the pumping plant. A central condensing plant is installed. This consists of two Mirrlees-Watson condensers, complete with two Edwards air-pumps, and provision is made for automatically exhausting to the atmosphere in the event of any failure of the condensing plant. The most interesting point in connection with the condensing arrangements is that the circulating water consists of effluent water drawn by gravitation from two of the precipitation tanks. Our representative was informed that in the outfall works of the Western District, where a similar system has been in use for some time, it is only necessary to clean the condenser tubes once in three or four months.

There are three generating sets installed, with provision for a fourth. The generators are of Messrs. Crompton's make, shunt-wound, and constructed to give 150 kw. output at 250 volts at a speed of 450 r.p.m. The triple expansion reciprocating engines are of Messrs. Jas. Howden & Co.'s enclosed type; this firm also supplied the main pumping engines.

The main switchboard and power distributing board and sub-boards are of polished slate, the motor-panels being of unpolished slate. The main switchboard is divided into four generating panels, two power-feeder panels, and two lighting-feeder panels. The generator and power panels are equipped with Whipp & Bourne S.P. and D.P. circuit-breakers, with laminated contacts and adjustable time-lag devices. With the exception of the main D.P. switches on the generator panel and No. 2 power-feeder panel, the switches are all arranged in vertical tandem. All the fuse handles are of the Reyrolle ventilated tubular type. Everett Edgcumbe instruments (including the integrating wattmeters on the generator panels) are used throughout.

No. 2 power-feeder panel mentioned above controls the main power distributing board, which is placed but a few feet away from the main switchboard; from this distributing board are controlled all the motor panels in and around the main buildings. No. 1 power panel controls the feeders to the sludge house and the high-level inlet chamber; both of these points are some distance from the main block of buildings. The backs of the main switchboards are arranged with strip copper connections to the bus-bars, the cables are brought into a trench, and the connection of the tails to the terminals is very neat and workmanlike.

An unusual feature in connection with the distribution scheme is that, in addition to telephonic communication from the main switchboard to the sludge

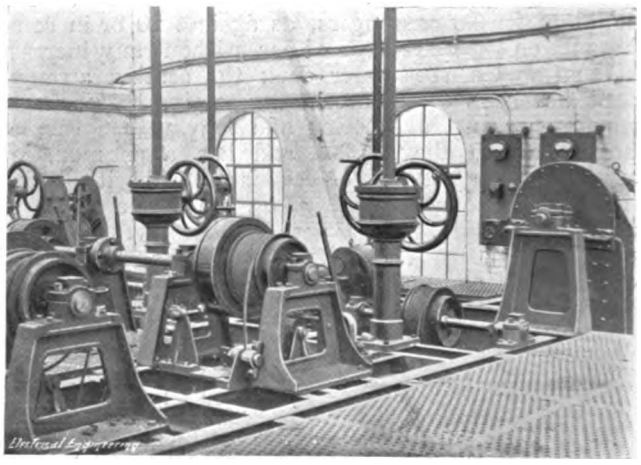

Fig. 2.—Low Level Screen House.

pump house and the high-level inlet chamber switchboards, there is provided a bell-signalling system between each motor panel and the main distributing board, by which the motor operator can signal to the switchboard attendant when power is required.

The lighting feeder and distribution cables are rubber covered, taped and braided, but with this exception, the whole of the cables from the main board

Digitized by Google

are vulcanised bitumen, lead-covered, armoured, and braided overall. The cables to the sludge house and inlet chamber are carried on cleats on the building walls as far as possible, but where they enter the ground the armouring ceases, and they are continued as plain vulcanised bitumen, lead-covered cables, in creosoted wood troughing filled with Trinidad bitumen. This arrangement saved the necessity for jointing while giving the desired protection. There are no joints in any of the main circuits. The whole of the cables from the main distributing board are vulcanised bitumen, lead-covered, and are carried through ducts or conduits, as is most convenient. Free use has been made of inspection boxes, some of very large size, in order to avoid making bends in the main conduit runs. The armoured cables are taken through the engine room in trenches, and where they rise up the walls of the adjoining rooms they are clipped in oak cleats spaced about three feet apart. For supports along the wall C.I. stepped racks are used.

There are altogether some 38 motor panels, varying from 3 h.p. for the inlet penstock motors to 30 h.p. for pump and oxidiser motors. Each motor panel is equipped with a totally enclosed starter, a D.P. knife switch in cast-iron hinged case, an ammeter with H.P. scale, and a push-button for the bell-signalling system already mentioned. The starters, which are of Messrs. Hamilton Bros.' make, have no-load and overload solenoid release, and are constructed without the use of asbestos; the larger proportion being water and gas tight. When necessary, the motor panels are equipped with reversing switches.

The whole of the motors are shunt-wound, and a large proportion are totally enclosed; they are all, except the smaller sizes, provided with commutating poles, and have split frames and bearings, thus allowing the armatures to be removed by a direct vertical lift. The specification called for a two hours' run at 30 per cent. overload; under these conditions, the temperature rise has not to exceed 80° Fahr. for the totally enclosed motors.

In order to understand some of the motor applications, it is necessary to have some idea of the various operations and processes. The low-level sewer discharges into a chamber known as the low-level screen house, which is equipped with two lines of box screens and one line of rough bar screens; these screens, which are 4 ft. wide and 7 ft. 6 ins. high, are designed to retain the solid matter entering with the sewage, and are raised and lowered into position by one 5-h.p. motor on each line of box screens, and a 3-h.p. motor on the line of bar screens. The shafting actuating the drums is controlled by clutches in such a manner that only one screen on each line can be operated at once. It is possible to lower the screens by their own weight, controlled by the action of the clutch brake supplemented by an electro-magnetic brake. The screenings are directed into a catch channel, and are discharged into waggons by means of a suitably designed dredger elevator operated by a 10-h.p. motor. The sewage, after leaving the low-level screen house, is lifted a height of 21 ft. by the steam-driven centrifugal pumps, and is discharged into what is known as the catch pit, where it is joined by the high-level sewage, which is discharged by gravitation through a screen house similarly equipped to the one described above. In the catch pit the sewage is mixed with purifying solutions, known respectively as the iron liquor and lime mixture. The catch pit is 160 ft. long by 17 ft. deep and 16 ft. wide at the widest part, and in section it resembles somewhat the outline of a peg-top with square shoulders. The top is partially closed in leaving a longitudinal opening 160 ft. long by about 3 ft. 6 in. wide. Surmounting the opening and running parallel to its centre is a railway track, which accommodates the novel dredger elevator, designed by Mr. W. D. Hamilton to lift and discharge the precipitated matter which collects in the narrow gulley at the bottom of the pit into waggons which are attached to the dredger truck. The dredger travels backwards and forwards at a constant speed, and is entirely automatic in its action. It is operated by a 1-h.p. shunt-wound motor, which is supplied by power from a triple trolley line, the lines being positive, negative, and shunt. This arrangement was adopted in order to allow of the machine being started and stopped from a point near the end of the building.

From the catch pit the sewage is discharged into the precipitation tanks, and, after the resulting effluent water has been drawn off, the sludge remaining is lifted by centrifugal pumps into cast-iron tanks, in which it is stored until the arrival of the sludge vessel at the riverside wharf. The sludge is discharged from the storage tanks into the ship's hold by gravitation, and is then carried out to sea. The equipment of the sludge pumping house consists of three 9 in. centrifugal pumps of Messrs. William Drysdale & Co.'s make, each driven by a 30-h.p. motor running at 600 r.p.m. The half-couplings on the pump shafts have large holes, into which pins projecting from the face of the half-couplings of the motor ends of the sets fit loosely; this arrangement allows the motor armatures to have the necessary end play. Rubber washers are fitted round the pins in order to take up shock.

The pumps just mentioned are for dealing with the sludge, but in addition there is fitted a 6-in. pump driven by a 15-h.p. motor for the purpose of spraying clean water into the tanks for cleaning-down purposes. Two 6-h.p. Brackett exhausters are installed for the purpose of assisting the sludge pumps at starting. The main feeders from the engine house are brought into a main panel, which supplies four power and lighting distributing panels, equipped in similar manner to the distributing board already described. A distributor is taken to the Riverside Wharf, where a 3-h.p. motor is installed to raise and lower the sludge discharge pipes to correspond with the position of the sludge vessel on a rising and falling tide.

The iron liquor mentioned is oxidised in what are known as oxidising chambers, which are large round tanks constructed of oak, with revolving paddles of the same material inside; there are three of these tanks in line, and the revolving paddles are actuated from a three-section shaft, fitted with clutches in such a way that no more than two sections can be driven from one end at once. A 30-h.p. motor is fitted at each end of the shaft line, and the arrangement described allows of one or two oxidisers being driven from either motor. The solution is fed into the oxidisers by gravity from a small supply tank, into which it is forced, from an air chamber under the floor level, by compressed air supplied from a 3-h.p. motor-driven air-compresser.

In the preparation of the lime mixture there are two processes. In the first, the lime is passed through machines known as lime-mixers, of which there are two pair, each pair being driven by a 30-h.p. motor through spur and pinion gearing. In the second, the prepared lime is made into solution in what are known as lime-stirring tanks, which are shallow concrete-lined ponds, equipped with moving iron structures designed to agitate the solution. These agitators are three in number, and are constructed principally of angle iron, forming open frames about 20 ft. wide, and sufficiently deep to reach the bottom of the tank. The structures travel backwards and forwards along the tanks, and are arranged to tilt right down into the corners at the ends of the tanks in such a way as to prevent the accumulation of lime at these points. They are actuated by wire ropes driven from 15-h.p. electrically-operated haulage gears arranged for automatic reversal. In the inlet chamber already mentioned there are four Glenfield & Kennedy penstocks operated through worm gearing by four 3-h.p. motors. The feeder is branched into enclosed power and lighting fuseboards arranged on the wall.

One 8-ton crane is arranged in the engine room, and another in the main workshop. The cranes are of Messrs. Jas. Carrick & Son's make, with three-motor equipments. In the main workshop there are two groups of engineering tools, both driven by 10-h.p. motors, the only individual drives being a 5-h.p. bandsaw and a 5-h.p. blast fan.

A notable feature of the mechanical equipment is the free use of worm-reduction gears on practically all the motor drives, and the large number of clutches in use. The former are of Messrs. D. Brown & Son's make, and the latter Messrs. D. Bridge & Co.'s make; the only other forms of mechanical transmission adopted appear to be spur and pinion gears and chain drives.

At the ends of the main buildings there are installed five 36-in. Blackman fans. The general interior lighting in the engine room is by means of Osram weather-fitting clusters hung on brackets from the wall; in other parts of the main building there are some 28 Gilbert enclosed arc lamps, arranged with lowering gear of Messrs. the North Western Electric Appliance Co.'s make. Provision is made for the installation of further arc lamps on standards around the precipitation tanks.

The offices are equipped with a complete set of "Prometheus" electric heating and cooking apparatus, supplied by Simplex Conduits, Ltd.

The whole of the electrical and mechanical equipment, the necessary buildings, substructures, super-

Digitized by Google

structures, &c., have been constructed to designs of Mr. William D. Hamilton, M.Inst. Mech.E., of 59 Bath Street, Glasgow, and under supervision of Mr. W. P. Miller, assistant to Mr. Hamilton.

The whole of the electrical work, in fact, the whole of the power equipment of the works, has been in the hands of Messrs. Lowdon Bros. & Co., of Dundee and Glasgow, who themselves constructed the main switchboards and other important parts of the plant, and Mr. W. D. Hamilton has expressed himself as being highly satisfied with Messrs. Lowdon Bros.' work. The sub-contractors for the motors were The Rees Roturbo Co. and Messrs. Wright, Wood & Co., and for the motor panels Messrs. Hamilton Bros., Glasgow, who also supplied the Everett Edgcumbe instruments. The cable was all supplied by Messrs. W. T. Glover & Co., Ltd., of Trafford Park, Manchester.

In conclusion, we should like to express our thanks to Mr. W. D. Hamilton, and to Mr. Morris, representative of Messrs. Lowdon Bros. & Co., for information supplied, and for facilities afforded to our representative for inspecting the plant.

ELECTRIC LIGHT AND POWER IN SHANGHAI

THE annual report of the electricity department of the Shanghai Municipal Council shows that close on six million units were sold during the year 1909, an increase of 29 per cent. over the previous year. These include two million units for the tramways, over 600,000 units for public lighting, and 320,000 units for power and heating. The maximum load on the station was 3,100 kw., while the generating plant capacity is 4,400 kw., including the 800 kw. Willans-Peebles turbo-alternator installed in 1908. The load factor is 22·05 per cent. In spite of trouble with the turbine plant, necessitating the more frequent use of the older reciprocating engines, the coal per unit sold has been reduced to 6·02 lbs. The total working costs, including repairs and maintenance of the distribution system, rent, rates, and taxes, and management expenses, work out at 1·246 pence per unit.

The charges in Shanghai are, we believe, lower than those charged anywhere else in the East. The price per unit for lighting, which is made up either on the discount system or on the maximum demand, is from 13 to 8 cents (3·7d. to 2·28d.). The power rates are on the sliding scale, according to the monthly consumption per horse-power installed, and range from 6 cents (1·71d.) to 2·5 cents (0·713d.) per unit. In the hope of building up a large heating and cooking load, energy for these purposes is shortly to be sold at a flat rate of 3 cents (0·86d.). Gas is supplied by a company at 3s. per 1,000 ft. for lighting, and 2s. 8d. per 1,000 ft. for power, heating and cooking, with discounts. It is proposed to hire out electric heating and cooking appliances to create a demand for domestic purposes. An arrangement has been made to purchase these heaters and cookers by open tender through the local contractors, in order to benefit them at the same time as affording facilities to the consumers.

Incandescent lamps (specially stamped) of only good makes are sold by the department to consumers, at a small profit. These lamp contracts are placed with the local contractors, the last one being for 23,000 metal filament and 10,000 carbon filament lamps. Motors and arc lamps are hired out to consumers on a monthly rental.

Mr. T. H. U. Aldridge, the Municipal Electrical Engineer, reminds us that in comparing the above costs with home undertakings, it must be remembered that interest on money in Shanghai is at 6 per cent., as against the average of 3 per cent. in England; that the plant is depreciated at higher rates than those prevailing in England; that wages and management costs are not so low as might be expected, because the European members of the staff are paid nearly double what they would receive in England, and native labour is not really cheap, since so much of it is required to do the work which less than half the number of Europeans could perform; and lastly, that repairs and maintenance costs are higher on account of the overhead mains. The coal used is Japanese, having calorific value of 11,915 B.Th.U. The cost averages about 14s. to 15s. per ton, landed at the works.

During the year the distribution system has been enlarged by the amount of 109 miles of cable, including over 30 miles of H.T. feeders. Five new sub-stations were installed, bringing the total number up to 60. Eleven of these are equipped with Berry automatic series switches for cutting out the large transformers during periods of light load. The power load has increased considerably, and there is now some 800 h.p. connected. Some 4,000 fans are connected, and the punkah is practically extinct. The public lighting includes 343 arc lights and 364 metal filament lamps. The house service connections now number over 3,200. A 1,000 ampere hour (Chloride) storage battery and a 300 kw. motor generator have been added to the plant. Two 480 kw. Howden-Siemens mixed pressure turbo-alternators will shortly be installed, and will enable the building of the proposed new power station to be postponed. The accounts show a net profit of 5 per cent. on the capital, the gross profit on the year's working being 10·3 per cent.

PHOTO-TELEGRAPHY

AT the Royal Institution, London, on Friday evening last, Mr. T. Thorne Baker, of the photo-telegraphic department of the *Daily Mirror*, delivered a lecture in which he described the latest advances in photo-telegraphy by wire and wireless. Mr. Thorne Baker's apparatus, the "telectograph," was fully described in an illustrated article in Electrical Engineering, August 6th, 1909, Vol. V., p. 697. At the sending station is a metal drum revolving under an iridium stylus. The photograph to be transmitted is printed on to a bichromatised film on a sheet of lead foil through a coarse single-line screen. This foil is then wrapped round the drum. The receiver consists of a similar drum revolving synchronously with the sending drum, and having a wrapping of chemically prepared paper, on which bears a platinum stylus. Every time the transmitter stylus comes in contact with the lead foil, a current impulse is transmitted along the line, and a black mark appears on the receiving paper. The method of reproducing the photograph is clear, when it is remembered that each stylus traces a spiral path round its drum. The impulses follow rapidly one after another at the rate of 300 per second, and in order to make the marks well defined and exactly equal in length to the spaces between the gelatine lines, an arrangement of cells, resistances and condensers, called a line balancer, is used, which wipes out the residuary currents from the cable as in duplex telegraphy. The drums are driven by small motors run off accumulators. The motors are started at the same speed by means of frequency meters connected to slip-rings, and are then left, the gain in speed of each being approximately the same. Mr. Thorne Baker showed for the first time a portable instrument of this pattern, with the aid of which a photographer could telegraph a photograph to a newspaper office directly he had taken it, by connecting the apparatus to the nearest telephone station. The apparatus is said to weigh only 24 lbs. complete, and to cost about £25. A portrait of the Queen, transmitted by one of these portable instruments from Brighton to London in six minutes was shown. Very successful results obtained with the larger apparatus used between London and Manchester, and between London and Paris, were also exhibited, and during the lecture a portrait was transmitted from Manchester direct to the lecture hall.

The lecturer then proceeded to describe Prof. Korn's system, in which use is made of the electrical properties of selenium (Electrical Engineering, Vol. II., page 766), and mentioned that Korn was now constructing apparatus with a view to transmitting photographs from New York to London. The method employed to compensate for the inertia of the selenium cells was then explained. Mr. Thorne Baker also described an apparatus for measuring the strength of X-ray tubes by allowing the rays to fall on a fluorescent screen in contact with a selenium cell. The scale of a milli-ampere meter in circuit with the cell could be calibrated so as to give a direct reading of the strength of the rays, or of the time necessary for the correct exposure of a given photographic plate.

Finally, Mr. Thorne-Baker described a modified form of his telectograph, in which the current impulses are transmitted by wireless with the aid of a special form of decohering apparatus. An outline portrait of the King transmitted in this manner in 7½ minutes was shown, as well as a simple plan, such as might be used for military or naval purposes. A modified form of the Einthoven galvanometer for use with wireless telephotographic apparatus is being constructed. The received oscillations will be rectified by a valve receiver and passed through the silvered quartz fibres. The fibre is in a strong magnetic field, and is displaced, and this allows a beam of light to reach a pair of compensated selenium cells. By means of a relay, the variation of resistance of the cells is caused to work the receiver of a telectograph instrument.

Glasgow Local Section of the Institution of Electrical Engineers.—In the list of the nominations for the new committee of the Glasgow Local Section of the Institution of Electrical Engineers on page 267 of our last issue, the name of Mr. J. C. McMillan was given in error for that of Mr. Campbell McMillan (Electrical Control, Ltd.).

Electric Light and Power in Country Houses.—We have received so many applications for copies of this book that the supply of copies kindly placed at our disposal by Messrs. Drake & Gorham did not suffice to meet the demand. We regret, therefore, that we have been unable to send copies to several of our readers who asked for them.

STREET LIGHTING IN THE WEST-END OF LONDON

As announced on p. 267 of our last issue, the City of Westminster, at a meeting held on April 14th, decided to accept the tender of the Gas Light & Coke Co. for street lighting in Regent Street, Piccadilly, St. James's Street, Pall Mall, Coventry Street, and part of Shaftesbury Avenue, in which electric lighting is now employed. The contracts for the electric lighting of these streets by means of 46 ordinary arc lamps and 20 flame arc lamps expire this year, together with contracts with the Gas Light & Coke Co. for gas lighting in a large number of other streets in the area under the control of the City of Westminster. Fortunately, this resolution does not exclude electric street lighting altogether within the City of Westminster, for there are other contracts running. In the Strand district there are 121 ordinary arc lamps and 3 flame arc lamps, the contract for which is terminable in 1913 or 1920 at the option of the Council, and in the St. George's Parish, the contract for five flame arc lamps is terminable in 1913, while that for the bulk of the lighting (957 ordinary arc lamps and 216 "various" lamps) only expires in 1931. We have no doubt, however, that the electric lighting companies will not be satisfied merely in retaining this latter portion of the street lighting, and will make a determined effort to-night, through their supporters on the Council, to obtain a reconsideration of the award at the meeting a fortnight ago. The circumstances which should render this possible are as follows:—

Instead of simply scheduling the streets which are to be lighted, and the number and size of lamps in each, and asking for tenders, the Council invited tenders both from the Electric Lighting Companies and the Gas Company *per lamp* of various sizes, and in four districts. These tenders were considered at the meeting on April 14th, and that of the Gas Company accepted, and to-night the Works Committee are bringing forward a further report recommending the number and size of the lamps to be utilised in the four districts. These represent a very large number, although, as we have said, it was only in Regent Street, Piccadilly, and some adjoining streets that electric lighting was employed.

Owing to the tenders being invited in this manner, the electric light companies were, of course, at a considerable disadvantage. Obviously, if the streets already lighted in which arc lamps are in use, the cost of the lighting would be considerably less than that in other streets in which mains, lamp-posts, lamps, and lanterns would have had to be erected. On the basis upon which the tenders had to be made, the Gas Company's tenders were considerably lower in each of the districts and for each size of lamp; so much so, in fact, that it would have been very surprising if the Westminster Council had not accepted them. On the other hand, it is reasonable to suppose that the electric light companies would have been able to offer a far lower price, and been able to compete effectively with the Gas Company for the lighting in Regent Street, Piccadilly, &c. A still further handicap against the electric light companies is that it is free to the Council actually to use the existing electric light standards in these streets for their new gas lamps.

At to-night's meeting of the Council the Works Committee are presenting a report giving the list of the streets to be dealt with under the new contracts, a schedule of the number of lamps of the various sizes which they propose to use, and the cost. The total numbers of lamps which it is proposed to put in are as follows:—1,246, 90 c.p.; 1,165, 180 c.p.; 297, 300 c.p.; 10, 1,000 c.p.; 153, 1,800 c.p.; and 16, 3,000 c.p. The first three sizes refer to low-pressure gas lamps, and the last three sizes to high-pressure gas lamps, and they include the substitution of 55 1,800 nominal c.p. gas lamps for 51 1,000 c.p. and 4 1,800 c.p. arc lamps, and 16 3,000 nominal c.p. gas lamps for 16 3,575 c.p. arc lamps, the latter being the much-discussed lamps in Regent Street.

In their new report, the Works Committee go out of their way to "rub in" the discrepancy between the tenders for gas and electric lighting, pointing out that, on a five years' contract, the cost of the gas lighting will be £14,450, as compared with a cost of £24,900 if the streets had all been lighted by electricity. On a ten years' contract the comparative figures would have been £13,800 for gas, and £21,800 for electric lighting.

We cannot but think that, in all fairness to the electric company, it should be given an opportunity of giving an amended tender for the electric lighting in those streets already mentioned in which the arc lamps already exist. Although it has been suggested on many sides that the Gas Light & Coke Co.'s tender is considerably below cost, and the electric lighting company's tender might therefore still be higher, yet there is no doubt, having particularly in view the fact that the householders in Regent Street have expressed a decided preference for electric lighting, that the electric lighting company's tender would prove the more acceptable in those streets.

At the last meeting, a petition was presented by the ratepayers asking the Council to postpone any contract for the gas lighting of Regent Street till the matter might be further considered, but the petitioners have been informed that the Council did not see their way to postpone the consideration of the tenders, and had decided to accept the lowest.

In response to several requests that we should publish the actual tenders, both for electricity and gas, we are now able to give the two tables below, from which it will be seen that both for the cost of installation and for maintenance, the gas tenders are very much the lower. The "maintenance" quotations include supply of gas or electricity, and, in the case of electric lighting at any rate, interest, &c., on the capital outlay.

We have received the following correspondence on the above subject:—

To the Editor of Electrical Engineering.

Sir,—I have read your article in connection with the decision of the Westminster City Council to accept the estimate of the Gas, Light & Coke Co. for the lighting of Regent Street, Piccadilly, &c., by high-pressure gas instead of by electricity. The competition between high-pressure gas and electric flame arc lighting has during the past few years been very acute, in some cases gas has been awarded the contract, whilst in others electricity has been victorious. This is curious, for it has been shown over and over again that the cost of the candle-power from flame arcs is considerably lower than that from high-pressure gas, and electricity is generally more advantageous.

It is very often readily stated by our fraternity that because the gas people have succeeded in making a lower price than the electric company, that they have quoted under cost price for the advertisement. Personally, I do not think this is the case nine times out of ten. The conditions of the contracts under which tenders are made are generally, in my opinion, the prime cause of the high cost of electric lighting, for the capital outlay in expensive posts, line cables, and so forth, weigh heavily against us when the contracts are for comparatively short periods, and, unfortunately, the general tendency seems to be to shorten the lighting contracts further.

The arc lamp industry at present is deficient, inasmuch as it has not produced an arc lamp which can compete on even capital cost terms with the gas. Such a lamp for the purpose would be one of about 1,500 c.p., burning singly in parallel across the 200- or 400-volt networks without the use of transforming apparatus, total consumption of lamp 200 to 250 watts, at least 100 hours burning, and cost of carbons say a twentieth of a penny per lamp-hour. A lamp as this indicated on inexpensive pillars would reduce costs of running and capital outlay from a third to a half of present rates. As an arc-lamp maker I am disposed to think that such an almost ideal lamp is not outside the bounds of possibility. I think that we may see the fulfilment.

Cambridge Place, Yours faithfully,
Burrage Road, Woolwich. Charles Oliver.
April 22nd, 1910.

To the Editor of Electrical Engineering.

Sir,—It is now well known that arc lamps of 3,000 candle-power can be maintained for 4,000 burning hours per annum at from £14 to £24 each, according to the total cost of electrical energy, and electrical engineers would certainly welcome the assurance that the powerful London companies were realising the importance of their action in this matter with regard to the welfare of the industry at large, and not allowing themselves to be influenced by any hard and fast rule concerning the ratio of profit to outlay where work of such immense advertising value is concerned. In the absence of information it is only possible to assume that the estimates for electric lighting were based upon the lowest rate per unit which any private consumer would be quoted for a supply of similar load factor and value to the undertaking.

In the writer's opinion such work should not be carried out at a loss, but the usual profits might be sacrificed on all incidental outlay, and their amount debited to publicity account.

The satisfactory lighting of the busiest thoroughfares in the world would bring a better return than expenditure on posters, which seldom convey any clear message to the preoccupied crowds which stream past the coloured matter of a London street hoarding.

April 26th, 1910. W. B.

In response to some inquiries, the Mr. Jacques Abady, Chairman of the Works Committee of the Westminster City Council, who was referred to in the article of our last issue, is the same Mr. Abady who is a member of the firm of Messrs. Alexander Wright & Co., of Westminster, and is one of the inventors of the Simmance-Abady photometer. The firm is fairly well known to central station engineers as makers of CO_2 recorders, draught recorders, gas analysis apparatus, &c. Although it has been suggested to us that Mr. Abady, whose firm has, of course, large business relations with the gas interests, should not have taken so prominent a part with regard to the award of these contracts, yet we fail to see how his Committee could have done otherwise than award the contracts to the Gas Co. on the prices tendered. The injustice to the electric lighting companies lies, as we have already stated, in the manner in which the tenders were invited, and we presume that it was the Westminster City Engineer, and not the Chairman of the Streets Committee, who was responsible for drawing up the specification.

THE PHOTOMETRY OF ILLUMINATION

On Thursday, April 14th, a meeting of the Illuminating Engineering Society was held at the Royal Society of Arts, London, and the discussion on the subject of photometry was continued. A report of the discussion at the last meeting was given in Electrical Engineering, March 17th, 1910, p. 186. Dr. S. P. Thompson, who was in the chair, desired the members to confine their remarks, as far as possible, to the subject of illumination photometry.

Mr. A. P. Trotter (Electrical Adviser to the Board of Trade), referring to the question as to whether the surface on which the illumination of any space was to be measured should be horizontal or inclined, said that where many sources of light were concerned a horizontal surface was best, as it summed up all the lighting. A photometer should, in his opinion, have a horizontal screen with no obstruction, so that the light could come from all round. The screen should be free from glaze and angle errors. He had found an electric lamp most suitable, although in Germany a benzine lamp with the flame adjusted to a certain height was much in use. The total time an electric lamp was switched on was only one-half to three-quarters of an hour for one evening. It was very necessary, however, to check the lamp carefully before and after the tests. On one occasion he had found his lamp 15 per cent. out on returning from an evening's work, due possibly to a loose contact. For an outdoor photometer, a range of 1 to 10 was not enough; it should be capable of reading up to 4 foot-candles and down to 0·02 foot-candles, or lower. The lower limit was really the most important, as it was the minimum illumination which had to be measured most carefully in cases of dispute concerning lighting contracts. A photometer for ordinary use should be capable of comparing lights of different colours as met with in street lighting to within an accuracy of from 4 or 5 per cent. without the aid of any "flicker" arrangement. It was not necessary to attempt any greater accuracy on account of the variations due to reflected light from buildings and the fluctuation in gas pressure or in voltage. Mr. Trotter then demonstrated the use of his own illumination photometer made by Messrs. Everett, Edgecumbe & Co. (see Electrical Engineering, May 16th, 1907, Vol. I., p. 849). He preferred to work without a tripod. The instrument could be held horizontal with the aid of the level, but he had found that when measuring between two sources of light a slight inclination did not matter, as what was lost from one lamp was gained from the other.

Mr. Lancelot Wild (Westminster Electrical Testing Laboratories) gave the results of some experiments made to determine the relative sensitiveness of the various photometers. The results showed that the Bunsen was the most sensitive, while the Lummer-Brodhun came second. He also exhibited a modified photometer of the latter pattern, in which both eyes were used. In one form, with a mirror silvered on the front, the slightest movement of the photometer head threw the illumination out of balance.

Mr. Clarke (Gas Light & Coke Co.) said that he used the Bunsen photometer for testing gas mantles, and found it the only photometer he could work with for long periods without fatigue. With regard to the measurement of the candle-power of sources of light, he preferred to take a complete distribution curve than to measure the mean hemispherical candle-power by one observation, as in the Ulbricht globe test. It took some time to take a curve, but it was much more useful. When checking the illumination of spaces, he found it more convenient to measure the candle-power of the individual lights and to calculate the illumination. He then demonstrated the use of a portable Simmance-Abady photometer used for this purpose. The electric standard was enclosed in a globe with an adjustable aperture for varying the illumination of the flicker wheel. It was important that the wheel should run at a low speed for low illuminations.

Mr. Haydn Harrison emphasised the statements made by Mr. Clarke that a reading of mean hemispherical candle-power was no use, and that it was necessary to obtain a distribution curve. He did not agree with Mr. Trotter that an inclination of the screen some 2 or 3 degrees from the horizontal was unimportant. It might not matter exactly half-way between two lamps, but if nearer one lamp than the other there would be a big difference. When the illumination at any point was too low to measure on the horizontal, he took it nearer the source, and then calculated it for the further point. He had found a small tungsten lamp an excellent standard; it varied little with the pressure, and could be relied upon for an accuracy of within one per cent. By inserting a resistance, the candle-power could be reduced to one-tenth the normal value, and it

Digitized by Google

was still accurate. It was certainly unnecessary to attempt a greater accuracy than 5 per cent. for street lighting work. Mr. Harrison then demonstrated the use of his "Universal" photometer, made by Messrs. Elliott Bros. (see Electrical Engineering, January 14th, 1909, Vol. V., p. 43). This was provided with a flicker wheel rotated by means of a blast of air from a rubber bulb. A special attachment enabled the angle of incidence of the rays on the screen to be easily read off, so that it was not necessary to adjust the screen exactly. A measurement was then made in the lecture hall, which showed that the illumination on the platform at the height of the table was 0·7 foot-candles. The electric lights were then switched off, and the original gas burner lighted. This gave an illumination at the same point of 0·08 foot-candles, thus affording a striking demonstration of the improvement effected.

Mr. B. J. Waldran called attention to the responsibility of the architect in providing efficient illumination, both daylight and artificial, and emphasised the importance of introducing the study of illumination into the training of architects. It was very difficult to measure the daylight illumination of a room, but the proportion of lighting in a room to that outside was always the same. If the illumination outside and inside were measured at the same time, a good idea of the efficiency of the lighting arrangements could be obtained.

In a written communication, Dr. W. E. Sumpner (Birmingham University) alludes to the possible sources of error in the method of measuring the mean spherical candle-power by the Ulbricht globe, and discusses whether it is possible to get equally good or even better results by using a rectangular box whitewashed or covered with matt white paper inside.

PARLIAMENTARY INTELLIGENCE

THE TROLLEY 'BUS.—The Bill of the Bradford Corporation, seeking powers to adopt the trackless trolley system of electric traction, was passed by the Local Legislative Committee of the House of Commons last week. We gave details of the scheme on page 269 of our last issue, and owing to the opposition of the local carriers, the proposal has been sanctioned under somewhat different conditions to those inserted in the Bill of the Leeds Corporation, which has already been passed by the same Committee. In the case of Bradford, the Committee have approved of the principle of the system for experimental purposes on one particular route. Its extension to other routes must be the subject of a further Private Bill or a Provisional Order, and the same procedure is to apply in the case of the Corporation desiring to convert the trackless trolley system to a tramway when the traffic develops. It is also a condition that the Tramways Committee are to keep separate accounts of the trackless trolley system. In regard to the tramway portion of the Bill, the Committee allowed the Corporation to carry parcels up to the weight of 56 lbs. over the whole tramway system. A few short tramway extensions were also authorised.

RHONDDA TRAMWAYS.—The Bill promoted by the Rhondda Urban District Council for the extension of the tramways in that district was considered by the Local Legislation Committee of the House of Commons last week, and passed. The tramways in Rhondda are run by a local tramway company formed by the National Electric Construction Co. under an agreement with the District Council. It is now proposed to extend the tramways in various directions at an estimated cost of £35,000, of which £29,000 is for construction, and will be repayable in thirty years. The only real opposition was from the Taff Vale Railway Co. from the point of competition, and the possible loss to them as ratepayers, should the proposed extensions prove unprofitable. Mr. Robert Hammond gave evidence in support of the Bill. The Committee agreed to the terms of agreement between the tramway company and Council, which was a rearrangement of the agreement entered into when the tramways were first constructed. The Council will now purchase the tramways as a going concern at the end of twenty-four years.

PROGRESS OF ELECTRICAL BILLS.—The Baker Street and Waterloo Railway Bill was read a third time in the House of Lords last week.

The North-East London Railway Bill and the London United Tramways Bill were read a second time, and the Wimbledon and Sutton Railway Bill a third time, in the House of Lords on Monday.

The Farnham Gas and Electricity Bill was ordered for third reading in the House of Commons on Monday.

The North and South Shields Electric Railway Bill was read a second time in the House of Commons on Monday.

The Handsworth Urban District Council Bill was read a third time and passed in the House of Lords on Tuesday.

South African Institute of Electrical Engineers.—The third ordinary general meeting of the South African Institute of Electrical Engineers was held recently at the University College, Cape Town. Mr. Elsdon Dew presided. Mr. A. E. Scott read a Paper on "Rotary Converters" and "Notes on the Erection and Maintenance of Electrical Plants on a Gold Mine." Prof. R. A. Lehfeldt exhibited some electrical measuring instruments.

WIRELESS TELEGRAPHY

THE total number of licensed wireless telegraph stations in the United Kingdom on December 31st, 1909, was 260; 241 of these are for experimental purposes only, of which 58 are in the County of London. In addition to these, 32 licences are held by shipowners in the United Kingdom, covering 116 ships, a list of which has just been published in a Parliamentary paper, obtainable from Wyman & Sons, Ltd., Fetter Lane, E.C., at the price of 1d. The total number of unofficial or non-departmental radio-telegrams exchanged between the shores of the United Kingdom and commercial ships at sea from March 31st to December 31st, 1909, was 54,496. No radio-telegrams embodying a general call for assistance were received at any of these stations, but in three cases vessels which were in distress communicated with their owners or agents through these stations. One of these was a damaged steamship, asking that a vessel might be sent to take off her passengers; in the second case, a steamship reported that she had been in collision with an unknown vessel; and in the third case a steamship had run short of coal and wanted to be towed. In addition to this, in sixteen cases (fifteen at the North Foreland and one at Caister-on-Sea station) vessels in distress were reported by lightships communicating with the stations by wireless telegraphy, and the local coastguard was informed in each case by the same method of communication. Between August 14th and September 17th, 1909, during salvage operations on the sunk submarine, H.M.S. *Vindictive* exchanged 172 messages with the Caister-on-Sea station.

On Saturday last, April 23rd, the Marconi wireless telegraph service between Ireland and Canada, which was stopped in August last owing to the destruction by fire of the Glace Bay station in Canada, was resumed, and it was announced that the Marconi Co. is prepared to accept public messages for direct transmission across the Atlantic at the low rates published in our last issue. The Clifden station in Ireland has also been re-equipped. According to the special correspondent of the *Times*, the area occupied by the buildings and aerials is 350 acres, and the total horse-power of plant installed is 1,100. It appears that there are three alternate methods of producing the high-tension discharge, and that in the event of the breakdown of one portion of the plant, one of the other two portions will be immediately ready for use. It is also stated that the plant includes an air condenser consisting of eighteen hundred plates of galvanised steel, 30 ft. by 12½ ft. The transmitting aerial comprises some 60,000 ft. of wire arranged on twelve poles in the form of a fan, so as to obtain a directive effect. For receiving a second and smaller aerial is used. We understand that the speed of transmission is about 20 words per minute.

The *Times* understands that the French Minister of Posts and Telegraphs has agreed to the erection of a wireless telegraph station at St. Lazare, to work in conjunction with the Marconi Company, which is to receive three-fifths of the receipts. The company is to take over and improve stations erected at Cadiz, Teneriffe, and Las Palmas by Spanish concessionary companies, and to construct others at Cape Finisterre, Barcelona, the Balearic Islands, and other points in Spain. High-power radio-telegraphic stations are also approaching completion at Coltarno in Italy, at Massowah on the Red Sea, and at Magadicio on the East Coast of Africa, and it is intended that all these stations shall communicate with one another by wireless telegraphy, and also directly or indirectly with Canada.

In a printed answer to a question in the House of Commons last week, the Postmaster-General (Mr. H. Samuel) stated that it was not true that instructions had been issued that Marconi messages were to be given priority at the Bolt Head station.

The Revolving Stage at the Coliseum.—A visit was paid last Saturday by members of the Institute of Marine Engineers to the London Coliseum, when an inspection of the arrangements for driving the revolving stage was made under the guidance of Mr. H. Crocker, the stage manager. The revolving part of the stage is 72 ft. 6 in. in diameter, and is in three concentric sections, which can be driven independently, or the whole mass of 160 tons can be locked together, up to a speed in the case of the outer ring of 20 miles per hour. Lately, however, the platform has only been worked at slow speeds for scene-changing. The revolving platform is driven by fourteen 14-h.p. motors, controlled from a platform at the side of the stage. There are three pillars, for the inner, middle, and outer tables, each with the necessary levers to rotate it at different speeds and in different directions, the orders from the stage manager being transmitted by a form of engine-room telegraph. The lighting switchboard is situated on the same platform a little distance from the driving apparatus. It contains about 85 distinct switches, some interlocked or fitted with automatic devices which reduce to a considerable extent the work of the operator. There are about 6,000 lamps in connection with the stage and the adjoining rooms, and those of the auditorium bring the number up to about 8,000 in all. In order to avoid risk of failure, there are two separate installations, supplied with current from different companies.

Digitized by Google

LOCAL NOTES

BELFAST: *Tramway Accounts.*—The net revenue on the tramways for 1909 was £46,057. The sum of £22,975 has been paid over to sinking fund, £13,000 to depreciation, £5,000 towards cost of the Act of 1904, and £3,031 statutory reserve fund. The balance has been applied to clearing off the debit balance of net revenue from previous years.

Cavehill & Whitewell Tramways.—A poll of the ratepayers is being taken in connection with the proposal of the Corporation to purchase the Cavehill and Whitewell Tramways Co.

BURY: *Tramway Accounts.*—The net profit on the tramways for the year to March 31st was £2,636. It has been decided to place £2,500 to reserve and depreciation, and to place the balance at the credit of the borough rates.

GREENOCK: *Supply to Admiralty.*—An agreement has been signed between the Admiralty and the Corporation for the supply of electrical energy to the new torpedo factory by June 1st.

HUDDERSFIELD: *Extension of Area.*—The Board of Trade have granted a Provisional Order for the extension of the Corporation's electricity area to the South Crosland district.

LEEDS: *Tramway Receipts.*—The revenue from the tramways for the year to March 31st shows an increase of £15,600 compared with the previous year. It is estimated that the Tramways Committee will be in a position to contribute £55,000 to relief of rates.

LEITH: *Proposed New Plant.*—A deputation is visiting various places in England in connection with the proposed extension of the electrical undertaking.

LIVERPOOL: *Tramway and Electricity profits.*—The Tramways Committee propose to transfer £27,450, or £2,600 more than the previous year, towards the relief of rates out of the tramway profits for 1909–10. The electric lighting undertaking will make a contribution of £20,000 to relief of rates out of the profits of last year.

LONDON: *Bethnal Green: Electricity Supply.*—Bethnal Green has the distinction of being the only district in the County of London in which no electric supply is available, although reports and schemes have been prepared on numerous occasions. The Electricity Committee now report having had the question again under consideration. Before dealing afresh with the subject, the Committee communicated with neighbouring authorised undertakers inviting offers. No electricity company has made any proposal. The Poplar and Hackney Boroughs adhere to previous offers, and the Stepney and Shoreditch Borough Councils make slight modifications in their previous offers. The Committee are of opinion that the Council should enter into a contract with the Shoreditch Borough Council upon the basis of their alternative flat rate scheme for a period of seven years. The terms of this and all the other offers are contained in a statement which has been circulated only to members of the Council.

Hampstead: New Plant.—A report by Sir Alexander Kennedy recommends new plant at a total expenditure of £18,000. There would be an annual saving of £4,000. The money required will be borrowed from the reserve fund, which now amounts to £45,000. The report has been adopted. A number of tenders for the supply of the new plant have been received.

Marylebone: Electricity Undertaking.—The Electricity Committee report that, as far as can at present be ascertained, the total sales to private consumers for the year ended March 31st last will amount to 10,316,000 units, and the average price to 3·63d. (including meter rents). The units show an increase of 16 per cent. over the previous year, and the average price a reduction of 9 per cent. The General Manager is of opinion that the sales department will pay its way after debiting all expenditure properly chargeable against it. Finally, the report says that after reducing the capital liabilities by £37,915, they estimate that there will be a surplus on the year's working of £8,602.

MANCHESTER: *Tramway Receipts.*—The Tramways Committee propose to reduce their contribution in relief of rates out of the profits for 1909 to £60,000. Last year the Committee contributed £75,000, by the special request of the Finance Committee, which was an additional £15,000 to the usual contribution.

Electricity profits.—The accounts of the electricity undertaking for the year to March 31st show a surplus of £35,220, of which £12,000 has been transferred to relief of rates, and the balance added to renewals fund.

STOKE-UPON-TRENT: *The New County Borough.*—The new Stoke-upon-Trent County Borough Council held their first meeting at Hanley last week. Mr. T. Willett, of Burslem, was elected chairman, and Mr. J. Schofield, of Hanley, was elected vice-chairman, of the Electricity Committee. The question of the appointment of a chief electrical engineer was referred to a sub-committee, which will report to the next meeting. A proposal was made to appoint Mr. Ashton Bremner (Burslem) chief engineer pro tem., but it was not proceeded with.

WIGAN: *The Proposed Tramways Purchase.*—Mr. J. R. Salter, of the Lancashire United Tramways Co., has sent a long letter to the local Press in regard to the recent discussion by the Corporation of a so-called offer to purchase the municipal tramways. According to newspaper reports, the result of the meeting in question was that the Council would not entertain an offer of the Tramways Co. to purchase the tramways. Mr. Salter points out that this is erroneous, and also that, in his opinion, the Council acted with undue haste in coming to their decision. He states that the Council were merely asked if they were prepared to discuss the question of the transfer of the tramway and electrical undertakings. No figure was mentioned, nor was any basis of negotiation referred to. At the same time, the only basis upon which the transfer could have taken place was the reimbursement to the Corporation of the whole of the capital expenditure on the undertakings. In conclusion Mr. Salter corrects the opinions of some of the Wigan Councillors that the municipal electrical undertakings could be disposed of at a profit of £100,000 if the Corporation desired. It is now well-known that the policy of the Board of Trade is not to allow either a loss or profit to be made on any such transfer of a municipal undertaking.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ARBROATH.—The directors of the Arbroath Electric Light & Power Co. are considering the advisability of increasing the plant at the power station.

BRITISH COLUMBIA.—The Prince Rupert Electric Light Committee invite tenders for boilers, engines, condensers, pumps, and electrical apparatus by May 3rd. Copies of the specifications, &c., may be seen at the Board of Trade, 73 Basinghall Street, London.

ERITH.—It is anticipated that during the ensuing year some 300 kw. of additional plant will be required to meet the demand.

FELIXSTOWE.—A Local Government Board inquiry was held last week concerning a loan of £4,500 for electrical extensions.

HESTON AND ISLEWORTH.—A 250-kw. continuous-current generating set, together with boiler, condenser, &c., is required by the Council. Particulars to the Clerk by May 11th.

IRELAND.—It is proposed to install electric lighting, &c., in the County Antrim Infirmary. Messrs. Miller, Wilson & Pegg are the consulting engineers.

LEICESTER.—The Tramways Committee recommend additional plant being installed at the tramways power station, owing to the rapidly increasing demand for power. It is proposed to instal an additional 1,000 kw. turbo-alternator with two boilers, condensing plant, &c., at an estimated cost of £19,190.

RUSSIA.—The town of Baku has raised a loan of 27,000,000 roubles, and the new works proposed include an electric power station.

SOUTHAMPTON.—A Local Government Board inquiry was held on Tuesday concerning a loan in connection with the installation of a new steam generating set and motor-alternator. The gas company were represented in force, but got very little satisfaction out of the proceedings. There was not a ratepayer present, and Mr. H. R. Hooper, the Local Government Board Inspector, expressed entire satisfaction with everything that was placed before him by the electric supply officials.

SPAIN.—The Municipal Authorities of Salamanca invite tenders for an electrical installation for the town. Tenders should reach either the Dirección General de Administración Local, Madrid, or the Alcaldía Constitucional de Salamanca, Salamanca, not later than May 13th. Local representation is necessary.

Miscellaneous

AUSTRALIA.—The High Commissioner for the Commonwealth of Australia, 72 Victoria Street, London, has received tender forms, specifications, &c., in connection with the following: A main distributing frame for the Postmaster-General's Department, West Australia; tenders to the Deputy Postmaster-General, Perth, by June 7th. 100 C. B. switches for the Postmaster-General's Department, Victoria; tenders to the Deputy Postmaster-General, Melbourne, by June 14th. Subscribers' equipment at the Hawthorn Exchange, Victoria; tenders to the Deputy Postmaster-General, Melbourne, by June 14th.

BELFAST.—The Belfast Harbour Commissioners recommend mend the electric lighting of the new graving dock at an estimated cost of £2,115.

BELGIUM.—The Municipal Authorities of Antwerp invite tenders by May 9th for the supply of electrical apparatus to the town workshop at the new North Dock. Tenders to the Burgomaster, Hotel de Ville, Antwerp. The specification may be seen at 73 Basinghall Street, London.

BIRMINGHAM.—In consequence of the result of the recent

Digitized by Google

ballot in favour of extending the tramways to the Harbourne and Quinton districts, the Tramways Committee recommend that this should be done. Should the recommendation be adopted by the Corporation a Bill will be promoted in the next session of Parliament.

CHILI.—A Reuter telegram from Santiago, Chili, states that the Chilian Government will in May ask for tenders for the electrification of the railway from Santiago to Valparaiso and its branches, the total length of line being about 156 miles.

LONDON: *London County Council.*—Tenders will shortly be invited for the supply of 250 bogey truck double-deck type cars.

TASMANIA.—The Launceston Council invite tenders by June 13th, for overhead equipment for tramways, and by June 27th for synchronous motor generators and battery, reversible booster, &c.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

W.C.—Rebuilding of Nos. 210 and 211 High Holborn, W.C. (£14,257). Architect, F. W. Foster, 26 Bedford Row, W.C. Builders, C. Allen & Co.

N.E.—Factory, 14 Ardleigh Road, De Beauvoir Town, Hackney, N.E., for J. Sleap.

W.—Hotel, Thurloe Place, Kensington, W. Architect, D. Joseph, 73 Basinghall Street, E.C.

E.—Cinematograph Theatre, Stratford, E. Architect, A. J. Gale, 4 Serjeant's Inn, W.C.

PROVINCES.

ASHTON-UNDER-LYNE.—Bank, Warrington Street and Old Street, for Ashton Savings Bank.

BLYTH.—Secondary school (£9,000). Architect, E. Cratney, Wallsend-on-Tyne.

CAMBRIDGE.—Rebuilding, Newton Hall (£12,975). Architect, F. W. Foster, 26 Bedford Row, W.C.

DARLINGTON.—Alterations and additions, workhouse (£2,183). Builder, T. Rogers, c/o Board of Guardians.

DUBLIN.—The Corporation invite tenders for the wiring, &c., of the Bolton Street Technical Schools. Particulars from the City Electrical Engineer, and tenders to the Chairman of Technical Education Committee by May 11th.

FINCHLEY.—Cooking and Manual Training Centres, &c., Finchley County School (£1,648). Builder, H. Stewart, West Green Road, Tottenham.

GATESHEAD.—School, Brighton Avenue (£5,500). Builders, Raven & Hitchen, Gateshead.

LOWESTOFT.—Parish hall (£5,000). Vicar, St. Margaret's, Lowestoft.

MANCHESTER.—Conversion of premises, Wilmslow Road, Rusholme and Stretford Roads, into electric theatres (1,000 and 650 places respectively). The Lancashire Cinematograph Theatre, Ltd.

RAMSGATE.—School (£5,431). Builder, W. J. Ballard, Ramsgate.

WIGAN.—Theatre. Heaton, Ralph & Heaton, architects, King Street, Wigan.

TENDERS RECEIVED AND ACCEPTED

ABERDARE.—The Council have received 36 tenders for the complete equipment of their new electric power station. These have been sent to Mr. Stephen Sellon, consulting engineer, and will be considered at a special meeting of the Council shortly.

BELFAST.—The Belfast Harbour Commissioners have accepted the tender of Messrs. Hind Bros. and Co. for the supply of castings of bases for arc lamp-posts; Messrs. James Allan & Sons, Ltd., for tubular posts; and Mr. Stanley Johnston for arc lamps.

DUNDEE.—The Public Health Committee have accepted the tender of Mr. T. C. Keay, of Dundee, for electrically-driven laundry machinery at the King's Cross Hospital at £162.

LONDON: *London County Council.*—The tender of Messrs. Buck & Hickman, Ltd., at £2,949, has been accepted for the supply of machine shop equipment for the second portion of the central car repair depôt.

The following tenders have been received for the supply of watt-hour meters for the central car repair depôt, car sheds, and sub-stations. The tender of the Electrical Co., Ltd., is recommended for acceptance. Electrical Co., Ltd., £364 9s.; Bat Meter Co., Ltd., £372 5s.; British Thomson-Houston Co., Ltd., £422 19s.; General Electric Co., Ltd., £450 12s.; Ferranti, Ltd., £544 12s.; British Westinghouse & Manufacturing Co., Ltd., £163 2s.; Chamberlain and Hookham, Ltd., £177 10s.

The tender of Messrs. P. & W. McLellan, Ltd., at £1,498 has been accepted for the supply of rails, fish-plates, and bolts in connection with the tramways.

Battersea.—The Council has accepted the tender of Messrs. Geipel & Co., for the annual supply of arc lamp carbons.

WEST HAM.—The Council have accepted the following tenders for electrical supplies:—House service A.-C. wattmeters, British Thomson-Houston Co. (new type of meter); house service cut-out boxes, Lucy & Co.; india-rubber-covered wires and cables, Messrs. Pirelli (six months, with option of extending for a further six months); electrical accessories, Baxter & Caunter, British Electrical Manufacturing Co., Feld Bros. & Co., Tucker & Co., Falk, Stadelman & Co., the General Electric Co., Edison & Swan Co., Siemens Bros. Dynamo Works, British Westinghouse Co., E. Dewhurst, W. T. Glover & Co., Accles & Pollock.

The Lea Recorder Co. have received the following orders recently for "Lea" recorders: Dublin (J. Jameson & Son, Ltd.), Stockholm (Nitroglycerin Aktiebolaget), Glasgow (Electricity Works), Stockport (Sewage Works), Norwich (Star Bleaching Co.), Huddersfield (J. B. Abbey & Son), Brighton (Electricity Works), London (General Post Office, three sets), Cardiff (Electricity Works), Newtownards (Glen Printing Co.), Australia (Ryde Pumping Station), London (London Hydraulic Power Co.), Halifax (Electricity Works), Adelaide (Municipal Tramways), West Bromwich (Electricity Works), Australia (Sydney City Council), Cheltenham (Sewage Works).

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 to £59 10s. per ton (last week, £59 15s. to £60 5s.).

DISSOLUTION OF PARTNERSHIP.—R. A. Dunt and E. N. Bedells, electrical engineers, 91 High Street, Southampton, have dissolved partnership. E. N. Bedells continues at 83 Above Bar, Southampton.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—W. H. Palmer, electrician, 7 Great Castle Street, Oxford Street, London, has been adjudicated bankrupt. The first meeting of creditors will be held at the Bankruptcy Building, Carey Street, London, to-day, at 11 a.m., and the public examination at the same place on May 6th at 11.30 a.m.

H. Barham, trading as the South of England Electrical Engineering Co., 16 Fratton Road, Portsmouth, has been adjudicated bankrupt.

The public examination of A. E. Felgate and W. Storey, electrical engineers, 10 Queen Victoria Street, Reading, was held last week. The assets were valued at £863, and the deficiency at £1,754. Bad trade, heavy rent, and loss at Oxford through the default of a manager were put forward as the causes of the failure. The examination was adjourned.

NEW ADDRESS.—Messrs. Ronald Johnstone & Son, mining and consulting engineers, of 190 West George Street, Glasgow, have opened a London office at No. 60 London Wall, E.C.

UNION CABLE CO.—Messrs. James T. Donald & Co., Ltd., 35 McAlpine Street, Glasgow, have relinquished the Scottish representation of the Union Cable Co., Ltd., in favour of Messrs. J. C. Fisher & Co. Mr. J. C. Fisher has had the management of Messrs. J. T. Donald & Co.'s electrical department for the past seven years, and has now opened offices at York Buildings, York Street, Glasgow, where all inquiries and orders for electric wires and cables may now be sent.

PRICE OF STEARN LAMPS REDUCED.—The Stearn Electric Lamp Co., Ltd., 47 Victoria Street, Westminster, announce reductions in the price of their "Leuconium" metal filament lamps of bulb form. The prices for 200-250 volt lamps now range from 3s. 9d. to 7s. (25 and 27 watt lamps 5s.); 100-120 volt lamps from 2s. 9d. up to 63 watts, and 6s. for 120 watts; the prices of lamps from 25-70 volts have also been reduced.

Robertson & Osram Staff Dinner.—The annual dinner of the Robertson & Osram Electric Lamp Works staff was held on Friday at Hammersmith, Mr. C. Wilson presiding. For the first time Mr. H. Hirst, the managing director of the two companies, found himself able to be present. Mr. Wilson proposed the toast of the allied firms, and alluded to the fact that he was within three months of his coming-of-age in regard to his service with the firm. He also mentioned that the Robertson & Osram works were, with one exception, the largest employers of labour in Hammersmith, their employees numbering 1,500, with a wages bill of £1,300. Their bill for electric light and power amounted to £6,000 per annum. Speaking of the relation of the staff with the directors, he said that no proposal of his on behalf of the staff was ever rejected. Mr. Hirst, in reply, recalled how Mr. Wilson had started on a month's probation nearly twenty-one years ago, as a shorthand clerk. With such a man in charge, the staff need not fear for the future. They were adopting the motto of "Don't put your headlights behind." A long and very enjoyable evening was spent as is usual at this annual event.

OSRAM·LAMPS

Digitized by Google

COMPANIES' MEETINGS AND REPORTS

GREAT NORTHERN TELEGRAPH CO.—Owing to the increased receipts in 1909 from the company's participation in other telegraphic undertakings, and to the fact that there has been a profit on exchange during the year instead of a heavy loss as in the previous year, the board proposes, notwithstanding a considerable decrease in the ordinary traffic receipts, to distribute the same dividend and bonus for the year 1909 as for the preceding year, viz., 18 per cent. (of which 5 per cent. has already been paid), and to set aside the usual amounts to the reserve and pension funds, viz., £55,555 and £8,333 respectively.

BROMLEY (KENT) ELECTRIC LIGHT & POWER CO.—After meeting debenture interest, there is a balance of £8,993 for 1909. The dividend for the year has been made up to 5½ per cent., £2,096 has been added to reserve for renewal, £2,600 to general reserve, and carrying forward £172.

COVENTRY ELECTRIC TRAMWAYS CO.—The net profit for 1909, including £57 brought forward, was £6,996. The sum of £2,000 is added to reserve for depreciation, a 3½ per cent. dividend is recommended, and £446 carried forward.

CRAIGPARK ELECTRIC CABLE CO.—The net profit for the year to March 31st was £6,243. A sum of £500 is to be added to depreciation and £500 to reserve. A dividend of 6 per cent. for the year is recommended.

UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON.—Sir Edgar Speyer presided at the half-yearly meeting last week, and pointed with satisfaction to the fact that the company is now free of floating debt, while the net revenue for the half-year is sufficient to pay the full interest on the 4½ per cent. bonds. The good results obtained have been due to savings in coal consumption, and other reductions at the Chelsea power station. So far as the Underground Co. was concerned, he felt confident that the period of deficit was now at an end, and that they could look forward with some degree of confidence to some small distribution on the income bonds.

CORK ELECTRIC TRAMWAYS & LIGHTING CO.—The net profit for 1909 was £16,294, and, after meeting preference dividends and adding £3,500 to reserve, a dividend of 3 per cent. is declared on the ordinary shares, carrying forward £514. At the annual meeting last week Mr. A. R. Monks drew attention to the fact that, in spite of the strike of employees last May, the profits for 1909 were considerably in excess of those for 1908. Speaking of the strike, he stated that an Employers' Federation has since been formed for the prevention and combating of unreasonable strikes, and, as most of the leading merchants and manufacturers had joined, the company had also become a member. To meet the increased demand upon the company acquiring the Cork Rural District Lighting Order, it is proposed to install a new boiler and automatic stokers. During the year a 1,500-h.p. Belliss-B.T.-H. generating set has been installed. For the first three months of the present year, the receipts show an increase of £300 over the corresponding period of last year.

LA PLATA ELECTRIC TRAMWAYS CO.—At the meeting last week it was stated that the first section of the electric tramways was opened early this year, and that the second section, comprising 5½ miles of track, was opened on April 3rd.

LONDON UNITED TRAMWAYS.—Mr. C. J. Cater Scott, presiding at the annual meeting last week, said that the gradual shrinkage of the company's receipts during the past three years was partly due to the very bad weather, but largely to motor-'bus competition. During the past four years there had been an absolute revolution in conditions under which London passenger traffic was carried on, and concurrent with the very great increase in competition, was a considerable increase in the cost of maintenance. The fact was that many of their lines had been carrying heavy traffic for many years, and now began to show signs of wear and tear, and he could not say that the increase in maintenance was likely to be temporary. With regard to the purchase of the Hammersmith line by the London County Council, after the rejection of their Bill in Parliament to postpone this purchase they had asked the Board of Trade to hold an inquiry into the special circumstances of the case, but this has been refused, and the London County Council had now given notice to purchase. Beyond saying this, he would not discuss the matter further with the shareholders at the present time, as it was a most difficult and complicated question.

AUCKLAND ELECTRIC TRAMWAYS CO.—There is a surplus of £39,044 for 1909, after placing £15,000 to depreciation, and meeting debenture interest and other charges, a dividend of 6 per cent. is recommended on the ordinary shares, carrying forward £3,544.

DEVONPORT & DISTRICT TRAMWAYS CO. Mr. W. G. Bond, presiding at the annual meeting on Friday, made a lengthy reference to the recent proceedings in Parliament between the Company and the Corporation. He stated that on the present traffic receipts from the extension lines leased from the Corporation, there was a net deficit of £2,356, and it was the impossibility of coming to a peaceful arrangement with the Corporation which had led them to introduce their Bill (ELECTRICAL ENGINEERING, April 14th, p. 253). In spite of their failure with their Bill, however, he did not anticipate that the future of the company would be more marked by tame submission than had been the case in the past. They only wanted fair play, and this they had never had. The company would gladly come to terms with the Corporation upon any reasonable basis, but it had declined, and would continue to decline, to hand over the undertaking to the Corporation for a mere song.

APPOINTMENTS AND PERSONAL NOTES

Salford Electricity Committee require a superintendent of the hired motor and testing department, at a salary of £120, rising to £180 per annum. (See an advertisement on another page.)

The following appointments have been made in connection with the West Ham electricity undertaking:—F. J. Delves, motor superintendent, at £2 10s. per week and commission, in place of Mr. T. O. Wilton, resigned; Mr. J. Inglis, assistant motor superintendent, at £2 per week and commission, in place of Mr. W. L. Wreford, resigned; Mr. J. Turtle, lighting superintendent, at £2 per week and commission, in place of Mr. A. S. Tong, resigned; Mr. E. E. Smith, as canvasser, at £1 10s. per week and commission, in place of Mr. E. A. Broom, resigned.

Mr. H. M. Gill has resigned the post of engineer and manager of the Surbiton Electricity Works, and will be succeeded by Mr. T. M. Colson, late engineer at the Hamilton (N.B.) Electricity Works.

A junior designer is wanted for D.-C. and A.-C. motors. (See an advertisement on another page.)

A young engineer is wanted by a firm interested in turbine machinery, to take charge of publication work. (See an advertisement on another page.)

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED. Calcutta Electricity Supply Co., at the rate of 9½ per cent. per annum for the past half-year, placing £17,000 to depreciation and renewals. Tynemouth & District Electric Traction Co., 3¼ per cent. on the ordinary shares. Montreal Light, Heat & Power Co., 1¾ per cent. for the quarter to April 30th.

Telegraph Traffic and Movements of Cable Ships.—On the 19th inst. the repair of communication between Tangier and Mogador was successfully accomplished. The Malta-Tripoli cable failed on the following day. The El Arich route was down between Adana and Bayreuth and between Alep and Bayreuth on the 21st, and on the same day work stopped on the line between Bagdad and Bassorah. On the 24th inst. the Tangier-Mogador connection gave out, to be followed on the succeeding day by the cable between Lattaquil and Larnasa. The Tangier-Mogador connection was repaired on the 25th inst., while the cable between Para and Pernambuco failed on the same day. Telegrams for Para will be sent by the Brazilian land lines till the repair of the cable is effected. The Bagdad-Bassorah line has been restored.—The cable ships were not very busy during the month of March. The c.s. *Contre-Amiral Caubet* repaired the section between Brest and St. Pierre, and returned to Halifax, N.S., on March 4th. The c.s. *Mackay-Bennett* had to attend to the Rockfort-Canso section, and then proceeded to repair one of the cables to Coney Island. The c.s. *Menia*, of the Anglo-American Telegraph Co., was chartered by the Direct United States Cable Co. to repair the cable from Halifax to the States, which was successfully accomplished in two days.

Cables over London Bridge.—In the Chancery Division of the High Courts on Friday, before Mr. Justice Parker, the City of London Corporation asked for an injunction to restrain the County of London Electric Supply Co. from breaking up the surface of London Bridge for the purpose of laying electrical cables. Under the terms of the London Electric Supply Act of 1908, the company wished to link up its northern and southern areas, and for this purpose proposed to lay a main over London Bridge. The Bridge House Estates Committee claimed that the bridge was in no area of supply, and they refused to give their consent to the roadway being broken up. An appeal to the Board of Trade, as provided for under the Act, was then made, but it was thought that the Board of Trade had no right to appoint an arbitrator in relation to London Bridge, this not being a thoroughfare repairable by a local authority. Mr. A. J. Walter, K.C., for the City of London Corporation, as Trustees for the Bridge House Estates, said the only alternative seemed to be to promote a Bill in Parliament. Mr. Balfour Browne, K.C., on behalf of the Company, contended that the spirit of the Act of 1908 was to enable companies to break up streets outside their area of supply, subject to the consent of the proper authority, with an appeal to the Board of Trade. Mr. Justice Parker took this view of the reading of the Act, and made a declaration that the Company have the power, subject to the provisions of the Act, to break up streets outside their area, including London Bridge.

GAS COMPANIES AND ELECTRICITY SUPPLY IN SMALL TOWNS

TWO Bills by gas companies, asking for powers to generate and supply electrical energy, occupied the attention of the Unopposed Committee of the House of Commons for a considerable time on Thursday. The detailed debate which took place was in strange contrast to the very cursory manner in which unopposed Bills were dealt with a few years ago, when the whole proceedings were a mere formality. Promoters of Bills are not represented by counsel before the Unopposed Committee, the matter being in charge of the Parliamentary agents, and whereas, until recent years, the Committee have been satisfied with a more or less bald statement of the objects of the Bills, the agents now find it necessary not only to provide facts and figures in support of the powers asked for, but even, as will be seen below, to be prepared with expert witnesses to prove their statements.

The Bills in question were the Bishop's Stortford and Epping Gas and Electricity Bill, and the Farnham Gas and Electricity Bill, and a curious fact is that in both cases the Council and a company have endeavoured to put an electric supply scheme into operation, but, after going closely into the question, decided that it would not be a profitable undertaking. In the case of the Bishop's Stortford Bill, this proposes the amalgamation of a number of small local gas undertakings, reaching as far as Ongar and Epping, but the limits of electric supply proposed do not extend far beyond Bishop's Stortford. The capital asked for in respect of electricity supply is £50,000. It will be remembered that Messrs. May & Hawes recently reported to the Council in favour of a municipal scheme, but the matter has remained in abeyance, and at the recent elections we understand that nine members were returned out of a Council of fifteen strongly against a municipal undertaking. The Gas Company, on the other hand, put forward as arguments in favour of their success, where others would fail, the fact that they had land upon which to install the plant, the gas with which to drive their generating plant, and to a large extent the office staff and collectors, &c., with which to carry on the business. Further, the company had retained no less an authority than Mr. J. F. C. Snell, who had calculated that with quite a small output, and prices ranging from 5d. to 5½d. per unit, the undertaking, under the conditions set out above, and without the necessity for raising capital in the open market, would become a profitable one, after meeting depreciation, at the end of the second year of working. It may be pointed out that the Bishop's Stortford Council at present possess an electric lighting provisional order, and the Gas Company is not to commence its electrical undertaking without the consent of the Council or until after the Council's order has been revoked by the Board of Trade. Furthermore, the company's undertaking, if and when established, is to be purchasable by the Council at the end of 21 years and recurring periods of seven years, on Electric Lighting Act terms plus a sum for goodwill, determined by arbitration, for the difference between the purchase period and the 42 years provided by the Electric Lighting Act of 1888. After probing into all these details, however, the committee were not absolutely convinced that the Bishop's Stortford Council yet knows its own mind in the matter, so to speak, and postponed a decision for a week in order that a resolution in favour of the company's scheme might be passed.

In the case of the Farnham Bill, such a resolution was forthcoming, and the Bill was passed. The promoters of this Bill, who ask for capital powers to the extent of £18,500, had called in Mr. A. H. Dykes, who has achieved success in a similar direction as consulting electrical engineer to the neighbouring Ascot & District Gas & Electricity Co. The arguments given above, in support of the theory that the Gas Company will make an electrical undertaking a success where an independent company or the Council could not, were again used, and, as stated, the Bill was ordered to be reported for third reading. The committee foresaw the difficulty that both companies might be asking for electric lighting powers, which would not be used, in order to keep out competition with their gas undertaking, but the fact that the Ascot Gas Co. had made a profit on its electricity appeared to satisfy the committee on this point.

Netherlands Electrical Exhibition.—An exhibition of applied electricity is to be held at Nymegen under the auspices of the "Maatschappij van Nyverheid" (Society of Industries) from July 2nd to August 15th next. Exhibits from foreign manufacturers will be received. Applications for space should be addressed to the Exhibition Offices, Kelfkensbosch 18, Nymegen. A copy of the general regulations, &c. (in English) may be seen by British firms at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

STORAGE BATTERIES FOR PRIVATE PLANTS.—We have received from the Chloride Electrical Storage Company, Ltd. (Clifton Junction, near Manchester), a leaflet on storage batteries for private plants. This draws attention to the advantages of several features of the construction of the well-known Chloride Cell for this class of work, particularly as regards the patented wood separator employed. A number of views of battery rooms in private installations are given, and full particulars and dimensions of the standard types of cell are contained in a table.

ELECTRIC HOISTS, &c., AND DRILLS.—A collection of leaflets from the Witton-Kramer Electric Tool and Hoist Co. (Witton, Birmingham), issued in advance of a complete catalogue now in preparation, illustrates the applications of Witton-Kramer lifting magnets for cranes, electric hoists, and transporters, and electrically-driven drilling and grinding equipments.

LIFTS.—A new illustrated eight-page pamphlet from Messrs. R. Waygood & Co., Ltd., contains representations of a large number of types of lifts and cranes for various purposes, including those driven electrically, as well as hydraulic belt-driven and hand-worked lifts.

AUTOMATIC PUMPING PLANT.—A leaflet published by the Allgemeine Elektricitäts-Gesellschaft describes an automatic pumping plant for country houses. The motor of the pump is controlled by a switch which, in turn, is closed automatically when the water pressure in the pipes falls below a certain amount. This occurs, of course, whenever a tap is turned on, there being no cistern to produce the pressure. The motor stops almost directly the tap or taps are closed.

MOTOR CONTROLLERS.—Another leaflet from the same company describes a new pattern of controller for heavy and severe work, such as cranes, transporters, and mining gear. The most important feature of this design is the use of stiff hinged contact fingers in place of spring contacts. The contact pieces can be readily renewed without removing the fingers. The current does not pass through the hinge, but is carried to the finger by additional copper strips.

ALUMINIUM.—A leaflet received from the British Aluminium Co., Ltd. (109 Queen Victoria Street, London, E.C.), gives dimensions and particulars of aluminium wire and strand.

ADVERTISING LITERATURE.—Mr. A. H. Seabrook, general manager of the Electricity Department of the Borough of St. Marylebone, has sent us a short explanatory pamphlet on systems of charging depending on the load factor of the consumer. This is an attempt to explain the maximum demand and "telephone" systems of charging, and is intended for non-technical consumers. A table is given to show the total candle-power equivalent (at the Marylebone pressure of 240 volts) to various values of current in amperes for both metal and carbon filament lamps. A diagram for estimating the number of units which have to be consumed before the lower rate is charged is also included. The annual charges for heating and cooking apparatus, taking current at 1d. per unit on the "telephone" system, are given. We are informed that £7,000 has been received by the department in annual charges since the system was introduced.

STORAGE BATTERIES.—An attractive little pamphlet from the D.P. Battery Co. (Lumford Mills, Bakewell, Derbyshire) contains an interesting discussion upon the *rôle* played by the storage battery in electric power traction and lighting schemes. The economies that can be obtained by employing a battery to shield the generating plant from the peaks of a variable load are explained, and some striking figures are quoted, showing the improved conditions brought about by the introduction of a battery in a certain traction station employing Diesel engines. Charts are also reproduced showing the working of a battery on an electric crane circuit, and the possibilities opened up as regards continuous-current colliery installations are dwelt upon. Finally, a quotation from an abstract of a Paper read in America, published in ELECTRICAL ENGINEERING, is given, showing the successful application of a battery in conjunction with split pole converters for regulating the load on the alternating current rolling mill circuit at the Gary Works of the Indiana Steel Co. The booklet is copiously illustrated, and some interesting discharge curves of D.P. cells are reproduced.

Iron and Steel Institute.—The annual meeting of the Iron and Steel Institute will be held at the Institution of Civil Engineers, Great George Street, Westminster, London, on May 4th and 5th. Among the Papers to be read, time permitting, are the following:—(1) "On the Girod Furnace and the Electric Smelting Works of the Paul Girod System," by Prof. Dr. W. Borchers; (2) "On the Progress of Electro-Smelting," by Donald F. Campbell; (3) "On the Developments in the Production of Electric Power; its Application and Bearing upon the Iron and Steel Industries," by D. Selby Bigge. The annual dinner will be held on May 4th at 7 for 7.15 p.m., at the Hotel Cecil.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 21st, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

2,147/09. **Storage Batteries on A.-C. Systems.** A. M. Taylor. Low-voltage storage battery units, each of a few cells of large capacity, are installed in a sub-station on a H.-T. alternating-current distribution system for the purpose of relieving the generating station of the peak loads, and for improving the power-factor of the system. Each set, comprising a battery, a synchronous motor-generator, and a transformer, is connected to the low-tension side of the main transformers. The excitation of one motor-generator is controlled automatically from current and pressure transformers on the outgoing feeders, so that it is over-excited, and (running as a motor) takes enough leading-current to compensate for the lagging-current of the load. Another motor-generator is automatically controlled so as to compensate for the lagging-currents on the H.-T. side. All the motor-generators are driven from the batteries to supply alternating current for the peak loads. A method of inserting a transformer (fed from a battery unit) into the H.-T. feeders to compensate automatically for the reaction or capacity of the transmission line is also described. Five claims, six figures.

11,135/09. **Insulated Cable.** British Insulated & Helsby Cables, Ltd., F. A. Cole, and J. Shaw. The insulation consists of the following in succession:—A thin layer of vulcanised rubber, a layer of vulcanised bitumen, another thin layer of vulcanised rubber, india-rubber coated tape, and, finally, the braiding or other suitable covering. By thus interspersing the materials each protects the other from deleterious chemicals, and the rubber increases the mechanical strength and flexibility, preventing decentralisation and cracking. Two claims, one figure.

13,142/09. **Motor Starters.** A. H. Curtis, J. T. Mould, and Adams Manufacturing Co., Ltd. A motor starter and an electrically-operated circuit-breaker are combined, and interconnected so that the circuit of the holding-on solenoid of the circuit-breaker is completed by a forward motion of the rheostat lever, or if the lever is held stationary, but is broken immediately any backward motion takes place. This prevents arcing on the main contacts due to re-insertion of resistance, and is particularly useful for starters for printing machinery, as when inching, any backward motion cuts off current instantaneously. One method of effecting this consists in providing a commutator with a limited movement, moving along a contact sector. Backward movement causes the roller to turn, and its conducting segment to break the circuit made through it and the sector. Six claims, eleven figures.

18,228/09. **Wall-plug.** J. F. and E. S. Conradi (British Central Electrical Co.). A connector plug is provided with a knob or handle for lifting it out of the socket. A disc or shield of insulating material protects the hand, and the flexible or cable passes out of the body of the plug at right angles to the axis of the pins and below the shield. The plug cannot be pulled out by means of the cable. A construction for a three-pin plug (*i.e.*, one earthing pin) for preventing the pins being inserted in the wrong contacts, is also described. To obtain a quick break on pulling out the plug, spring contacts are provided. Further, to enable the plug to be secured, it has a bayonet-locking device. Three claims, twelve figures.

19,368/09. **Cable Drying Apparatus.** J. E. Dane and Perks, Dane & Co., Ltd. An apparatus for drying out cables that have absorbed moisture (as, for example, after a long period at sea in a ship's hold), consists of a hollow metal drum heated by passing steam continuously through it. The cable is wound on the drum in one layer, and wound off on to another drum. The drying drum is jacketed. Nine claims, seven figures.

22,081/09. **Scenery Raising Gear.** E. F. Moy and P. H. Bastie. A gear for raising and lowering theatre scenery, comprises two continuously running shafts driven in opposite directions by a motor. These shafts transmit power to a number of sets of gearing, one for each of the sets of lines to be worked. Each set of gearing consists of two electrically-operated friction clutches, one on each main shaft, both geared to a pulley having one large groove for the hand-operating rope, and four smaller grooves for the wire ropes suspending the scenery. The controlling gear consists of a series of switches for working the clutches. Four claims, eleven figures.

229/10. **Photo-telegraphic Apparatus.** H. Carbonelle. In systems for transmitting photographs in which a stylus passes over the surface of a prepared metal cylinder making and breaking contact, the cylinder dips into a bath of petroleum or benzine, which causes the contact to be broken under a film of insulating liquid, thus preventing sparking. The whole apparatus may be immersed in benzine. The liquid also keeps the cylinder clean and free from dust. A blade of celluloid is attached to the stylus so as to brush and clean the cylinder before it reaches the stylus, and to limit the movement of the latter. Three claims, three figures.

1,292/10. **Commutator Construction.** Siemens-Schuckertwerke Ges. There is a tendency for the hard mica now used to project above the surface of the commutator and cause sparking. The mica has been placed between the segments below the radial wearing depth only, the remaining portion being fitted with a soft insulating material which wears away easily. In high-speed machines, however, this soft material is thrown out by centrifugal force, and accumulated carbon dust then causes a short-circuit between adjacent segments. According to the present invention, the hard insulating substance extends only over the inner part, and a gap is left between the adjacent segments; but to prevent short-circuiting by carbon dust, the sides of the segments are insulated with varnish or enamel, or a thin sheet of paper or mica glued to the segments. Three claims, two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Ges. für Elektrotechnische Industrie and Gyuris, 16,855/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Gray [Conductors] 8,419/09.

Dynamos, Motors, and Transformers: Hanna [Bearings for electrical machines] 8,382/09; Mavor and Mavor & Coulson, Ltd. [Enclosed machines] 9,133/09.

Electric Ignition: Burks [Magneto-machines] 8,489/09.

Incandescent Lamps: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Manufacture of metal filaments] 8,781/09; Heinrich [Manufacture of metal filaments] 16,065/09; Jaeger, 26,006/09.

Instruments and Meters: Siemens Schuckertwerke Ges. [Motor meters] 11,634/09; A.-G. Korting's Elektricitätswerke [Motor meters] 12,878/09.

Switchgear, Fuses, and Fittings: Simplex Conduits, Ltd., and Waterhouse [Fittings for surface wiring] 7,995/09; Lear [Suspension gear for incandescent lamps] 14,675/09; Thomas [Electrically-controlled brakes for cranes] 15,544/09; Hill [Electro-magnetic clutches] 16,095/09.

Telephony and Telegraphy: Rymer-Jones [Wireless telegraphy] 10,586/09; Tardieu [Breast-plate microphones] 1,794/10; Siemens & Halske A.-G. [Telephone exchanges] 2,608/10.

Traction: Westinghouse Electric Co. [Electro-magnetic brakes] 4,171/10.

Miscellaneous: Schneider [Electric clock] 8,123/09; Miller [Electric signs] 24,190/09; Alexander (*Reinhardt*) [Centrifugal separators] 27,582/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electrochemistry, &c.: Schott and Gen [Electrolytic apparatus with liquid anode] 6,596-7/10; Elektrochemische Werke Ges. [Improving mechanical properties of metal articles] 7,657/10.

Incandescent Lamps: Madden and Houskeeper [Filaments] 7,331/10.

Telegraphy, &c.: Juillac [Mast for wireless telegraphy] 7,082/10.

Traction: A.-G. Brown, Boveri et Cie., 6,403-4/10.

Miscellaneous: Grundy [Insulated shaft-couplings] 4,093/10; Houskeeper [Contact devices] 7,332/10.

The following amended Specification can now be obtained.

3,604/09. **Deposition of Metals.** A Sang. See Electrical Engineering, January 6th, 1910, p. 16.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: L. Hackethal [Insulators] 577/02; M. B. Field [Armoured cables] 319/04.

Electrometallurgy, &c.: W. Wright [Electrolytic apparatus] 490/97.

Switchgear, &c.: A. P. and G. C. Lundberg [Wall-plug] 367/01; G. Harrison (*Anderson Manufacturing Co., U.S.A.*) [Time switches] 400/05.

Telephony, &c.: S. P. Thompson [A.-C. signalling systems] 525/98.

Traction: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Pneumatically controlled overhead collector shoe] 401/05.

Miscellaneous: A. E. Salivén [Magnetic separator] 365/02; W. L. Wise (*Thomson Electric Welding Co., U.S.A.*) [Chain welder] 123/05; R. J. W. Grasset [Electro-magnet governor for marine engines] 410/05.

SUMMARY

Our monthly supplement, "Electrical Engineering in Mines," is included in this issue. It opens with a letter from a correspondent on the desirability of employing competent men as colliery electricians, and contains reports of a number of discussions in various parts of the country of the Institution of Mining Electrical Engineers. The Papers discussed include one on the relative merits of continuous and alternating currents for colliery work by Mr. C. R. M. Young, read at Newcastle. Mr. J. Glynn Williams handled some aspects of the same subject in a Paper on storage batteries for colliery work at Whitehaven, and the question of earthing was introduced for discussion by Mr. Routledge at Nottingham. A report of a discussion before the Mining Institute of Scotland on Mr. Nelson's Papers on electricity in mines; an abstract of a further contribution on the subject of electricity and coal-dust explosions by Prof. W. M. Thornton and Mr. E. Bowden are also given. We have also included in our supplement reports of the discussions at the Newcastle and London meetings of the Institution of Electrical Engineers on Mr. W. W. Wood's Paper on earthing of the neutral of three-phase colliery installations. Although he advocates earthing in the case of collieries supplied from power companies' mains, his arguments were mostly in favour of an insulated neutral. In the discussion, however, most of the speakers recommended earthing. A summary of electrical mining patents which have been published in April is given, and notes explaining the circumstances of one or two colliery accidents are included.

At the meeting of the Westminster City Council, on Thursday, a proposal was made that the Council should reconsider the decision arrived at at the previous meeting in regard to the lighting of Regent Street, Piccadilly, &c. A long letter from the St. James & Pall Mall Electric Light Co., complaining of the manner in which the specification was drawn up, was referred to, and the company made an offer to continue the present electric lighting at a price lower than the accepted tender of the Gas Light & Coke Co. After a speech by Mr. Jacques Abady, the Chairman of the Works Committee, it was decided that the previous decision of the Council to accept the tender of the Gas Light & Coke Co. should stand. (Page 293.)

Judgment was given on Saturday in the action by the Electrical Co., Ltd., against Messrs. Oliver Thomas & Co., in regard to electrical plant for unwatering the Llynvi mine in South Wales. The Electrical Co. claimed payment on the contract amounting to £1,150, but Messrs. Thomas counterclaimed for £31,000 damages alleged to have been sustained through delay in completing the work. The Official Referee, who heard the action, held that the Electrical Co. properly completed their contract, and that the estimate of damages of the counterclaim had been grossly exaggerated. He gave judgment for the Electrical Co., with costs, and allowed Messrs. Thomas £50 damages only on the counterclaim. (Page 295.)

Digitized by Google

A LETTER in our correspondence columns calls attention to an example of the use of metal filament lamps of high candle-power on high standards formerly used for arc lamps.—Mr. H. H. Harrison answers some criticism of his article on central battery circuits.—An announcement is made referring to tickets for admission to the Tariff Reform discussion to be held by the National Electrical Manufacturers' Association. (Page 295.)

AMONG the specifications published by the Patent Office on Thursday last was one by R. K. Gray for a method of protecting loading coils of telephone cables. A brass cylinder is placed round the coil, and its ends are cut and bent down in a conical form.—Messrs. Bertram and E. Thomas protect an electrically controlled mechanical brake for cranes. The brake is released in steps by increasing the excitation of a solenoid opposing the weight or spring.—An electromagnetic clutch, in which a starting torque is obtained by currents induced in short-circuited coils, but which eventually drives with magnetic pull only, is described by C. W. Hill.—The Westinghouse Electric Co. describe magnetic track brakes, in which the coils are excited from the trolley circuit alone in cases of emergency.—Opposition has been entered to the grant of a patent to the Westinghouse Metal Filament Lamp Co. for a process of decarbonising metal filaments.—Among the expiring patents is one by C. P. Steinmetz for a three-phase distribution system, in which a fourth neutral wire is used on the secondary side. (Page 296.)

THE Bournemouth Tramway Manager suggests the replacement of the conduit system of electric traction by the ordinary trolley system.—The Bath Electricity Committee propose to substitute 108 100-c.p. metal filament lamps for arc lamps in a number of main streets.—The dispute with regard to the assessment of the Glasgow tramways has been settled by it being placed at £258,853, instead of £278,070.—Newcastle Tramways Committee suggest the use of trolley omnibuses in outlying suburbs.—The Nelson Tramways Manager attributes the loss of £771 to ½d. fares, and recommends their abolition.—The Barking Tramways and Electricity Committee express the opinion that the tramways undertaking will not be a financial success until through-running is arranged with neighbouring Councils.—Owing to the tramway track in Linthwaite, which should be maintained by the Council, being in such a bad state, the Huddersfield Corporation are reducing their tramcar service to that district. (Page 297.)

SOUTHAMPTON Corporation require a 1,000 kw. generating set; Belfast Corporation, motor boosters and switchboard extension; Bray Council, cable and A.-C. meters; Eccles Corporation, motor-driven centrifugal pump and switchgear; and Radcliffe Corporation, a 300 kw. continuous-current dynamo.—A £4,000 loan been sanctioned at Cheltenham for meters, services, and mains.—Rangoon Electric Tramway & Supply Co. propose to install a 1,500 kw. turbine set.—West Ham Corporation require condensing plant, boilers, and switchgear. (Page 299.)

THE accounts of the British Westinghouse Co. show a deficit of £798, after setting aside large sums for depreciation and meeting all debenture interest. The amount required by the Urban Electric Supply Co. to meet the 5 per cent. guaranteed dividend for 1909 falls short by £3,622; this has been provided by Edmundsons Electricity Corporation. (Page 300.)

Association of Electrical Engineering Students.—An association has been formed among the electrical engineering students of the L.C.C. School of Engineering, Poplar. At the first meeting on Saturday last, Mr. H. A. Garratt read a Paper on James Watt. The next Paper will be read on Wednesday, May 25th, by Mr. W. W. E. Ibbetson, on "Hydro-electric Power Stations."

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MAY 5TH.

Institution of Electrical Engineers.

8 p.m. At Royal Society of Arts. "A Telephone Relay," by S. G. Brown.

Institution of Electrical Engineers: Dublin Section.

8 p.m. Annual Meeting at Royal College of Science.

Röntgen Society.

8.15 p.m. At 20 Hanover Square, London. "Quantitative Measurements of the Conversion of Cathode Rays into Röntgen Rays by Antikathodes of different Metals," by J. H. Gardiner.

SATURDAY, MAY 7TH.

Birmingham and District Electric Club.

7 p.m. At Colonnade Hotel. "The South Staffordshire Mond Gas Distributing Plant," by W. Dudley.

TUESDAY, MAY 10TH.

National Electrical Manufacturers' Association.

2.30 p.m. Committee meeting at Balfour House, Finsbury Pavement, London.

Institution of Electrical Engineers: Glasgow Section.

8 p.m. At 207 Bath Street, Glasgow. Annual meeting.

WEDNESDAY, MAY 11TH.

Junior Institution of Engineers.

7.30 p.m. At Royal United Service Institution, Whitehall. "Notes on the Running of an Electricity Works," by L. N. Jockel.

THURSDAY, MAY 12TH.

Tramways and Light Railways Association.

10 a.m. Dublin Congress: (1) "Short History of the Dublin United Tramways Company," by R. S. Tresilian; (2) "Should the Act of 1870 be revised?" by Fred Coutts (Engineer and General Manager, Paisley District Tramways Co.); (3) "Railless Traction," by H. England (General Manager, Wakefield & District Light Railways Co.); (4) "Standardisation of Brake Blocks," by J. A. Panton (Superintendent, Rolling Stock, Liverpool Overhead Railway); (5) "Tramway Economics," by J. R. Salter (General Manager, Lancashire United Tramways, Ltd.).

Institution of Electrical Engineers.

8 p.m. At Royal Society of Arts. "Street Lighting by Modern Electric Lamps," by Haydn Harrison.

FRIDAY, MAY 13TH.

Tramways and Light Railways Association.

Dublin Congress. Visits to works, &c.

Institution of Civil Engineers' Premiums.—Among the list of awards made by the Council of the Institution of Civil Engineers for Papers read during the session 1909-10 are Telford premiums to Messrs. J. Dalziel and J. Sayers for their Paper on "Single-Phase Traction on the Midland Railway," and Mr. J. Shaw for his Paper on "Comparison of Costs with Steam and Electricity on the Mersey Railway."

The Institution of Civil Engineers' Council.—At the annual meeting on Tuesday, April 26th, the result of the ballot for the election of officers was declared as follows:—President, Mr. Alexander Siemens; Vice-Presidents, Dr. W. C. Unwin, Mr. R. Elliott-Cooper, Mr. A. G. Lyster, and Mr. C. A. Brereton; other members of Council, Mr. J. A. F. Aspinall (Liverpool), Mr. B. Hall Blyth (Edinburgh), Mr. J. A. Brodie (Liverpool), Mr. W. B. Bryan, Col. R. E. B. Crompton, C.B., Mr. W. Davidson (Australasia), Mr. E. B. Ellington, Mr. Maurice Fitzmaurice, C.M.G., Mr. J. P. Griffith (Ireland), Sir Robert A. Hadfield (Sheffield), Dr. C. A. Harrison (Newcastle-on-Tyne), Mr. W. Hunter, Mr. G. R. Jebb (Birmingham), Mr. H. E. Jones, Sir Wm. Thomas Lewis, Bart., K.C.V.O. (Aberdare), Mr. H. D. Lumsden (Canada), Sir Thomas Matthews, Hon. C. A. Parsons, C.B. (Wylam-on-Tyne), Mr. A. Ross, Mr. J. W. Shores, C.M.G. (South Africa), Mr. F. J. E. Spring, C.I.E. (India), Mr. J. Strain (Glasgow), Sir Frederick R. Upcott, K.C.V.O., C.S.I., Sir Philip Watts, K.C.B., Mr. W. B. Worthington (Derby), and Mr. A. F. Yarrow (Glasgow). This Council will take office on the first Tuesday in November, 1910.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting of the Institution of Electrical Engineers on Thursday:—*Associate Members:* Lieut. E. D. Carden, R.E., J. H. Edwards, E. Harriss, J. R. Henry, R. Hills, G. J. Hollyer, F. H. Horner, R. Hunter, E. S. Hurlbatt, A. W. Isenthal, H. J. Jones, D. N. Keith, F. J. Launchbury, Capt. H. P. Lefroy, R.E., B. T. McCormick, F. C. Osborne, W. J. Richards, G. W. Richardson, R. J. Roberts, G. Rosenbusch, F. P. Sexton, J. S. Smyth, J. Thomson, G. H. Vaughan, J. A. Woods. *Students:* Singh Anant, J. H. Asdell, D. D. Barber, H. E. Betts, A. E. Boon, W. M. Cranston, H. E. Crowcroft, R. Davies, G. M. Doubleday, G. E. Graham, F. S. Heywood, E. Hughes, W. Inglis, S. N. Jackson, G. T. Levinge, R. E. Livesley, J. H. Lough, D. W. McIntyre, R. A. Mack, T. F. Phillips, E. A. Riordan, J. J. Savant, P. W. Scholefield, B. G. Spendiff, F. P. Swann, J. L. Thompson, M. S. Vernal, W. A. Ward.

STREET LIGHTING IN THE WEST-END OF LONDON

AS we anticipated in our article upon this subject last week, an effort was made at the meeting of the Westminster City Council to reopen the question of the street lighting in Regent Street, Piccadilly, and the neighbouring streets, the contract for which had been given to the Gas Light & Coke Co. at the meeting on April 14th. Unfortunately, however, the effort was unsuccessful.

The matter was discussed in connection with a report of the Works Committee recommending the various streets in which high-pressure gas lamps should be installed. In the above-mentioned streets the gas will displace the existing electric lighting, and Councillor Pullman moved that these streets be deleted from the recommendation. Personally, he said, he was satisfied that the new light would be as satisfactory as the old, but the residents of Piccadilly and Regent Street seemed to see some sort of fetish in electric light, and thought they were going to be done some injury by the installation of gas. As a representative of the Regent Street Ward he felt it his duty to put forward the views of his constituents.

During the subsequent discussion, reference was made to two letters which had been circulated by the St. James & Pall Mall Electric Light Co. These complained that the company had been prevented by the form of the specification and tender from submitting the price at which they could continue to supply to the existing lamps.

Under the contracts expiring this year, the St. James & Pall Mall Company maintain at the uniform charge of £17 per lamp per annum, a total of 66 arc lamps, consisting of 16 660-watt flame arc lamps in Regent Street which give an illumination according to the tests of the City Engineer of 3,575 candle-power, 4 440-watt flame arc lamps in St. James's Street which give an illumination of 1,800 candle-power, and 46 660-watt white arc lamps in Piccadilly, St. James's Street, Pall Mall, &c., which give an illumination of 900 candle-power. The company now offered to continue the supply to these lamps. As no further capital expenditure for mains, &c., is involved, the price would be £1,122 per annum inclusive, to cover the installation and maintenance of 16 flame arc lamps in Regent Street to the 3,000 candle-power standard, and the installation and maintenance of the other 50 flame arc lamps in Piccadilly, St. James's Street, Pall Mall, &c., to the 1,800 candle-power standard. This compares with the cost of £1,127 for the equivalent candle-power derived from gas lighting, to which must be added the further costs of installation of £140 per annum, making a total of £1,267 for gas as compared with £1,122 for electric light. These figures are on a five years' contract, with the option to the Council to renew for the ten- or fifteen-year period.

It may be mentioned that the decision of the Council on April 14th to accept the tender of the Gas Light & Coke Co. was immediately communicated to the company, and at the same time the Electric Light Co. was reminded that their contract expires on November 10th.

Councillor Abady, the chairman of the Works Committee, claimed that these letters were full of misleading statements, but he referred principally to the allegation of the company that the form of tender precluded them from submitting a separate price for continuing the present electric lighting. This he contradicted, and said that it was the Town Clerk's opinion that the company could have sent in a special tender for this lighting originally. In support of this contention, Councillor Abady read the two following clauses from the specification and form of tender. Clause 2 of the general conditions of contract is as follows:—

Scope and Acceptance of Tenders.—The contractor may tender for the lighting of all or any of the districts mentioned in the form of tender, and may either treat each district as a separate unit and/or may make an inclusive tender for any area formed by the amalgamation of two or more of the said districts, and where the contractor shall tender in respect of more than one of the said districts as separate units, the Council may accept such tender as to any one or more of such districts to the exclusion of any other or others. The Council may accept any tender in respect of any part of any district to the exclusion of the remainder of the same district, and for this purpose may subdivide any district; and the contract may, at the option of the Council, be extended to any other or others of the said districts in which the contractor may have powers of supply. . . .

Among the conditions to be observed in tendering appeared the following:—

The tender must be accompanied by a full description of the scheme submitted, and drawings of lamps and columns.

Reading these two together, Councillor Abady emphatically stated that he saw nothing to prevent the Electric Light Co. from making a separate offer for continuing the present electric lighting of Regent Street, Piccadilly, &c. Instead of doing this, they waited until they knew the Gas Company's price, and then naturally tendered lower. The Electric Light Co. said that they had to put in a high price to provide for their tender being accepted for streets in which they had no mains, but he described this simply as "fudge," because the contract was in two parts, viz., "maintenance" and "installation." Councillor Abady also pointed out that all comparisons had to be made on a five years' basis, because the Works Committee, in spite of his urging them, declined absolutely to enter into a longer contract. In conclusion, reference was made to the three leading electrical papers, in which it was admitted that on price the Council could not have done otherwise than accept the Gas Co.'s tender, and finally, Mr. Abady read triumphantly a note in the *Electrical Review*, which charged the Electric Light Co. with having quoted too high prices. This appeared to convert a number of councillors who were wavering, and Councillor Pullman seemed very glad of the opportunity to withdraw his amendment to the report.

While we agree with Mr. Abady that the St. James & Pall Mall Electric Light Co. would have been well advised originally to have tendered separately for the continuance of the present electric lighting in Regent Street, Piccadilly, &c., in addition to tendering for the whole contract, we are bound to say that, after a careful perusal of the specification (which Mr. Abady has been good enough to send us), we are convinced that there is nothing in it authorising the company to tender for lighting a part of a district. The whole area to be lighted under this contract was divided into four districts, A, B, C, and D, and the electric lighting in Regent Street, Piccadilly, &c., about which the complaint has been, represents a portion only of area D. Had the company tendered under the general conditions and specification for these streets at a lower price than for the remainder, they would have been liable to have their tender accepted at this price for the whole of the four districts in which the company have Parliamentary powers to supply. This is evident on reading the last sentence of the quotation of the general conditions under the heading "Scope and Acceptance of Tender" quoted above, and also from the following clause in the general conditions which Mr. Abady did not quote in his speech.

Increasing Number of Lamps.—The lamps will be in number approximately as stated in the schedule hereto annexed, but the

Digitized by Google

Council, within the limits of the specified lighting area, shall have power to increase the number of lamps, as and when they may deem desirable, such additional lamps being provided and maintained at the prices in the accepted tender.

We have received the following letter on the subject:—

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The information now to hand *re* the comparative tenders for electric lighting and gas show most conclusively that the gas tenders have been put forward below cost. The gas tender is for a light of 3,000 c.p., burning 3,940 hours per annum, at a price of £21 5s. for a ten-year contract.

Taking the most efficient gas lighting at present in Westminster, namely, the Whitehall lamps, Mr. Bradley's report gives the average candle-power as 985 for the consumption of 28 cu. ft. per hour, or 35 c.p. hours per cu. ft. of gas.

The statements of gas consumption are given by the gas company. On the above basis the cost of gas alone, at 2s. 6d. per 1,000 ft., will be £45 per annum. The cost of gas only leaves a deficit of £23 5s. per annum, apart from the cost of mantles, attendance, and fines.

I am aware that new mantles under laboratory conditions, with the most careful attention to the pressure and quality of the gas, have given results stated by the gas journal, as good as 95 c.p. per cu. ft., but this figure cannot be maintained in practice, even if the mantles are renewed daily, and an efficiency of 95 candles per foot would not allow a profit on the prices quoted.

Very high pressure lamps are often quoted by gas people as the latest development in street lighting, and the candle-power of these mantles is stated not to fall appreciably. I quite admit this, as the mantles apparently fall off instead, the lamps being often attended to by a man and a ladder both morning and evening.

The gas companies appear to be following the example of the man who gradually reduced his horse's food to one straw a day, but when the minimum of consumption was reached, the mantle (I mean the horse) unfortunately expired. But the consumer who buys his gas does not always realise the unfortunate sequel until his mantle bill is more than his gas bill. Apart, however, from the advertising value of the Westminster contract to the gas companies, it is certainly unfortunate that the tenders were considered only on the basis of cost and candle-power, and not on a basis of useful illumination.

Sickly green gas lamps dotted at intervals on the roadway may give a good effect when measured by the photometer, but they cannot compare for traffic purposes with the mellow light of flame arc lamps placed well above the line of vision on 25 to 30-ft. poles. So far, the gas people have not produced a 3,000-c.p. lamp in Westminster, and it is possible that this new competitor may prove to be a dark horse in more than one sense. The gas people seem of this opinion, as they have asked for the fine to be reduced from 5s. to 6d. when the candle-power falls below the guaranteed minimum.

Yours faithfully,

Hartham Road, Holloway, N., May 2nd, 1910. A. DENMAN JONES, *Manager*, *Jandus Arc Lamp & Electric Co., Ltd.*

CATALOGUES AND PAMPHLETS, &c., RECEIVED

METAL FILAMENT LAMPS.—We have received from Messrs. Siemens Brothers Dynamo Works, Ltd. (Incandescent Lamp and Fittings Department, Tyssen Street, Dalston), an illustration showing the various applications of tantalum lamps aboard ship, a purpose to which they are particularly adapted owing to their ability to stand vibration. The illustrations range from a view of an Atlantic liner, on which over 1,000 tantalum lamps are installed, to a small pleasure yacht.

TWO-RATE METERS.—A well got up pamphlet from Messrs. Ferranti, Ltd. (Hollinwood, Lancashire), describes the Ferranti two-rate continuous-current meter, in which one of two alternative trains of wheels is put into action by means of an electromagnet controlled by a time switch. The armature of the magnet swings over a rocking arm carrying a gearwheel, which can engage in either of two wheels on either side of it. Otherwise the meter is of the same construction as the well-known Ferranti-Hamilton instrument.

CABLES, &c.—A card with ornamental coloured cover, from the St. Helens Cable & Rubber Co., Ltd. (Warrington), forms a "summary catalogue" of their rubber and electrical goods, including cables, wires, tape, insulating gloves, mats, &c., and ebonite articles.

GLASGOW MAIN DRAINAGE.—We have received from Mr. Wm. D. Hamilton, M.Inst.Mech.E., 59 Bath Street, Glasgow, an illustrated description of the Shieldhall outfall works of the Glasgow main drainage system. An account of the electrical equipment of the works was given in ELECTRICAL ENGINEERING, April 28th, p. 280.

STEAM TURBINES.—A booklet is to hand from the A.E.G. Electric Co., Ltd. (121 Charing Cross Road, London, W.C.), describing the A.E.G. impulse steam turbines. An illustrated description of this turbine appeared in ELECTRICAL ENGINEERING, November 4th, 1909, Vol. V., p. 951. We understand that some 800 turbines of this type, aggregating over 1,100,000 b.h.p. have been installed. The outputs range from 2 to 15,000 kw.

DYNAMOS, MOTORS, AND STARTERS.—We have received from the Braulik Engineering Co. a price list of "Eclipse" continuous-current dynamos and motors up to 25 h.p. These are provided with interpoles on the Ziehl system, and are listed in the open, ventilated, and enclosed patterns for 110, 220, and 440 volts, for both continuous and intermittent running. A separate list deals with starters of the metal and liquid types, speed regulators, dynamo shunt regulators, reversing starters and controllers, and three-phase starting and controlling gear.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

INSTRUMENTS.—Messrs. Crompton & Co., Ltd. (Salisbury House, London Wall, E.C.), have issued a new catalogue, containing full particulars and illustrations of their moving-coil continuous-current instruments, which include voltmeters and ammeters of the round sector, illuminated dial, and edgewise switchboard patterns, as well as portable instruments, paralleling voltmeters, with plug contacts, leakage indicators, and combined instruments for motor-cars, launches, &c.

ADVERTISING ELECTRICITY IN LONDON.—We have received from the Electricity Supply Publicity Committee of London one of the new coloured showcards which are to be circulated and exhibited in London and the suburbs with the idea of encouraging the use of electric light. The card measures 20 in. high by 15 in. wide, and has in its centre a bird's-eye view of London by night under the rays of a boldly outlined incandescent lamp. Suitable wording referring to the reductions in cost of electric lighting is placed above and below the illustration. The whole is artistically printed in attractive colours, and a blank white space is left at the bottom for the name and address of the local supply authority.

ALTERNATING-CURRENT INDUCTION MOTORS

A BOOKLET on induction motors, intended for buyers and users of such machines, and issued by Messrs. T. Harding Churton & Co. (Atlas Works, Water Lane, Leeds), contains a great deal of useful information as to the action and construction of these, together with their selection and use. Commencing with a *résumé* of principles of alternating currents so far as necessary, the construction of the ordinary induction motor is dealt with, and the various methods of starting short-circuited and slip-ring machines are explained by the aid of numerous illustrations. Another section treats of heating and rating of induction motors, including a discussion of "crane" ratings for intermittent loads. After a few words on speed control and reversibility, there is a useful section on the selection of motors for particular purposes, including a list of requirements that should be specified with inquiries and hints on choosing the most suitable style of machine. A description follows of the Churton induction motor, which has several interesting points in its construction, and typical curves of efficiencies, power factors, &c., are given. Another part of the booklet contains diagrams for connecting up, and notes on the management of motors, and other sections deal with fuses and circuit-breakers and the planning of private three-phase power transmission schemes. We have no doubt that Messrs. Harding Churton & Co. will be glad to send copies of this booklet to those of our readers who apply to them, mentioning this notice.

Birmingham Local Section of the Institution of Electrical Engineers.—The following list of officers to act during the session 1910–11 has been prepared by the committee:—Past Chairman, R. A. Chattock, Gisbert Kapp, and R. K. Morcom; Chairman, M. Railing; Vice-Chairman, A. M. Taylor; Present Ordinary Members of Committee (remaining in office), J. H. Barker, J. P. Kemp, M. Kloss, J. F. Lister, F. J. Moffett, W. E. Sumpner; Ordinary Members of Committee (new nominations), W. C. Goodchild, W. J. Larke, F. M. Lea, D. K. Morris, C. E. C. Shawfield, R. Threlfall; Hon. Secretary, H. B. Matthews. The committee invite other nominations, which must reach the Hon. Secretary not later than Saturday, May 7th.

"The Central."—The April issue of this magazine, published by the Central Technical College (London) Old Students' Association, has, as a frontispiece, an excellent photograph of Mr W. Duddell. Among the contents is an article on main drainage by H. G. Lloyd, some notes on the water-power, electric generating and distribution undertakings of America, by E. W. Marchant, and a description by H. L. Armstrong of various processes carried out in iron works. The new accelerometer brought out by Messrs. Elliott Bros. is described in an illustrated article by the inventor, Mr. H. E. Wimperis. Several pages are devoted to the doings of old students of the college, and many have interesting experiences to record.

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203-206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

OWING to exceptional pressure on our space this month, we have been obliged to hold over several articles of special interest, including our report of the annual meeting of the South Wales Branch of the Institution of Mining Electrical Engineers, held at Cardiff last Saturday, when Mr. W. J. Richards read a Paper on "Colliery Cables."

CORRESPONDENCE

COMPETENT ELECTRICIANS FOR COLLIERIES.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Kindly allow me a little space in your supplement to draw the attention of colliery managers to the disadvantages of employing incompetent electricians on their collieries. Much has been said in the electrical Press on the employment of competent electricians, but little or no practical headway has been made in that direction. I feel confident that if colliery managers would only look into the matter more seriously, and employ none but competent and skilled men, there would be less accidents put down as "caused through faulty electrical work." Turning to the rules for the installation of electricity in mines, Section 1, Rule 2, we find:—"A competent person shall be on duty at the mine when the electrical apparatus or machinery is in use." Is this so at every colliery? Perhaps it is to a certain extent, but is the so-called "electrician" employed competent? He may be a person that has worked there all his life as a handy man, and was put in charge of running a small lighting plant, when he accomplished some repairs more by accident than skill, and finally he was called an "electrician." He may then answer an advertisement for a colliery electrician, and he may get the job because he has been at So-and-so colliery for so many years as electrician, the employers never inquiring into his abilities, which they usually find out later on. How many cases does this "go home" to. Then what does competent mean? It means, in the case of a colliery electrician, that he must be used to all branches of electricity as applied to collieries. He must be able to do all repairs and keep the plant in order and up to every letter of the Rules. He must have had at least three years' experience at a colliery, of which half has been spent underground, and such a term must be spent where the greater part of the colliery is dependent on the electrical plant for power and light. A man is no use on a modern colliery if he has had to do with nothing larger than a small portable fan motor running on the manager's desk. A competent person knows what is required for a certain job, the type design, capacity for various conditions of motors and plant. He also knows what class of cable to instal for a certain job, and the way to fix it for safety. He knows where to look, and what to do, at various breakdowns. To employ a competent electrician means to the owners pounds in their pockets, but to employ an incompetent electrician means pounds out of pocket, and a wrecked plant. The incompetent person has no idea what to do or where to look when there is a breakdown; he usually sends his assistants to put it right, while he keeps out of the way until it is in order; then he goes to the manager and tells him the tale that all is right. He has no idea of insulation tests; all he troubles about is the plant running either well or badly, and receiving his wages on Friday. He is usually known by his rough work and old-time methods. The question arises, What wages should a competent electrician demand? This depends upon the size of the plant. No matter how small the plant, he should not be paid less than 45s. a week, with free coal. The custom of asking in advertisements for applicants to state wages required should be abolished. Testimonials from applicants should be ignored. It is much more satisfactory to the employer to write to the applicant's previous employers for his character. He should be employed for three months on trial, and then if satisfactory an agreement should be drawn up and signed by both parties. Of course, men can be got cheaper, but they rarely stay long. They are, as a rule, wanting in experience. An electrician to have had sufficient experience must have been at the trade from 15 or 16 years of age, and wants a proper wage in return for the expenses of years spent on acquiring his skill. The colliery manager does not get his certificate without great expense, and so it is in the electrician's case; he does not get to competency without expense, and therefore he has an equal right with the manager to demand a proper wage. In conclusion, I must say that the colliery electrician should be looked upon as an official. Does he not hold as much, if not more, responsibility as the engineer? The electrician should be in charge of his department, and should receive orders only from the manager. No engineer should have control of the electrician. The electrician is looked upon too often as a common workman. One great fault in colliery managers generally is, they think they know all about electricity, and an electrician has no chance to suggest anything for the welfare of the plant. Finally, give your competent electrician full charge of his department, and pay him well, and it will pay you.

Yours, &c.,

Wakefield, April 20th, 1910. "UNLUCKY."

RELATIVE MERITS OF CONTINUOUS AND ALTERNATING CURRENTS FOR COLLIERY WORK

AT a meeting of the Newcastle branch of the Institution of Mining Electrical Engineers on March 23rd, a Paper on the above subject was read by Mr. C. R. M. Young. He thought that the tendency for the centralisation of power supply was at the root of the preference which was generally felt for the alternating system, and he admitted that for a large new power scheme it would be folly to consider using any system other than three-phase.

Considering first the question of reliability, the general tendency was to regard three-phase plant as more reliable than direct-current. In the case of a scattered installation with a large number of small motors there was much to be said in favour of three-phase plant. In collieries, however, which required a large quantity of power about the shaft for winding, hauling, pumping, and other purposes, the direct-current system had a good deal to recommend it. In such a case, the motors would be sufficiently close to each other to receive ample attention, and provided a direct-current motor is kept reasonably clean it is in every way as reliable as a similar motor of the three-phase type. A direct-current motor has the advantage that dirt is not so likely to lodge in its armature as in the stator of a three-phase motor, and these are, of course, in both cases the most vulnerable parts.

As regards safety from shock, opinions seemed to be pretty evenly divided, but from Dr. Thornton's recent experiments (see ELECTRICAL ENGINEERING IN MINES, March 3rd, p. xxv., and April 7th, p. xlix.) it would appear that the danger due to direct current in this connection is greater than that due to alternating.

Turning to considerations of first cost, Mr. Young works out an estimate for a typical self-contained installation of moderate size, which goes to show that for all practical purposes there is no difference in first cost on a plant of the kind considered between direct-current and three-phase plant at 500 volts, and that even when the voltage in the case of the three-phase system is raised to 3,000 the difference is only small

Digitized by Google

in favour of the alternating system. As regards running cost also, although it is difficult to make a fair comparison, there does not seem to be any reason why the costs should not be practically the same on both systems, provided that in both cases the plant is given reasonable attention.

The Paper then repeats the summary of argument in favour of three-phase working given in a Paper read in January by Mr. R. Nelson, H.M. Electrical Inspector of Mines (see ELECTRICAL ENGINEERING IN MINES, February 3rd, p. xiv). In commenting on these Mr. Young pointed out that the lower cost of three-phase motors claimed as an advantage by Mr. Nelson did not necessarily mean lower cost of the whole system. He did not think that the simple starting gear required by squirrel-cage motors was of much account, as it was only in exceptional cases that induction motors without slip-rings could be used. Nor did he agree with Mr. Nelson's contention that induction motors could be used satisfactorily on higher overloads than direct-current machines when the latter were provided with commutating poles.

The principal advantages of direct current were summarised as follows:—

(*a*) Cables for direct-current installations for the same power and voltage are cheaper than those required for three-phase work.

(*b*) A direct-current motor is more readily and economically started up than is the case with a three-phase motor.

(*c*) In the case of a motor which requires to be started and reversed frequently there is less liability to break down on a direct-current than on a three-phase motor.

(*d*) The speed of a direct-current motor can be controlled within very wide limits economically.

(*e*) A direct-current motor, especially when series wound, has a greater starting torque for a given power than any other type of motor without taking excessive power. It also has a very large overload capacity. A direct-current motor can be arranged to run at any reasonable speed, and is not tied down to synchronous speeds.

In view of these considerations, the author considers that there is no reason why collieries having existing direct-current installations should not carry out their extensions on the same system. Even in cases of groups of collieries where extensions are more economically supplied from a new central three-phase station, the existing direct-current machinery may be retained and worked through motor generators.

In the case of a small isolated colliery, the author would favour direct current, especially where haulage forms a large proportion of the load, as the direct-current motor is much superior to its rival for starting heavy loads and the controlling gear is less complicated and less costly. In the case, however, of a large group of collieries with no existing electrical plant, the three-phase system is to be preferred.

In conclusion, the author says:—It would appear that the chief difference between the merits of the two systems is the existence of the static transformer. If it were possible to transform direct current from one voltage to another with the same ease and efficiency with which alternating current can at present be transformed, there seems little doubt that direct current would be the more useful of the two. But as it is necessary to take things as they exist, it must be acknowledged that the three-phase alternating system has many advantages which are of the greatest importance in many instances, but whilst admitting this it must be remembered that the direct-current system has many very good features which cannot be claimed by its rival, and that under suitable conditions it can be employed with advantage.

DISCUSSION.

Mr. W. C. MOUNTAIN (Messrs. Ernest Scott and Mountain), who was in the chair, opened the discussion by pointing out that in small installations where alternating current was used, the generator plant had to be of excess capacity in order to cope with one or two large haulages, if these were installed with squirrel-cage motors. Some years ago he quoted to a direct-current specification for a colliery equipment, and then offered to do the same work by means of alterating-current plant at the same price, which offer was accepted. The excellence of continuous-current plant in mines, moreover, had been shown in the way that plants had been running for many years without trouble. He knew of one case where a commutator had not been touched for seven years.

Prof. W. M. THORNTON (Armstrong College, Newcastle) referred to ignition of coal-dust and gas, and pointed out that the question resolved itself into an investigation of which system was most subject to sparking. As regards coal-dust, alternating current was in certain cases three times as safe as direct current. With regard to shock there was not much difference of risk, as the danger from the extra 40 per cent. of maximum pressure above normal in alternating current was compensated by the clutching effect of continuous current in systems above 480 volts.

Mr. FIELD considered that the installation of small transformers on alternating-current systems was inadvisable, because it would be necessary to install an earth-detector, and to keep records on every secondary circuit. He had installed a 50-kw. Crompton "C.B." converter in one of his pits, for reducing from 500 to 250 volts, with 93 per cent. efficiency, and this was giving every satisfaction. He thought the difficulty of switching on squirrel-cage haulage motors was over-estimated, as this would only occur once in a shift, the rest of the operations being done on the clutch. He had been strongly warned against using high-voltage alternating-current machinery in a mine on account of the question of voltage front, and understood that modern practice was now to discard high-tension machinery in the pit, and to go in for transformers and 500-volt motors. From quotations which had recently been received for controller gear for a 300-h.p. direct-current haulage and a 500-h.p. alternating-current haulage, he had found that the direct-current controller, which was of the metal type, came out to double the price of the liquid alternating-current controller. With regard to the working conditions of the two systems a very important point was the question of air-gaps in induction motors; he only knew of one firm at present which allowed for wear on the brasses by lowering the stator in the frame in order to follow this wear.

Dr. Thornton here remarked that potential front, although usually described as an effect of switching on, was, he believed, really due to switching off a circuit, although the effect was not, of course, discovered until the next switching on. Mr. Mountain said that in his experience voltage front troubles had been eliminated in some 350-h.p. motors running on 3,000 volts by switching on through auxiliary water resistances. Mr. WOOD pointed out that the effect was confined to a difference of potential across the first few turns of the windings and not to earth.

Mr. H. J. FISHER (Electrical Engineer, Lambton Collieries) confirmed this by saying that in motors which he had seen after breaking down from this cause, the trouble was confined to the first few turns, and the insulation had been pierced between turns and not to earth.

Mr. H. W. CLOTHIER (Messrs. A. Reyrolle & Co.) drew attention to the fact that this had been discussed at the last meeting, and that the remedies there described had been the heavier insulation of the first few turns or the use of choking coils. He thought that it was a wrong idea to put a water resistance on the switch, as it complicated the switch, introduced water on the switchboard, and although operating on switching in or out, would not be any precaution against surges produced by switching operations elsewhere.

Mr. TENNANT pointed out that several collieries had used turbine pumps, which required high-speed motors for large horse-powers, up to, say, 500, and it was difficult to obtain such high speeds from direct-current motors. A point with regard to direct-current switchgear was that oil-break switches were useless, owing to the fact that they could not break at zero potential, as on alternating-current supply, so that heavy surges were produced in the system.

In reply to a question asked by Mr. BAXTER, Mr. G. RALPH (Messrs. J. H. Holmes & Co.) said that a great many ball bearings had been used in mining machinery. He knew of one high-speed turbo-pump of 350 h.p. which had been running for two years on ball bearings without any trouble. In this case there was no sidepull. Mr. Fisher thought that dirt caused more breakdowns on direct current than three-phase gear. He had running three squirrel-cage haulage motors of 500, 450, and 350 h.p. respectively without any trouble, the supply being obtained in bulk from a power system. He thought the future of mining supply might lie in single-phase alternating current, 15 or 20 periods per second.

Mr. Clothier, discussing the question of switchgear, said that he had always found that alternating current was more easily controlled than direct current, as the arc from the latter appeared to be more violent than in the former case. Moreover, alternating-current switchgear can be better enclosed than direct-current gear. He doubted whether alternating current was more dangerous than direct current from the point of view of shock, as an absolutely instantaneous contact with alternating current would not be sufficient to kill. He was beginning to hope that it was possible to design a good oil-break switch for direct-current systems, although this was a prospect rather for the future than for the present. With proper protection, the prices of switchgear for controllers would be about the same, both for direct current and alternating current, but at present in practice 500 volts direct-current plant was not so fully protected as in alternating current. The point mentioned by Mr. Field as to putting leakage detectors on every sub-circuit would be obviated by earthing the neutral of the sub-circuits. This was a point in favour of alternating currents, and in his opinion lighting sub-circuits should not be operated at a higher pressure than 50 volts.

Mr. SIMPSON, Mr. HUNTER, and Mr. PARK also spoke, and after a brief reply from Mr. Young, the discussion was adjourned.

The Paper was further discussed on Wednesday, April 6th, when two written communications were read. In one of these Mr. E. MUDD pointed out that as the majority of shocks are obtained between one phase and earth, the advantage of safety appeared to lie with alternating current when the neutral was earthed. The use of large squirrel cage motors with auto-starters was possible, especially with a three-phase supply taken from a power-in-bulk system, and saved cost in motors and switchgear, as well as cutting down costs of attendance.

Mr. W. W. WOOD pointed out that an advantage of a continuous current compound-wound motor over three-phase machinery for haulage work was that it would automatically slow up on the heavy gradients, at the same time giving a greatly increased torque, while on the flat parts of the road its speed automatically increases, keeping up a high average speed, and equalising the power demand on the generating plant.

Mr. SNAITH said that three-phase machinery, saturated with oil, did not, in his opinion, give much trouble compared with the dust difficulty in direct current work. He also referred to the question of protection on alternating current mains, and thought that the time element device was a very important factor in the system of protection. One was required which could be used at any time for any load and capable of variation from 20 per cent. to 100 per cent. overload in a few seconds by simple adjustment.

Mr. C. S. VESEY BROWN thought that direct current work did not require such a high standard of technical training on the part of the engineers in charge as did alternating current. The possibilities of high-tension continuous current such as employed in the Thury system had not been referred to in the Paper. He objected to the prevalent practice of asking for heavy overload capacity in motors. Manufacturers in tendering simply rated their motor at a lower capacity than that for which it was originally designed. This could be done equally well with direct or alternating current machinery, so that it was not an exclusive advantage of the latter, as claimed by Mr. Nelson. He did not like the idea of using transformer sub-stations inbye.

Mr. TENNENT said he had had recent information of a new three phase repulsion motor, started by a simple three-pole switch, and working on varying speeds by shifting the brushes. Full particulars had not yet come to hand, but he believed that the information was authentic. Objections to the Thury system were that it was necessary to insulate the engine from the generator, and to have an attendant in every sub-station. As regards machinery, direct current appeared to be freer from accident than alternating current, because of the larger clearances between fixed and moving parts, but he thought that better protective appliances were available in the case of large powers with alternating current. Alternating current supply also lent itself more readily to leakage detection and isolation.

Mr. YOUNG, in replying to the discussion, pointed out that what he had attempted to show was not that direct current was superior to three-phase systems, but that there were cases in which it could be used with advantage. It was true that the shock pressure on an earthed three-phase system would be lower than the working pressure between phases, but in a direct current system, providing that insulation was good, a man touching one pole would receive no shock at all as he would reduce that pole to earth potential. His own experience with regard to squirrel cage motors had not been satisfactory. He thought that the most of the arguments brought forward to show the superiority of the three-phase system from the point of view of protection were based on the assumption that the neutral point of a three-phase supply would be earthed; he did not think that this was the time to enter into such a wide field of discussion, but he was not prepared to admit that either for theoretical or practical reasons a neutral point of such a system should be earthed.

Sandwell Park Colliery Fatality.—On April 6th, a sinker, T. W. Ward, was killed at the Jubilee Pit of the Sandwell Park Colliery Co., Ltd., West Bromwich. At the inquest, held on April 9th, evidence was given to the effect that the deceased and two others were engaged in shifting a set of 550-volt cables in a new shaft some 250 yards from the bottom. These cables supplied power to the pumps at the bottom, and the latter were supposed to be worked only between shifts. Deceased was in the cage and the other two men were on the top, and all three were removing the wooden covering from the casing, when the former drove his chisel into a cable and, receiving a shock, fell down into the sump. Before he fell, one of the other men attempted to save him, and in doing so received a slight shock. There was a rule posted up at the shaft top and generally observed that current should be cut off before anything was done to the cables, but the deceased, who should have given the order for the current to be cut off, had not done so. The other men also knew the cables were alive. The coroner concluded that the deceased might have been killed either by electric shock or by falling down the shaft, as the body was badly mutilated. A verdict of accidental death was returned, and no blame was attached to anyone.

STORAGE BATTERIES FOR COLLIERY WORK

A PAPER on "Storage Batteries for Colliery Work" was read by Mr. J. Glynn Williams at a meeting of the Cumberland Branch of the Institution of Mining Electrical Engineers on April 16th, at the Scientific Institute, Whitehaven.

He believed that the only colliery where a battery is used in conjunction with a three-phase transmission and D.C. distribution was the Hucknall Torkard Colliery, Notts. In this installation the main generator is a Rateau exhaust steam turbo-generator, having an output of 110 kw. at 500 volts, and the spare power from this is stepped up to 3,000 volts through a 90 kw. transformer, and transmitted across the town to another pit, and delivered to a 80 k.v.a. 3,000-volt synchronous motor direct coupled to a 500-volt 100 amp. direct current generator and a Lancashire Dynamo Company's booster. At the same time there is a transformer to step down from 3,000 volts to 500 volts, so that either A.C. or D.C. can be used as required. The battery comprises 240 "Tudor" cells of 400 ampere hours capacity, and the conversion plant is so arranged, that in case of full load, part of the current is supplied by the transmission lines, and the balance by the storage batteries, whilst in cases of the working load being less than the power transmitted, the balance of transmitted power is used to recharge the batteries. Some of the motors are run from the A.C. circuit and some from the D.C. circuit. The lighting is also divided up between the two.

In the case of a group of collieries supplied from one three-phase generating station, conversion to D.C. and the use of batteries would make each pit to some extent independent in case of breakdowns at the station or on the transmission lines, as work can still proceed up to the limit of the batteries while repairs are carried on. With this in view, it is advisable that in such a system the surface and ventilating machinery should be worked from the D.C. circuit, as well as the lighting and signals. Should it be desirable to use three-phase machines in some of the places underground, of course it would be an easy matter to take some of the power transmitted without conversion, or say during the light load period, if transmission is cut off, the current from batteries could be re-converted to three-phase A.C.

Mr. Williams then proceeds to work out comparisons of costs of the following schemes. (1) Transmitting to colliery B from colliery A, with a battery to meet the case when the load at B is greater than the power available at A. (2) Separate plant at colliery B, including a battery. (3) Separate plant at B without battery. The collieries are supposed to be three miles apart.

A certain schedule of power requirements is assumed, under which in scheme (1) for 300 h.p. required at colliery B during the day shift, there is only spare power available for transmission from colliery A of 150 h.p. The storage battery is therefore employed to help the peak. The arrangement suggested is to give the A.C. supply to colliery B at about 300 volts direct to a rotary convertor giving 500 volts on the D.C. side with a reversible booster on the same shaft. The actual cycle of operations is investigated by load curves on the basis of a battery of 240 of the D.P. Battery Co.'s L.S. 33 type cells, giving 2,048 ampere hours at the 8-hour rate. The total cost of the plant is worked out as follows. Battery, £2,500; converter and booster, £510; switchboards, £290; transformers, £570; transmission line, £1,157; total, £5,027.

Scheme (2) is based on a 240 h.p. steam-driven generating plant at B, and a battery to give 720 h.p. hours, consisting of 240 L.S. 19 D.P. cells. The total cost for this scheme is given as £6,704, not including spares for the generating plant. Scheme (3) provides simply for a 300 h.p. generating plant, costing £5,625. The author then works out fixed charges on a basis which he gives as follows:—3 per cent. interest, 2 per cent. sinking fund, 5 per cent. repairs on generating plant; 7 per cent. battery maintenance rate for 10 years, in 12 years at 7 per cent. compound interest, the capital expenditure on the battery will have been replaced; 5 per cent. is allowed for transmission line. These charges come out as follows:—Scheme (1), £615; Scheme (2), £690; Scheme (3), £563.

Mr. Williams does not consider running costs, so no real comparison can be made, but he points out, in comparing schemes (1) and (2), that with the higher fixed charges in scheme (2) would be to some extent balanced by the avoidance of the transmission and transmission losses of scheme (1), but that the labour charge in (1) would be much less than with (2). Scheme (2) might entail a slight saving in labour over scheme (3), owing to it being possible at times to let the battery take the load without running any plant, but the saving would only be small. Mr. Williams discusses these schemes in a general way, but does not arrive at any very definite conclusion as to which is the best scheme. Scheme 1, he says, could be adopted on the same lines as at the Hucknall Torkard Collieries, in Notts. In this case, a motor generator would be employed instead of a rotary converter. The voltage would be transformed from 3,000 volts down to 500. The load then could be taken down the pit from the alternating current side at 500 volts, and the surplus current would be used for charging the batteries during that part of the day when the load was light,

Digitized by Google

and during that part of the day when the load was heavy the accumulators would be switched in to help it.

Speaking generally, the author appears to recommend the use of batteries for loads of the order of magnitude considered, but not in case of much heavier loads.

A few questions were asked by members, but the main discussion was adjourned.

SAFETY PRECAUTIONS IN MINES

THE Paper on "Electricity in Mines," which was read by Mr. R. Nelson (H.M. Electrical Inspector of Mines) before the Institution of Mining Engineers about a year ago (see ELECTRICAL ENGINEERING, Vol. V., p. 527), was discussed by the Mining Institute of Scotland at Glasgow on April 13th.

Mr. FRANK ANSLOW (Messrs. Walter Dixon & Co., Consulting Engineers, Glasgow), while in hearty agreement with the major portion of Mr. Nelson's Paper, regretted that Mr. Nelson had recommended practically only one type of supply and one type of cable. Mr. Anslow was of opinion that A.C. was the more satisfactory supply for fiery mines, besides possessing advantages with regard to economical transmission, but at the same time D.C. supply was often more adaptable for driving colliery machinery. He agreed that the power supply companies might have been a boon to collieries in isolated districts, but it was not clear that the companies could always supply at as cheap a rate as the larger collieries could themselves generate, taking into account the growing use of exhaust steam turbines and the fact that the collieries were often able to use coal which has little or no commercial value. The use of armoured cable usually insured the work being carried out in a proper manner. He thought that the protective system described in Mr. Nelson's Paper had not had a sufficiently prolonged trial under the conditions existing in collieries to enable them to come to a final decision. One disadvantage in his opinion was that a temporary interruption of supply at one point might lead to the shutting down of the whole system, and would consequently hamper the work to too great a degree.

Mr. C. A. ATCHLEY (Messrs. Harland, Bowden & Co., Glasgow) was of opinion that A.C. supply in general was more satisfactory, but he admitted that in thin seams D.C. supply was preferable as smaller motors could be used for a given power, thus reducing the necessary head-room for a coal-cutter. While he agreed that A.C. motors generally were more robust, he thought that the sparking from slip-rings was as potentially dangerous as that from commutators. A prime objection to the concentric system was the great difficulty in securing quick repair of faults. He did not think that lead-covered cables should be recommended for mining work, as his experience had been that lead covering would not last in a mine. He was of opinion that vulcanised bitumen cable was the most satisfactory, with the possible addition of armoured cable in the main roads. A copper earthing sheath was unnecessary in any but the very large pits with long in-bye roads. Mr. Atchley emphasised the dangers to be anticipated from the use of armoured cable without proper supervision to ensure perfect metallic continuity. His experience was that automatic cut-outs and similar devices tended to get out of order so rapidly owing to the dust and damp found in a mine interfering with the necessarily fine adjustments, that fuses were in many cases preferable.

Mr. S. MAVOR (Messrs. Mavor & Coulson, Glasgow) protested against Mr. Nelson's somewhat curt dismissal of the claims of D.C. supply to the mine manager's notice. The principal advantages of three-phase supply were the additional economy of transmission and the possibility of using motors without moving contacts. The latter advantage was qualified by the fact that many operations required slip-ring motors, which were as objectionable with regard to sparking as D.C. motors. In a large number of the Scotch mines which had relatively short cable-runs, economy in transmission had comparatively little weight. These mines also were usually not of the fiery type, and therefore even the second advantage claimed did not generally require consideration. He admitted that A.C. motors were preferable for the high speed turbo pumps now so much used. With the bar type of cutter squirrel cage motors can be used, but with both other types it is necessary to use slip-ring motors.

Mr. ANDERSON (Messrs. Anderson & Boyes, Motherwell) was of opinion that D.C. coal-cutters were preferable to the A.C. type. He did not agree with the opinion of one of the previous speakers that the use of armoured cable leads to good work, but rather thought the contrary. He was of opinion that only one earthing point should be used, and that it should be at the surface. An entirely separate earth lead should be run to earth, and for this purpose he recommended an old wire rope—pipe returns should on no account be used.

Mr. ROBERT MCLAREN (President of the Institute) remarked on the great difference of opinion existing among mining and electrical men on the subject of earthing. He thought that the method proposed by Mr. Anderson of running separate earth leads to only one point was open to the objection that a large proportion of the plant might be made potentially dangerous by a fall of roof severing the earth wire at a point at which the damage would not be easily noticed. It had been the practice in some mines to carry cables on either side of the main roads and haulage ways, which meant that there was nearly always one cable in close proximity to the signal wire, and this was a dangerous practice. An objection to armoured cable was that when twisted, the armouring tended to leave the cable.

Mr. DAVID MARTIN (Messrs. Reyrolles, Ltd.) remarked that the protective gear to which Mr. Nelson referred had had an extended use in the coal mines of the N.E. coast of England.

Mr. J. T. FORGIE (Messrs. W. Baird & Co., Glasgow) said that although the D.C. system had been found perfectly satisfactory for a large number of small mines in Scotland, for the large and fiery mines more common in England it was probably more satisfactory to use three-phase supply.

Mr. G. L. KERR (Scottish Mine Owners' Association, Glasgow), in a written communication expressed the opinion that for mines where firedamp was given off in dangerous quantities, alternating current, particularly three-phase, was the safer system. In the Scottish coalfields the percentage of fiery collieries was not really very great, for many of the mines which were worked with safety lamps were practically free from fire-damp in dangerous quantities. There would be no risk in 80 per cent. or more of the Scottish mines using direct current. With regard to shocks alternating current seems to be the more dangerous. In his opinion armoured cables were all right in the shafts, but possessed serious disadvantages in underground roadways, and along working faces there was a danger of heavy falls of roof driving the armouring into contact with the cores. With regard to Mr. Nelson's contention that a proper system of earthing and cut-out gear made that contingency remote, Mr. Kerr was of opinion that no system of earthing or cut-out gear could be said to offer absolute safety in underground work, as the conditions were quite different from surface installations, and even with good earthing it seemed to him that there was considerable danger with armoured trailing cables. Another serious drawback to the use of armoured cable was the difficulty of locating faults, allied with the difficulty of repairing them or the making of joints. Trip-gear was apt to cause trouble in acting when not required on momentary overload, and he questioned whether a time-limit apparatus did not allow the very danger to arise which it was designed to avoid.

Newcastle Branch of the Institution of Mining Electrical Engineers.—By kind permission of the Newcastle-upon-Tyne Electric Supply Co., Ltd., arrangements have been made for members to inspect the electrical plant at their Carville power station, Wallsend-on-Tyne, on Saturday, May 14th. Members meet at the power station not later than 2.30 o'clock. It has also been decided to hold a picnic at Fountain's Abbey, Ripon, on Saturday, June 11th.

Lancashire Branch of the Institution of Mining Electrical Engineers.—A meeting of this branch was held at the Grand Hotel, Manchester, on Saturday, April 16th, when a discussion was held on the subject of the special rules for electricity in mines. All the members joined in the discussion, raising some very interesting and instructive points with regard to the safe application of electricity to motive power in mines. The next meeting will be held at the above hotel on Saturday, May 28th, at 6.30 p.m., when a Paper will be read by Mr. Bolton Shaw on "Colliery Cables."

Coal-cutter Accident.—On April 20th, a miner, H. T. Calladine, was killed by electric shock at the Wingfield Manor Colliery, Derbyshire. The inquest was held on April 23rd. At the time of the accident the deceased was working an electric coal-cutter, in conjunction with his brother. The latter was some distance from the machine, and on hearing the deceased cry out, he switched off the current. On returning to the machine, however, he found the deceased lying across the haulage rope. Artificial respiration proved ineffective. It appears that the colliery supply is on the D.-C. 500-volt concentric system with unarmoured cables and earthed negative. The coal-cutter in question was connected by a flexible twin-core unarmoured cable to a single-pole gate-end switch-box. The positive core of the trailing cable and the positive inner core of the main cable were taken into the box. A short length of 7/16 cable was connected by means of a clamp to the negative outer of the main cable, and this was bolted to another length of 7/16 cable jointed to the very flexible second core of the trailing cable. The continual connecting and disconnecting at the bolt had apparently weakened the latter joint, because the length of 7/16 cable must have broken away from the trailing cable core. This caused the motor to stop, but as the negative core of the trailing cable (and therefore the negative terminal of the motor) was connected to the frame, the whole machine and frame was raised to the full potential of the positive. As the negative core was severed, the connection to earth was broken. Mr. R. Nelson, H.M. Electrical Inspector of Mines, who was present at the inquest, suggested that the system would be improved by the use of proper connecting plugs between the trailing cables and gate-end boxes. The jury returned a verdict of accidental death, attaching no blame to anyone.

EARTHED v. INSULATED NEUTRALS

ON Thursday last, a Paper was read before the Institution of Electrical Engineers, in London, by Mr. W. W. Wood, dealing with the question whether a three-phase colliery installation should work with an earthed or insulated neutral. The Paper was read before the Newcastle Section on the previous Monday. The author points out that there are a number of examples of each system at work, and that conditions vary so greatly that what is suitable in one case may be dangerous in another. When power is taken direct from a supply company, an earth on the company's mains will have the same effect as an earth on the installation, and under such circumstances it is better to earth the neutral. Where the supply is transformed, however, the colliery circuit is insulated, and this does not apply. The earthing or insulating of the neutral makes little difference to the generating plant, as trouble with triple-frequency currents in the former case may be got over by only earthing the neutral of one generator, or by the introduction of choking coils. (See ELECTRICAL ENGINEERING, Vol. V., pp. 411, 432.) As far as the transmission lines are concerned,

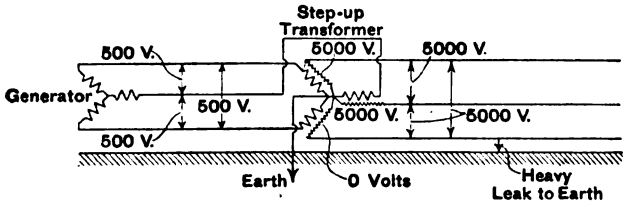

FIG. 1.—EFFECT OF ONE PHASE ON SECONDARY SIDE OF TRANSFORMER GOING TO EARTH; *i.e.*, PRESSURE PER PHASE IN OTHER TWO PHASES NEARLY DOUBLED.

the question is a very open one indeed, and very diverse opinions have been expressed. Under certain conditions it is possible to get the full line-voltage to earth in two phases, even with the neutral earthed and connected on both sides of the transformers, if the generator neutral is insulated. This is due to the instability of the neutral-point, and is illustrated in Fig. 1.

Turning to the underground plant, the author asserts that though it is possible to get a severe shock from the capacity effect alone, on an insulated system, there is no doubt that a system with earthed neutral presents greater dangers. On medium-pressure insulated systems, however, the neutral-point is often connected to earth through a leakage indicator, which will pass several hundred milliamperes, sufficient to give a fatal shock. This danger can be reduced by using electrostatic indicators, or the Nalder instrument, which only passes a few milliamperes. With an earthed system the voltage between any point and earth cannot exceed 58 per cent. of the line pressure, but this is not of any great advantage. The best protection against shock lies in properly enclosing all live parts, and in efficiently earthing all motor frames, switch-cases, &c. The earth wire should be large enough to carry the current which will blow the fuses of the plant it protects, and should be frequently tested for continuity. In a dry pit it is often necessary to employ a separate earthing cable or core, but this may be a source of danger unless the system is also earthed underground. Fig. 2 shows a three-phase system with the neutral earthed at

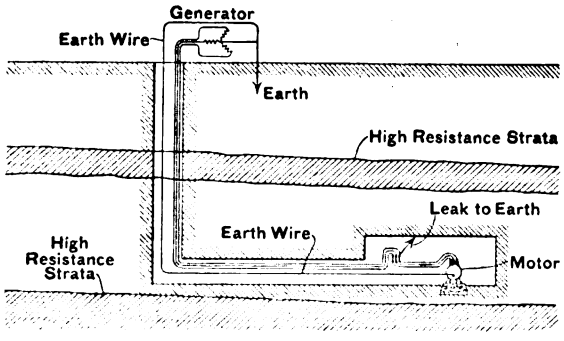

FIG. 2.—MOTOR RAISED TO HIGH POTENTIAL ABOVE EARTH BY HIGH RESISTANCE STRATA INTERVENING BETWEEN EARTH PLATE AT BANK AND SEAM IN WHICH MOTOR WORKS.

the generating station. Suppose a leak takes place on one of the outers near a motor situated between high-resistance strata. The resistance from the ground to the earthplate at bank (except through the earth wire) is very high. If the motor makes bad contact with the ground, anyone touching the motor-case may get a fatal shock. If the neutral is insulated it is necessary to have a leak on one of the other phases at bank before the same conditions can apply. A non-fatal shock due to the same causes occurred recently in a colliery in Scotland, and on measuring the resistance between an earthplate at bank and an earth connection at the bottom of the shaft, this was found to be 100,000 ohms. Messrs. J. G. and R. G. Cunliffe have shown that the resistance of an earthplate is often very considerable. (See ELECTRICAL ENGINEERING, Vol.. V., p. 261.) Thus, it was shown that the resistance between two plates each 1½ ft. square, and arranged 200 ft. apart, may be about 30 ohms, so that a leakage current of a few amperes would cause a big P.D. Further, nearly 50 per cent. of this drop occurs within 3 ft. of the plates. It was further shown that no great advantage was gained in making plates more than 4 sq. ft. in area. It appears necessary, therefore, to provide several earthplates distributed over the installation.

Danger of shock by coming in contact with an unarmoured damaged cable cannot, however, be guarded against in this way. With an earthed system shock is certain; with an insulated system it is likely to be less severe. With armoured cables this danger cannot occur as long as the armouring is efficiently earthed and electrically continuous. If this is not the case, however, the conditions are more dangerous than before, as an earth will cause a considerable length of armouring to be alive.

Recent experiments show that an arc will ignite either gas or coal dust in suspension, if present in suitable proportions. It is, therefore, doubtful whether many managers would instal electric plant in places where inflammable gas or much dust are constantly present. With an earthed neutral failure of the insulation of one phase to earth will produce an arc. With an insulated system, an earth on one phase shows on the leakage indicator, and there is a chance of isolating the section before any arc occurs. An advantage of the earthed system is that an earth on one phase isolates the faulty part, and does not increase the stress elsewhere, while a similar occurrence on an insulated system doubles the stress on the other phases, and is likely to cause further breakdowns.

Devices have been recently introduced to cut off current as soon as the leakage exceeds, say, ¼ ampere. They are only for use on a system with earthed neutral. By the use of these with armoured cables, danger from shock and explosion is said to be largely avoided, and Mr. Wedmore, of the B.T.H. Co., had described experiments showing that with armoured cables and leakage trips, external arcs do not occur, even if the cable is badly damaged by a fall of roof. These devices depend absolutely, however, on the continuity of the armouring or earthing being maintained, and if this is not done, they afford little protection against explosion and shock. A motor on concrete is well insulated, and if the earth connection is broken insufficient current would flow to operate the leakage trip in case of leakage to the frame. As long as earth connections are kept in good order there is no danger of shock from motors or switch casings or armourings, so that while there are cases in which a leakage device may be of use, there are also others where it would not justify the increased expenditure.

It is sometimes desirable to run plant in a damaged condition. Thus the stoppage of a main haulage gear will disastrously affect the day's output of coal, and if the plant can be kept going till the end of the shift, the fault can be remedied without disorganising the working of the pit. For this reason an installation with earthed neutral is likely to give more trouble than an insulated system. If leakage trips are indiscriminately used, there may be many unnecessary interruptions.

In the author's opinion it is better to rely upon having good men to look after the plant, and see that small details, such as earthing, &c., are properly attended to than on automatic appliances.

Dealing with the question of cost, the author points out that where automatic oil switches are used, three relays, one in each phase, are needed with an earthed neutral, and only two with an insulated neutral. The cost of armoured cable is nearly double that of unarmoured, so that if there is no danger of mechanical damage or explosion, armouring is an unjustifiable expense. The cost of maintenance is of greater importance than first cost, and thus simplicity is of primary importance. Concluding, the author states that an insulated neutral is better for standing plant when the cables are not liable to mechanical damage. Where coal-cutters are used, or where cables are liable to hard usage, it may be worth while to use automatic devices. If a separate transformer were used in the latter case, its neutral could be earthed (preferably through a resistance), without interfering with the remainder of the system. Where small lighting transformers are used, it is desirable to limit the secondary pressure to 110 volts, and earth the neutral. Finally, the author disclaims any sympathy with the present scare in regard to the use of electricity in mines. The number of accidents that occur is, he says, extraordinarily small considering the widespread use of electricity, and the

Digitized by Google

insufficient staff employed. The average number of deaths caused electrically in mines appears to be about 1 per cent. of all the accidental deaths, and many of these have been due to pure accident or wilful carelessness.

Discussion in Newcastle.

Prof. W. M. Thornton (Armstrong College, Newcastle), suggested that the reason why insulated delta connected systems were so common in America was that they did not think it necessary to take such precautions against shock, as men were cheap. An American engineer had told him that to earth the neutral was to put a premium on breakdowns. With regard to the effect of a high-resistance stratum, he thought that it would have to be many square miles in area to insulate the upper and lower conducting layers. Further, geological faults would occur in the area and pierce the insulating stratum. He had known of fatal shocks at 80 volts, but he thought that under mining conditions about 150 volts would be the limit for fatal shocks. It would be interesting to know if the large drop near the earth plates was due to electrolytic effects. The author had described a case where the trip-gear would not work, on account of the failure of the earth connection; a new rule for mines might provide that motors should be earthed by two or three flexible wires, so coiled that they could not be easily broken. He had once acted as Referee on the question of earthing the neutral. The contractor had objected, and a compromise was effected by installing a switch in the earth connection; this was closed only when tests were made several times every day. He did not think there was a scare with regard to the use of electricity in mines, but more care was being taken than formerly. Referring to Fig 2, he suggested that it was advisable to make an efficient earth in every seam, and to put in as many earth-plates as possible.

Mr. J. G. Wilson (Waste Heat and Gas Electrical Generating Stations, Ltd.), pointed out that on large three-phase systems with an insulated neutral, there was practically always sufficient leakage from motor windings, &c., to make it dangerous to touch any phase. The amount of danger was fluctuating, and variation of danger in collieries was the last thing desirable. With an earthed neutral it was thoroughly understood that touching any phase was dangerous. Armoured cables were, in the general opinion, correct practice, and with such there was a strong argument for earthing. A good armoured cable would stand considerable mechanical stress, but in the event of a very heavy fall of roof it might happen that the armouring would be brought into contact with one core. If the neutral were not earthed there would be no certainty of the cut-out operating, but if it were earthed, the supply would be cut off instantaneously. In the latter case, the cut-off could be secured either by a balanced system of relays, or by a trip-coil in series with the armouring. In the case of an unearthed system, the supply would not be cut off unless one core were forced into contact with another. On the other hand, it was conceivable that a D.C. 500-volt installation, with a neutral wire, was a case for not earthing the neutral.

Mr. H. W. Clothier (Messrs. A. Reyrolle & Co.), said he was a strong advocate of earthing the neutral in three-phase installations. He thought that a damaged circuit should be instantly isolated. With an earthed neutral it was not necessary to have a leakage detector, a device which was a nuisance in practice, and this far outweighed the advantage of the insulated system, that one trip-coil was saved. Further, it was not necessary to have earthing devices, as were necessary on insulated systems, as, for example, the Cardew earthing devices to prevent the L.T. windings of transformers being raised to the pressure of the H.T. side. In this respect the earthed system was simpler than the insulated system. The author seemed to admit that in the case of collieries supplied from supply companies' mains, it was best to earth the neutral. He assumed that the author would be of the same opinion in the case of large collieries with their own generating plant and sub-stations. Mr. Clothier continued that he was in favour of 50 or 25 volts for lighting circuits in mines. Auto-transformers with one terminal connected to a common earthed neutral conductor should be employed. He agreed with Mr. Wilson on the importance of armouring cables. The keynote of safety was that the system should be thoroughly iron-clad from generator to load. Given a complete armouring throughout, it was then necessary to have proper protective devices. In the case referred to by the author of a tripping device on the balanced system not operating, due to a broken earth connection, if the cable were armoured it would be necessary for the armouring to be discontinuous also before the device would fail to act. Referring to Fig. 2, he agreed with the necessity of numerous earth-plates, but the argument could not be directed against earthing the neutral; similar trouble could occur on an insulated neutral system under certain conditions.

Mr. F. O. Hunt said that the severity of a shock from an insulated system depended on the size of the system; with a large enough capacity it might be a fatal shock. With regard to leakage indicators, the electrostatic type did not involve connection to earth, and did not, therefore, provide a path for a shock curent on insulated systems. The limitation of voltage obtained by earthing was of little advantage; experiments had shown that labourers with wet hands were unable to let go of a conductor at a pressure as low as 30 volts at ordinary frequencies. On an earthed-neutral system, failure of one phase to earth was practically certain to produce a flash, even with automatic devices. He did not see why leakage trips should not be applied to insulated-neutral systems. With regard to the increase of stress on insulation when one phase of an insulated-neutral system went to earth, Mr. M. B. Field had shown that the condenser effects fixed the potential with reference to earth as when earthing through a high resistance. He did not agree that the elimination of the leakage indicator was an unmixed blessing, as a good instrument would give warning of a leak before it caused a stoppage of supply.

Mr. C. S. Vesey Brown said that an earthed neutral was a good fault finder. Personally, he always earthed, but had had much difficulty in finding really good earths.

Mr. Porter suggested that the concentration of the drop near earth-plates was due to the restricted cross-sectional area of the current path near the plates, and not to electrolytic effects. Leakage trip-gear on the balanced system could not be used indiscriminately on a network. With a main distributor with branches, the gear could be placed on the branches, but not on the main; *i.e.*, it could not be placed in series as duplicate tripping would occur.

Mr. W. Wood, in reply, emphasised the fact that each case had to be considered on its own merits. In reply to Dr. Thornton, he had noticed electrolytic action on earth-plates. He agreed that H.T. cables should be armoured, probably in all cases. With regard to danger due to leakage on insulated systems, he only claimed that there was less danger with insulated neutrals. The question of false confidence was not, he thought, a serious point. Capacity current could kill, but only a large system would have enough capacity. It was good practice to use leakage indicators even on an earthed system. With balanced trip-gear, and a non-earthed motor on insulating foundations, the gear would not work on the motor winding failing if the armouring were not continuous. With continuous armouring there would be no fear of shock, whether the trip-gear were there or not.

Discussion in London.

Mr. J. G. Wilson (Waste Heat & Gas Electrical Generating Stations, Ltd.) repeated the arguments he had given at the previous meeting at Newcastle in favour of earthing the neutral, and quoted in support of these an original communication by Mr. M. B. Field, published in Vol. 41 of the Institution *Journal* (p. 200). Referring to danger from falls of roof, he said that in the case of an unearthed system the supply would only be cut off if one core were forced into contact with another, and even then the current had to rise to a value probably double the normal, and considerable heating and arcing might occur. On the other hand, with an earthed system, the supply could be cut off instantaneously. Reliability of supply was, of course, most important, especially in the case of winding and blowing, both of which are done at Bank. Temporary cutting off of the supply underground to haulage, pumping, or even coal-cutter motors, while objectionable, ought not to be considered where there was danger of explosion.

Mr. H. W. Clothier also employed similar arguments to those he used at Newcastle in favour of earthing the neutral. He emphasised the danger of not isolating a damaged circuit, and advocated armouring throughout. Contact between core and earthed armouring due to a heavy fall of roof would, with proper protective devices, result in instantaneous isolation of the cable before any external flame could occur; he had known cases where after such damage the place of contact could not be found. The cost of the leakage protection system was little, if anything, more than ordinary overload protection. He disagreed with the author's comparison of the cost of armoured and unarmoured cables. With small cables the extra cost of armouring might be 40 to 50 per cent., but with larger cables it was only 20 per cent.

Mr. W. H. Patchell emphasised that they should have efficient men to look after the plant. It would pay to put less money in providing mechanical safeguards and more money on the staff. The possibilities of flashing due to falls of roofs were very remote; he had never had one. With regard to earthing, each case ought to be dealt with on its merits. Neither earthing nor non-earthing could be laid down as a principle to be universally adopted.

Mr. W. C. Mountain (Messrs. Ernest Scott & Mountain) said that 99 per cent. of breakdowns in mines were due to earths on the systems. There was always an accumulation of damp in a mine, and this acted upon the motor windings, which eventually —especially with coal-cutting machines—broke down the insulation. Whilst everything that could be done to promote the safety of the miner was necessary, he did not think this object would be attained by the protective gear only. An essential for colliery work was strength and simplicity. Armouring should be used wherever possible; at the same time, with portable apparatus, armoured cable was unwieldy and more likely to cause trouble than unarmoured cable. All motor frames, switchgear, &c., should be as permanently and efficiently earthed as possible, for nearly all the troubles in collieries from shock had arisen through defective earthing. He did not know of a

Digitized by Google

single accident through the armouring of a cable being broken by a fall of roof. The scare in connection with the use of electricity in mines was not warranted, and would never have existed if efficient men had been employed to look after the plant.

Mr. J. F. C. SNELL said that after the very careful investigations which he and some others had made on behalf of the Institution in connection with the Home Office Committee now considering the mining regulations, he had come to the conclusion that it was imperative that the neutral of three-phase systems should be earthed. This did not interfere with the simplicity of the system if they coupled with it a complete system of armouring. All cable joints should be bonded, and all frames of fixed machines should be bonded to the armouring. It was necessary, however, to protect cable armouring against acidulated water, but this was a question for the cable makers. Personally he would like to see complete armouring made compulsory in collieries, in order to avoid armouring here and there and thus getting patchy systems.

Mr. E. B. WEDMORE entirely agreed with Mr. Snell's remarks. He thought the percentages of deaths due to electricity in mines given in the Paper, viz., 1 per cent. of all accidental deaths, would be much higher if only mines in which electricity was used were taken into account. The author's arguments against earthing the middle point were in many cases weak, because they referred to defective systems. The author seemed to suggest that it was usual abroad to allow a system to continue working with one phase earthed where the middle point was not earthed, but this threw unusual stress upon the other phases and was liable to cause a very serious short. The author advocated earthed metal cases for switches, motors, &c., and the only logical conclusion was to continue this and provide a continuously armoured system, earthed at one or more points. He did not think that introducing a relay into the armouring circuit would be effective, because on calling on the wire to carry the leakage current there was a drop of potential, and the armouring and other metal parts were raised materially above earth potential.

Mr. H. M. SAYERS advocated the earthed neutral, which, he claimed, afforded distinct economy in cables, machines, and apparatus. Further, it provided a constant watch upon the insulation of the whole system, without which faults might remain undetected. He disagreed with the author that under the conditions given in Fig. 1 it was possible to get the full line voltage to earth in two phases. The distribution of voltage on the high-tension side of the transformer in the author's diagram was impossible. The use of local earth plates might produce very serious accidents in connection with signal wires; he believed that fatal shocks had taken place from signal wires due to their picking up the leakage currents. The present scare was due to the electrically ignorant man who came up against something which he did not know was dangerous, and this was the main thing they had to contend with.

Mr. H. BRAZIL said that if the neutral were earthed, it should be earthed through a resistance, which would limit the current flowing in the event of a fault. This resistance could take the form of the carbon powder device, described by him on a previous occasion, which decreased in value when a fault occurred until the current which flowed was sufficient to operate the cut-outs.

Mr. C. H. WORDINGHAM strongly endorsed the safety of earthing, but emphasised that it should be a real earth. He regarded the practice of inserting resistances in the earth connection to be undesirable, as it might cause a dangerous potential and risk of shock. The difficulty of finding an efficient earth was one of the points which the committee of the Institution was dealing with.

Mr. S. Z. DE FERRANTI reiterated his opinion that it was desirable to thoroughly well earth the neutral point and also to substantially cover with earthed metal all parts carrying a potential high enough to do any damage. Above all, the work should be done thoroughly.

Mr. WOOD, in reply, said that in America the conditions shown in his Fig. 1 were frequently met with, and the transformer did not burn out. Armouring, if it could be relied upon, gave the greatest protection, but it could not always be relied upon. In some parts of Yorkshire the armouring had been known to last only three weeks. With an earthed neutral they were relying upon one set of insulation, whilst with an insulated neutral there were two sets, and there was means of seeing that the insulation was in fair condition. It had been suggested that a leakage indicator might not show a leak in non-conducting strata, but the earth plate should be put in the non-conducting strata; an earth wire should be used in addition.

Coal-cutters in Shallow Seams.—Messrs. Mavor & Coulson have recently supplied to the Glenclelland Colliery of Messrs. Horns, Ltd., Glasgow, a coal-cutter for working in a 19-in. seam, driven by a three-phase 25-cycle motor running off the mains of the Clyde Valley Electric Power Co. This machine is only 18 in. high, and is normally rated at 30 h.p., but is capable of working up to 60 h.p. Another coal-cutter for the same pit, rated at 33 h.p., but with the same stalling point output, is being supplied by Messrs. Hunter & Jack, of Glasgow.

REVISION OF THE SPECIAL RULES FOR ELECTRICITY IN MINES

THE special departmental committee appointed by the Home Secretary to inquire into the working of the existing special rules for the use of electricity in mines, and to consider the advisability of their amendment, is still continuing its sittings at the Home Office, Whitehall. Considerable progress has been made; we understand that over thirty witnesses have already been heard, and that the hearing of evidence is nearly completed. It will be remembered that the committee consists of three members, namely:—Dr. R. A. S. Redmayne, H.M. Chief Inspector of Mines; Mr. C. H. Merz, and Mr. R. Nelson, H.M. Electrical Inspector of Mines. The proceedings, which commenced on March 8th last, are strictly private.

ELECTRICITY AND COAL-DUST EXPLOSIONS

A PAPER entitled "The Ignition of Coal-Dust by Single Electric Flashes," by Prof. W. M. Thornton and Mr. E. Bowden, was read before the North of England Institute of Mining and Mechanical Engineers on April 9th. The same series of experiments were detailed that Prof. Thornton has already referred to at meetings of the Newcastle Local Section of the Institution of Electrical Engineers and the Institution of Mining Electrical Engineers (see ELECTRICAL ENGINEERING IN MINES, March 3rd, p. xxv, and April 7th, p. xlix). The authors summarised their conclusions as follows:—

Coal-dust, although an insulator when dry, becomes a conductor if wet enough for carbonisation to take place. The necessity for keeping commutators clean, especially the small gap between live copper and the frame, is obvious. There appears to be no danger of flashing over on 480 volts between live parts 1¼ in. apart, unless the deposit of dust is entirely conducting, as from carbon brushes. Distributing-boxes should be dust- and flame-tight, and should be in compartments, so arranged that the main terminals cannot be short-circuited by a flash. Cartridge fuses should be always used where possible. Momentary arcs produced by break of cables or conductors can ignite dust; but the current required to do so is very much greater when the voltage is low, and at moderate voltages is greater for alternating than for direct current. This suggests that the arrangement most satisfactory from the point of view of safety, both for flashes and for shocks, is high-tension transmission to a sub-station or transformer-house, probably with cables well enough armoured to prevent any external flash, and quite low-tension local transmission for power and lighting. Series lighting with incandescent lamps is not to be recommended. Although it has been shown that a cloud of coal-dust can be ignited by small single flashes, and the degree of probability has been found for most cases likely to occur in practice, it does not follow that the use of electricity in collieries is dangerous. Electricity is no more dangerous than the supply for domestic use of highly-poisonous and explosive coal-gas. An efficient leakage-indicator is equally necessary for both. No indicator will prevent risk from sudden breakage of either pipes or cables; but in the electrical case there is the advantage that the main supply can, if desired, be cut off by a small leakage current.

NOTTINGHAMSHIRE AND DERBYSHIRE BRANCH OF THE INSTITUTION OF MINING ELECTRICAL ENGINEERS

AT a meeting at University College, Nottingham, on Saturday, April 30th, the Secretary's quarterly report, showing a steady increase in membership, was read. The Chairman appealed to members for practical papers for discussion.

The concluding few minutes of the meeting, after the discussion of general business, were occupied by Mr. L. Routledge (Eastwood), who read extracts from his Paper (in course of completion) on "Earthing." He described several experiments relating to the testing of earths, and found that the average resistance of the armour came out at about 0·87 ohm. The tests were made with switchboard type instruments on an A.-C. supply. He would like to have figures for similar tests on a D.-C. supply on account of electrolytic and polarisation effects which might occur.

The Chairman agreed that the question of earths was an important one, and hoped members would be prepared at the next meeting to discuss it thoroughly.

The recent electrical fatality at Wingfield Manor Colliery, Derbyshire, was also mentioned as likely to provide interesting discussion, and it was arranged to discuss this matter along with Mr. Routledge's Paper on "Earthing" at the next meeting.

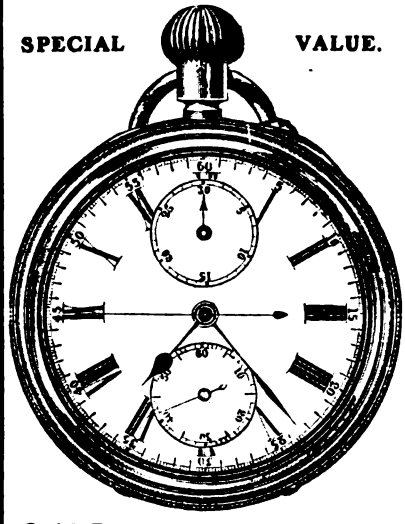
ELECTRICAL MINING PATENTS OF APRIL

AMONG the patents published last month of especial interest to mining electrical engineers was one (No. 7,141 of 1909) by W. B. Durant and R. W. Durant for a safety lamp consisting of an aluminium case lined with vulcanite and containing an accumulator. The lamp is attached to the side of the case in a suitable reflector, and the whole is constructed so that no contacts are exposed. Patent No. 7,151 of 1909, by Messrs. Mavor & Coulson, Ltd., describes a trough conveyer of the reciprocating type consisting of a number of interchangeable sections mounted on wheels, so that the conveyer can be readily advanced along the working face. This has no special features from an electrical point of view. A device for throwing out of gear the cutter-bar or other cutting arrangement in electric coal-cutters when it is desired to move the machine by means of the driving motor is described in Specification No. 8,694 of 1909, by T. Thomson. In one arrangement the bevel pinion is mounted loose on the driving spindle, and a clutch block sliding in a tongue on the spindle is moved into or out of contact with the bevel pinion. In another arrangement the driven crown bevel wheel and mitre wheel are lifted out of gear with the driving bevel pinion and the cutter-bar mitre wheel. Patent No. 9,133 of 1909, by H. A. Mavor and Mavor & Coulson, Ltd., describes the methods of air-cooling totally enclosed motors for mining work, which were described in ELECTRICAL ENGINEERING, Mining Supplement, March 3rd, page xxix. Another specification (No. 10,334 of 1909), by T. Thomson, describes a method of slewing the gear head and cutter-bar of an electric coal-cutter by its own motive power by means of ratchet-wheel gear and a rod connection between the haulage and slewing mechanisms.

Power Station Fatality.—On April 15th, W. Liddle, a joiner in the employ of Messrs. G. Wardropper & Sons, contractors, of Penshaw, was killed by electric shock at the Durham Collieries' power station. The deceased was found dead, with one arm severely burnt. It appeared that he had to fit a wooden framework round some connections, and was doing so while they were alive. The pressure was 575 volts A.-C.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during April.

April 7th.—Supplement on "Electrical Engineering in Mines," opening with a practical article by a colliery electrician, including notes on the maintenance of colliery electrical plant, and proposed modifications of the special rules. Reports are given of further discussions on Mr. W. Maurice's Paper on "Electric Shocks" at four branches of the Institution of Mining Electrical Engineers. A summary is given of mining patents which have been issued by the Patent Office during March, including one relating to a short face coal cutter by Messrs. Mavor and Coulson. The principal article is a long illustrated description of the electrical equipment of the Ashington Collieries. Reports are also given of two meetings of the Newcastle branch of the Institution of Mining Electrical Engineers, on a Paper by Mr. H. J. Fisher on causes and prevention of electrical accidents in collieries, and on a demonstration by Prof. Thornton and Mr. H. W. Clothier on electrically-caused coal dust and gas explosion. A signalling system for winding plants is also described.



April 14th.—Special illustrated article on fans and ventilation; description of some new types of motor control gear; an article on jointing aluminium; report of a Paper and discussion on switch and transformer oils.

April 21st.—Illustrated description of the new 12,000 ampere-hour central station battery with boosters and switchgear at Manchester.

April 28th.—Description of the electrical equipment of the Shieldhall sewage works, Glasgow.

DISPUTE WITH REGARD TO PUMPING PLANT IN A MINE

JUDGMENT was delivered on Saturday in an action in which the Electrical Co., Ltd., sued Messrs. Oliver H. Thomas, Son & Co., Ltd., for the recovery of £1,150, balance due on a contract entered into in November, 1905, for the installation of electrical pumping plant, to replace certain steam plant, for the unwatering of the Llynvi Valley Colliery. Messrs. Thomas entered a counterclaim for a sum exceeding £31,000, the value of the loss which they alleged they had sustained by reason of the delay in the erection of the plant, and the failure to accomplish the unwatering of the mine. The judgment by Mr. E. Pollock, the Official Referee, who has been hearing the case, was delivered on the fortieth day of the action, and occupied three hours in delivery. It is said that the legal costs amount to over £10,000.

In November, 1905, an agreement was come to by which the Electrical Co. was to install certain electrical plant in the mine, but numerous delays took place, and instead of the plant being in position by December 23rd, 1905, it was not until February, 1907, that the contract was actually completed. During this period a voluminous correspondence took place between the parties, and, having perused this, the Official Referee has come to the conclusion that the blame for this delay rests mainly, if not entirely, with Messrs. Thomas, who had not been in a position to receive the electrical plant; the Electrical Co. admitted some delay on their side, but not, in the opinion of the Referee, sufficient to cause serious results. On February 7th, 1907, Mr. Oliver Thomas admitted that the contract of November, 1905, had been completed, and that the company were entitled to payment. On the other hand, the counterclaim was set up by reason of the allegation that the work ought to have been completed within a much shorter time, and that it should have been possible to get at the coal in the mine by April, 1906. For a certain period before 1907, the pumps kept the water out of the mine, and coal was mined, but apparently further flooding took place, and no further coal could be procured. This flooding is held to have been due to a strike of workmen and not to the incapacity of the plant. The Official Referee, in the course of his judgment, dealt in detail with some of the causes of breakdown in the plant, and, in view of recent complaints as to incompetent men in charge of electrical plant in mines, the following remarks made by him are noteworthy:—"The chief difficulty in regard to the exciter was due to the improper attention bestowed upon it by those in the employment of Mr. Oliver Thomas. There was obviously nobody there who knew anything at all about this electrical plant; there was no expert of any sort or kind. Whenever an expert went there on behalf of the plaintiff company, the exciter was put in order and worked perfectly well."

He blamed Messrs. Thomas for prolonging the case to such a length, and also charcterised the particulars of damage as "grossly exaggerated," and the only damage, he said, to which Mr. Thomas could directly point was some wear and tear of the steam pumps before the electrical plant was completed, amounting to about £50, and this he was willing to allow. It was quite clear that the damage due to the mine remaining unwatered must be very small, owing to the difficulties other than water, which had to be overcome before the coal could be reached.

He therefore found for the Electrical Co., with costs on the claim and counterclaim, but allowed defendants £50 damages on the counterclaim, with a further sum of £151 agreed.

CORRESPONDENCE

STREET LIGHTING.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—In view of the recent prominence that has been given to the question of street lighting, it may be of interest to you to know that we have recently installed two metallic filament (Osram) lamps (400 c.p.) on an elevated arc lamp-post in Westbourne Terrace, Paddington. Specialy designed brackets and globes have been used in order to produce the best effect, which, in our opinion, is so successful that we venture to suggest that it would be worth while for your representative to inspect them some evening after dark. We think that you will agree that these lamps compare very favourably with arcs, though, of course, the candle-power is far less, and it may be stated that although they have been in use for a month, the globes have not once been cleaned.

The post is situated at the Bayswater Road end of Westbourne Terrace, and I may add that at the other end of the Terrace, on the bridge crossing the Great Western Railway, we have installed three ordinary street gas pillars with 100-c.p. Osram lamps, also in special globes, which your representative might also like to see at the same time.

Yours faithfully,
E. CUNLIFFE OWEN, *Secretary.*
(*Metropolitan Electric Supply Co., Ltd.*)
16 Stratford Place, W.

[We have inspected the lamps in question, and can fully substantiate the claims made above. There is no doubt also that comparisons will be still more favourable to the metal filament lamps in foggy weather. It is interesting to remember that Westbourne Terrace was one of the first residential streets in London to be lighted electrically, although the old open arcs were removed some time ago, when the gas mantle came to the fore. It is one of the original posts that is being utilised by replacing the old and rather unsightly lyre from which the arc lamp was hung by a much more artistic arrangement, from which the two new lanterns hang on either side of the post.—ED. *E.E.*]

CENTRAL BATTERY OMNIBUS TELEGRAPH CIRCUITS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Your correspondent, Mr. P. J. Ridd, is in error in asserting that I have neglected to take into account the effect of line leakage in my article of March 17th under the above heading. In this article it is distinctly stated that r and R are the *measured* conductor and insulation resistances respectively. r is thus the true conductor resistance of the whole line diminished by the conductivity of the leakage paths, while R is the joint resistance of the total elementary portions of the line and the leakage paths. Mr. Ridd's method does not, therefore, give the theoretically correct result for x, which is that set forth in my article. r and R are obtained by standard methods of calculation, which Mr. Ridd will find in Kempe's Handbook or J. Elton Young's "Testing for Telegraph Engineers."

I am, Sir, yours faithfully,
H. H. HARRISON.
British Insulated & Helsby Cables, Ltd.,
Lennox House, Norfolk Street,
Strand, W.C., May 3, 1910.

DISCUSSION ON TARIFF REFORM.

To the Editor of ELECTRICAL ENGINEERING.

DEAR SIR,—With reference to the meeting which this Association is convening on May 23rd next at Caxton Hall to consider the effect of Free Trade or Protection on the Electrical Industry, I have received many communications regarding this, and should be glad if you can intimate to your readers that the meeting will be a ticket meeting, and that tickets will be sent by this Association to all its members, also to all the members, associate members, and associates of the Institution of Electrical Engineers.

I am, sir, yours faithfully,
Balfour House, Finsbury Pavement, F. B. O. HAWES,
London, E.C., April 29th, 1910. *Secretary.*

Parliamentary Intelligence.—The Bishops Stortford and Epping Gas Bill was passed by the Unopposed Committee of the House of Commons on Thursday. As mentioned on page 289 of our last issue, the Committee had called for a resolution by the Bishops Stortford Council in favour of the Bill, and this being forthcoming, the Bill was ordered to be reported for third reading.

The Yorkshire Electric Power Bill has been read a second time in the House of Commons.

The Mersey Railway Act received Royal Assent on Friday.

Telegraph Traffic.—The cable between Lattaquie and Cyprus was restored to working order on April 27th, while on the following day the Para-Maranham cable was working again. The Bagdad-Bassorah line was down on 2nd inst. The cable between Malta and Tripoli has not yet been repaired; telegrams are still being posted from Malta at sender's risk. The Argentine Administration has announced that telegrams for the Pacific coast of South America can be sent *viâ* the Andes with advantage until the end of June.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 28th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

8,419/09. **Loading Coils for Telephone Cables.** R. K. GRAY. Pupin induction coils inserted in telephone cables to neutralise the capacity effects are protected by a metal cylinder deeply serrated at the ends, and bent down to a conical form. The cylinder is of brass, and may be inclosed in a second cylinder of steel. Rings are placed over the serrates at each end, and wooden blocks are placed at either end of the cylinder to prevent flattening and damage to the coils during sheathing. If there are two circuits, the wires of the other circuit are laid side by side outside the coil, but inside the metal cylinder. Five claims, three figures.

8,781/09. **Metal Filaments.** BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*). A plastic mass containing tungsten is produced by precipitation from a solution of tungstate of ammonia or other alkaline compound, and a cyclic hydrocarbon derivative, such as gallic acid. The precipitate can be squirted, and a shrinkage in section of 75 per cent. is said to be obtained, thus rendering possible the production of very fine filaments. Finely divided tungsten may be added to the mass previous to squirting; this makes it conductive, and renders baking previous to sintering unnecessary. Six claims.

15,544/09. **Crane Control.** BERTRAM and E. THOMAS. A mechanical brake, such as a band brake, is provided with a solenoid acting against the weight or springs. By shaping of the core or by suitable mechanism, the pull is made equal for all positions of the core. When lowering, resistance is gradually cut out of the solenoid circuit, and the braking effect is removed in steps. The final step may apply a lowering current to the motor. The device may also be arranged to remove the brake entirely when current is applied for raising the load. Four claims, two figures.

16,095/09. **Electromagnetic Clutch.** C. W. HILL. This clutch transmits the power by magnetic pull only, and not by the friction of surfaces drawn together by electromagnetic action. On the driving shaft are mounted two concentric rings of laminations, the outer periphery of the inner ring and the inner periphery of the outer ring being provided with a large number of small teeth. Between these two rings is another ring mounted on the shaft to be driven and provided with teeth on both peripheries to correspond with those on the outer rings. An exciting winding, supplied from slip-rings, is provided on the driving rings, and the teeth of the inner ring have short-circuited coils. On switching on the current with the driving rings rotating, currents are induced in the short-circuited coils, and a large starting torque is obtained. When the inner ring has run up to speed, the two run absolutely synchronously, so long as the torque does not exceed the magnetic pull exerted by the teeth. One claim, two figures.

26,006/09. **Metal Filament Lamps.** H. J. JAEGER. Elastic anchors for supporting filaments at the bend of the loop consist of a metal wire support with a glass bead fused on to the end. The filament passes through the glass bead and does not come in contact with the wire. Volatilisation of the wire is thus avoided, and the supports of the different loops may be twisted together. The glass may be in a fused condition during the operation of the lamp. Four claims, four figures.

4,171/10. **Electromagnetic Railway and Tramway Brakes.** WESTINGHOUSE ELECTRIC Co., LTD. Magnetic wheel or track brakes are provided with series and shunt windings. For ordinary service applications, the series winding is supplied with current from the motors acting as generators. If necessary, the shunt winding can be excited at the same time through a resistance direct from the trolley-wire through one or more contacts on the controller. For emergency applications, the shunt winding only is employed, but all resistance is cut out so that the full trolley-wire voltage is applied to the winding. Three claims, one figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: TANNER and CLAREMONT [Distribution system and cables] 27,858/08; BRITISH THOMSON-HOUSTON Co., WEDMORE, and WHITCHER [Distribution systems] 8,979/09.

Dynamos, Motors, and Transformers: FELTEN & GUILLEAUME-LAHMEYERWERKE A.-G. [Motor control] 9,338/09; SCHWERIN [Generator] 10,793/09; ALLDAYS & ONIONS PNEUMATIC ENGINEERING Co. and JOSELIN [Electrically-driven centrifugal fans] 16,476/09; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Regulation of load equalisers] 20,055/09; SIEMENS BROS. DYNAMO WORKS (*Siemens-Schuckertwerke Ges.*) [Polyphase commutator machines] 21,540/09; BRUSH ELECTRICAL ENGINEERING Co. and PORTER [End connections of rotor and stator bars] 27,641/09.

Electric Ignition: DE POORTER [Sparking-plugs] 19,082/09.

Electrometallurgy and Electrochemistry: IMRAY (*Soc. of Chemical Industry in Basle*) [Continuous electrolysis of aqueous solutions] 25,118/09.

Incandescent Lamps: HORVATH, 9,318/09; RAWLINGS [Candle-lamp] 10,288/09.

Instruments and Meters: BRITISH THOMSON-HOUSTON Co. and D'ARCY [Bearings for spindles of instruments] 2,031/10.

Switchgear, Fuses, and Fittings: RAWLINGS, HANDCOCK, and DYKES [Wiring fittings] 5,891/09; STEVENSON and WILLIAMS [Switch movements] 8,620/09; ROSE [Switch mechanism] 8,692/09; HATRY [Fuse carriers] 11,954/09; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Enclosed fuse indicators] 19,209/09; LUNDSTEEN and AKTIESELSKABET INTERNATIONAL ELEKTRISK TRAPPEAUTOMAT [Switches] 19,826/09.

Telephony and Telegraphy: FESSENDEN [Wireless telegraphy] 6,008/09; GOTTSCHALK [Telephone transmitters] 17,368/09; KIESSLER [Recording telephone calls] 23,742/09; STILLE [Telephone relays] 65/10.

Traction: MICHEL [Air brakes] 8,446/09; COCKSHOTT [Trolley heads] 15,147/09; BAXTER [Rails] 20,075/09.

Miscellaneous: WISKOTT [Light diffusing device] 2,125/09; LEA [Meter] 9,723/09; PINSON [Current distributors] 11,413/09; PARKER [Electrically-driven models] 12,063/09; SUNDHEIMER [Burglar alarm] 13,955/09; HENNAH and RISSEL [Ship's course recorder] 17,389/09; KENNEDY [Bending metal conduit] 25,044/09; HALL & KAY, LTD. [Centrifugal fans] 29,657/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: SIEMENS-SCHUCKERTWERKE GES. [Search lights] 8,411/10.

Dynamos, &c.: AKT.-GES. BROWN, BOVERI ET CIE. [Single-phase motors] 645/10.

Telephony, &c.: EGNER and HOLMSTROM [Cooling heavy-current telephone transmitters] 7,656/10; KAJIURA [Semi-bridge duplex telegraphy] 8,141/10.

Traction: GOLDSCHMIDT [Rail joints] 21,750/09; GIBSON [Air brakes] 25,910-1/09; BATCHELDER [Electric vehicles] 8,363/10.

Miscellaneous: DUTHEIL and CHALMERS & Co. [Magnetic clutch] 8,294/10; BOMBORN [Centrifugal blowers] 8,454/10.

The following amended Specification can now be obtained.

21,580/08. **Flywheel Load Equaliser.** AKT.-GES. BROWN, BOVERI ET CIE. See ELECTRICAL ENGINEERING, March 3rd, 1910, p. 154.

Opposition to Grant of Patents

6,956/09. **Metal Filaments.** THE WESTINGHOUSE METAL FILAMENT LAMP Co., LTD. (*A. Lederer, Vienna*). Opposition has been entered to the grant of this patent, which covers a process of decarbonising tungsten filaments. (*See* ELECTRICAL ENGINEERING, March 10th, 1910, page 172).

5,638/09. **Ventilation of Ships.** J. KEITH (James Keith & Blackman Co., Ltd.) This patent has been granted in spite of opposition. (*See* ELECTRICAL ENGINEERING, December 30th, 1909, p. 1104.)

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

9,993 of May 11th, 1896. **Ammunition Hoist.** A. G. HADCOCK and C. W. HUTCHINSON. This patent covers an electrically-driven ammunition hoist for warships, &c. The lifting ram is worked up and down continuously, waiting at the bottom for a short period after the downward movement.

10,124 of May 12th, 1896. **Distribution System.** J. DEVONSHIRE (*C. P. Steinmetz, U.S.A.*). In a three-phase distribution system, the primaries of the transformers are connected in delta and the secondaries in star. A fourth wire connected to the neutral point of the secondaries is used in distribution.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: J. H. SUTTON and L. GREGSON [Cable conduits] 786/04; E. E. BUTT [Manhole cover] 760/05.

Dynamos, &c.: A. ZANI [A.C. commutator motors] 513-4/05.

Instruments, &c.: R. S. WHIPPLE [Resistance pyrometer] 918/02; O. T. BLÁTHY [Motor meters] 493/05.

Storage Batteries: T. PESCATORE [Plates] 1,056/04; P. MEUSNIER and G. MOUNIER [Plates] 521/05.

Telephony, &c.: G. DRAPER and W. J. MURPHY [Grapnels for submarine cables] 725/99; L. T. BASSOMPIERRE and L. J. DARDEAU [Telephone microphone] 552/04.

Traction: J. HOLDEN [Sanding device] 708/03; E. A. CAROLAN (*General Electric Co., U.S.A.*) [Petrol-electric drive] 1,063/03.

Miscellaneous: J. MACLEAN [Electric curling-tongs] 540/05.

Digitized by Google

LOCAL NOTES

ACCRINGTON.—The Electricity Committee have quoted terms to the Haslingden Corporation for a supply of electricity in bulk for seven years.

BACUP: *Light Railways.*—The Light Railway Commissioners have submitted to the Board of Trade for confirmation an order authorising the construction of a light railway in Bacup.

BARKING: *Electricity and Tramways Undertakings.*—The units delivered during the past twelve months were 1,374,960, against 1,337,344 in the previous year. The comparatively small increase is accounted for by the fact that one of the largest works in the district has for several months been on short time owing to slackness of trade. Partly owing to the cost of the mechanical stokers being met out of revenue, the department will not show a profit for the year. During the twelve months, 1,292,146 passengers were carried on the tramways, the receipts being £3,099, the figures for the previous year being 1,280,420 and £3,130. The financial result of the undertaking is, however, still far from satisfactory, and in this connection the chairman of the Committee does not see hope for much improvement until arrangements had been made for inter-running with neighbouring authorities.

BATH: *Street Electric Lighting.*—The Council have decided to substitute 108-100 c.p. metal filament lamps for the present arc lamps in Bridge Street, Argyle Street, Pulteney Street, and Sydney Place, 10 in number, and for 54 of the gas lamps in the adjoining streets, at a total annual charge of £522 16s. 6d. (such charge amounting to the same as is now paid for the present lighting), and a capital outlay of about £300 for columns.

BELFAST: *Cavehill and Whitewell Tramways.*—The result of the poll of ratepayers concerning the purchase of the undertaking of the Cavehill & Whitewell Tramways Co., is a majority of 18,516 in favour of the purchase.

BOURNEMOUTH: *Proposed Discontinuance of Conduit System.*—The Manager of the Corporation tramways has presented a report in which he recommends the discontinuance of the conduit system of electric traction and the substitution for it of the overhead trolley system. He estimates a saving of £3,000 per annum by this proposal.

BRAUNTON: *Electric Lighting.*—A circular is to be issued to the ratepayers in connection with a proposed scheme of electric lighting.

BURTON-ON-TRENT: *Electricity Accounts.*—The surplus on the past year's working is £1,473, in addition to a rebate on income tax amounting to £190. It is proposed to add £1,155 to renewals fund, plus the £190 referred to above. The revenue from lighting for the year is actually lower than it was seven years ago, although during this period the lamp connections have increased by 47 per cent. The average price received for electrical energy for power purposes was 0·953d. per unit. The total costs, exclusive of capital charges, are now 0·918d. per unit, or 1·726d. per unit, including capital charges. No less than 79 per cent. of the units sold for power purposes are supplied to consumers working on the restricted hour supply. The number of units sold for the year is practically stationary, against an increase last year of 9·3 per cent., and 20 per cent. for the two previous years.

CANADA: *Government Transmission Line.*—It is announced that the Ontario Government's loan of £700,000 for the purpose of the long-distance electric power transmission scheme which they have in hand has been fully subscribed.

DARWEN: *Electricity and Tramway Accounts.*—Last year there was a profit of £573 on the electricity undertaking, but official figures are not yet available concerning the loss on the electric tramways. The reduced charge for current to the tramways has accounted for a reduction in receipts to the electricity department of nearly £400, compared with the previous year.

DUNDEE: *Price for Tramway Energy.*—The dispute as to the price which should be paid for electrical energy by the Tramways Department has ended by the Electricity Committee making a reduction in the price for lighting, but maintaining the price for traction. The electrical engineer pointed out that, owing to the economies of the tramway manager, the consumption for traction is being reduced, yet the Electrical Department still had to keep the same amount of plant available for the maximum demand. The Tramway Department paid less for energy last year, and for the present year it was calculated that the bill would be reduced by £1,000. If the proposed reduction of ⅛d. per unit were made, there would be a still further diminution in the amount received for tramway supply of £1,300.

Electric Lighting.—On Saturday evening a splendid system of electric lighting extending the whole length of the High Street and Bank Street, Lochee, was inaugurated. The lamps are of the "Duplex Excello" type, and number sixteen. Lochee, a busy town in itself, adjoins Dundee, being about two and a half miles distant, and linked up with a service of cars. It has hitherto been quite a common thing to hear the place referred to as "Lochee and nae licht," but as the convener of the Electricity Committee very aptly remarked at the inauguration ceremony, the citizens need have no fear of ever being chaffed on this score again, as the position was now entirely reversed, and if they liked to put it that way they may say that it was now "Lochee and a' licht."

FLEETWOOD: *Electricity Undertaking.*—For the first six months of the Council's working of the electric supply undertaking, which was taken over from the company last September, there was a gross profit of £2,164, and a net profit of about £1,000.

GLASGOW: *Tramways Valuation.*—Judgment has been given in connection with the appeal of the Tramways Committee against the increased assessment of the tramways undertaking for the year ending Whitsuntide, 1911. The new assessment has been placed at £278,070, whereas it is claimed that it should be £230,573. The valuation is based on revenue, and in previous years the assessor has allowed as a deduction from the gross revenue not only one-half of the cost of maintenance of the permanent way and electrical equipment of the line, but also one-half of the sum annually set aside for renewal thereof. He now proposes to allow no deduction whatever in respect of such renewal, but to continue to allow one-half of the cost of repairs. As one-half of the sum set aside for renewals amounted last year to over £57,000, the alteration proposed is a very serious one. In the event of a distinction being drawn between the larger and the smaller repairs, it was submitted that the undertaking was entitled to the whole cost of the latter as a deduction, instead of one-half. The valuation on this basis would be £269,059. The Appeal Court in Glasgow has placed the valuation at £258,853.

HUDDERSFIELD: *Linthwaite Tramways.*—Owing to the dispute between the Corporation and the Linthwaite Council as to the maintenance of the track in Linthwaite, which should be maintained by the Council, the tramway manager's recommendation to reduce the service on account of depreciation to the cars has been adopted by the Corporation. The manager also reports that the condition of the track is a public danger.

LANCASHIRE: *Electric Driving of Cotton Mills.*—The Acme Spinning Co., of Pendlebury, Manchester, which was the first spinning company in England to adopt electric driving, and is one of the few large spinning mills in England without a chimney, have just entered into another contract with the Lancashire Electric Power Co. for a supply of current for power and lighting purpose, the contract to cover a considerable number of years. The supply will also include a portion of the adjoining Albion Mill.

LONDON: *Stepney: Electric Power Charges.*—Some large firms have approached the Electricity Committee with a view to getting a uniform charge for lighting and power purposes. At present a number of firms will not take electrical energy in the absence of a single rate for both purposes. After discussion with the Electrical Engineer, the Electricity Committee recommend that contracts should be entered into with power users, who are willing to guarantee a minimum half-yearly bill of £200, at a rate of £3 per annum per e.h.p. demanded, divided into twelve monthly payments, and ½d. per unit for electricity consumed, whether for lighting or power purposes, provided that the total lighting demand does not exceed 25 per cent. of the whole. The committee also recommend that fixed charges calculated on the above scale should be charged when the load factor is guaranteed.

MANCHESTER: *Tramways.*—The Audenshaw District Council have leased to the Manchester Corporation three sections of tramways within their district.

NELSON: *Tramway and Electricity Accounts.*—According to an official report, a loss of £771 has been sustained during the past year on the working of the local tramways. Mr. Helme, the manager, advocates the abolition of the halfpenny fare system. The accounts for the electrical department show a loss of £132, against an estimated profit of £268.

NEWCASTLE: *The Trolley Omnibus.*—The Tramways Committee have under consideration the adoption of trolley omnibuses for linking up a number of the more or less isolated suburbs.

PENMAENMAWR: *Public Lighting.*—The Council are discussing a proposal to illuminate the promenade by electricity.

PONTYPRIDD: *Tramway Accident.*—In an action recently taken by a Mrs. Lever against the Urban District Council for damages in respect of the death of her husband in a tramway accident, the jury awarded £275 damages. A point of law was subsequently argued as to whether there was any evidence of negligence upon which the jury could give a verdict for the plaintiff. Mr. Justice Pickford, in the King's Bench Division, has decided that there was not, and entered judgment for the Council.

STIRLINGSHIRE: *Rating of Telephones.*—The Stirlingshire Parish Council has suggested that the Postmaster-General should make a contribution in one sum, in lieu of annual rates on the telephone undertaking in the district. The matter is now under the consideration of the Lords Commissioners, who have not yet come to a decision owing to the questions of principle raised being of great importance.

TASMANIA: *Electric Lighting.*—A large quantity of electrical machinery has been landed for the Hobart Gas Co. The contractors are Messrs. Siemens Bros. & Co., Ltd.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BELFAST.—The Tramways and Electricity Committee require motor boosters and switchgear; and also an extension of the lighting switchboard. (See an advertisement on another page.)

BRAY.—The Council require cable and A.-C. meters. (See an advertisement on another page.)

CHELTENHAM.—A Local Government Board inquiry was held last week concerning a loan of £4,000 for meters, services, and mains.

ECCLES.—Tenders are to be invited for an additional 10-in. motor-driven centrifugal pump and switchgear, also for a high-tension feeder.

JAPAN.—The British Acting Vice-Consul at Dairen reports that a loan of £4,000,000 is to be floated by the South Manchuria Railway Co. for the following, among other purposes:—Electric power-house at Dairen; electric tramway at Dairen; and electrical plants at various places.

LONDON: *Fulham.*—The Finance Committee of the L.C.C. recommend a loan of £3,868 for boiler extensions at the electricity works.

Hackney.—Mains are to be extended at an estimated cost of £554 10s.

RADCLIFFE.—The Council invite tenders by May 14th for a 300-kw. continuous-current dynamo. Particulars from the Borough Electrical Engineer.

RANGOON.—The directors of the Rangoon Electric Tramway and Supply Co. state, in their annual report, that they have decided to extend their power station, and to instal an additional 2,500-kw. turbine.

SOUTHAMPTON.—The Corporation require a 1,000-kw. steam alternator, boiler, and motor alternator. (See an advertisement on another page.)

SWEDEN.—H.M. Legation at Stockholm reports that it is intended to expend a sum of £80,000 upon additional electrical works at Trolhätten.

WEST HAM.—Tenders are invited for condensing plant, boilers, and switchgear in connection with the new Rateau turbine which is being installed by the British Westinghouse Co.

Miscellaneous

BATH.—The Corporation are re-arranging their public lighting (see Local Notes).

HOLLAND.—The municipal authorities of Gouda have granted to J. H. Muller, of The Hague, a concession for the construction of electric tramways between Gouda and Rotterdam.

NEW ZEALAND.—H.M. Trade Commissioner for New Zealand (Mr. G. H. F. Rolleston) reports that a Wellington firm desire to obtain quotations from British manufacturers for solid drawn steel conduit and fittings, screwed with standard gas thread; also for C.M.A. insulated cable or equal thereto. Manufacturers interested should send catalogues, with the latest discounts and trade terms, quoting preferably c.i.f. and e. Mr. Rolleston also reports that another Wellington firm wish to get into touch with manufacturers of electric cable of all descriptions. Communications regarding both the foregoing inquiries should be addressed to H.M. Trade Commissioner, 9 Grey Street, Wellington, New Zealand.

PERTH.—Some small extensions of the tramways have been decided upon by the Council.

RIPON.—It has been decided to spend a sum of £200 upon electrical appliances for medical purposes at the Spa Baths.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

AYR.—Pavilion, Low Green (£6,000). Architect, J. K. Hunter, Ayr.

BOLTON.—School (£7,000) for St. George's Road Congregational Church.

BOOTLE.—Balliol Road, Schools (£12,000). Architects, Medcalfe & Medcalfe, Dale Street, Liverpool.

BRIGHTON.—School, Coombe Road (£9,000). E. Hackforth, Secretary, Education Committee, Brighton Town Council. The Royal Pavilion is to be re-wired for electric light.

BURY.—Wesleyan School (£2,000). Architect, W. E. Gill, 6 Fleet Street, Bury.

DONCASTER.—Technical School (£10,000). Architects, Schofield & Berry, Leeds.

DUBLIN.—The Cattle Markets Committee have under consideration the electric lighting of the markets.

DUMBARTON.—Academy Buildings (£3,000). Architects, McWhannel, Rogerson & Reid, 58 West Regent Street, Glasgow.

DUNDEE.—Academy for West End (£2,000). Architects, J. J. Langlands, 81 Murraygate, Dundee.

FARNWORTH (Lancs.).—Secondary School (£17,500). Architect, Mr. Littler, Ribblesdale Place, Preston.

GLASGOW.—Royal Exchange buildings (£20,000). Campbell, Douglas & Patterson, architects, 266 St. Vincent Street, Glasgow.

NEWCASTLE.—Extension Union Hospital (£5,000). E. Bowman, County Chambers, Westgate Road, Newcastle.

SOUTHEND-ON-SEA.—Additions, school (£4,115). Architect, W. J. Wood, 26 Alexandra Street, Southend. Builder, A. H. Fryd.

TENDERS RECEIVED AND ACCEPTED

ABERDARE.—Eighteen tenders were received by the Council for generating plant for their new power house, and that of the Lancashire Dynamo & Motor Co. at £3,312 was accepted. Nine tenders were received for the battery, but the acceptance of one has been left in the hands of the Consulting Engineer, Mr. Stephen Sellon. Of the seven tenders for cables, that of Messrs. Callender's Cable & Construction Co. was accepted at £8,247.

AUSTRALIA.—According to *Commercial Intelligence*, no tender has been received from any Australian manufacturer for the supply of 20,000 telephone instruments for the Australian Post Office, which were recently advertised for. Every possible effort is being made by the Australian Government to induce firms to manufacture the instruments in the country. Three complete tenders were submitted; one from an English firm offering to make the instruments in Australia, or to make the parts in England and assemble them in Australia. Another English tenderer is prepared to do the work in Australia if he can make the necessary arrangements. The third tender is from a Continental firm.

BEDFORD.—The tender of Messrs. W. H. Allen, Son & Co., Ltd., has been accepted, at £3,706, for a 750-kw. generating set.

DERBY.—The Midland Railway Co. have decided to extend their electrical generating station at Derby, and have placed an order for two 1,250-kw. Willans "Impulse Disc and Drum" type turbines with Messrs. Willans & Robinson, Ltd.

DUBLIN.—The Electricity Committee recommend the acceptance of a tender by the British Insulated & Helsby Cables, Ltd., for the supply of cable at £17,532.

LONDON: *London County Council.*—The following tenders have been received for three-phase motors for the second section of the central car repair depôt of the tramways department:—Bruce, Peebles & Co. (recommended for acceptance), £575 5s.; Lancashire Dynamo & Motor Co., Ltd., £611 10s.; Electric Construction Co., £624 10s.; the British Westinghouse Co., Ltd., £677 16s.; British Thomson-Houston Co., Ltd., £741; and Dick, Kerr & Co., Ltd., £849 5s.

Hackney.—The Electricity Committee report having examined eleven tenders for 80,000 yellow flame arc lamp carbons, and the prices ranged from £5 15s. to £4 5s. per thousand pairs. The highest price in the past has been £3 12s. 6d. per thousand pairs. This rise would mean an increase of £50 per annum, or practically 10s. per lamp per annum on the cost of maintaining the flame arc lamps. The Committee go on to say that an attempt appears to have been made to force up the price of flame carbons, and that they have therefore decided for the present to instruct the Borough Electrical Engineer to buy in the ordinary market from time to time to meet requirements.

Poplar.—The Council have accepted the tender of the Worthington Pump Co., at £218 10s., for a motor-driven feed pump.

SALFORD.—The Lancashire Dynamo & Motor Co. have, for the ninth successive year, received the contract for high- and low-speed motors (20 to 50 h.p.) for the Corporation.

WARRINGTON.—The Council have accepted the following tenders: J. Howden & Co., Ltd., 1,000-kw. turbo-alternator, £4,255; British Westinghouse Electric & Manufacturing Co., 750-kw. rotary converter, £1,850; Cowans, Ltd., switchgear, £506 5s.

The following tenders have been accepted by the Government Departments named:—War Office: Conduit fittings, Barton & Sons, Ltd.; Credenda Conduits Co.; General Electric Co.; Nettlefold & Sons, Ltd.; Profecta Seamless Steel Tube & Conduit Co., Ltd.; motors, Lancashire Dynamo & Motor Co., Ltd.; motor-generators and switchgear, Electric Construction Co., Ltd.

India Office, Store Department: Insulators, Bullers, Ltd.; Manganese blocks, Siemens Bros. & Co. General Post Office: Indiarubber and cotton core cable, Western Electric Co.; paper-core cable, Johnson & Phillips, Ltd.; Western Electric Co.; British Insulated and Helsby Cables, Ltd.; submarine cable, Indiarubber, Gutta-percha & Telegraph Works Co., Ltd.; loading coils, Western Electric Co.; flexible cords, British Insulated & Helsby Cables, Ltd.; earthenware ducts, Stanley Bros., Ltd.; telephones, British L. M. Ericsson Manufacturing Co., Ltd.; four electric lifts at the Head Post Office, Newcastle-on-Tyne, A. and P. Steven; local and telephone exchange equipment installation at the post office premises in Dalrymple Street, Kirkintilloch, Western Electric Co., Ltd.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £57 15s. to £58 5s. per ton (last week, £59 to £59 10s.).

D.P. BATTERY AGENCIES.—The D.P. Battery Co., Ltd., have appointed representatives in Argentina and in Turkey. In the first-named country, Messrs. Milne, Makein y Cia., of Suiphaca 88, Buenos Aires, represent them; and the firm of Messrs. Wm. Sprowson & Son, of Constantinople, has accepted their agency for Turkey, Greece, and the Balkans.

"TANTALUM" ATHLETIC CLUB CONCERT.—The first annual concert of the "Tantalum" Athletic Club, connected with Messrs. Siemens Bros., Dalston Works, was held on Monday, April 25th, at the Assembly Hall of the Dalston Central Mission. The Hall was illuminated by "Tantalum" and "Onewatt" lamps, which shed their brilliance on the "brilliant passages" of the artists. A novel feature of the affair was a singing competition, open to all employees of the firm. Prizes were offered, the audience acting as judge.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—The Grasse & Cannes Electric Tramways Syndicate, Ltd., is to be wound up voluntarily. Mr. H. R. Green, 37 Conduit Street, London, is liquidator.

R. E. Joy, trading as the Bristol Electrical Co., 143 Cheltenham Road, Bristol, has been adjudicated bankrupt.

A meeting of creditors of the late Mr. F. H. Medhurst, electrical engineer, 13 Victoria Street, London, was held yesterday at Bankruptcy Buildings, Carey Street, London.

The trustee in the bankruptcy of L. W. de Grave, electrical engineer, 19 Queen Street, Derby, has been released.

A meeting of Amalgamated Dry Batteries, Ltd., will be held at 394 Moorgate Station Chambers, London, E.C., on May 26th, at twelve noon, to hear the liquidator's account of the winding-up.

A meeting of the City of Wellington Electric Light & Power Co., Ltd., will be held at 180 Dashwood House, Old Broad-street, London, E.C., on May 23rd, at twelve noon, to hear the liquidator's account of the winding-up.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—City of Buenos Aires Tramways (1904), 1s. 3d. per share, less tax for the March quarter.—Airdree and Coatbridge Tramways Co., 3 per cent. on the ordinary shares for 1909, placing £250 to depreciation.—Wemyss & District Tramways Co., 6 per cent. for 1909 on the ordinary shares.—Colombo Electric Tramways & Lighting Co., 6 per cent. for 1909 on the ordinary shares, adding £5,300 to general reserve.—Eastern Telegraph Co., 7 per cent. on the ordinary shares for 1909.—Greenock and Port Glasgow Tramways Co., 1 per cent. on the ordinary shares for 1909.

Dudley, Stourbridge & District Electric Traction Co., 2 per cent. on the ordinary shares for 1909, placing £998 to depreciation.

Yorkshire Local Section of the Institution of Electrical Engineers. The candidate nominated by the committee to hold office for the ensuing session, of whom a list was given on p. 207 of ELECTRICAL ENGINEERING of April 21st, have been duly elected.

The South London Single-Phase Railway.—It was announced at the annual meeting of the London, Brighton & South Coast Railway Co. that, owing to the success of the single-phase railway between London Bridge and Victoria, the directors were considering the extension of the system. It is now definitely announced that the first of the new lines selected for conversion is the important section running to the Crystal Palace *viâ* New Cross, Brockley, Honor Oak Park, Forest Hill, and Sydenham, on the London Bridge side, and Battersea Park, Clapham Junction, Wandsworth Common, Balham, Streatham Common, Norbury, Thornton Heath, Selhurst, Norwood Junction, Anerley, Penge, Streatham Hill, West Norwood, and Gipsy Hill, on the Victoria side. The change over is expected to be complete in about eighteen months. The time taken to reach the Crystal Palace will then be little more than half that occupied at present.

COMPANIES' MEETINGS AND REPORTS

ROTHESAY TRAMWAYS CO.—The revenue for 1909 was £10,568, a slight increase over the previous year, and the working expenses were £5,689, a slight decrease. There is a balance of £1,306, after transferring £400 to renewals and £100 to depreciation. A dividend of 1 per cent. on the ordinary shares is recommended.

LISBON ELECTRIC TRAMWAYS.—There was a net profit of £107,146 for 1909. From this, £35,000 has been added to depreciation, and £5,000 to exchange reserve. The sum of £5,000 has also been invested for the establishment of an employees' pension fund. A final dividend of 3 per cent., making 5½ per cent. for the year, is recommended on the ordinary shares.

RANGOON ELECTRIC TRAMWAY & SUPPLY CO.—After adding £5,000 to reserve for renewals, there was a net profit of £5,930 for 1909. A dividend of 3 per cent. is recommended on the ordinary shares, carrying forward £621. The power station plant is to be extended (see Tenders Invited). Both tramway and lighting receipts show considerable increases over 1908.

ELECTRIC SUPPLY CORPORATION.—After meeting debenture interest, &c., there was a surplus of £3,780 for 1909, compared with £2,397 in 1908.

LISBON ELECTRIC TRAMWAYS CO.—The annual general meeting was held last week, when a dividend at the rate of 5½ per cent. per annum for the year was declared. The general manager in Lisbon is now engaged in the preliminary work of the conversion to electricity of the most important section of the Ascensores line, which, it is anticipated, when completed, will add considerably to the company's revenue.

BRISBANE ELECTRIC TRAMWAYS INVESTMENT CO.—At the meeting last week the 5 per cent. preference dividend, and a dividend of 8 per cent. on the ordinary shares, were declared. During the Brisbane anniversary celebrations in August last year, the receipts amounted to no less than 18·18d. per car mile. The company have several extensions under consideration, and a commencement upon these is only delayed pending the approval of the local authorities.

URBAN ELECTRIC SUPPLY CO.—The accounts for 1909 show that the profit falls short by £3,622 of the amount required, namely, £32,500, to meet the 5 per cent. guaranteed dividend. This deficit has been duly provided by Edmundson's Electricity Corporation under their contract.

BRITISH WESTINGHOUSE ELECTRIC & MANUFACTURING CO.—The trading profits for 1909 amounted to £84,156, but after deducting depreciation on machinery (£6,480); reserve for general depreciation (£10,262); expenses on surplus lands and buildings (£5,673); interest on 6 per cent. prior lien debentures (£14,700); and interest on the 4 per cent. mortgage debentures (£49,654); there is a balance of £7,647, which has been absorbed by the amount required for the prior lien redemption fund, expenditure on contracts of previous years, &c., leaving a debit balance of £798. The total debit balance now amounts to £7,319. Whilst the output for the home market during the year has decreased, the export business shows an appreciable improvement. Orders to date are substantially in advance of the corresponding period of last year.

WELSBACH INCANDESCENT GAS LIGHT CO.—After paying 3 per cent. on the 6 per cent. preference dividends for 1909, the accounts show a net balance of £5,966, which it is recommended should be carried forward. A circular has been issued dealing with the proposed reorganisation of capital. The capital at present is £1,344,000, of which £600,000 is in preference shares and £744,000 in ordinary shares. The proposal is to reduce the capital to £500,000, which will be a common stock, of which £450,000 will be allotted to the preference shareholders, and £50,000 to the ordinary shareholders, the former abandoning all claims for arrears of the cumulative preferential dividend.

APPOINTMENTS AND PERSONAL NOTES

Mr. J. W. Hame, Electrical Engineer to the York Corporation, has been voted an increase in salary of £100 per annum in view of his duties as Tramway Manager.

Warrington Tramways Committee have decided to increase the salary of Mr. J. F. Cameron, the electrical engineer, from £170 to £180 per annum, rising to £200 per annum.

Mr. J. M. Smyth, the Borough Electrical Engineer at Keighley, has tendered his resignation on account of ill-health. The Electricity Committee have accepted this with regret, and recommend that a successor be advertised for at a salary of £250 per annum.

There have been 100 applications sent in for the post of Borough Electrical Engineer at Torquay.

Electrical Equipment of the Shieldhall Sewage Works, Glasgow.—In our article describing these works last week, the size of the dredger elevator motor was given by a misprint as 1 h.p. instead of 15 h.p.

On account of the lamented death of His Majesty King Edward VII. there will be no meeting of the Institution of Electrical Engineers to-night.

The Congress of the Tramways and Light Railways Association, which was to have been held in Dublin to-day and to-morrow, has also been postponed as a mark of respect to the Royal Family.

His Majesty was the Patron of the Royal Institution, and it has been decided that the lectures and evening meetings be discontinued until further notice.

SUMMARY

Special reduced railway fares have been arranged for members and visitors attending the forthcoming convention of the Municipal Electrical Association at Glasgow in June. (Page 302.)

In our monthly illustrated article on new electrical supplies and accessories, we describe a new house fuse box for concentric wiring, several new patterns of wall-sockets and plugs, a bell-ringing transformer, and a new line of motors. (Page 303.)

A series of fittings specially designed for an Eastern hospital is described on page 304.

In a Paper read before the Institution of Electrical Engineers in London on Thursday, Mr. S. G. Brown described a telephone relay, consisting of two osmium iridium contacts about half a millionth of an inch apart, one of which is mounted on a steel reed. The latter is supported over an electromagnet, and is set in vibration by the variations in the field produced by the telephone currents. A minute movement of the reed produces a large variation in the current passing between the contacts. Excellent results have been obtained in wireless work with this relay, and successful experiments over telephone cables have also been made. A new microphone transmitter, in which osmium iridium alloy granules are substituted for carbon, was also described. (Page 305.)

At the annual meeting of the Iron and Steel Institute, held in London last week, Mr. D. Selby Bigge read a Paper on the production of electric power from exhaust steam and blast-furnace gas. An interesting discussion followed, in which some actual figures for the cost of power generated from exhaust steam were given. A Paper by Dr. W. Borchers described the Girod electric furnace. In the discussion, the results obtained were compared with those for the Héroult furnace. A discussion on the relative merits of steam and electric drive for reversing rolling mills was aroused by a Paper on a new type of reversing mill engine, by Messrs. E. G. Sehmer and Dr. R. Drawe. (Page 307.)

Digitized by Google

A COMMITTEE has been formed to further united action for the protection of electrical interests. (Page 309.)

ATTENTION is called in a letter in our correspondence column to the distribution of light obtainable by suitable design of street lighting fittings for metal-filament lamps. Another letter refers to the durability of Osram lamps. (Page 310.)

IN a report to his Committee, Mr. C. Hill, General Manager of the Bournemouth Corporation Tramways, recommended that the conduit system of traction, which is now used in the central narrow streets of the town, should be replaced by the overhead trolley system. He estimates a capital expenditure of £1,910, and an annual saving of £3,000 in working expenses. (Page 310.)

AT the annual meeting of the Welsbach Incandescent Gas Light Co., on Tuesday, it was stated that the advertising of the new electrical section of the company's business had cost over £6,000, and the legal expenses in connection with the action by the General Electric Co., concerning the company's trade mark, amounted to £1,000. (Page 310.)

A LATHE recently supplied for use in the Antarctic is described on page 311.

"NOTES from the Wiring Contractor's Point of View" will be found on page 311.

A PROPOSAL by the Electricity Committee of the Bethnal Green Borough Council to purchase electricity in bulk from the Shoreditch Council has been referred back.—Newcastle Corporation will apply next Session for powers to adopt the trackless trolley system.—Two new trunk telephone lines have recently been laid between London and the West of England, and five others are in course of construction.—In order to avoid arbitration in connection with the purchase of the Hartlepool Tramways by the Corporation, the Company have suggested a price which they would be willing to accept.—A large number of municipal electricity accounts for the year to March 31st, 1910, have been published. (Page 312.)

THE following loans for electrical extensions have been applied for or have been sanctioned:—Colchester (£8,000); Darlington (£1,500); Derby (£9,850); Grimsby (£6,459); Heckmondwike (£24,159); Weymouth (£1,970); York (£1,500). Rochdale Corporation require accumulator, reversible booster, and switchboard panels; Leicester Corporation a 750-kw. mixed pressure turbo-generating set, condensing plant, boilers, &c., and Wallasey Corporation A.C. transformers. (Page 313.)

CALLENDER'S Cable & Construction Co.'s accounts for 1909 show a net profit of £68,452. Johnson & Phillips made a net profit of £942. (Page 314.)

A NEW moving coil permanent instrument, which is rendered available by an arrangement of thermo-junctions for alternating as well as continuous current, is described. (Page 315.)

A REVIEW of a well-known electrical year-book appears on page 315.

AMONG the Specifications published by the Patent Office on Thursday last was one by E. B. Wedmore and the B.T.-H. Co., for switchgear for use with three-phase alternators running in parallel. This ensures that the neutral of one machine only will be earthed, and transfers the earthing connection automatically should the earthed machine be switched out.—Means for indicating when a cartridge fuse has blown is covered by the B.T.-H. Co. This consists of a piece of prepared paper in contact with an auxiliary fuse, which burns the paper when the fuse blows.—A. C. Stille describes a telephone relay comprising two co-axial coils wound in opposite directions, and placed in a strong magnetic field. Movements of the coils produced by sending the telephone currents through them vary the pressure on a carbon microphone placed between them.—A method of making the end connections of bar-wound armatures, covered by the Brush Electrical Engineering Co., consists in inserting the ends in a short tube, driving a wedge in, and locking the wedge.—An important patent granted in 1896 to H. O. Tudor for a process of forming positive storage battery plates expires during the current week. (Page 316.)

SPECIAL TRAIN FACILITIES TO THE I.M.E.A. CONVENTION

WE understand that the Incorporated Municipal Electrical Association has arranged for the issue of return tickets to Glasgow for the Convention, from June 14th to 17th, at a specially reduced rate, namely, single fare and a quarter. This will be greatly appreciated by those attending the Convention, for the ordinary return fare from London, for instance, is no less than £3 2s. 11d., and members attending the Convention, and others invited to it, will be able to obtain tickets at £2 1s. 3d. We believe this is the first occasion on which the Association has been able to negotiate with the Railway Company for such facilities, and we hope that it will in future be the rule rather than the exception.

Our contemporary *Electrical Industries and Investments* informs us that they have also made arrangements with the London & North Western Railway Company for a similar reduction in the fare by the 2 p.m. train from Euston, upon which they will have a special saloon carriage for their party.

Faraday House.—Major O'Meara, late R.E., C.M.G., will deliver a special lecture to the Third Year Students on May 20th, commencing at 10 a.m. The subject of the lecture will be "Depreciation."

Test-room Fatality.—Mr. G. J. Porter, who has for some years been works superintendent of the Brush Electrical Engineering Co.'s works at Loughborough, was killed by electric shock on Saturday last. Mr. Porter was engaged in the testing department, and accidentally received a shock while flashing an armature at 2,000 volts.

New C.B. Telephone Exchange.—On Saturday last, at 2 p.m., the National Telephone Co. transferred the subscribers connected to its Anfield exchange to a new C.B. equipment installed in a suitably altered building at Richmond Terrace, Anfield, Liverpool. The new equipment has been manufactured and installed by Messrs. Western Electric Co., Ltd., of North Woolwich, and is of the No. 10 C.B. type, consisting of eight subscribers' positions giving accommodation for 880 subscribers' lines and three incoming junction positions, and similar to that installed in the Great Yarmouth exchange (see ELECTRICAL ENGINEERING, Vol. V., p. 230).

Electrical Working of Fog-horns at a Distance.—A fog-signalling apparatus at an unattended lighthouse on an isolated rock called the Platte Fougère, off St. Peter's Port, Guernsey, is described in the *Engineer*. The fog-horn is worked from two compressed-air reservoirs, supplied from Reavel air-compressors, each direct-coupled to a Mavor & Coulson three-phase motor, and these compressors are supplied with current through a submarine cable from a small generating station on the shore, containing two 11½kw. gas-engine-driven sets. The cable was specially manufactured and laid by Messrs. Siemens Brothers & Co., Ltd., and is of specially heavy rock-armoured type, with three power conductors and a pair of small conductors for a telephone and control circuit. The whole cable is 3½ in. in diameter and weighs 45 tons per naut.

Interruption of Supply at Glasgow.—On Thursday night, at about 8.15, there was a temporary failure of the lighting supply in the centre of Glasgow. The light first dwindled down, and then went out completely. The duration of the stoppage was, however, only about three minutes in all, and, owing to the fact that darkness had not set in entirely, very few places except the theatres and music-halls were at all seriously affected. On inquiry we find that the two stations at Port Dundas and St. Andrew's Cross were running in parallel at the time—this is frequently done now in order to get the benefit of any diversity in the loads on the respective stations—and the mishap occurred through the failure of the field of one of the alternators, due, it is thought, to some outside cause. The disturbance in the circuits resulted in the maximum load cut-out relays on the E.H.T. trunk mains acting, and so preventing the St. Andrew's Cross Station from sharing in the load, with the effect that the Port Dundas station was unable to maintain supply until connection had been restored and other sets put on load.

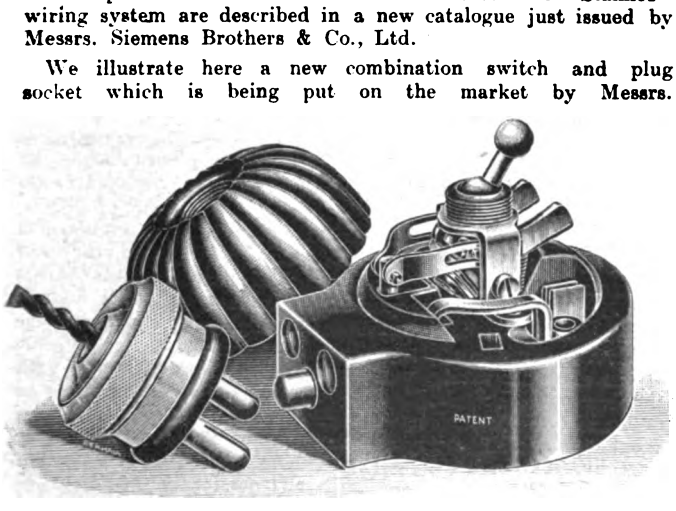
NEW ELECTRICAL SUPPLIES AND ACCESSORIES

Incandescent Lamps.

In addition to their "one-watt" lamps with drawn tungsten filaments for high candle-powers, Messrs. Siemens Brothers Dynamo Works, Ltd. (Tyssen Street, Dalston), now announce that they are putting on the market a series of "one-watt" battery lamps from 2 to 16 volts, with a similar drawn wire filament. A very extensive range of sizes, shapes, and candle-powers are included in the new catalogue which has been issued, and the prices compare very favourably with those of other small metal filament lamps. The strengths of the filament should render these lamps particularly suitable for motor-car work.

Fittings, Switches, and Accessories.

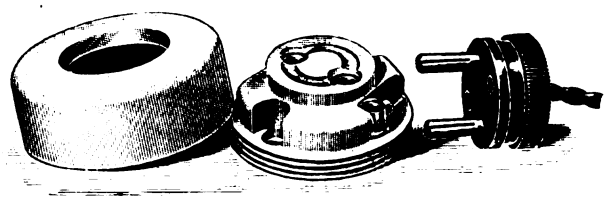


The accompanying illustration shows a new house fuse box which Messrs. Siemens Brothers & Co., Ltd. (Caxton House, Westminster), are introducing in connection with their now well-known "Stannos" system of wiring. This box consists of a small cast-iron case with hinged lid, containing a Siemens "Zed" cartridge fuse, with non-interchangeable cartridge. (For full particulars of "Zed" fuses see Electrical Engineering, Feb. 10th, page 89.) The "Stannos" wire enters the box through a wooden bush, and the sheathing is clamped into

Siemens' "Stannos" House Fuse Box.

a fitting, which is screwed to the base of the iron case, the inner conductor going to the fuse. The house wire, or wires, enter the box through a wooden bush at the other end, and are connected in a similar manner. The two clamps are bonded together by means of a copper strip. The lid of the box is provided with a glass window in order that the fuse may be inspected without unsealing the case. The latter is locked by means of a brass pin, which has a hole through which the seal wire is passed. This and other accessories for the "Stannos" wiring system are described in a new catalogue just issued by Messrs. Siemens Brothers & Co., Ltd.

We illustrate here a new combination switch and plug socket which is being put on the market by Messrs.



Lundberg "Auto Combination" Switch and Plug.

A. P. Lundberg & Sons, under the name of the "Auto combination." This is already obtainable in the 10-ampere size and a 5-ampere size is in preparation. The chief feature of the apparatus is the automatic release arrangement, which is covered by Messrs. Lundberg's patent No. 22,896/09. This acts by means of a horizontal spring plunger embedded in the base, which is in linked connection with the rocking cradle of the switch arm, and ensures a quick-acting automatic release of the switch contact arm before the plug can be withdrawn.

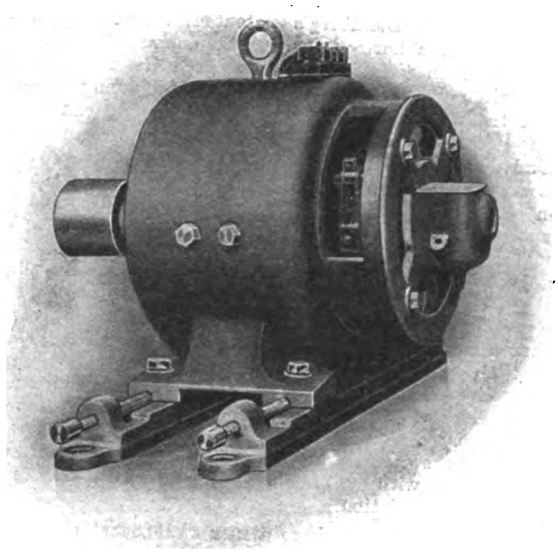
The advantages resulting from the use of this device are as follows :—The contact arm flies automatically into the "off" position before the plug can be withdrawn, and remains there. The rupture of the circuit on withdrawal of the plug is rapid and independent of the operator, the break occurring at its proper place, viz., at the switch contacts. While the plug is in position, the device does not prevent actuation of the switch in the usual way. Withdrawal of the plug is thus only necessary when the apparatus connected requires removal. The plug must first be pushed into full contact before the switch arm can be made to remain permanently in its "on" position. As the circuit cannot be broken where the plug pins leave the socket tubes, any destructive arcing at these points is effectually prevented. The switch is of Messrs. Lundberg's well-known "Pivot pattern," with knife blade contact arms, double contacts, and mica insulation.

We are able to illustrate here a new wall-socket and plug of British manufacture, which Messrs. Marsh, Son & Co. (15 Gerrard Street, Soho, W.), are putting on the market. A

New Wall Plug (Messrs. Marsh, Son & Co., Ltd.).

special feature of the design is the flatness both of the base and the plug, and the arrangement of the base and cover, both of which are very substantial, renders it very easy to wire. The pins are, of course, of standard dimensions. Messrs. Marsh & Co. are also bringing out a new design of 10-ampere tumbler switch with particularly large break and substantial parts, enabling it to withstand heavy overloads. Its construction is particularly suitable for looping in wiring.

A new catalogue from Messrs. D. H. Bonnella & Sons, Ltd. (58 & 60 Mortimer Street, W.), contains particulars of an extensive series of wall and floor sockets and plugs, including the ordinary types, as well as non-reversible, three-pin concentric, and other special plugs, flush-type sockets, combined switches and sockets, multiple sockets, &c. A special design, with plain round cover, is made for hospital work. The same list also deals with pressure switches of various patterns. It may be mentioned that this list is under the auspices of the Engineers' Standardised Publication Association.



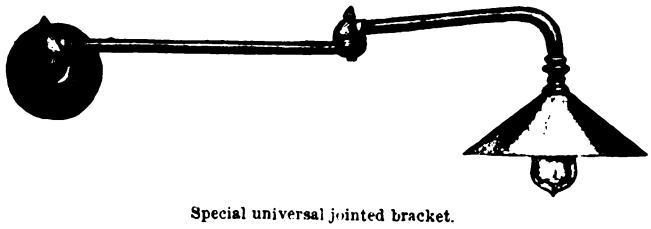
Miscellaneous.

Messrs. Birch Bros. (3 Brunswick Place, Leeds) have introduced a new bell transformer for ringing bells off A.-C. lighting circuits. The transformer itself is of the shell pattern, with the two coils of enamel insulated wire wound on the central leg and carefully insulated from each other to obviate any danger of the bell circuit reaching a high potential. All the iron joints are interleaved, and the constant loss is said to be less than one quarter of a watt. It is stated that if a short develops on the bell circuit, the transformer will not burn out, but will run safely until the fault is repaired, taking some 12 watts only. The shell is clamped between a cast-iron cover and base, rendering the whole water-tight. The terminal screws are embedded in a hard fibre block. The complete transformer measures 3 in. by 4½ in., and weighs just under 2¾ lbs. No special bell is required, the ordinary battery bells working quite well without any alterations. Where there are long runs or circuits including indicators, a transformer with tappings giving two different voltages is used. Messrs. Birch Bros. have also developed a line of small transformers for low-voltage metal filament lamps. These can be obtained with single or divided secondary circuits. They appear to have very low "no-load" losses.

Messrs. Matthews & Yates, Ltd. (Cyclone Works, Swinton), the makers of the well-known "Cyclone Fans," have recently placed on the market a new design of D.-C. motor, as illustrated

Digitized by Google

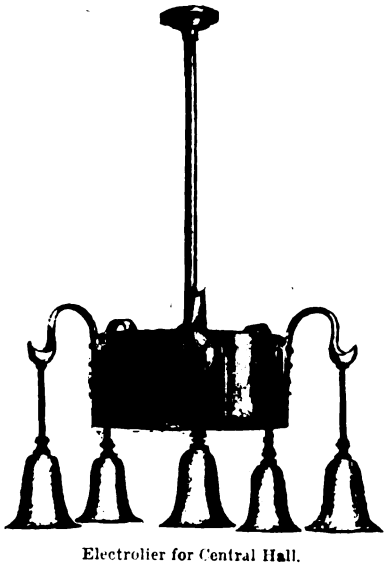
in the accompanying figure. The motor can be supplied either open, protected, semi, or totally enclosed, and may be shunt, series, or compound wound. It is made at present in sizes



SMALL PATTERN D.C. MOTOR (MATTHEWS & YATES, LTD.)

from 3/16 B.H.P. to 5 B.H.P., and is suitable for driving all classes of machinery. This motor is also supplied in combination with the firm's "Cyclone" fans and exhausters, which, we understand, are regularly being supplied to H.M. Office of Works and General Post Office.

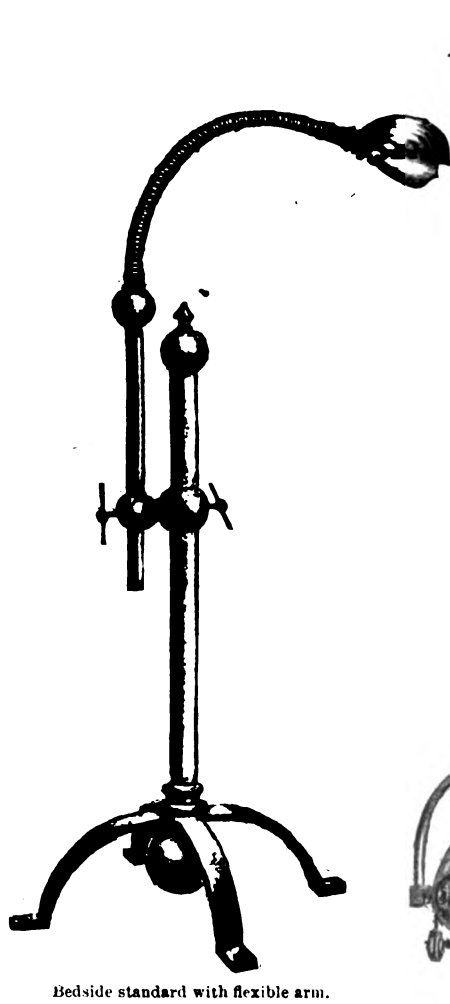
SOME SPECIAL FITTINGS FOR A HOSPITAL



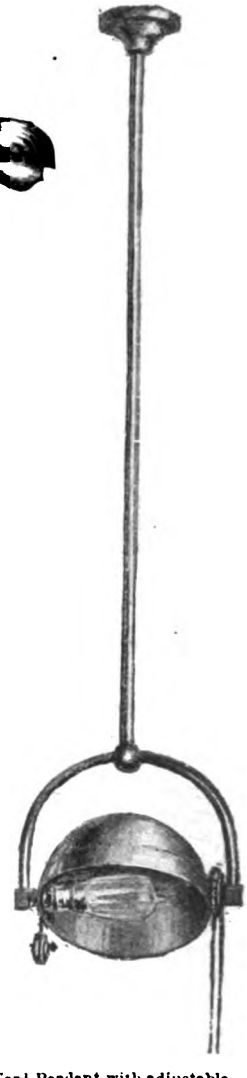
THERE are few classes of installation where special requirements call for more consideration than those in hospitals, and considerable interest attaches to the series of fittings which Messrs. Siemens Brothers Dynamo Works, Ltd. (Tyssen-

Special universal jointed bracket.

Corridor bracket.



Electrolier for Central Hall.



Oyster fitting for Storerooms.

SIEMENS' HOSPITAL FITTINGS.

street, Dalston), have just supplied to an eastern hospital, and added to their already long list of fittings for special purposes. In many of these, facility for freedom of action so that an effective light may be thrown in any desired direction, immediately at will, is essential, and must be accomplished with a degree of ease which is not readily obtainable in any one fitting. We illustrate here a few of the special designs which are installed in this hospital, and it will be noticed that considerable thought has been given to this requirement. In some cases, light mechanical devices have been employed to obtain this end. In the case of the ward pendant, which we illustrate here, the lamp is enclosed in a hemispherical reflector, which is mounted on a spindle or axis. To this spindle is fixed a toothed wheel, which may be turned, by means of an endless chain, from below. A balance weight is fixed on the spindle to counterbalance the weight of the reflector on the opposite side, so that it may be adjusted at any angle without fear of its swinging back owing to the weight of the reflector. The bracket which carries this reflector is loose, so that it can be swivelled round in a horizontal direction. We also illustrate a wall bracket, with an extension arm, which has at the back plate and at the junction of the extension a horizontal joint, so that the light can be adjusted anywhere within a wide radius from the wall as the require-

Bedside standard with flexible arm.

Ward Pendant with adjustable reflector.

SIEMENS' HOSPITAL FITTINGS.

ments of the patient may necessitate. The bedside standard is also capable of wide adjustments, special facilities having been taken for freedom of action, whilst it is portable, and capable of being moved from one position to another. Cheaper designs of brackets have been installed for corridors, and these are of fixed and massive design. For store rooms, &c., a durable design of oyster fitting was supplied, which is protected with a galvanised wire guard. For the central hall, electroliers of neat and artistic design were employed, having a spread of about 4 ft., and carrying 8 lights. These fittings give a very even distribution of light, and being fitted with opalescent shades, they entirely eliminate all possibility of glare or dazzling effect, which is often a set-back to electric lighting installations. For these fittings, many of which are continually being moved about, the tantalum lamps, with which the hospital is lighted throughout, are particularly suitable.

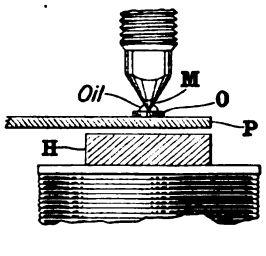
A TELEPHONE RELAY



A TELEPHONE relay, which could be placed at the end of a long telephone line to strengthen the received current or be connected as a repeater in the middle of a long line, in the same way as telegraph relays and repeaters, has long been sought after. At the Institution of Electrical Engineers on Thursday, however, Mr. S. G. Brown (of Messrs. Clark, Forde & Taylor), described how, after six years' study, he had devised a telephone relay which had given extremely good results, both for ordinary telephony and wireless telephony, and afforded a practical solution of the first problem. In the Paper he also described an application of the same principle which governs the relay to improving the microphone transmitter for ordinary and trunk telephone circuits, and this suggests a new direction of useful research, in which extremely valuable results are practically assured.

DESCRIPTION OF THE RELAY.

If the metallic circuit of a dry cell be interrupted by a minute opening or space of the order of half a millionth (5×10^{-7}) cm., the metal at the point of interruption being platinum, the current will continue to flow round the circuit and across the opening, and any slight alteration in the length of the space, which Mr. Brown calls the conduction space, will vary its resistance and greatly affect the value of the current that flows round the circuit. This conduction space is employed by Mr. Brown for transforming microscopic mechanical movements into large current changes, which is the function of the telephone relay. The dimensions of the conduction space are so small that it is difficult to ensure and maintain it by direct mechanical means. The current that flows across the space was therefore made do its own adjustment, very much in the same way as the current that passes through the arc of an arc lamp is made to strike and maintain the length of the arc.

SIDE VIEW OF TELEPHONE RELAY. (COVER REMOVED.)

ENLARGED VIEW OF THE REED AND CONTACTS.

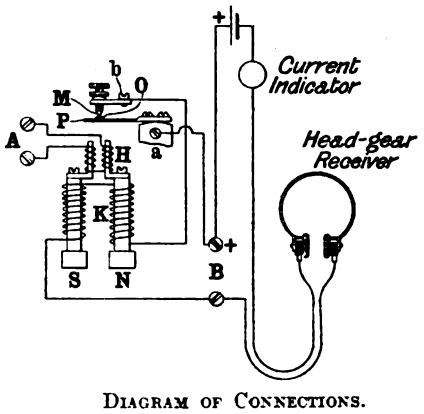


DIAGRAM OF CONNECTIONS.

In the accompanying illustrations of the relay, N is a permanent magnet, continued by soft iron poles right up to but not touching the "invar" steel reed P. Round the soft iron pole extensions are wound the two sets of coil windings H and K. The telephone currents to be magnified circulate round the winding H and thus by varying the magnetism set the reed P in vibration. M, O are the top and bottom metal contact-pieces, which are opened to an infinitesimal degree to form a microphone by a fine adjusting screw W and by the automatic action of the local current passing through the contact and round the winding K. So good is the automatic adjustment that the instrument may be turned upside down, without any effect on the working of the relay. The regulating winding K must not act when traversed by the rapidly varying telephonic currents; this is brought about by surrounding the iron under the coil by a closed circuited copper sheathing. Eddy currents set up in this sheathing by mutual induction destroy the self-induction of the coil. In the present instrument the contact is made between metal pieces of hard osmium iridium alloy. The top contact is pointed, the lower one is flat and is soldered to the reed, both are polished and work under a small drop of thin oil.

The connections are shown in the diagram. A single dry cell is sufficient to work the instrument, and the resistance of the telephone receiver employed is approximately 40 ohms. When the microphone contact is opened so as to cut down the local current to half its maximum value, the relay is usually at its best adjustment. The telephone currents to be magnified enter by the terminals marked A and circulate through the winding H.

Speech or signals that are too faint to be heard in the ordinary Bell receiver may be heard clearly through the relay.

This property of magnifying feeble telephone currents has made the relay particularly useful in wireless telegraphy, and the distance over which is it possible to receive signals has been doubled. Its utility in this direction has been tested among others by the Admiralty and the Post Office. In a wireless receiving station, messages, the very existence of which was not even suspected, owing to their extreme feebleness, when listened for under former conditions with the relay in circuit were easily read. The relay is not easily affected by extraneous noises and vibration. It can thus be carried on board ship and worked in all weathers.

On ordinary telephone lines, speech may be magnified many times in loudness without perceptible loss in the articulation, and it will work with large currents to a point at which the Bell receiver in its local circuit is responding with uncomfortable loudness. In experimenting over a 20-lb. standard cable and speaking only one way, it has been proved that, when the relay is applied, 30 miles may be added to any length through which it is possible now to speak direct. These tests prove that the telephone currents must be increased in strength to the extent of something like 20 times.

A LONG-DISTANCE STETHOSCOPE.

By means of the local regulating winding (K), the metal contact M O is transformed into the most exquisitely delicate microphone, more sensitive, there is very reason to believe, than could be formed by light pressure between carbons. Such a microphone has rendered possible the construction of an electric stethoscope, an instrument by the use of which the sound of the heart or other internal organs may be greatly magnified. In place of the ordinary end of the stethoscope, which is placed against the body, a shallow brass cell of similar shape, faced by a thin ebonite diaphragm, is used, which is connected by a tube to a second diaphragm. This latter is of metal; one of the two osmium iridium contact-pieces is mounted on it, and there is the same metal reed as before. Behind the reed is a horseshoe magnet, on one leg of which is a coil carrying the local current from the dry cell. The local circuit is made up by the cell, the osmium iridium contacts and the coil in series with the primary winding of a special transformer of 20 ohms resistance, to the secondary of which a telephone is connected. The electric stethoscope in its present form causes the sound of the heart to be three times as loud as in the ordinary stethoscope. But if a telephone relay, as previously described, be connected to the secondary of the transformer, the two instruments combined raise the intensity of the sound some twenty times and more.

The combined stethoscope and relay have been tested with great success at the London Hospital upon a number of diseased heart cases. Mr. Brown has also connected the secondary of the transformer to the telephone line at his own house, and has transmitted the sound of the heart over several miles of telephone line to doctors in various parts of London, and on one occasion from London to the Isle of Wight. Thus it is now possible for a specialist in London to examine, stethoscopically, a patient in the country.

The relay has also been used on the electrophone system, and by its aid, damping the reed with a piece of rubber, the speaking and music from the theatres are rendered with loudness and great clearness.

Researches on an Improved Microphone.

During some experiments with the telephone relay, attempts were made to dispense with the regulating winding and form the microphone by the mere pressure of the electrodes one against the other as with carbon. With gold, platinum, palladium, and rhodium, it was not possible to do so; with iridium the action was only just shown, a ruthenium contact was a little better than carbon, but osmium iridium alloy made a microphone that can carry large currents stand high temperatures, and is exceedingly sensitive to small changes of pressure. This alloy can be readily purchased as natural grains or granules, sifted to any desired uniform size. Ruthenium and osmium are of little value for microphonic purposes if purchased in their commercial form as grains or powder; the grains must be first fused into a bead and then crushed into granules. This may account for the failure of previous experimenters, who tried nearly all these metals without success.

Mr. Brown has taken several "solid back" transmitters and altered them to make use of the new metal. In one case the ordinary carbon electrodes were entirely removed and replaced by sheet iridium faced ones $\frac{7}{16}$ in. in diameter; these electrodes were separated by a distance of $\frac{1}{8}$ in., and the space between was nearly filled by 3 grains weight of very fine granules of osmium iridium kept in place by a rubber tube. This new transmitter would take permanently a current of $\frac{3}{4}$ ampere from a 2-volt accumulator. It was connected to the telephone service through a large transformer, which had a low-resistance primary of only $\frac{1}{10}$ of an ohm, and produced far louder speaking than a carbon transmitter. After the instrument had been in use some months, however, there was a gradual weakening of the power of transmission, which was eventually found to be due to the iridium faces of the electrodes becoming superficially oxidised. To remedy this the iridium has been replaced by gold, which so far has proved satisfactory. Another improvement was to cone inwards the faces of the gold electrodes; this is to prevent the granules from unpacking, as they had previously a tendency to do when worked between plane faces.

An osmium iridium granular transmitter has been constructed embodying all these later improvements, the electrodes have a diameter of $\frac{1}{4}$ in., and it will work permanently with 1 ampere at 2 volts. Up to the present no regular long-distance tests have been made, but it has been tried over 60 miles of 20-lb. standard artificial cable, and will work over this length with clearness and reasonable loudness, showing that this was by no means the limit. The upper harmonics of the voice are more faithfully transmitted by the metal granules than by the carbon. A much smaller quantity of the metal powder or granules is required as compared with carbon, and its sensitiveness in resistance to small changes of pressure is much greater; the new material is therefore peculiarly adaptable for the purposes of a relay for use on telephone lines where moderate magnification only is required. Such a relay has been constructed using osmium iridium powder as the resistance varying medium; it is simple in design, requires no adjustment, and so far gives a moderate magnification with good articulation.

The Telephone Repeater.

A telephone relay, if placed simply in the middle of a long telephone line, can magnify the currents only in one direction —such a device is called a single repeater. The relay for practical use has therefore to be associated with balancing coils and placed in the line so that it may work in either or both directions—such a combination is termed a two-way repeater. In a two-way repeater the lines on each side of the coils have to be balanced one against the other, and anything that produces a variation, say leakage, will cause the relay to react upon itself and thus interrupt the conversation till the balance has been restored. Theoretically it would seem that the two-way repeater can be only one-quarter the efficiency of the single repeater. Although the one-way relay is now solved, it will be seen that there is still much to be done before the two-way repeater is practicable.

Discussion.

Mr. J. E. Taylor (Engineer-in-Chief's Department, G.P.O.) testified to the fact that the instrument was capable of picking up and magnifying 20 times wireless telegraph signals, which were entirely inaudible with the ordinary telephone receiver. When he first experimented with the instrument, the contact point had become flattened, and the results were not so good. He asked whether it was necessary to keep a fine point on the upper part of the contact in order to maintain the magnifying power and reliability. The new microphone transmitter gave a volume of sound at the end of 60 miles of artificial cable equal to that received at the end of 45 to 45 miles of line upon which an ordinary transmitter was used, but there was no experience of how it would act under practical conditions. However, the instrument was very suggestive of future progress.

Mr. B. Davies, who represented Sir Oliver Lodge, referred to some experimental work upon carbon relays, which had been carried out by Sir Oliver 10 years ago.

Dr. C. B. Voysey (London Hospital) said he had tested the electrical stethoscope in the out-patients' department of the hospital and over the telephone, and there were many possibilities in connection with it. It might enable the physiologist to demonstrate that what are now regarded as simple sounds are really compound, and it might be the means of splitting them up into their constituents. It might also enable a determination of the exact relationship in time between the occurrence of the heart contraction and the heart sounds. Clinically, also, it might be of assistance in detecting sounds in the body which at present are only suspected, *e.g.*, sounds caused by friction of gallstones in the gall bladder, calculi in the kidney, or by the passage of the blood stream along an aorta roughened by disease. He thought, however, that it would be difficult to damp down or exclude extraneous sounds, or to tune the instrument to different wave-lengths.

Mr. J. E. Kingsbury referred to the Shreeve repeater (Patent No. 11,605/05), which was unquestionably a practical telephonic relay. Such instruments had, however, all been subject to drawbacks in the shape of adjustments, and even Mr. Brown would have to tackle the question. One of the greatest difficulties was to make the repeater talk both ways. The metallic surface contact adopted by Mr. Brown was akin to the Berliner microphone, although the automatic adjustment was entirely different to anything Berliner ever thought of.

Mr. B. S. Cohen (National Telephone Co.) referred first to the principle underlying the action of the relay. Mr. Brown had explained the cause of the wide variations of current with small differences in the length of conduction space as being the variation in the flow of electrons across the gap, but Mr. Cohen thought that it was merely due to variation in resistance caused by variation in pressure and temperature at the surface of contact. The results of tests made in the National Telephone Co.'s laboratory with the relay were not quite so good as those given in the Paper, but probably this was due to their want of experience in adjusting the apparatus. With a relay placed in the centre of a line, an improvement of 19 miles of standard cable was obtained in volume. Articulation tests showed that with 44 miles of standard cable and a relay, and 25 miles without the relay, the percentage of words missed with the relay was 55 per cent. more than without the relay, so that the articulation with equal volumes was 55 per cent. worse. The cables were then readjusted to give comparative length and equal audibility, including both articulation and volume. The result was that the relay gave a net improvement of eight miles of standard cable. This sounded very little, but it might represent approximately 300 miles of trunk line. He supplemented Mr. Kingsbury's remarks concerning the Shreeve repeater by some figures given him by the Western Electric Co. This instrument was in use on a large number of long American telephone and telegraph lines, and was generally in series at the middle of lines, whose total length was not less than 12 standard miles. With less length, trouble was experienced by the receiver and transmitter reacting. With the repeater exactly at the centre, very good results were obtained. The improvement, with double repeaters working both ways, was about six standard miles. More than one repeater could be inserted in a line; for instance, on a 1,500 mile line, running out from Boston, three repeaters were joined in series, and the net improvement was 18 standard miles. He had obtained some encouraging results with Mr. Brown's metal transmitter, carried out under favourable conditions; there was an improvement over the ordinary carbon transmitter of 10 standard miles, whilst the articulation was good. He thought the Brown transmitter had a good future, providing it could be turned out in bulk for commercial work with the same efficiency. Unfortunately, he believed Mr. Brown had not been able to design an instrument to work on common battery systems, and this seriously limited the effectiveness. No doubt, however, he would get over this.

Mr. A. C. Booth (Engineer-in-Chief's Department, G.P.O.) stated that he had used the relay for wireless work, and that it magnified the received signals from four to twelve times. Working as a repeater in the middle of an artificial telephone line of 68 miles of standard cable, the speech was little inferior to that over 34 miles of standard cable without the relay. As a further test, the relay was placed half-way along 108 miles of standard cable, and one could clearly distinguish that speech was being made, whereas without the instrument the 108 miles of cable was absolutely silent. Experiments were being pursued on trunk line working. The instrument had weaknesses. Although the adjustment was simple, it took time to settle down, and sometimes more than an hour was spent in regulating before good results could be obtained. In wireless work, the ordinary detectors were absolutely silent except when signals were being received, whereas the relay gave a very slight noise, which seemed to have a disturbing effect on the operators, who wore headgear telephones for several consecutive hours daily. As regards trunk telephone circuits, such a very sensitive instrument would magnify any defects or disturbances which might be many on the long lines. The switching necessary for to and fro conversation was certainly a disadvantage. However, the invention marked a very long stride in the direction of a perfect telephone repeater.

Dr. W. H. Eccles, speaking on the question of wireless telegraphy, said that as such relays were not monotonic they magni-

Digitized by Google

fied atmospheric and other disturbances, as well as the signals to be received. He had developed a selective form of Mr. Brown's relay, comprising an iron wire stretched so as to vibrate at the signalling frequency. This apparatus did not select as well as it should, due probably to the damping effect of the point in the oil. Working on the Clifden signals as heard in London, this instrument kept on singing for five or ten minutes after the signal was started. He thought Mr. Cohen's explanation of the action was the correct one, and this being so, it was possible to get a good idea of the size of the air-gap. Dr. P. E. Shaw measured, some years ago, that the minimum audible sound involved a diaphragm movement of 0·028 millionth of an inch, which was about 400 or 500 times smaller than the wave-length of blue light, and it was less than this that Mr. Brown succeeded in dealing with. This illustrated the difficulties of adjustment, and it was very surprising that Mr. Brown had been so successful.

Dr. E. H. Rayner (National Physical Laboratory) asked whether it was necessary to have the point of negative polarity. He also wished to know whether invar was used for the reed for magnetic or mechanical purposes, and whether it could be used for the whole apparatus to keep the dimension constant and avoid temperature changes.

Mr. Brown said it was advisable to have the point negative as it worked better. Invar was used for keeping the temperature constant and to keep the reed from warping. It was likely to buckle if it had a coefficient of expansion. It would be better if the whole instrument were made of invar.

Mr. D. H. Kennedy (Engineer-in-Chief's Department, G.P.O.) also referred to the experiments described by Mr. Booth, but said that he was able to follow what was being said over the 108 miles of standard cable with the relay in use. Before the tests he had deliberately put the instrument out of adjustment, and there had been no difficulty in getting it back again. The instrument had also been used on the Glasgow trunk line, and although there was a great increase in audibility, there was also a great increase in extraneous noises. He was very sanguine that the instrument would greatly increase the distance over which speech would be possible.

Mr. W. M. Mordey referred to the transactions of the Institution for 1883, when discussions took place upon the use of various substances for microphonic purposes.

Prof. Perry expressed his admiration of the instrument, and promised to send in a communication for the *Journal*, explaining mathematically how the film of oil between the contacts was maintained automatically at constant thickness. He understood the instrument had maintained perfect adjustment for twenty-four hours.

Mr. S. Evershed, who was in the chair, was inclined to think that a telephone relay, in the true meaning of the word, was impossible. Mr. Brown's instrument was a magnifier, and not a relay. A telephone relay would be an instrument that would not only restore the amplitude of the current impulses as Mr. Brown's did, but would also restore the waves to the same phase relation and the same shape as when they started.

Mr. Brown expressed a wish to reply to the discussion in writing, and a hearty vote of thanks to him concluded the proceedings.

THE IRON AND STEEL INSTITUTE

THE annual meeting of the Iron and Steel Institute, which now comprises over two thousand members, was held in London at the Institution of Civil Engineers on Wednesday and Thursday of last week. The chair was taken by the Duke of Devonshire, whose presidential address consisted mainly of a comparison of the present social and economical conditions with those obtaining in 1869, when the Institute was founded. The Paper on electric smelting, announced for reading by Mr. D. F. Campbell, has been postponed until the autumn meeting of the Institute, but the following Papers of electrical interest were read and discussed.

Production of Electric Power from Waste Heat.

In a Paper on this subject, Mr. D. Selby Bigge, of Newcastle-on-Tyne, deals with the generation of electric power in iron and steel works from waste gas and steam, with particular reference to the mixed-pressure turbine. Whereas the pure exhaust steam turbine runs with a constant supply of exhaust steam, such as that from blast furnace blowing engines, pumping engines, &c., the mixed pressure turbine utilises the exhaust from intermittently working engines, such as winding engines, rolling mill engines, compressors, steam hammers, &c. The turbine has two parts, a high-pressure end, adapted for running with live steam, and a low-pressure end, for working with exhaust steam. Live steam is automatically admitted to the high-pressure end if the supply of exhaust steam fails. The author gives diagrams showing how, by combining an exhaust steam turbine with reciprocating engines, the fullest range of expansion can be taken advantage of. Figures are given in the Paper for the steam consumption of a 1,000-kw. 3,000 r.p.m. mixed-pressure turbine set. The boiler pressure was 163 lbs. per sq. in., superheat 117° Fahr., exhaust steam pressure 15·7 lbs. per sq. in. abs. Using exhaust steam only, the consumption was 30 lbs. per kw-hour; with somewhat under half exhaust steam the consumption was 22 lbs. per kw.-hour; and with live steam only a figure of 17 lbs. per kw.-hour was reached. Referring to cooling plant, the author states that where ground space is not of great importance, spray nozzles are to be recommended. Mr. Bigge then describes briefly various types of mixed-pressure turbines.

Turning to gas-engine generating plant, the author refers to the large Mather & Platt engines, of which an illustrated description appeared in Electrical Engineering, Vol. V., June 10th, 1909, p. 523. The Nurnberg and the Cockerill-Westgarth types are also briefly referred to. One ton of coal distilled in a coke oven gives about 15 cwt. of coke, 5 per cent. ash, and 20 per cent. volatile matter. This latter yields gas of the value of 960,000 calories. The gas required for coking is about 65 per cent. of this, leaving a surplus of 336,000 calories, which will produce in gas engines some 135 b.h.p.-hours. If the 15 cwt. of coke are employed in a blast furnace, after allowing for the heat required for smelting, a surplus of 3,186,000 calories is left. Some 45 per cent. of this is required for the hot-blast stoves, and 15 per cent. for the blast-furnace auxiliaries, leaving 1,274,520 calories available for use in gas engines. This would give some 510 b.h.p.-hours. Thus the waste power from both coke oven and blast furnace would produce some 645 b.h.p.-hours per ton of coal consumed, assuming that 2,500 calories represented one b.h.p. A blast furnace producing 250 tons of iron per day delivers enough gas to generate 10,000 b.h.p. continuously, of which 2,500 b.h.p. is required for the furnace equipment, leaving 7,500 b.h.p. for generating electric power. Considering the question of cost of production, the author states that for a small 300 to 500-kw. steam plant with coal-fired boilers the total costs, including interest and depreciation, work out at from 0·6d. to 1·0d. per unit; the cost of power from a supply company depends upon the load factor and the amount purchased, but 0·5d. per unit may be taken as a low figure. For consumers of from 100 to 400 kw. it will generally be preferable to purchase power than to generate privately unless waste heat is available. In large works where power is required for driving machinery, rolling mills, and possibly for electric furnaces, the total amount may reach anything from 1,000 to 10,000 kw., and with waste heat private generating plant is desirable.

As an example to illustrate the utilisation of exhaust steam, the author takes the case of a steel works, where 1,600 b.h.p. is installed in electric motors supplied from a coal-fired steam plant. Exhaust steam is assumed to be available from other steam-driven machinery. Assuming that the average motor load for 20 hours out of the 24 is 400 kw., the units used per annum will be 2,400,000. Two 600-kw. mixed-pressure turbine units are installed, one to act as stand-by, and the cost of this plant may be taken as £9,000. Taking interest and depreciation at 12 per cent. per annum, or £1,080; attendants' wages, £200; oil and stores, &c., £52; and provision for live steam, £728; the total cost of production per annum will be £2,060, or 0·206d. per unit. The Fife Coal Co. have installed at their collieries five mixed-pressure turbines, each of 1,000 b.h.p., and one of 800 b.h.p., and current is generated at 3,000 volts, 50 cycles. At another colliery, where 750-kw. mixed-pressure turbine plant has been in operation for one year, the total cost of production, after allowing 12 per cent. interest and depreciation on the capital cost (£9,400, including stand-by unit), and including attendance, stores, and cost of live steam, amounts to 0·211d. per unit. The total amount generated during the year was 2,295,000 units. The net saving already exceeds £3,000 per annum, but will be more when the plant is fully loaded. The author refers briefly to the various applications of electric power, including the electric driving of rolling mills, and electric furnaces, and comments on the great progress which is being made on the Continent. Concluding, he asserts that this country is suffering from apathy and lack of enterprise, but that if the required improvements in plant and methods are

Digitized by Google

effected, there is no country better able to meet the growing competition.

The discussion on Mr. Selby Bigge's Paper was opened by Mr. T. WESTGARTH (Richardsons, Westgarth & Co., Ltd.), who stated that the substitution of gas engines running with blast-furnace gas for steam plant in the Barrow Hematite Steel Works, to do the blowing for the furnaces and to produce electric power for the works, had resulted in a saving of 1,500 tons of coal per week, which he supposed was equivalent to some £50,000 per annum. Another course had been adopted at South Bank, where the exhaust steam from the original steam plant was utilised for low-pressure turbo-generators. They were not driving their rolling mills and heavy machinery by electricity, however. It was always a question as to whether it was the more economical to scrap steam engines and install electric drive, or to use the exhaust steam from the engines and effect economy in that way. At Messrs. Hickmans' works they had done away with the steam plant, installed gas engines, and they now drove their rolling mills electrically. At Messrs. Samuelson's works in Middlesbrough they had no use for their exhaust steam, so they sold it to the Waste Heat Co., who utilised it to feed the public electricity supply mains in that district. He understood that at Skinningrove power would be generated direct from gas, and that the works would be driven electrically, whereas at Frodingham gas engines would be used for blowing and for generating electricity, and the large machinery and rolling-mills would be steam-driven, exhaust steam turbo-generators being employed in conjunction with the steam engines. There were thus varied methods, and no general rule could be laid down. Each case had to be considered on its own merits.

Mr. C. H. MERZ stated that exhaust-steam and mixed-pressure turbines were advocated in a number of cases where the conditions, if properly looked into, did not justify their use. There was a fashion for these turbines. It was due, he thought, to the love of the engineer for his old plant. Instead of putting in exhaust steam turbines to improve the efficiency of old plant, it might often be more economical to install entirely new steam plant, or gas engines, or take power from a supply company. The speaker then emphasised the importance of a good vacuum with exhaust plant, and stated that very costly condensing plant was necessary to get good results. Referring to the figures given by the author, he did not think that two 600 kw. turbo-generators could be installed for £9,000. If it had been done, they were either installed in existing buildings or the condensers had been cut fine. The allowance of 12 per cent. for interest and depreciation was also too low, as it would only allow the plant to be written off in twenty years. He thought the total costs would amount to 0·5d. per unit, not 0·206d. Further, in the costs, no allowance had been made for the cost of the exhaust steam. This had a value, as by putting in new plant altogether, all the heat would be utilised in the one engine. There were, however, cases where the use of exhaust steam plant was justifiable. Such was Messrs. Samuelson's works, where the heavy cost of the necessary condensers was justified, as the plant was continuously loaded throughout the year. In general, however, exhaust steam plant did not pay, and it would be better to wait until entirely new plant could be installed.

Mr. W. C. MOUNTAIN (Messrs. Scott & Mountain, Ltd.) referred to actual results obtained with exhaust steam generating plant in collieries. In one case power was produced from the waste heat of coke ovens, and cost 0·146d. per unit. At the Kirkby Colliery, with coal at 2s. 6d. per ton, depreciation at 10 per cent., and interest at 5 per cent., the total costs came to 0·326d. per unit. In a South Wales colliery, with coal at 3s. 6d. per ton, the average cost for 12 years was 0·29d. per unit. These results confirmed Mr. Bigge's figures for total costs. It was questionable whether the application of electric drive to rolling mills would always be commercially successful. Finally, the speaker referred to a colliery plant in which the exhaust steam from two winding engines had been utilised in a low-pressure turbo-generator to supply power to three 200-h.p. haulage gears and a 200-h.p. electric winding gear.

Mr. W. J. LARKE suggested that in certain cases it might be most economical to burn the waste gases from blast furnaces and coke ovens under boilers to raise steam for high-pressure turbines.

Mr. I. WILLIAMS said that at the works at Eston they used the gas from the blast furnaces to raise steam for the engines in the steel works. The exhaust steam was collected and used for electric generating plant and turbo-blowers. They had no difficulty in obtaining a vacuum of 28 or 28½ in., but certainly they would lose enormously if they did not keep this vacuum.

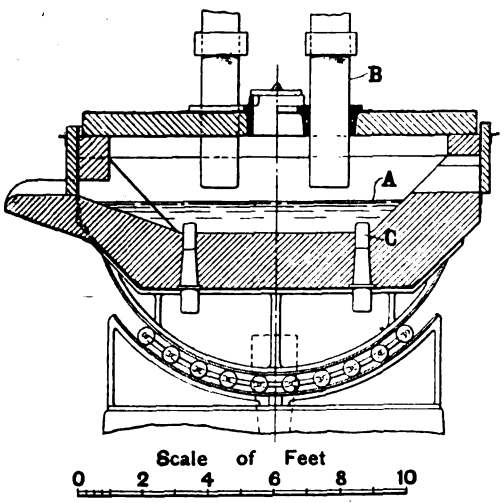
Mr. SELBY BIGGE, in reply to Mr. Merz, said that 28½ in. was quite an ordinary vacuum, and that he had known cases where 29 in. had been reached. He agreed that it was very important to install a large enough condensing plant. With regard to his figures for costs, he would be sorry to advocate a scheme which would not show a return on the capital in three or four years. He had found the total costs to be always below 0·25d. with exhaust steam plant. The £9,000 quoted referred to an actual case, and was the exact figure for the total outlay.

Steam v. Electric Driving for Rolling Mills.

A Paper read by Mr. E. G. Sehmer and Dr. R. Drawe (Messrs. Ehrhardt & Sehmer, Saarbrücken) deals with the economies to be effected by the use of modern reversing steam engines for the driving of rolling mills, and includes a description of a new design of valve gear to obtain low steam consumption and rapid reversal. Results obtained with some engines fitted with this gear are compared with similar results for an ordinary rolling-mill engine, showing an economy of 50 per cent. The authors conclude that such an engine is much more economical than an electrically driven reversing mill. Further, they assert that whereas the high steam consumption of rolling-mill engines has led to the adoption of exhaust steam turbines in conjunction with the mill engines, the steam consumption of a mill engine is increased considerably by the interpolation of the exhaust turbine between it and the condenser, and that there is no economy effected.

Mr. A. LAMBERTON did not think that it was possible to effect the saving of 50 per cent. in steam consumption claimed. However, he agreed that driving by modern steam engines was more economical than by electric drive. With regard to the use of exhaust steam plant, the power obtained from the turbine might more than make up for the increased consumption of the mill engine, and it had been proved that the combination often effected great economy.

Mr. C. A. ABLETT (Siemens Bros. Dynamo Works) stated that the arrangement of valve gear described by the authors was a compromise between conflicting requirements, and that both to obtain economy and to avoid stalling involved a larger engine with a correspondingly higher capital cost. This was interesting when comparing electric drive, because it was well known that though electric drive required less power, the capital cost was higher than that of steam drive. To effect economy, it was necessary that the saving in power should more than pay the extra capital charges. The results given by the authors were very vague, and did not allow of strict comparison with electric drive. With an electrically driven reversing mill the energy consumption in rolling a 7-ton ingot measuring 34½ in. by 25 in. to ten times elongation would be 14-kilowatt-hours per ton, with an output of 65 tons per hour. Power from blast-furnace gas cost from 0·1d. and 0·2d. per unit, and would therefore amount to 2d. per ton rolled, as compared with Mr. Sehmer's figure of 4·375d. per ton for the cost of steam with a steam-driven mill. The electric mill therefore saved 2·375d. per ton, and, with an output of 4,000 tons per week, this was nearly £2,000 per annum. This would pay the capital charges on a greater difference of cost than actually existed between the steam and electrically driven mill. The latter would cost from £12,000 to £13,000. In the last twelve months ten or eleven contracts had, he said, been placed in Germany for large electrically driven reversing rolling mills. About twenty-four large electrically driven reversing rolling mill plants were either on order or at work on the Continent, while only four were on order or at work in England.



In reply, Mr. E. G. SEHMER stated that by employing the new design of steam rolling mill engine, a saving of over 60 per cent. could be effected in the steam consumption over that of the old type of engine.

The Girod Furnace.

A Paper by Dr. W. Borchers, of Aix-la-Chapelle, on the Girod electric furnace was taken as read. The author states that the Girod furnace is the simplest of modern electric steel furnaces. As shown in the illustration opposite of a 12½-ton furnace, it is a combination of a resistance and an arc furnace. The metal to be smelted *A* serves as one of the electrodes, and is covered by the refining slag as an electrolytic conductor, while carbon blocks *B*, introduced through the cover of the furnace, form the opposite electrodes. The arcs play between the carbon blocks and the slag, and the current flows from the slag to the metal, and through the metal to the electrodes *C*, of which there are several round the periphery of the furnace. These electrodes are of pure iron to avoid any deterioration of the charge, and are water-cooled. The molten metal is kept in constant motion, and this effects contact between the impurities of the iron and the refining slag. In the author's opinion, the advantages of the induction or transformer furnaces and of electrode furnaces are combined in the Girod furnace, while the imperfections of both forms have been overcome. When cold scrap is to be smelted, the upper electrode is lowered until it rests upon the scrap, and the current passes by means of numerous arcs through the scrap to the hearth-bottom. The heap breaks down simultaneously, and there is no necessity for stirring. For a 2-ton furnace the charge consists of 2,000 to 2,500 kilogrammes of iron scrap, and the first batch of flux usually consists of about 80 kilogrammes of lime and 220 to 250 kilogrammes of iron oxide in the form of ore, which, with the iron oxide on the scrap, serves

Digitized by Google

as an oxidising agent. The smelting of the iron charge and of the first batch of flux requires 4½ to 5 hours. On the slag becoming exhausted, samples are taken to ascertain the degree of refining. A second, and if necessary a third, batch of lime and iron oxide is then introduced. After cleaning the surface, refining agents such as ferro-mangano-silicon, ferro-aluminium-silicon, and other alloys are added. For producing carbon steels an addition of Swedish charcoal iron can be made. The final step in the production of special steels is the addition of iron alloys with metals like nickel, tungsten, and chromium. The total duration of one smelting operation from the starting of the current to the casting of the finished product into ingots or moulds covers about eight hours, assuming that the raw material is not pure. The smaller of the two types of furnaces consume about 300 kilowatts A.-C. at about 60 to 65 volts. The larger furnaces require 1,000 to 1,200 kilowatts at 70 to 75 volts. Taking into account a loss of 10 to 11 per cent. of the charge by oxidation and evaporation, the power required to make one ton of steel in a small furnace is 900 to 1,000 kilowatt hours, and, in a large furnace, 800 to 900 kilowatt hours. The consumption of carbon electrodes amounts to 12 or 15 kilogrammes per ton of steel. The calcined dolomite furnace lining will withstand at least 80 charges. The bottom of the furnace will, however, stand 120 to 160 charges without repair.

Section of 12½-ton Girod Furnace.

With liquid charges the linings last longer; one furnace working in this manner was run for 200 charges without any repairs. The linings of the furnace covers require more frequent renewal. In the small furnaces they need repairs after 25 to 30 charges, and in the larger furnaces after 20 to 25 charges.

At the works of the Soc. Anon. Electrométallurgique Procédés Paul Girod at Ugine only scrap iron is used as raw material for steel-making as well as for the manufacture of iron-alloys; a high degree of refining is obtained. The cost of a 2½-ton furnace, including regulators, measuring instruments, tilting device mechanism, and cables, is about £600. A 12½-ton furnace with a similar outfit will cost about £1,200. The electrodes cost about four francs per ton. A complete plant with one 2½-ton furnace for regular running and one furnace for reserve, and with all appliances and melting-house, but without dynamo or transformer, will cost approximately £8,000 to £12,000; and a plant working with a large 12½-ton furnace, £12,000 to £16,000. At present the Ugine plant consists of nineteen furnaces aggregating 400 to 600 electrical h.p., and twelve new furnaces, of 1,200 electrical h.p. each, are being installed, some in a new works which will be devoted to steel manufacture. The old works will make only alloys. The company also owns an electrode factory, turning out 7 tons of carbons daily. The power-house for the old works contains ten Pelton-wheel turbo-sets, furnishing 8,000 to 9,000 electrical h.p.

A second power station provides a further 12,000 electrical h.p. Three-phase current is transmitted some 3 or 4 km. at 45,000 volts to Ugine, where it is transformed to 60 to 75 volts for the furnaces. Besides this, the works are obtaining 6,000 electrical h.p. from a power station at Bionnay, and 8,000 to 10,000 electrical h.p. from a power station at Veuthon. The plant in the new steel works consists of three 2-ton and two 12-ton furnaces. The steel is cast into large ladles worked by electric cranes, and run into ingots, which are sent to the rolling-mills. Steel castings (dynamo frames) up to 20 tons have been made.

Mr. J. H. Heap opened the discussion on this Paper, pointing out that the conditions in the Middlesbrough district were very favourable to electric steel furnaces. Ferro-alloys produced in the electric furnace were imported into this country, but electric power could be obtained here cheaper than that produced from water-power on the Continent. He was surprised that Dr. Borchers approved the Girod furnace, and further that he confined his Paper to the one type. The only special feature was the row of lower electrodes, and he thought this was a doubtful improvement. No arrangements were made to produce a good circulation, and this had been found to be necessary. He was surprised that Sheffield should be the first to adopt electric furnaces, as the conditions there were by no means favourable. They had not, he thought, selected the most suitable type.

Prof. J. O. Arnold (Sheffield University) said that in Sheffield they wanted a melting furnace and not a refining furnace, and had therefore selected the Kjellin type. All that concerned them was the relative capacities of the electric and the crucible furnaces. They used the finest Swedish iron, and its quality remained unchanged during melting.

Mr. F. W. Harbord was surprised that the author should state quite generally that the Girod furnace was the simplest. He thought that, as in large 200-ton furnaces they had no trouble with circulation, in the small sizes it could not be a matter of importance. The ordinary reactions produced a sufficient circulation. He suspected that there would be much trouble with the bottom electrodes.

Mr. D. F. Campbell compared the Girod furnace with the American Héroult furnaces. The figures in the Paper did not justify the statement that the Girod was the simplest. A 15-ton Héroult had three holes in the roof and a bottom as in the best open-hearth practice, but the 12½-ton Girod had four holes in the cover and 16 electrodes in the bottom. The latter were likely to be a source of trouble, as the steel might get under the layers of dolomite. In refining furnaces, the essential object was the slag reaction; there should be no trouble with the circulation. With the Héroult furnaces at South Chicago the bottom lining lasted 4,000 to 5,000 heats. The roof lasted 100 to 150 heats, and cost about 2d. per ton of steel produced. The heating period was six instead of eight hours. The consumption of a 15-ton furnace was 111 kw. hours for five heats, refining only, and 172 kw. hours for five heats with a more impure charge. With current at 0·3d. per unit refining should cost only 3s. 6d. to 4s. per ton when producing axle steel.

COMMITTEE FOR PROTECTION OF ELECTRICAL INTERESTS

At a meeting held last Friday at the Savoy Hotel—the Hon. Arthur Stanley, M.P., presiding—a committee was constituted with the object of endeavouring to secure united action, with a view to the protection and advancement of the commercial and legislative interests of the British electrical industries. The committee, which is limited to eighty members, consists of the following:—Messrs. Addenbrooke, Albright, A. B. Anderson, L. B. Atkinson, Baylor, Lt.-Col. Beddoes, H. R. Beeton, E. Bergtheil, Browett, J. C. Bull, Charrington, Conaty, Connett, Cownie, A. Dickinson, Dobson, Drake, Dykes, Eck, Elphinstone, Erskine, Esson, de Ferranti, Freeman, Garcke, Geipel, Glenn, Gripper, Hammond, Handcock, Hawtayne, Highfield, Hirst, F. Hope-Jones, E. M. Lacey, Lorrain, Lycett, Madgen, Morcom, Morse, W. C. Mountain, Murphy, Lee Murray, Nalder, Hon. C. A. Parsons, W. H. Patchell, Phipps, A. H. Preece, W. L. Preece, Rawlings, J. S. Raworth, Renwick, Rich, J. R. Salter, Seabrook, S. Sellon, A. M. Sillar, J. F. C. Snell, C. P. Sparks, Hon. A. Stanley, Statter, Campbell Swinton, W. A. Vignoles, F. J. Walker, H. L. Webb, Wetzler, Woodhouse, A. P. Wood, Foulds (Electrical Standardising, Testing and Training Institution), Gay (Associated Municipal Engineers of Greater London), Goodyer (Metropolitan Association of Electric Tramway Managers), L. G. Tate (Electrical Contractors' Association), de Turckheim (Incorporated Association of Electric Power Companies and Tramways and Light Railways Association), J. Glynn Williams (Institution of Mining Electrical Engineers), and R. Borlase Matthews (hon. sec.). The Electrical League and the Electrical Industrial Association of Great Britain will not now be proceeded with, and all subscriptions which have been received are being returned in full.

The George Montefiore Levi Prize.—A prize, to be known as the *Fondation George Montefiore Levi*, is offered triennially for international competition for the best original work on the scientific advance or the progress of the technical applications of electricity. The essays may be in French or English, and the regulations exclude what may be described as compilations or descriptions. The first prize will be awarded in 1911, and will amount to 20,000 francs. The awards will be made by a jury of twelve electrical engineers, six Belgian and six of other nationality, chosen from the holders of diplomas of the *Institut Electrotechnique Montefiore* of Liège, and including the director of that institution. Further particulars can be obtained from the Secretary, 31 Rue St.-Gilles, Liège.

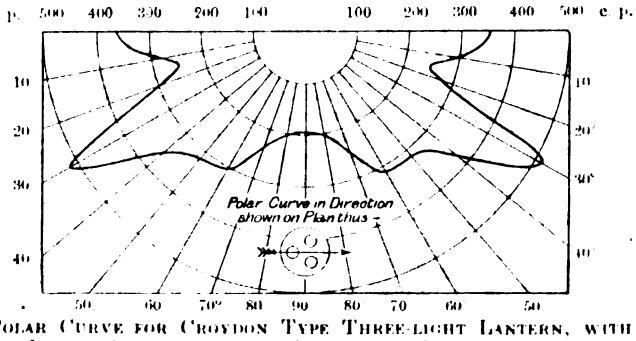
CORRESPONDENCE

OSRAM LAMPS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—As illustrating the increasing robustness of some forms of metallic filament lamps, your readers may be interested in the enclosed photograph. It shows two outside weather fittings of the General Electric Co.'s make, each equipped with one 100-c.p. 240-volt Osram lamp, and supported by ¾ in. gas-barrel brackets, erected by Mr. J. A. Allan, electrical contractor, Bellshill, for Mr. J. Hamilton, draper, Bellshill. As can be surmised from the photo, the spring attachment holding the sun-blind in position broke, and allowed the heavy blind, with the attached front-board, to fall with such force as to bend the brackets about six or seven inches in a downward direction and to shatter the front board. Notwithstanding the severe shock, the Osram lamps were undamaged, and were in use that same evening in the position shown. They are still in use, this making their sixth week, as they had been erected for about a month before this photo was taken at the beginning of last week.

When examined by Mr. J. Allan and myself on the day following the mishap, we were surprised to find that not only did the lamps light, but that the filaments were absolutely intact—we quite expected to find one or more loops broken off short and welded together—and that they were only slightly curved owing to having been in use in an inclined position.



Yours truly,

Glasgow, May 2nd, 1910. P. FREDK. ALLAN.

STREET LIGHTING.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I note with interest that Mr. Cunliffe Owen, in your issue of May 5th, calls your attention to the excellent results obtained when lighting a street by means of 400-c.p. Osram lamps, and that you have had an opportunity of inspecting a lamp erected at the Bayswater Road end of Westbourne Terrace. While on this subject, it may interest you to know that nearly 300 grouped Osram lamps, each group consisting of three 100 c.p. lamps in one lantern, have been erected in the streets of Croydon. These lanterns are designed to take full advantage of the upper hemispherical rays by means of a large and correctly

POLAR CURVE FOR CROYDON TYPE THREE-LIGHT LANTERN, WITH LARGE SPHERICAL CLEAR GLOBE AND INSIDE AND OUTSIDE ENAMELLED REFLECTORS, THREE CLEAR 110-WATT SPHERICAL OSRAM LAMPS.

shaped reflector, which directs them to a useful angle, with the result that 300 watts give over 500 candle-power at the most important angles for street lighting purposes. This is clearly demonstrated by the profile curve submitted herewith. An inspection of these lamps will show the very excellent and even illumination which results.

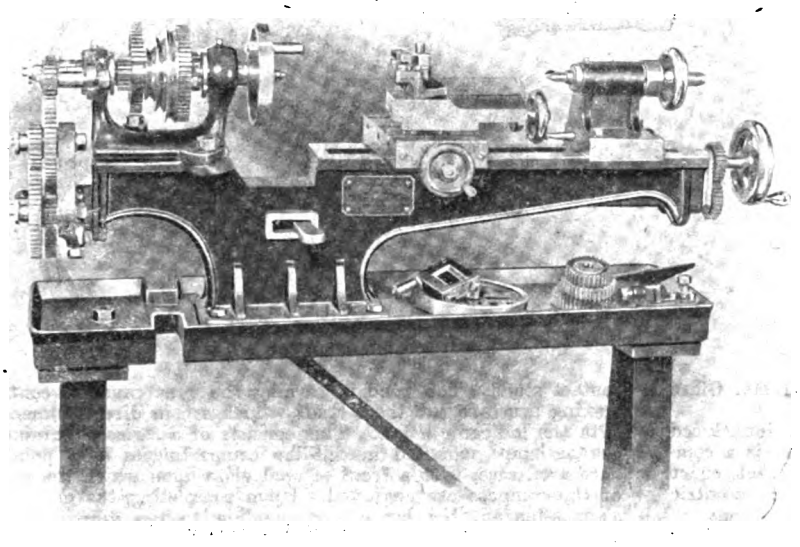
11 Victoria Street, Westminster, May 9th, 1910. Yours faithfully, HAYDN HARRISON.

BOURNEMOUTH TRAMWAYS
Conduit System to be Abandoned

MR. C. HILL, the General Manager of the Bournemouth Corporation Tramways, has presented a report to his Corporation in favour of substituting the overhead trolley system for the conduit system, which is now in use in the narrow portions of the streets. The report, which has been adopted by the Corporation, has been prepared from financial considerations only. There is nothing amiss with the conduit system beyond the heavy cost of working, and unfortunately the tramway traffic of Bournemouth, up to the present, at any rate, has certainly not been sufficient to warrant the expense. The conduit system in the centre of Bournemouth was adopted purely for aesthetic reasons. In fact, there was bitter opposition to tramways in Bournemouth at all, and the conduit system was accepted as a sort of compromise. Having in mind that the opinions of the inhabitants have changed since those days, Mr. Hill points out that it will be cheaper to work on the overhead system, and that by so doing the tramways, within the next year or two, will show a small profit instead of a loss.

Mr. Hill, in his report, states that he is in a position to say that a saving of £3.000 per annum would be effected if the conduit were abandoned and the overhead construction substituted. In his opinion, the adoption of the side slot for Bournemouth was unfortunate owing to the tortuous nature of the route. Many of the present difficulties would not have arisen had the centre slot been adopted, and the cost of maintenance would certainly have been reduced. The cost of renewing the rails is causing a great deal of anxiety, not only for the present but for the future, as, even if all the rails are shortly renewed, a similar expenditure would have to be incurred again in the course of a few years' time. Further, the bogie trucks carrying the plough gear are beginning to show signs of fatigue, and will all shortly have to be braced up at a considerable cost. Another consideration of extreme importance is that without the plough gear on the cars the question of fitting mechanical attachments to the car brakes, concerning which there has been correspondence with the Board of Trade, becomes a simple one so far as the small cars are concerned, and even on the large ones it becomes possible. Mr. Hill, after mentioning the delay at the points of changing over from the trolley to conduit and *vice versa*, and the loss of traffic entailed thereby, estimates that the erection of overhead construction on the present conduit routes would cost £1.910, and that the saving in working would soon place the undertaking in a sound financial position. With regard to the conduit itself, this could be gradually filled up, and in the meantime would be cleaned out as usual, so that no difficulty would arise from a sanitary point of view. In conclusion, Mr. Hill expresses the opinion that the advantages to be derived by the changing over of the system, both to the travelling public and the department, outweigh any objections which might be raised from an aesthetic point of view.

THE WELSBACH COMPANY AND THE ELECTRICAL INDUSTRY



AT a noisy meeting of the shareholders of the Welsbach Incandescent Gas Light Co., Ltd., on Tuesday, the proposals of the directors for the drastic reduction of capital, referred to in our last issue, were postponed for twelve months. This course was adopted by the Board in view of the strong opposition by a number of large preference shareholders, although proxies for an overwhelming majority in favour of the scheme were held by the directors. The scheme provided for the conversion of 600.000 £1 preference shares into common stock having a value of 15s. each, and the reduction of 743,975 £1 ordinary shares to the value of 1s. 4d. each. The accounts for the year to March 31st show a net profit of £5.966, after meeting preference dividends.

The Rt. Hon. Lord Weardale, chairman of the company, presided, and considerable reference was made to the company's venture into the electrical business. The cost of the advertising campaign in this connection, placed by a member of the Shareholders' Committee which has been conferring with the board, at considerably in excess of £6.000, has shown practically no return, owing to the inability to obtain deliveries of the lamps, but a new contract has been entered into by which delivery is guaranteed. The Board have great faith in the possibility of profit for the electrical section, although several disappointed shareholders pointed out that the electrical industry is already in a bad way from over competition. It was interesting to hear the chairman confess that the poor result from the sale of gas mantles was due, in a considerable degree, to the competition of electricity, which, he said, had now invaded even the smallest house. Referring to the action taken by the General Electric Co. in the Clerkenwell Police Court in respect of the use of the trade mark "Aur" (which, by the way, cost the Welsbach Co. £1.000), Lord Weardale said the company were not going to be kept out of the great electrical market by futile litigation. During a discussion on the report and accounts, which were eventually adopted, it was stated that the cost of the electrical section last year had been met out of revenue, and not capital. A number of the shareholders complained that they were never able to obtain the company's goods, and one gentleman, who had been making inquiries amongst the trade, said that retailers would not stock because the terms offered were not so good as those to be obtained from other makers. The management was also blamed for extensive but injudicious advertising, but the meeting ended more or less in harmony on account of the board accepting the proposal to postpone the writing-down scheme until next year.

A LATHE FOR THE ANTARCTIC EXPEDITION

WE have received from Messrs. Drummond Brothers, Ltd. (Churchill Works, near Guildford, Surrey), the accompanying illustration of a lathe which they have just supplied to Captain Scott's South Polar Expedition. The machine is one of their standard 3½-in. screw-cutting lathes, as usually supplied for motor-car repairing, fitted, at the request of the Expedition, with the same accessories as one recently supplied to H.M.S. *Swift*. Besides its use in connection with the motor sledge equipments, &c., this lathe, which we believe is the first to take part in a polar expedition, should be of welcome assistance in relieving the tedium of the long waits at the base. These lathes have several points of usefulness, among which are the following:—The slide-rest can be detached by undoing one nut, leaving a truly surfaced ⊥ slotted, self-acting sliding boring carriage, converting the lathe into a convenient boring machine. The headstock can be set over for small taper work to an exact angle, and is graduated for this purpose. The tail-stock can also be set over for long taper turning. When accurately set it remains true (until altered for taper), as it is accurately guided by and locked to the outside of the bed, instead of loosely fitting a slot. The lead-screw is central and close up to the saddle, and therefore has no twisting tendency and works easily. Quick return by hand can be made when cutting odd pitch-screws without chalking gear-wheels or the use of wood stops. It is speeded highly for small work and wood turning, and has low speed also for large work.

LATHE SUPPLIED BY MESSRS. DRUMMOND BROS. TO CAPTAIN SCOTT'S EXPEDITION.

Arc Works Engineering Society.—The annual meeting and conversazione of this society was held at Chelmsford last Friday, when it was announced that a first-class pupil's premium had been awarded to Mr. C. G. S. Willet for a Paper on electric heating and cooking. Messrs. F. Jackson and W. Peyton were bracketed for the First-class Apprentices' Premium for Papers on "Metal Cutting Tools" and "Metal Founding" respectively. These premiums were presented by Col. R. E. B. Crompton, who also gave a discourse on flight and aeroplanes. Lord Rayleigh, who was present, also made a few remarks.

Sir George Gibb.—The appointment of Sir George Gibb to the chairmanship of the new Road Board, which is being constituted under the Development and Road Improvement Funds Act, 1909, is announced. In consequence, Sir George will sever his connection with the Underground Electric Railways Co. of London, the Metropolitan District Railway, and the Baker Street & Waterloo, Great Northern & Piccadilly, and Charing Cross, Euston, & Hampstead Railway Companies. Sir George Gibb will also retire from the Board of the North-Eastern Railway Co. The directors of the Underground Electric Railways Co. of London have passed a resolution recording their regret at Sir George Gibb's retirement, and expressing their appreciation of the invaluable services rendered by him to the company.

OSRAM·LAMPS

From the Wiring Contractor's Point of View

SATISFACTORY arrangements have been made between the Electrical Contractors' Association and the Cable-Makers' Association for members of the former body to receive a rebate on the orders for C.M.A. cable placed during the past year, in spite of the fact that the sales did not reach the agreed amount of £100,000.

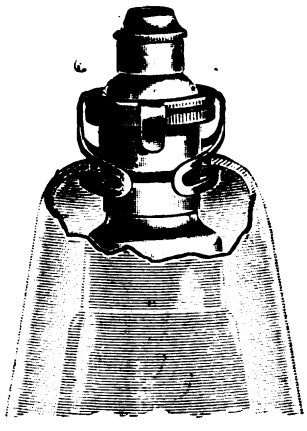
At Hull the electrical contractors are keeping a very close watch on the Corporation. It has been alleged that the Corporation are selling motors outright after hiring them to consumers. The local contractors have also apparently a grievance against the City Architect, who has been formally asked by the Hull Branch of the Electrical Contractors' Association not to include electrical items in contracts for decorations, furnishing, &c., and in specifying arc lamps and other electrical apparatus to specify the nature and size of the lamp without saying from whom they should be procured. The City Architect, remarks the Editor of the *Electrical Contractor*, evidently wishes to save poor overworked electrical contractors all unnecessary brain fag.

At the April meeting of the Hull Branch of the Association, the Honorary Secretary read a letter from the General Electric Co. *re* the sale of Osram lamps by Gamage's at lower than list prices. He was asked to thank the G.E. Co. for the steps they had taken. In connection with the action of Gamage's, we may say that we recently heard of a case in which a firm of lamp suppliers, who had been unable to obtain payment from a bankrupt creditor for certain lamps, actually found them being offered for sale by a large shop of this character in competition with the suppliers own lamps at a lower price.

Marylebone Borough Council appear to recognise the trade status of a contractor. A case recently occurred in which a consumer called in the Borough Council to remedy some defects in the installation, for which it appears that the contractor who originally carried out the work was liable. The consumer passed on the Borough Council's account to the contractor for payment, who then took the matter up with the Council's electricity department and obtained the ordinary trade rebate off the account.

There is an unfortunate dispute between the Dublin Electrical Contractors' Association and the Electrical Contractors' Association. It appears that the Dublin Branch of the Electrical Contractors' Association was dissolved in 1906, but a large number of the members formed a new association as a separate body. At a dinner of this new Association in Dublin last January, the chairman said that it was when they found that most of the money was going to England that they decided to start a branch of their own. Apparently the Electrical Contractors' Association has taken this up, and has reminded their Dublin friends that up to April, 1906, the branch was indebted to the Association to the extent of about £20, and they are pressing for payment.

Mr. E. T. Steinthal, a prominent north country member of the Electrical Contractors' Association, has recently gone out to Winnipeg, where, we learn, he has established a satisfactory business.



An average of 500 units per week have been consumed in a ten-roomed house near London during the past six months. In this house all the lighting, heating, and cooking is done by electricity. There have been radiators in use in every room practically throughout the winter, and the bath-water heating is done by a "Therol" heater. The house is occupied by a family of three adults and a child, and one servant. This consumption is regarded as satisfactory, when it is considered that no coal had been used and that much servant labour has been saved by the smaller amount of cleaning, not only in the house generally, but to the kitchen utensils, &c. Another advantage in the cooking is that there is a very great gain in efficiency over a coal fire, or even a gas stove, by the fact that the precise time for cooking any particular dish is always constant, and does not depend on the state of the fire or the pressure of the gas.

In connection with the overhauling, re-wiring, &c., of the electrical installation at the Marylebone Public Baths, the Electricity Committee have now offered to do the work at prime cost plus a small percentage for supervision. If this is not accepted, they regret they will be unable to comply with the request for Mr. Seabrook, the General Manager, to prepare a specification upon which tenders could be invited. The General Manager stated that the job is a complicated one, and that he would prefer to do the work himself rather than take the responsibility of supervising a contractor. Under these circumstances the Baths Committee have requested their chairman to give notice of a motion in the Council to the effect that the Electric Supply Committee be permitted to carry out the work at prime cost plus a small percentage for supervision.

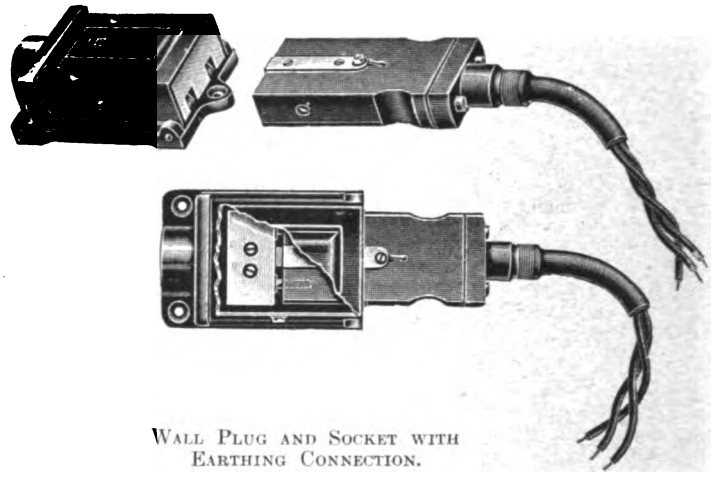
THE QUARTERLY GENERAL ELECTRIC PROGRESS SHEET



THE May issue of the "*General*" *Electrical Progress*, dealing with the past quarter, contains a description of some feeder pillars which the General Electric Co. (67 Queen Victoria Street, London, E.C.) have recently supplied to India (see ELECTRICAL ENGINEERING, February 10th, page 97), and describes recent patterns of stage and cinematograph arc lamps, &c., vacuum cleaners, reflectors, heating appliances, Aron meters, shade carriers, and a special series of lampholders, wall plugs, &c., with earthing terminals to comply with the Home Office Regulations.

NEW SHADE HOLDER FOR DEEP SHADES.

A convenient piece of apparatus which has been introduced for use with alternating-current cinematograph lamps is a combined transformer and choking coil, arranged so that exact adjustments can be made on the choking coil by an eccentric lever arrangement without altering any electrical connections.

We illustrate here a new shade carrier specially adapted for use with the deep shades which metal filament lamps necessitate. No shade ring pliers being required—the carrier clipping over the top cap and dome of the lampholder—it provides a ready and very simple means of fixing the shade, which can be hung quite rigid and more quickly than when the ordinary screwed shade ring is used. One of the forms of plug with earthing connection referred to above is also illustrated. This is so arranged that the earth connection is made first and broken last, an essential feature of the new requirements. Among other items dealt with is a wind-direction indicator suitable for clubs, hotels, &c. The vane mounted on the roof is provided with a staff at the base of which is a hollow box containing a series of contact studs. The wind in turning the vane causes a contact-making brush to rub these studs, which are in direct connection with the indicator below. This consists of a series of miniature Osram lamps mounted in cell-like compartments in a polished hardwood case, with a front of opal glass upon which the points of the compass are engraved. Upon completing the circuit by a push-button, the lamp corresponding to the direction from which the wind is blowing is illuminated.

WALL PLUG AND SOCKET WITH EARTHING CONNECTION.

The list contains descriptions and prices of other new accessories, and, as there will doubtless be a great demand for it in the retail trade, any of our readers desiring copies should make early application to the company.

LOCAL NOTES

ASTON: *Electricity Profits.*—The net profits on the electrical undertaking for the year to March 31st amounted to £4,694, against £2,941 in the previous year. It is proposed to place £2,000 to a reserve fund, and to hand over £2,600 in aid of the rates.

BATH: *Trunk Telephone Communication.*—In answer to a communication from the local Chamber of Commerce, as to inefficiency in the trunk telephone service to South Wales, the Postmaster-General is unable to find any evidence of this. He points out that two new trunk lines have been recently provided between Bristol and Cardiff, and one between Bristol and Newport, and four additional Bristol—Cardiff circuits are in course of construction. The extensions will, it is expected, materially improve the service to South Wales.

BEXLEY: *Inaccurate Tramway Meters.*—The Electrical Engineer reports his belief that the B.T.-H. meters used for measuring the tramway energy are reading inaccurately. The three meters are to be tested *in situ* by the London County Council.

BLACKBURN: *Tramway and Electricity Profits.*—*The* accounts of the Tramways Department show a profit of £453 for 1909–10, against a loss of £4,803 in the previous year. There was a net profit, after meeting capital charges of £1,388 upon the electricity undertaking. This has been placed to reserve.

BLACKPOOL: *Electricity and Tramway Profits.*—The net profit on the electricity undertaking last year was £6,500, and on the tramways undertaking £9,430.

DUBLIN: *Electricity Deficit.*—A ratepayer having objected to the inclusion in the rates of a sum of £4,000, part of the loss on the electricity undertaking, the Town Clerk has taken counsel's opinion, and is advised that the Corporation is entitled to include this sum in the rates.

HARROGATE: *Street Electric Lighting.*—The Council have unanimously passed the Electrical Engineer's scheme for an additional 500 lamps to be converted from gas to electricity. Competitive schemes have been submitted by both the gas and electricity undertakings, and the saving by substituting electricity was found to be a very substantial one. The cost per post to be charged to the Lighting Committee for a 50-c.p. lamp, including renewals and all accessories, is 17*s.* per annum, the lamp being extinguished at midnight.

LONDON: *Bethnal Green.*—A recommendation by the Electricity Committee that a supply of electrical energy in bulk should be taken from the Shoreditch Council was discussed at the last meeting of the Council. On an estimated annual consumption of 300,000 units, the total costs were put at £2,952, and, after meeting the amount payable to the Shoreditch Council, a profit of £48 was looked to in the first year. Repairs to mains were estimated to cost £50 a year; financial management, collections, books, stationery, &c., £150; rates, taxes, and insurance, £120; and capital charges, £1,119. Some discussion took place upon the proposition during which exception was taken to the estimate of £50 per annum for repairs to mains worth £25,000, and that the charge for financial management was much too small. The Council decided in favour of the principle of the proposal, but referred to report back for further consideration of details by the Electricity Committee.

MIDDLESBROUGH: *Electricity Profits.*—The net profit upon the electricity undertaking for the past year amounted to £1,301, against £1,277 in the previous year. The number of consumers increased by 144.

MORLEY: *Electricity Accounts.*—The accounts of the Electricity Department for 1909–10, after meeting all capital charges, show a deficit of £792, against £1,799 in the previous year.

NEWCASTLE-ON-TYNE: *Trolley Omnibus.*—It is probable that the Corporation will promote a Bill next session in which powers will be sought for tramway extension, with authority to use trolley omnibuses.

RIO DE JANEIRO: *Electric Supply Concession.*—A *Central News* cable from New York states that the Brazilian High Court of Justice has issued an injunction against the Companhia Brazileira de Energia Electrica, restraining that company from exercising a concession to supply electric light and power for a period of ninety years, in competition with the Rio de Janeiro Tramway, Light, & Power Co. The Court holds that the latter company has the exclusive concession for the purposes mentioned.

ROTHERHAM: *Electricity Profits.*—The Electric Light Committee have come to the rescue of the Finance Committee, who have found themselves with a big deficit, by voting £2,000 out of the profits of the electrical undertaking.

WARRINGTON: *Electricity and Tramway Profits.*—The net profit on the electricity undertaking for the past year amounted to £1,697, against £943 for the previous year, and on the

Digitized by Google

tramways undertaking £2,750, against £2,307 for the previous year.

WEDNESBURY: *Electricity Accounts.*—The electricity undertaking showed a profit last year for the first time, there being a balance of £142, after meeting capital charges.

WEST HARTLEPOOL: *Electricity Accounts.*—After meeting capital charges, the electricity accounts for 1909-10 show a net profit of £1,128, which is to be added to reserve.

Proposed Tramway Purchase.—The Hartlepools Electric Tramway Co. have, in order to avoid arbitration, offered to accept £22,000 for the sections of their undertaking, concerning which the Council have given notice of purchase.

WIGAN: *Electric Supply Accounts.*—There was a profit on Wigan electricity works of £3,952 for the past year, to which was added the sum of £1,472 brought forward from the previous year, giving a total of £5,424. Of this there has been transferred to capital account as ordered by the Local Government Board a short time ago, the sum of £4,472, add to which is the loss on Pemberton, £1,746, making £6,218. There was therefore a deficit of £794 on the year's working.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

CANADA.—The Winnipeg Board of Control require tenders by May 16th for transformers and switchgear. This information is only of value to firms having agents in Canada, whom they can instruct by cable.

COLCHESTER.—An inquiry has been held into an application by the Council for a loan of £8,000 for mains and house services.

DARLINGTON.—A loan of £1,500 for extensions to the condensing plant at the electricity works is to be applied for.

DERBY.—A loan of £9,850 for a motor-generator, mains, services, meters, &c., is to be applied for.

DUBLIN.—A loan of £76,320 has been taken up with the Liverpool Victoria Legal Friendly Society by the Electricity Committee.

GRIMSBY.—A loan of £6,459 for electrical purposes has been sanctioned.

HECKMONDWIKE.—A loan of £24,159 is to be applied for. Of this, however, £19,959 represents excess expenditure over existing borrowing powers. The additional capital is required for condensing plant, cable, and services.

IRELAND.—The Monaghan Council have adopted an electric lighting scheme, prepared by Messrs. Curran Bros., of Belfast.

LEICESTER.—A 750-kw. mixed pressure turbo-generating set, condensing plant, switchboard, boilers, &c., are required by the Tramway Committee. Particulars from the Tramway Engineer, and tenders by May 25th.

LONDON: *Southwark.*—An exhaust steam turbine, condensing plant, cooling tower, and switchgear is to be installed at an estimated cost of £6,909.

NETHERLANDS.—Plans and specifications are being drawn up for electricity generating stations in the towns of Deventer and Zwolle, in the province of Overijssel.

NEWPORT (MON.).—Two 400-kw. motor-generators (three-phase to direct current), one 600-kw. motor-generator (three-phase to single-phase), and a three-wire booster are required by the Corporation. (See an advertisement an another page.)

ROCHDALE.—The Corporation require battery accumulators, reversible booster, and switchboard panels. Particulars from the Borough Electrical Engineer, and tenders by May 25th.

WALLASEY.—The Council require tenders by May 30th for two years' supply of alternating-current transformers.

WEST BROMWICH.—A new turbo-generator is to be installed. New mains are also to be laid.

WEYMOUTH.—An inquiry was held last week concerning a loan of £1,970 for mains and mechanical stokers. There was little opposition.

YORK.—A loan of £1,500 is to be applied for to extend the condensing plant at the electricity works.

Miscellaneous

BIRKDALE.—Additional street electric lighting is to be put in hand.

CLACTON.—The Council invite tenders for electrical service fittings, and joint box compound. Particulars from the Clerk, and tenders by May 23rd.

HANDSWORTH.—A loan of £19,150 has been granted in connection with the purchase of the cable tramways, and their reconstruction for electric traction.

LONDON: *St. Pancras.*—The Council require 21 flame arc lamps with 20 suitable cradles. (See an advertisement on another page.)

URUGUAY.—The Ministry of the Interior has granted to Don Antonio Rossi a concession for the establishment of a telephone service at Villa del Carmelo (Colonia).

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

S.E.—Cinematograph theatre, Ventry Place, Walworth Road. Architects, Gilbert & Constanduros, 43 Finsbury Square, E.C.

Public slaughterhouses, Deptford, S.E. (£20,000). F. Summer, Engineer, City of London Corporation, Guildhall, E.C.

W.C.—Nurses' home at Holborn Workhouse (£2,500). A. S. Snell, 32 Southampton Buildings, Chancery Lane, W.C.

PROVINCES.

BECKENHAM.—The Council invite tenders for the electric wiring of houses in their district. Particulars from the Borough Electrical Engineer, and tenders by May 23rd.

BIRMINGHAM.—Factory, Edward Street. Builders, Sapcote & Sons, Camden Street.

Factory, Regent Place. Builders, G. Webb & Son, Soho Hill.

CANTERBURY.—Extensions, School of Art (£2,453). Builder, C. Mount, Canterbury.

COLWYN BAY.—Pavilion (£1,200). Builders, Woodhouse & Co., Nottingham.

CROYDON.—Tenders are invited for the wiring of the two isolation pavilions and additions to the administrative block of the Borough Hospital. Particulars from the Town Clerk, and tenders by May 26th.

DERBY.—Nurses' Home. Builders, Ford & Sons, Summer Hill, Derby.

DONCASTER.—Technical institute. Schofield & Berry, architects, 61 Albion Street, Leeds.

DUMFRIES.—Crichton Royal Institution (£12,000). Architects, Mitchell & Wilson, 13 Young Street, Edinburgh.

GATESHEAD.—Police station (£3,000). Architects, Fenwick & Watson, Pearl Buildings, Newcastle.

MIDDLESBROUGH.—Reconstruction of markets (£25,000). S. E. Burgess, Borough Surveyor, Town Hall, Middlesbrough.

PONTYPOOL.—Bank, Crane Street, for the London, City & Midland Bank.

SHEFFIELD.—Baths, Corporation Street (£7,250). City Architect, Town Council.

TENDERS RECEIVED AND ACCEPTED

DUBLIN.—Messrs. R. Waygood & Co., Ltd., who have already installed their automatic push-button lifts in Buckingham Palace and Marlborough House, have just received the order to fit a similar lift in the Viceregal Lodge, Phœnix Park, Dublin, for the use of his Excellency the Lord Lieutenant.

EDINBURGH.—The tender of the Lahmeyer Electrical Co., Ltd., has been accepted for the supply of cable for one year at £5,866. Complaint was made at the last Council meeting that a British tender had not been accepted, but it was pointed out that the lowest British tender was £600 more than the accepted one.

GLOUCESTER.—The tender of Messrs. Geipel & Co. for the supply of carbons at £112 (the lowest) has been accepted.

LONDON: *Bermondsey.*—The Council have accepted the following tenders:—Meters, British Thomson-Houston Co., Ltd., and Ferranti, Ltd.; demand indicators, Reason Manufacturing Co., Ltd.; cut-outs, General Electric Co., Ltd.

St. Pancras.—The Council have received the following tenders for arc lamp carbons:—Sloan Electrical Co. (accepted), £687 15s.; William Geipel & Co., £744; H. G. Mayer & Co., £756; Crompton & Co., Ltd., £763 15s.; Ship Carbons, Ltd., £774 10s.; G. Baulik, £813 15s.; General Electric Co., Ltd., £922 18s.; Siemens Bros., Ltd., £1,279 8s. 11d.; Sirius-Werke, £1,386; Johnson & Phillips, Ltd., £777.

SALFORD.—The Council have accepted the following tenders:—Circuit breakers, Cowans, Ltd.; switches and cut-outs, Electrical Co., Ltd.; bitumen cables and bare copper stranded wire, W. T. Glover & Co., Ltd.; copper fuse wire and white tape, Johnson & Phillips, Ltd.; high- and low-speed motors, ½ to 7½ h.p., Verity's, Ltd., and General Electric Co., Ltd.; 10 to 15 h.p., Electric Construction Co., Ltd.; 20 to 50 h.p., Lancashire Dynamo & Motor Co., Ltd.

MANCHESTER.—The Electricity Committee have accepted the tender of a Milan firm for low-tension house-service cable. The chairman of the Electricity Committee said this tender had been accepted in view of the combination of English cable-makers to keep up prices. In the present case there would be a saving of £158.

WALTHAMSTOW.—The tender of Messrs. Siemens Bros. Dynamo Works, Ltd., Tyssen Street, Dalston, London, N.E., has been accepted by the Council for the supply of "tantalum" lamps.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 to £58 10s. per ton. (Last week, £57 15s. to £58 5s.)

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—A meeting of creditors of the late Mr. F. H. Medhurst, Electrical Engineer, 13 Victoria Street, London, was held last week. The claims amounted to £117,309, including: Lord Armstrong, £53,642; P. Saunders, £37,420; Earl of Verulam, £1,700; Viscount Grimston, £8,534; and Capt. H. J. de la Condamine, £2,150. The assets are said to consist of shares in various companies. Messrs. F. S. Salaman and F. W. Pixley were appointed trustees.

A meeting of the Himalaya Electric Railway, Ltd., will be held at 28 Chapel Street, Liverpool, on June 10th, at 11.30 a.m. to hear the liquidator's account of the winding up.

BUFFOLINE GEARS.—Messrs. Davies & Ransome, Caxton House, Westminster, London, have been appointed sole agents in London and the south of England for the Buffoline Noiseless Gear Co., of Levenshulme, Manchester.

DISSOLUTIONS OF PARTNERSHIP.—Messrs. Morgan Williams & Couzens, consulting electrical engineers, 39 Victoria Street, London, are dissolving partnership. Mr. H. W. Couzens will continue.

F. B. Hellon and H. P. Twyerner, electricians, 57 Moorfields, Liverpool, have dissolved partnership. The former continues.

MESSRS. VERITY'S GLASGOW BRANCH.—Our Glasgow correspondent writes that a great deal of surprise was expressed when it became known throughout electrical circles in Glasgow that the above firm had suddenly decided to close their warehouse and showrooms in this city and to maintain only a comparatively small branch office. The present staff numbers somewhere about twenty to twenty-two persons, we believe, and a good deal of sympathy is felt for those members of the staff who are not to remain on at Glasgow or to be transferred. The new office is to only have a staff of some four people, under the direction of Mr. Andrews, the present manager.

ELECTRICAL FOOTBALL LEAGUE.—The annual general meeting will be held on May 18th at the offices of the St. James' & Pall Mall Electric Supply Co., 19 Carnaby Street, Golden Square, W. All football clubs attached to firms in the electrical trade within fifteen miles' radius of Charing Cross are invited to send two representatives, as the Council are anxious to increase the number of clubs. Full particulars of the League can be had from the Hon. Secretary, Mr. H. W. Roberts, 71 Queen Victoria Street, E.C.

COMPANIES' MEETINGS AND REPORTS

JOHNSON & PHILLIPS.—The accounts for 1909 show a gross profit of £16,040, after charging £3,691 for maintenance of buildings, plant, &c. Directors' fees, debenture stock interest, debenture sinking fund reserve, and second debenture interest absorb £15,098, and the balance of £942 is carried forward. The gross profit exceeds that of the previous year by £5,322.

URBAN ELECTRIC SUPPLY CO.—At the meeting on May 4th, Mr. P. D. Tuckett pointed out that a moderate writing down of capital would be necessary if an early resumption of dividend was to be made. He foreshadowed a new agreement with Edmundson's Electricity Corporation.

BRITISH WESTINGHOUSE ELECTRIC & MANUFACTURING CO.—Mr. J. A. Bryce, the chairman of the company, presided at the annual meeting on Monday, and said there were distinct signs of improvement in the electrical industry. During a time of keen competition, the company were specially handicapped by having works much too large for the amount of business available, and their only policy was to carefully foster economy in all departments. He thought it was a satisfactory feature in the accounts that there was a difference of over £17,000 to the good compared with 1908. Mr. J. A. Lange, Works Manager, has been elected to a seat on the Board.

CARLISLE TRAMWAYS CO.—A circular has been issued to the shareholders, pointing out the very depressed condition of the company's business, and recommending that an offer for the purchase of the undertaking at £7,000, subject to the debenture holding of £41,000, be accepted. If the proposal is carried out, the ordinary £1 shares will be purchased at 2s. 2d. each.

DIVIDENDS ANNOUNCED. Eastern Telegraph Co., final dividend making 7 per cent. for the year on the ordinary shares.—Eastern Extension, Australasia & China Telegraph Co., final dividend on the ordinary shares making 7 per cent. for the year. West African Telegraph Co., final dividend on the ordinary shares making 4 per cent. for the year.—Callenders Cable & Construction Co., 10 per cent., with a bonus of 5s. per share.

The Royal Society.—Prof. B. Hopkinson and Mr. F. Soddy have been elected Fellows of the Royal Society.

APPOINTMENTS AND PERSONAL NOTES

The short list of candidates for the post of Borough Electrical Engineer at Torquay, in succession to the late Mr. P. Storey, was as follows:—Messrs. A. W. Clegg (Accrington); J. M. Keenan (Torquay); J. W. Turner (Huddersfield); B. S. Hornby (Bolton); C. N. Hefford (Leeds); and S. W. Salt (Bradford). The choice of the Electricity Committee fell upon Mr. Salt, Chief Assistant at Bradford, and this has been confirmed by the Council.

At the last meeting of the Acton Electricity Committee, it was decided to request Mr. J. M. Blair, the Borough Electrical Engineer, to resign. When the proposal came before the Council, however, it was negatived by 12 votes to 9.

It is with great regret that we hear of the resignation through ill-health of Mr. V. A. H. McCowen, chief electrical engineer to the Salford Corporation. The Salford Electricity Committee have placed on record their appreciation of Mr. McCowen's valuable services to the Corporation and the ratepayers, and wish him a speedy recovery. A successor is to be advertised for at a salary of £700 per annum, rising to £800.

The St. Pancras Electricity Committee has promoted Mr. G. T. Rawson, second clerk, to the position of first clerk, at a salary of £150, increasing annually by £10 to £200.

Mr. H. C. Quinn, of the Bristol Tramways & Carriage Co., has been appointed Assistant Superintendent of the Bombay Tramways Co.

The late Mr. Frank Dawes, a director of the Underground Electric Railways Co. of London, who died on April 5th, left £51,469.

A draughtsman is wanted with experience in electrical starters, controllers, and other switchgear. (See an advertisement on another page.)

Telegraph Traffic.—The route between Bagdad and Bassorah was restored on the 3rd inst., while communication between Mozambique and Majunga, and between Madagascar and the Island of Réunion, was down on the same day. The cables between Souakim and Djedda and Bonny Duala broke on the 6th inst., and May 9th saw the failure of communication between Saigon and Bangkok, traffic being sent *via* Pakse Obone with delay. The Saigon-Bangkok route was again restored on the 9th inst. The Madagascar—Réunion Cable was restored on the 10th inst.

Advertising Electricity in London.—The Electric Supply Publicity Committee of London and District, whose show-card and poster advertising the advantages of electric lighting have already been referred to in these columns, has now issued similar advertisements illustrating electric ironing. The poster (40 in. by 25 in.) is lithographed in five colours, and the show-card (15 in. by 20 in.) is of identical design and colouring. An illustrated four-page folder touching on the various domestic uses of electric power, and a tastefully coloured post-card illustrating electric ironing have also been designed.

A NEW ALTERNATING CURRENT INSTRUMENT

A NEW aperiodic millivolt and amperemeter which can be used either for continuous or alternating currents, is being put on the market in this country by Messrs. Isenthal & Co. (85 Mortimer-street, W.). The instrument itself is of the ordinary moving coil permanent magnet type, with shunts for current measurement and resistances for voltage measurement, and is made suitable for alternating as well as continuous current by the following ingenious arrangement.

The moving coil is placed across two opposite corners of a Wheatstone bridge, of which the four branches are built up of thermo-elements, in the manner shown in the figure. The two other corners of the bridge are connected to the two terminals of the instrument, so that the current to be measured, directly traverses the thermo-elements, and thus heats them. The

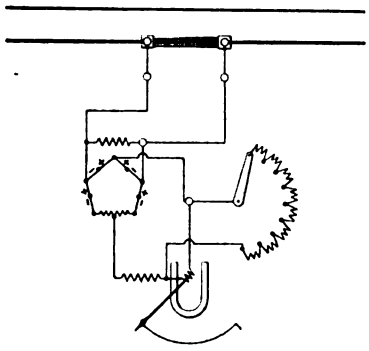

Diagram of Connections.

thermo-elements are placed in series in the two lateral branches from the connecting points to the moving coil, and they are paralleled in these points so that the moving coil is traversed by the thermo current of two paralleled groups of thermo-elements in series. By means of suitably arranged compensating resistances, the branches of the bridge are so adjusted that it is impossible for any part of the thermo current to enter the outer leads or for any branch current to be measured to enter the thermo-elements. An adjustment for the temperature of the atmosphere is provided.

This arrangement renders all the advantages of the moving coil permanent magnet instrument available for alternating as well as continuous currents. It is not affected by periodicity or wave form, and is, of course, independent of the effects of stray fields.

BOOK REVIEWED

Manual of Electrical Undertakings and Directory of Officials, 1910. Compiled by E. Garcke. Fourteenth Edition. 1,774 pp. 8½ in. by 5½ in. (London: *Electrical Press.*) 21s.

The fourteenth annual edition of Garcke's Manual, recently published, contains statistical and general information relating to about 3,000 electrical undertakings. When it is pointed out that the first edition, published in October, 1896, contained particulars of only 200 undertakings, the enormous growth of the electrical industry—and consequently the value of the Manual—will be appreciated. But the Manual does something more than bring together available and scattered information in a concentrated form; it supplies information which is not obtainable in any other publication, and must not be regarded as in any way clashing with the electrical directories. A valuable feature is a list of members of the principal Electric Lighting and Tramway Committees, with their addresses; whilst a new departure has been made in a directory of electrical contractors, in which the special business of each firm is indicated where possible. As a record, compiled from official sources, of all electrical companies formed under the Joint Stock Acts, of all electrical undertakings belonging to local authorities in Great Britain and Ireland, and of electrical undertakings in the Colonies and all British Possessions, Garcke's Manual is unique, and is unapproached by any other publication relating to the electrical industry. It consists of 1,774 pages, and not the least valuable portion is the special series of over 60 maps relating to tramways and electric power undertakings. A map is also reproduced showing the routes of underground telegraph lines in the United Kingdom.

Asbestos-Covered Wire for Tramcar Controllers and Motor Starters.—At the offices of the Concordia Electric Wire Co., Ltd. (Crown Parade, Cricklewood Lane, N.W.), we were recently shown some asbestos-covered wire, which appears to be extremely suitable for tram-controller connections and motor starters. The asbestos covering presents a smooth and compact surface, which is fairly hard, and it does not disintegrate or become loose even when exposed to very high temperatures.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

GEARS.—We have received a folder, having written on the cover, "Have you heard of us?" On opening this we are met by the word "No," and then "Why?" and on unfolding the sheet inside, the answer appears, "Because we are noiseless." This refers to the gears of the Buffoline Noiseless Gear Co., Ltd. (Levenshulme, Manchester).

TELEPHONES.—A new catalogue from the Sterling Telephone & Electric Co., Ltd., 200 Upper Thames Street, E.C., describes the Sterling common battery automatic intercommunication system, in which one common battery supplies the ringing and speaking current for the entire system. The instruments are made with radial or multiple lever selector switches. A special cell, known as the Invicta sac cell, with specially low resistance and large capacity, is listed for use with these telephones, and a multiple cable, with two extra heavy conductors, for the battery lines, is also included in the list, with various accessories.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

STEAM TURBINES.—The construction of the Oerlikon mixed pressure steam turbine is dealt with in a new leaflet issued by the British Department of the Maschinenfabrik Oerlikon (34–35 Oswaldestre House, Norfolk Street, Strand, W.C.). The special feature of this turbine lies in the fact that the exhaust or low-pressure steam works in two separate low-pressure turbine sections, one of which is directly connected in series with a high-pressure turbine the moment the machine is to run with live steam alone.

FLEXIBLE CABLES WITH EARTHED CORE.—A leaflet from Messrs. W. T. Henleys Telegraph Works Co., Ltd., describes several types of twin flexible cables, provided with earthing cores to meet the requirements of the Home Office Regulations for factories and workshops.

CARS FOR LIFTS.—Particulars of a number of handsome designs for lift cars, both in wood and iron, are given in a new catalogue from Messrs. A. & P. Steven (Thanet House, 231–232 Strand, W.C.). Some views are also included of the company's works at Glasgow, where these are made.

TECHNICAL BOOKS.—The latest catalogue of new books and new editions added to Messrs. H. K. Lewis & Co.'s Medical and Scientific Circulating Library, 136 Gower Street, W.C., contains a number of works on electrical engineering and science.

COMMUTATING-POLE MACHINES.—Messrs. T. W. Broadbent, Ltd. (Victoria Electrical Works, Huddersfield), are issuing an illustrated leaflet calling attention to the fact that they have modified the design of their standard 440 volt-460 volt D.C. machines, and are now fitting them, both motors and generators, with commutating poles. This ensures large overload capacity and sparkless running with fixed brush position. The machines have some interesting features. In the larger sizes, longitudinal ventilating ducts are carried right through the commutator.

GOVERNORS.—A catalogue from Messrs. Jens Orten-Böving & Co. (9½ Union Court, Old Broad Street, E.C.), gives full particulars of the Jahns combined centrifugal and inertia governor. This apparatus is made for every class of engine, and the weights, springs, &c., are entirely enclosed. A very high degree of sensitiveness is claimed with the slightest trace of instability.

THE SIEMENS WOOLWICH AND DALSTON WORKS.—We have received from Messrs. Siemens Brothers & Co., Ltd. (Caxton House, Westminster), a copiously illustrated book describing these two works. The Woolwich Works was established in 1864, and until 1905 was the headquarters of the dynamo, motor, and heavy electrical engineering branches of the business, as well as the submarine and other cables, telegraph, and apparatus department, &c. The dynamo work was however, transferred to Stafford in 1905, but not only were the shops thus vacated immediately filled by the cable department, but considerable extensions were required as well, including new battery and insulator shops, &c. A glance through the illustrations gives a good idea of the variety of the work and the large scale on which it is carried out, and the views of the various telephone and lead cable shops, as well as of the instrument adjusting, testing, and calibrating rooms, are of particular interest. The railway signalling department also has its manufacturing headquarters here. The works at Tyssen Street, Dalston, was established for the manufacture in this country of tantalum lamps, and the book follows through the various stages of the preparation of bulbs, mounting of the filaments, and exhausting, finishing, and testing of the lamps. Messrs. Siemens' customers and, indeed, many others will find much of interest in this book.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 5th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

5,891/09. **Wiring Fittings.** J. J. RAWLINGS, H. W. HANCOCK, and A. H. DYKES. A clip for fixing cables or wiring conduit consists of a saddle of resilient metal with a long lug arched over on itself. Opposite holes are made in the upper and lower portions for the nail. The lug is thus put in compression. There is less risk of damaging the conductor when hammering in the nail, as the head is on a level with the saddle. A bridging piece for several conductors is also described. Three claims, eleven figures.

8,979/09. **Earthing Switch for Three-phase Generators in Parallel.** BRITISH THOMSON-HOUSTON CO., LTD., E. B. WEDMORE, and J. WITCHER. When three-phase alternators are running in parallel, it is usual to earth the neutral of only one, in order to avoid circulating currents due to the third and ninth harmonics. According to this invention, double-throw switches, mechanically operated by the main switches, are interposed between the neutrals and the earth connection, and so interconnected that only one machine is earthed at a time. If this particular machine is switched out, one of the other machines is earthed automatically without breaking the earth connection. In an alternative arrangement the earthing switches are operated electrically by solenoids controlled by auxiliary contacts on the main switches. Nine claims, four figures.

9,318/09. **Lamp Globe and Reflector.** S. HORVATH. A spheroidal, shaped glass globe, silvered at the back and adapted for use with a tubular incandescent lamp. (See ELECTRICAL ENGINEERING, Vol. V., p. 631.) Two claims, four figures.

16,476/09. **Centrifugal Fan.** ALLDAYS & ONIONS PNEUMATIC ENGINEERING CO., LTD., and E. L. JOSELIN. A two-part centrifugal fan casing is fixed to the driving motor bedplate by means of a ring-shaped bracket, the central hole of which coincides with the inlet aperture of the fan casing. The bracket is either integral with the motor bedplate or has a foot for bolting to it. Three claims, three figures.

17,368/09. **Telephone Transmitter.** F. GOTTSCHALK. The effect of the sound waves on the diaphragm is intensified by focussing them at the centre. This is accomplished by attaching a cup-shaped device to the centre of the diaphragm, the concave surface facing the aperture in the mouthpiece. The cup also protects the diaphragm from dust and moisture. A microphone contact consisting of a small asbestos chamber, with partitions filled with carbon granules, is also described. Four claims, five figures.

17,389/09. **Ships' Course Recorder.** W. H. HENNAH and A. K. W. RISSEL. The movements of a compass card are caused to vary the current in a circuit which includes an electromagnetically controlled clockwork mechanism. The latter records the variations of the compass. Five claims, two figures.

19,209/09. **Indicating Fuses.** BRITISH THOMSON-HOUSTON CO., LTD. (*General Electric Co., U.S.A.*). The fuse is enclosed in a fibre cartridge, and an auxiliary fine wire fuse in parallel with the main fuse is threaded through apertures in the wall of the tube, so that a short portion lies on the outside of the tube. Over this is placed a piece of rice paper impregnated with potassium chlorate, and coated with collodion to keep it dry. A label with an aperture to enable the condition of the rice paper to be seen is pasted over the whole. When the main fuse blows, the fine wire blows and burns the rice paper. A recess is made in the outer wall of the tube under the wire to provide air and prevent the conducting away of the heat. Four claims, four figures.

27,641/09. **End Connections of Windings.** BRUSH ELECTRICAL ENGINEERING CO., LTD., and G. J. PORTER. Two saw-cuts are made in the ends of each of the two bars to be connected, and after inserting these ends into the rectangular connecting tube, a metal wedge is driven in between the two bars. The two outer ends of each of the split bars are then bent over so as to lock the tube and wedge respectively. The connection may be sweated up if desired. One claim, three figures.

65/10. **Telephone Relay.** C. STILLE. Two coils wound in opposite directions and connected in series are placed side by side in a strong magnetic field, the axis of the coils being at right-angles to the direction of the field. A stationary iron core is inserted in the coils to increase the flux. The two coils are pivoted or suspended and are kept in position by a spring or torsional wire. Attached to each coil is a carbon block, and between the two blocks are carbon balls forming a microphonic contact. Weak telephone or other currents in the coils cause them to move in opposite directions and vary the pressure on the microphone contact. This variation in pressure reproduces the original current waves in the secondary circuit containing this microphone contact. Three claims, one figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: OSTERBURG [Suspension gear] 22,941/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: AMES [Conduit manhole covers] 14,898/09.

Dynamos, Motors, and Transformers: ALLGEMEINE ELEKTRICITÄTS GES. [Machines] 6,512/09; THOMSEN and CHRISTENSEN [Driving Small dynamos for cycle lamps] 27,810/09.

Electric Ignition: BLOXAM (*R. Bosch*), 19,306/09; GILLIES and MCPHEE [Electric blasting fuses] 23,302/09; DEIMEL [Electric gas-igniter] 24,500/09.

Electrometallurgy and Electrochemistry: WILLIAMS, BRADLEY and BRADLEY [Electrolytic cells] 9,796/09; BENKÖ [Carbon electrodes for cells] 12,677/09.

Incandescent Lamps: REGNART [Reflector lamps] 15,115/09.

Storage Batteries: O'KILL, 8,875/09.

Switchgear, Fuses, and Fittings: SILL [Controllers] 9,349/09; VON ZWEIGBERGK [Protection of H.T. d.c. motors running in series] 11,304/09; VANDERVELL and MIDGLEY [Switchgear for small lighting installations] 18,665/09; PETZET [Combined lamp shade and reflector] 21,044/09.

Telephony and Telegraphy: SIEMENS BROS. & CO. (*Siemens & Halske A.-G.*) [Semi-automatic telephone exchanges] 9,055/09; SAYERS [Protection of telephone circuits from disturbance by traction systems] 15,158/09; HUFSCHMIDT and WAGNER [Telephone mouth-pieces] 23,269/09; COMPAGNIE GÉNÉRALE RADIOTÉLÉGRAPHIQUE CARPENTIER, GAIFFE, ROCHEFORT [Wireless telegraphy and telephony] 25,542/09; SIEMENS BROS. & CO. (*Siemens & Halske A.-G.*) [Telephone exchanges] 3,400/10.

Traction: LLOYD-DAVIES and NOVELLI [Speed indicators] 8,815/09; ABRAHAM and BRITISH PNEUMATIC RAILWAY SIGNAL CO. [Relays for signalling apparatus] 13,831/09; KITTO [Operating points] 15,386/09; GIBSON [Air brakes] 25,911/09.

Miscellaneous: BEVILLE [Illuminated signs] 21,725/08; VICKERY [Signalling apparatus] 1,948/09; HOLLINGHURST [Illuminated signs] 9,250/09; FELTEN & GUILLEAUME-LAHMEYERWERKE A.-G. [Transporting mechanism] 25,590/09; GRUNDY [Insulated shaft-couplings] 4,093/10.

The following Specification is open to Inspection at the Patent Office before Acceptance, but is not yet published for sale.

Dynamos, &c.: ALLGEMEINE ELEKTRICITÄTS-GES. [Control of A.C. induction motors] 8,621/10.

Amendments Allowed.

19,520/03. **Control of A.C. Commutator Motors.** C. F. SCOTT. The British Westinghouse Electric & Manufacturing Co., Ltd., have been given leave to amend this specification.

28,546/07. **Track Brake.** E. FREUND. Leave has been granted to amend this specification subject to certain modifications.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

10,718 of May 18th, 1896. **Storage Battery Plates.** H. O. TUDOR. A modification of the Planté process for forming positive plates. Lead plates are charged in weak acid as positive electrodes and discharged at intervals until a thick porous layer of oxide is formed containing sulphate. They are then charged as negative electrodes until the oxide is reduced to spongy lead. Finally, they are repeatedly charged and discharged as positive electrodes in strong acid until the layer is completely converted into peroxide.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: SIEMENS BROS. & CO., A. E. FOSTER and H. J. NOTT [Cable conduits] 1,148/00.

Dynamos, &c.: E. E. NOLAN [Mounting core plates on spiders] 16,489/97.

Electric Ignition: R. H. JONES [Contact-breaker and switch] 883/05.

Electrometallurgy, &c.: E. ANDREOLI [Ozone generator] 1,356/03; H. PAWECK [Refining of zinc] 1,688/02.

Switchgear, &c.: J. G. LANG [Motor controller] 1,374/04; H. P. DAVIS and F. CONRAD [A.C. reverse energy cut-outs] 352/05.

Traction: C. H. JERRARD [Rail cleaner] 1,323/02; A. J. BOULT (*J. E. Forsyth*) [Air brake couplings] 1,610/02.

Miscellaneous: O. RENNERT [Temperature control apparatus] 1,704/04.

SUMMARY

We regret to announce the death on Tuesday of Major Philip Cardew, R.E. (Page 318.)

The new type of Edison alkaline storage battery differs from the previous patterns in the construction of the pockets of the positive plate and the composition of the active materials. Nickel hydrate mixed with nickel flakes is used for the positive, and iron oxide and mercury for the negative pockets. We are enabled to publish some curves from tests, and also the results of the trials made in New York with a small tramcar equipped with the new cells. (Page 319.)

In a Paper read recently before the Physical Society, Mr. B. S. Cohen gave results of some experiments on telephone currents in loaded and unloaded lines. (Page 320.)

We describe a large electric power system which is being completed in the Argentine, involving the lighting and tramways of the town of Bahia Blanca, and power supply to the harbour. The article includes a plan and section of the station, and detailed description of the new Browett-Lindley expansion gear and the Leblanc condensing plant. (Page 321.)

The Papers to be read at the Annual Congress of the Tramways and Light Railways Association, which has been postponed as a mark of respect to the late King, have been published. Mr. R. S. Tresilian gives a historical account of the Dublin tramway system, a proposed standard brake shoe is described by Mr. J. A. Panton, Mr. J. R. Salter writes on the business side of a tramway undertaking, Mr. H. England compares railless traction with the ordinary system for new routes, and a short Paper on the Tramways Act of 1870 is contributed by Mr. F. Coutts. (Page 324.)

A paper read before the Institution of Electrical Engineers, by Mr. A. V. Clayton, on the water-power installations of Sweden, includes full particulars of two large power stations of unusual design. A large three-phase generator with magnet-wheel boss, arms, and poles in one single steel casting, and a novel construction of oil tank for transformers with water-cooling, are described. In the discussion, the low capital cost of the stations was referred to, and comment was made on the high regulation figure of 1·5 per cent. at unity power-factor obtained with one of the generators described. The subject of protection from lightning and earthing resistances was also brought up. (Page 325.)

A letter from Mr. T. L. Miller condemns the practice of canvassing in connection with the election of the Council of the Institution of Electrical Engineers. —A letter from a firm of battery makers comments on a battery and booster installation in America.—The consulting engineer to the Glasgow Main Drainage System writes regarding some inaccuracies in the descriptions of the Shieldhall Outfall Works which have appeared in some of our contemporaries. (Page 327.)

The annual report of the Comptroller-General of Patents shows an increase of 7 per cent. in the number of applications for patents in the year 1909. The

Digitized by Google

accounts show a surplus of over £94,800, excluding an amount of £30,000, which has gone towards the purchase of a site for new offices. The number of applications for patents relating to electric railway signalling has increased considerably. (Page 328.)

UNDER Electrochemistry and Electrometallurgy, is given an account of the South Chicago Electric Furnace plant of the United States Steel Corporation, where a 15-ton Héroult furnace is used in combination with a Bessemer converter. (Page 328.)

A NEW testing set is described on page 329.

THE overhauling of the electric wiring of the Marylebone Public Baths, concerning which there has been considerable discussion, is to be carried out by the Borough Council's Electricity Department, and will not be tendered for by wiring contractors. This decision was arrived at after a somewhat heated debate. (Page 329.)

AMONG the specifications published by the Patent Office on Thursday last was one by J. Sayers for a method of neutralising the induction effects of A.-C. traction systems on telegraph and telephone circuits. Insulated wires are run parallel to the trolley wires, and are joined so as to form a closed circuit, and this circuit is supplied with an A.-C. current proportional to and 180 degrees out of phase with the traction current.—C. C. Regnart covers a form of reflector lamp unit. The body is of porcelain, with pins at one end and sockets at the other, enabling several units to be connected end to end to form a long rigid trough. The conductors are embedded in the body.—A process for constructing accumulator cells of the rolled grid pattern is described by G. Okill; the grids are successively charged and discharged as negative plates before rolling.—Apparatus for telephone exchanges for registering the time of conversation between two connected subscribers is described by Siemens Bros. & Co. (Page 330.)

THE new station which has been erected in Horseferry Road for the Westminster Electric Supply Corporation, by arrangement with the London County Council, replaces the company's original Millbank Street station, as the latter site has been acquired by the Council for extension of the Thames Embankment. The station is equipped with continuous-current turbo-generators at present aggregating 3,000 kw., not including steam balancers. There is also converting plant for dealing with the three-phase supply from the Grove Road station of the Central Electric Supply Co. Condensing water is taken from the river through pipes over 300 ft. long. Special arrangements, including the use of a battery, are employed to ensure continuity of supply to the Houses of Parliament. (Page 331.)

A NEW lamp locking device is described on page 332.

THE Acton Electricity Committee recommend the Council to decide whether their undertaking should be transferred to the Metropolitan Electric Supply Co.—A smoke abatement exhibition is to be held in Glasgow.—It is proposed to convert 282 street gas lamps in Grimsby to electric lamps.—The Fulham Borough Council propose to adopt a scheme of free wiring, using the "Stannos" system.—A proposal by the Hampstead Electricity Committee to convert all the remaining street gas lamps to electric lamps has been referred back.—The Board of Trade threaten to refuse to renew the licence for the Dolter surface contact system at Torquay.—An independent expert is to report upon the Limerick undertaking. (Page 333.)

LOANS have been granted, or applied for, as follows:—Belfast Board of Guardians (£6,000); Bridlington (£3,000); Wakefield (£7,150). The Cornwall Electric Power Co. propose to erect a power station. Mains and extensions are to be carried out at Sheffield, Rotherham, and Rhyl. Generating machinery is required at Coventry, Copenhagen, and Batley. (Page 333.)

IT was stated at the annual meeting of the Electric Supply Corporation that the introduction of metal filament lamps has upset all the calculations upon which the company was formed. The Canadian General Electric Co. propose to issue 9,400 $100 shares. Mr. Thomas Dence, one of the directors of Messrs. Johnson & Phillips, stated at the annual meeting last week that he looked forward to considerable improvement in the electrical industry in the near future. (Page 335.)

ARRANGEMENTS FOR THE WEEK

SATURDAY, MAY 21ST.

Institution of Mining Electrical Engineers.

4.30 p.m. Cumberland Branch. At the Scientific Institute, Whitehaven. Continuation of discussion on Mr. Glynn Williams' Paper, "Storage Batteries for Colliery Work."

MONDAY, MAY 23RD.

National Electrical Manufacturers' Association.

8 p.m. Discussion on Free Trade *v.* Protection, at Caxton Hall, Westminster.

WEDNESDAY, MAY 25TH.

Institution of Electrical Engineers: Birmingham Section.

7.30 p.m. Annual meeting at the University. "Standardisation of Fuses," by H. W. Kefford.

THURSDAY, MAY 26TH.

Institution of Electrical Engineers.

8 p.m. Annual meeting at the Royal Society of Arts. [Ballot papers for the election of Council were posted yesterday.]

OBITUARY

PHILIP CARDEW.

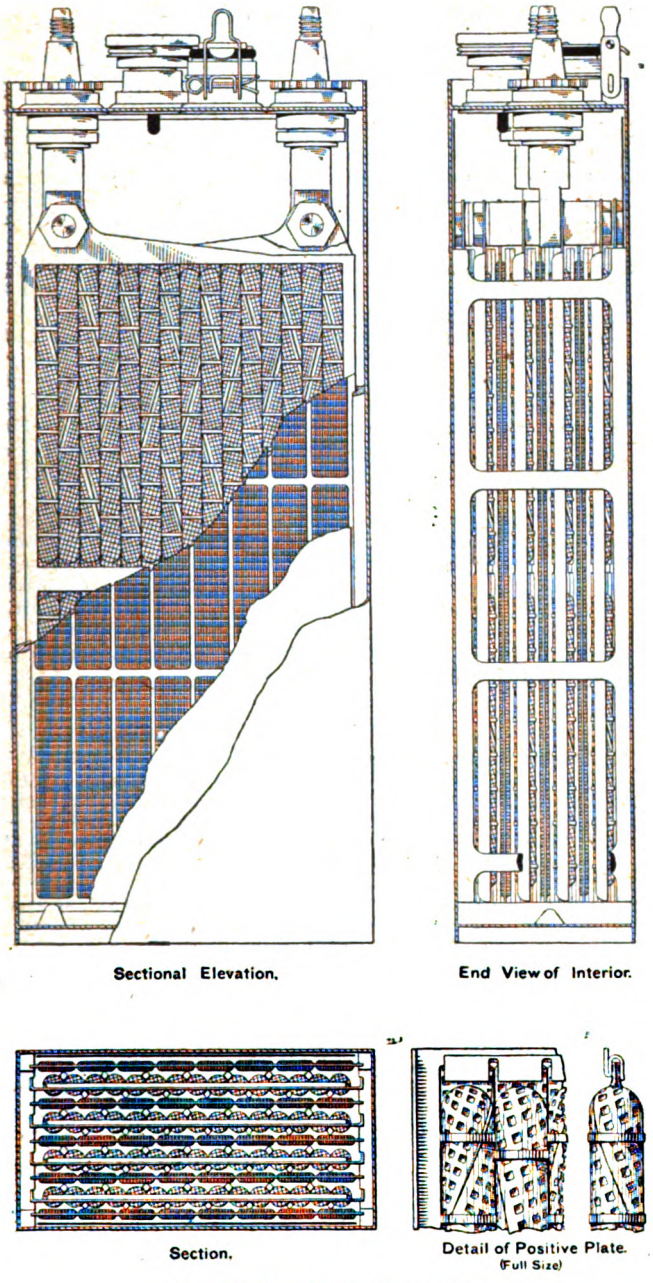
IT is with great regret that we have to announce the death of Major Cardew, R.E., one of the partners in the well-known firm of consulting electrical engineers, Preece & Cardew. Major Cardew paid a visit to Sydney about twelve months ago to inspect the Corporation's electrical power station, and to advise upon further extensions. On his return to England in July of last year he was suffering from ptomaine poisoning, and has been unwell ever since. In November he was operated upon for a tumour behind the nose, which is thought to have been possibly an indirect result of the poisoning, and later on one or two similar operations upon the neck were found to be necessary, but unfortunately his illness gradually got worse, and he passed away on Tuesday last.

Major Cardew, who was born in 1851, obtained a commission in the Royal Engineers in 1871. He served in Bermuda, and was subsequently instructor in electricity at Chatham. In 1888 he was appointed electrical adviser to the Board of Trade, a position which he held during a period of great development of the electrical industry, following on the passing of the Electric Lighting Act of 1888, with its less onerous terms for the promotion of electric supply undertakings. The first Board of Trade regulations—both those for electricity supply and electric traction—made their appearance during his tenure of office, and he was the originator of the rule limiting the drop on the rail return circuit of tramway systems to 7 volts.

Major Cardew was the inventor of the famous hot-wire voltmeter, which was for many years during the earlier history of electric lighting regarded as practically the standard instrument for use on central station switchboards.

The necessity of the introduction of a device for the automatic earthing of transformer windings in the event of a breakdown between primary and secondary was early recognised by Major Cardew, and resulted in the invention of his well-known "Cardew Earthing Device," which is still employed to a considerable extent, although now its place is largely taken by earth shields.

Major Cardew interested himself considerably in recent years with electric traction on railways, and as a director of the London, Brighton and South Coast Railway Co. he had considerable influence in the adoption of single-phase traction on the company's line, a policy which has been attended with conspicuous success.



With the death of Major Cardew, we lose not only one of the most earnest and conscientious workers in the electrical profession, but one whose work carries us back to the pioneering days of an industry when there was great need for men with the abilities and perseverance of Major Cardew.

His loss will be deeply regretted by a large circle of friends and acquaintances, for he was held in esteem by all who came in contact with him.

TESTS ON THE NEW EDISON BATTERY

SOME particulars of the tests which were made in New Jersey with a small tramcar equipped with a battery of the new "A" type Edison accumulator were given in ELECTRICAL ENGINEERING, Feb. 24th, 1910, page 139. This car has been tested in New York, and we are informed has given such satisfaction that sixteen cars of the same pattern have been ordered by the authorities on whose lines the test was made. It will be remembered that the first commercial cell of the Edison alkaline pattern was put on the American market as long ago as 1903. Considerable advance

THE EDISON CELL, TYPE A.-4.
(Scale: Approx. One-third Full Size.)

has been made since then. A more recent cell, made by the German Edison Accumulator Co., was described in ELECTRICAL ENGINEERING, May 7th, 1908, Vol. III., p. 695. The latest pattern cell, Type "A," embodies a number of improvements, which are said to have raised the capacity by 25 per cent., and was introduced by Mr. Edison in the latter part of 1909.

The "A" type cell is constructed in two standard sizes, of 150 and 225 rated ampere-hour capacity, and designated by Type "A.-4" and Type "A.-6" respectively. The former has four positive and five negatives plates, the latter six positive and seven negative plates. As shown in the illustration, each positive plate consists of a grid of nickel-plated steel holding thirty tubes, 7 mm. in diameter, of thin spirally-wound, nickel-plated, perforated sheet steel. The active material consists of horizontal layers of nickel hydrate 0·01 in. thick separated by thin flakes of pure nickel to increase the conductivity of the mass. There are some 350 layers of each material in a tube 4⅛ in. long. The flakes are prepared by an electro-chemical process, described in ELECTRICAL ENGINEERING, January 7th, 1909, Vol. V., p. 8. The negative plate has twenty-four flat rectangular pockets. These are made of thin, perforated nickel-plated steel, and are filled with a mixture of iron oxide and mercury. The plates of each group are hung from a rod, on which they are spaced by nickel-plated steel washers, and held firmly in contact by nuts screwed on both ends. The plates are insulated from the containing can by pieces of hard, vulcanised rubber. The nickel-plated steel containing can is corrugated to give strength, and the seams are welded by the autogenous process. The cover is also welded on. The terminals pass through stuffing boxes in the cover,

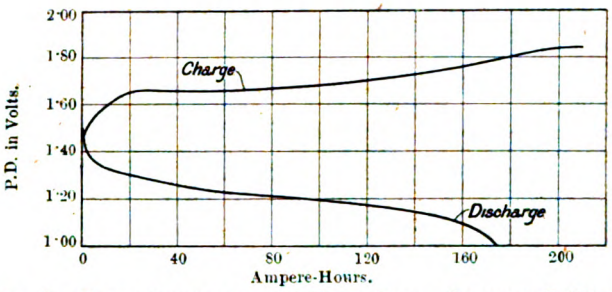

FIG. 2.—TEST CURVES OF A.-4 TYPE CELL. CHARGED 7 HOURS AT 30 AMPS. AND DISCHARGED AT SAME RATE.

which has two other fittings, namely, a separator for filtering the escaping gas of spray, and a water-tight cap for filling. Connection from cell to cell is made by nickel-plated copper connectors with steel lugs on each end for making a taper-joint connection with the terminals. The electrolyte consists of a 21 per cent. solution of potassium hydrate, to which has been added a small amount of lithium hydrate. This solution has a normal specific gravity of 1·210, which does not change during charge or discharge. The average discharge voltage per cell is 1·2 volts. Some interesting information with regard to the effects of charging at high rates were given on page 139 of our issue of February 24th, referred to above. A life of 1,200 complete charges and discharges is claimed for the plates.

We are indebted to Mr. H. F. Parshall for the following curves and test results, and for lending us the cell from which the above illustration was drawn. The curves were plotted from test results obtained at the Edison Laboratory towards the end of last year, and refer to cells of the A.-4 type, which have a rated capacity of 150 ampere-hours.

Fig. 2 gives the charge and discharge curves at the normal rate of 30 amperes. The ampere-hour input was 210 at an

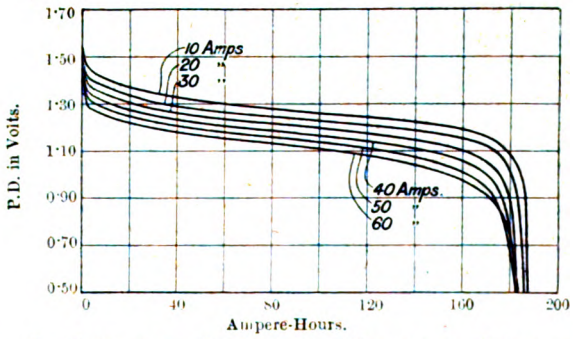

FIG. 3.—DISCHARGE CURVES FOR DIFFERENT RATES AFTER CONSTANT CHARGE OF 30 AMPS. FOR 7 HOURS IN EACH CASE. TYPE A.-4 CELL.

average P.D. of 1·7 volts, and the ampere-hour output was 174·5 at an average P.D. of 1·2 volts. This gives an ampere-hour efficiency of 83·1 per cent., and a watt-hour efficiency of 58·7 per cent. The weight of an A.-4 type cell is 13·5 lbs., so the output per lb. of cell is 15·57 watt-hours. Including the

Digitized by Google

weight of the crate and connections, the battery weight per horse-power hour works out at 50·5 lbs. Fig. 3 gives a series of discharge curves at different rates obtained from an A.-4 type cell which had been given a 7-hour charge at 30 amperes in each case. The normal discharge rate for this cell is 30 amperes, but it will be seen that the ampere-hour output was practically the same for all discharge rates from 30 to 60 amperes. Another test consisted in charging the same cell at different rates, and discharging at 30 amperes until the terminal pressure had fallen to 1 volt. When charged at 40 amperes for 5¼ hours, the ampere-hour efficiency was 79 per cent., and the watt-hour efficiency 55·8 per cent.; when charged at 20 amperes for 10½ hours the ampere-hour efficiency was 83·8 per cent., and the watt-hour efficiency 61·2 per cent. A three-hour charge of 210 ampere-hours (2 hours at 90 amperes and 1 hour at 30 amperes) gave an output of 156 ampere-hours up to a terminal pressure of 1 volt. This is an ampere-hour efficiency of 75·3 per cent. Charging continually at such a high rate reduces the life of the cell, however, owing to the excessive heating. The Type A.-6 cell weighs 19·2 lbs., and has an output of some 16 to 17 watt-hours per lb. The normal charging and discharging current of this cell is 45 amperes, and at this rate, a watt-hour efficiency of over 60 per cent. is attained.

We described in the article already referred to in our issue of February 24th, the tramcar with which the recent tests have been carried out. It will be remembered that it is a two-axle 5-ton car, seating 26 passengers, and driven through silent chain gear by two 110-volt, 5 h.p. motors. The battery consists of 200 Type "A.-4." cells, weighing 3,000 lbs. The

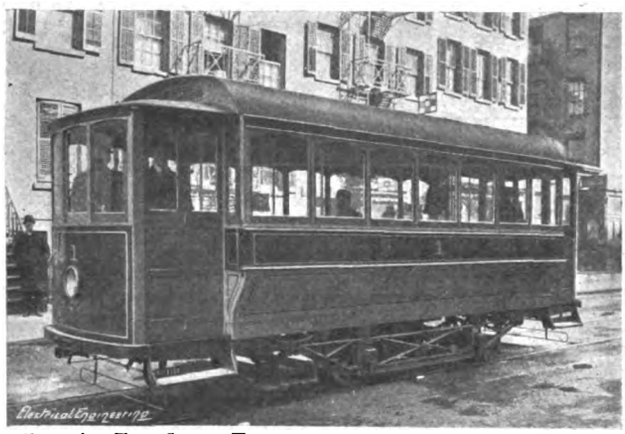

FIG. 4.—THE 5-TON TRAMCAR EQUIPPED WITH THE EDISON BATTERY, AND TESTED IN NEW YORK.

controllers give series parallel connection, both of the cells and motors. A maximum speed of 15 m.p.hr., and a schedule speed (with 14 stops per mile) of 8 m.p.hr. were obtained in New Jersey. The power consumption in accelerating is said to be about 3·5 kw., and in running about 1·5 kw.

On March 3rd last, the car was started in the ordinary service on the 28th and 29th Streets, New York, and the results of a month's trial are very satisfactory. We understand that the car was in service for 14½ hours daily, covering in all a distance of nearly 67 miles. At the end of each day's run, it was inspected, and the battery charged for five hours. The track conditions were not favourable, there being a large number of curves, and further nearly 600 stops were made on the total daily run of 67 miles. The registered consumption of the motors was 530 watt-hours per car-mile, and 853 watt-hours per car-mile at the station bus-bars. On two days, the car was run 85 miles with its full complement of passengers without on either day completely discharging the battery. By April 1st, the records of the car showed that the battery had been charged and discharged 476 times, and on that date the capacity was found to be 11 per cent. higher than when the battery was first put into service. Assuming a run of 80 miles per charge, this corresponds to a total distance of 38,000 miles.

The Edison accumulator factory at Orange, New Jersey, is a four-storey building with some 200,000 square feet of floor space. A large amount of special machinery is employed, including electrolytic apparatus for producing the nickel flakes for the positive plates and for plating the cans and various other steel parts of the cells, tube and pocket filling machines, hydraulic presses for crimping the negative plates, and a number of special lathes and stamping machines. The output of the works is already over 200 complete cells daily, and, it is expected, will soon reach 500.

Glasgow Local Section of the Institution of Electrical Engineers.—At the annual meeting of the Section on May 10th, the chairman announced that arrangements had been made to combine with the Iron and Steel Institute for the summer excursion down the Clyde, as was done last year. A steamer had been chartered, and all arrangements made for the 9th of June.

TELEPHONE CURRENTS

AT the meeting of the Physical Society on April 8th, a Paper entitled "Demonstration of Telephone Currents in Loaded and Unloaded Lines," was read by Mr. B. S. Cohen. The demonstration showed the relationship between the sent and received currents in telephone lines under the various conditions which occur in practice. As mentioned by Prof. Perry in his Paper read before the Society a few weeks ago, it is of little or no practical value to make calculations on the current attenuation in lines of infinite length and with the terminal conditions neglected. The effects of the line length and of the terminal apparatus must be taken into account. By the aid of Prof. Kennelly's formulæ it is possible to calculate the relationship between the sent and received currents under any conditions met with in practice, and for some of the conditions used in the demonstration the calculated results had been obtained. Four essentials were necessary for the experiments shown:—(1) A current comparable to the actual telephonic speech current. This was obtained from a vibrating wire interrupter giving a wave with a fundamental of about 100 cycles per second with a damped oscillation of about 800 cycles per second superimposed. (2) A telephone line with or without its load in the shape of inductance coils. (3) Terminal apparatus. The lines were terminated by receivers and induction coils as used in practice for what is known as local battery working. (4) Current measures. For this purpose barretters arranged as alternating current ammeters were used. The first experiment showed the relationship between the received and sent current for various lengths of standard cable unloaded. The second experiment illustrated the variation in the current sent when the receiving end was open or closed circuited and the length of cable was varied. The third experiment showed the current distribution along the loaded cable by inserting a barretter at different points along the cable. The author gave explanations of the various phenomena illustrated in the experiments. He pointed out that it is now possible to make both calculations and quantitative telephonic tests which give mutual confirmation.

In reply to questions asked during the discussion, the author stated that the current was determined in practice by the volume of sound transmitted, and not by articulation conditions. In his experiments he was working with an attenuation of 1·5 per cent., and the sending current was 3 or 4 milliamperes. The apparatus would work quite well up to frequencies of 1,500. Increasing the current in the circuits up to 0·1 ampere would have no effect on the inductances.

Agreements under the London Electric Supply Act, 1908.—We recently referred to some agreements between the London Electric Supply Corporation and the St. James & Pall Mall Electric Light Co., and the London Electric Supply Corporation, under the London Electric Supply Act, 1908. It will be remembered that the London County Council took exception to some of the provisions in these agreements, and urged the Board of Trade to withhold their consent to them. The Board of Trade has now stated that it does not see its way to give effect to the Council's suggestions, and that it proposes to approve the agreements. In the circumstances, the Highways Committee of the London County Council does not think that any further action can with advantage be taken in the matter.

Overhead v. Underground Telegraph Wires.—The Railway and Canal Commissioners last week decided a dispute between the Postmaster-General and the Tottenham Urban District Council as to the laying of telegraph lines in St. Ann's Road, Tottenham. The Tottenham County Court judge had decided in favour of the contention of the Council that the line should be underground, but the Postmaster-General, on the plea of economy, desired to erect poles and carry the wires overhead. It was urged by the Council that the extra cost would only be £105, and that in order to avoid overhead wires in the district the Council themselves had transferred theirs underground at a cost of over £5,000. In view of these circumstances, the Court held that the underground system should be adopted.

Battery Tramcars in New York.—A tramcar propelled by storage cells of the ordinary lead type has been put into experimental service on certain lines of the Third Avenue Railroad Co., New York. The car in question is a reconstructed horse-car for 26 passengers, and weighs complete with passengers about 6 tons. Two 5 h.p. motors are fitted, driving through chains, and the car is designed to run at from 7 to 8 miles per hour. The battery consists of 44 cells of the Gould type, each with 29 plates, and is rated at 420 ampere hours. The cells are placed under the seats, and special arrangements are made for their ventilation.

A LARGE ELECTRIC POWER SYSTEM IN THE ARGENTINE

BAHIA BLANCA, a town about 400 miles from Buenos Aires, is the principal port in the Argentine Republic for the shipment of grain, and is rapidly developing in size and importance. It is served by two railways: the Buenos Aires and Gt. Southern, and the Buenos Aires and Pacific. The port itself is practically owned by the latter railway company, to whom all the moles belong, and they have there a complete equipment of jib cranes and capstans, grain silos and elevators, all electrically driven by three-phase motors. Until recently the concession for the supply of electricity in the town of Bahia Blanca itself—a town of about 80,000 inhabitants and some three miles distant from the port—was owned by the South American Light & Power Co., and the supply was given from a station in the town named the Usina Donado; the railway company had a separate power-house for driving the machinery above mentioned. A few years ago, however, when the railway company erected some repair shops by the terminal station, they decided to co-operate with the Light & Power Co. by taking over the whole of the generation themselves and supplying the latter company in bulk.

They therefore took over the Usina Donado, which contains three 250-kw. and two 500-kw. steam turbo-generators (put in about three years ago), and two 1,000 k.v.a. Bellis—Dick, Kerr triple-expansion steam alternators erected more recently. Owing to a large increase of the electrical energy required for the harbour, and also for the town and tramways, Mr. J. F. C. Snell, M.Inst.C.E., the Consulting Electrical Engineer to the Buenos Aires & Pacific Railway Co., was called in to advise, and he recommended the erection of a new station on the Paraguaya site, and a reconstruction of the distribution system.

The work in accordance with Mr. Snell's designs and specifications is now proceeding with great rapidity, the erection being carried out under the superintendence of Mr. P. W. Beatty, the resident engineer at Bahia Blanca, and a short description of the main features of the scheme will doubtless be of interest to our readers. For supplying us with the necessary information for this article, we are indebted to Mr. Snell, and to the British Westinghouse Electric & Manufacturing Co., Ltd., who were awarded the complete contract. Messrs. Browett, Lindley & Co., Ltd., have also given us some information with regard to the engines which they supplied as sub-contractors to the Westinghouse Co.

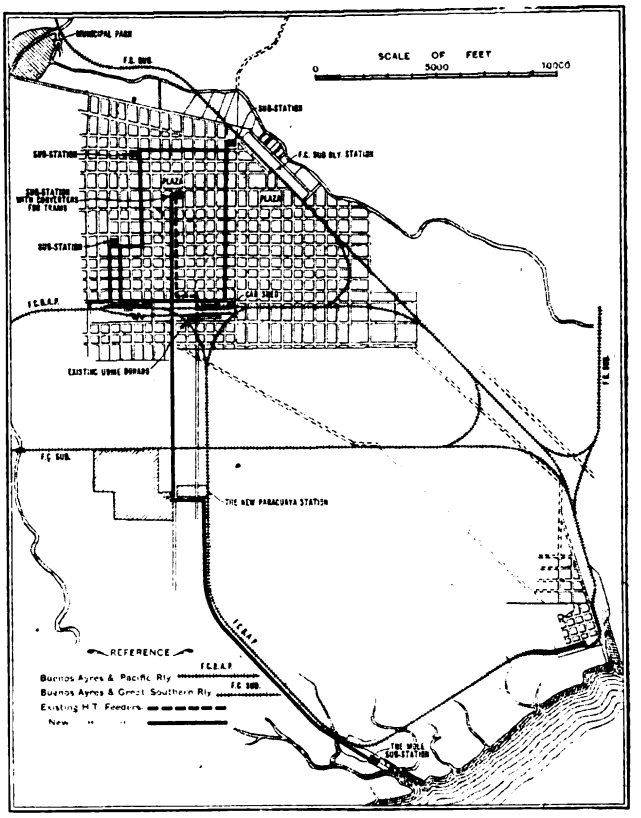

FIG. 1.—MAP, SHOWING RELATIVE POSITIONS OF THE TOWN, HARBOUR, AND ELECTRICITY WORKS AND THE ROUTE OF THE H.T. MAINS.

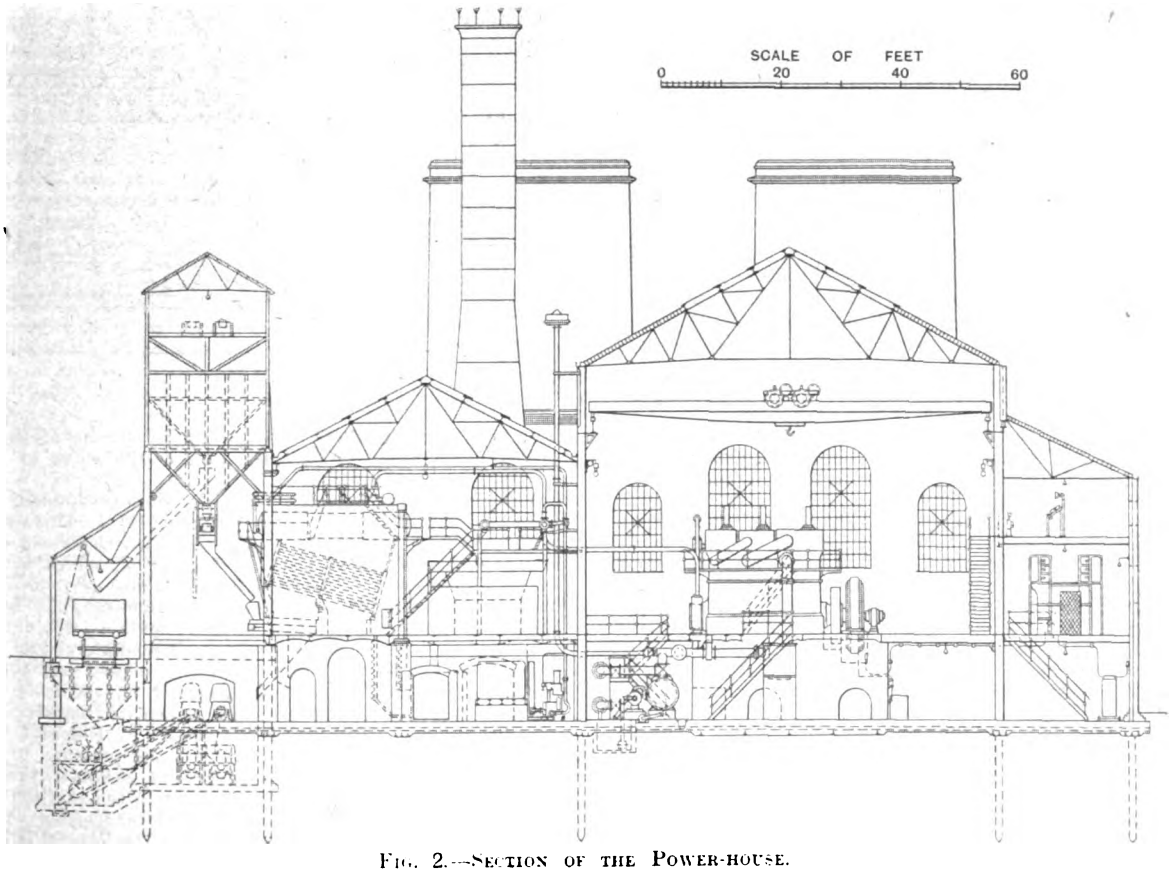

FIG. 2.—SECTION OF THE POWER-HOUSE.

The relative positions of the harbour, town, stations, and sub-stations are seen in the map (Fig. 1).

The new station will contain three 1,000-kw. (1,250 k.v.a.) Browett-Lindley–Westinghouse triple-expansion steam alternators, two 75-kw. sets by the same makers for exciting and station lighting, and two (1,000 k.v.a.) Belliss-Dick, Kerr sets with their own exciters transferred from the Usina Donado. Figs. 2 and 3 are a section and plan of the new Paraguaya station;

Digitized by Google

these represent, however, only a quarter of the ultimate size of the station, as it is proposed to extend it eventually to twice the length, with a second boiler-house on the other side of the engine-room. The liberal space allowed will be noticed. In summer, the temperature frequently reaches 90° F. in the shade in the daytime for periods of two or three weeks continuously, and in consequence it was necessary to depart slightly in this respect from the conventional lay-out of the engine-room which would be adopted in power-houses in this country.

There are four B. & W. boilers, each having a total evaporation per hour of 23,000 lbs. under normal steaming conditions. The working pressure will be 180 lbs. per sq. in. Each boiler will be fitted with a superheater capable of imparting 50° C. superheat. The stokers are of the Underfeed type, arranged to burn Welsh coal. Forced draught will be produced by means of two electrically-driven blowers, and an 800-tube Green economiser is being fixed in the main flue. In addition to these four boilers, three B. & W. boilers are being transferred from the old station. The main flue is led outside to a 100-ft. steel chimney.

A complete coal and ash handling plant of the gravity bucket pattern will be installed, and the coal will be discharged direct from the railway waggons into a crusher and screen, from

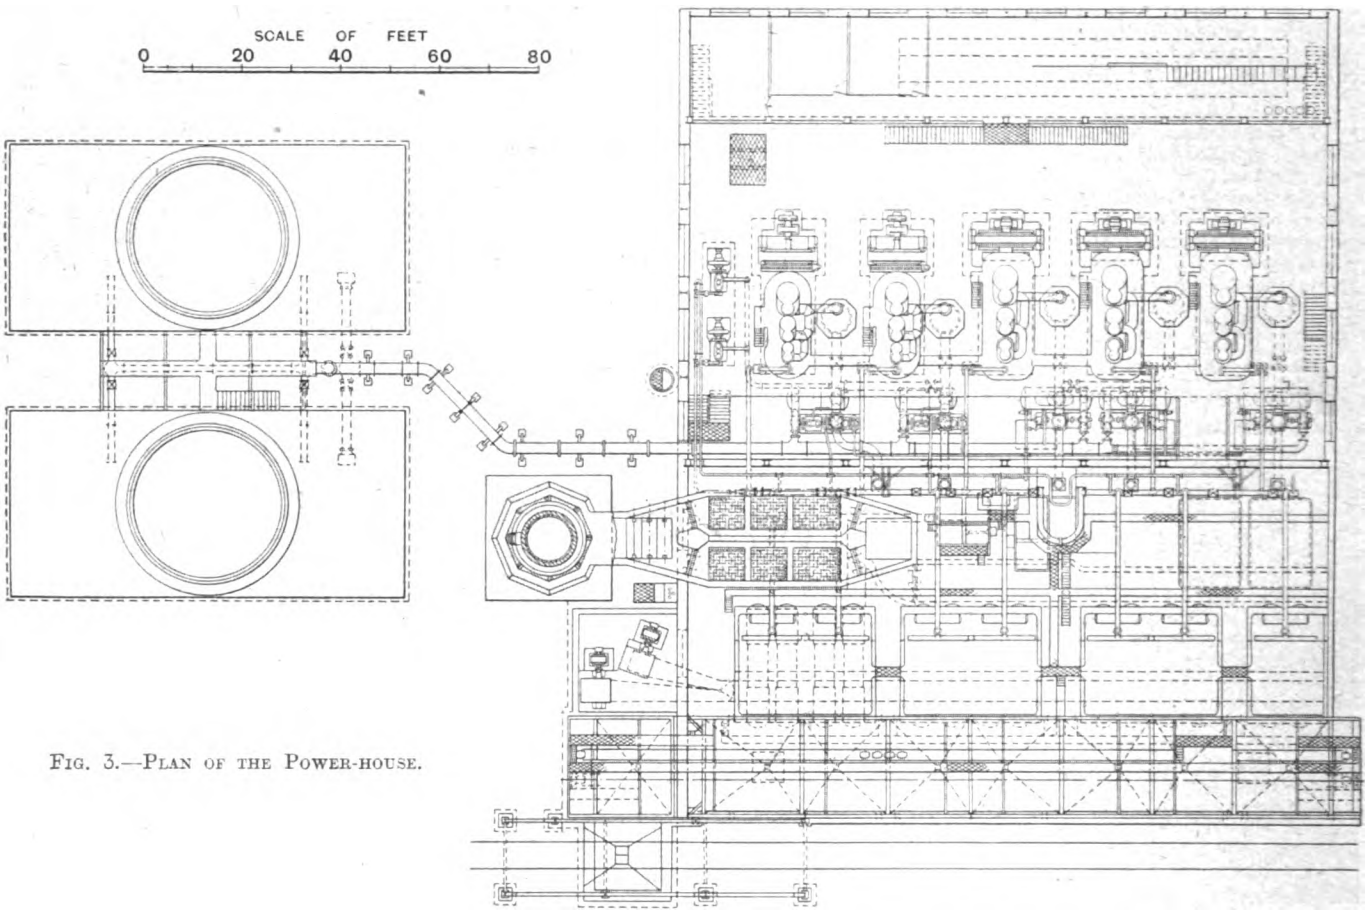

FIG. 3.—PLAN OF THE POWER-HOUSE.

which the buckets will be automatically filled. The aggregate capacity of the coal bunkers will be 1,000 tons, and the ash bunker 50 tons. The conveyor will be capable of dealing with 50 tons from each.

The three new Browett-Lindley engines are three-crank triple-expansion double-acting vertical engines, each designed to develop its full output continuously at a speed of 188 r.p.m., with 170 lbs. steam pressure, 50° C. of superheat, and condensing into a 25½ in. vacuum. The above rated output can also be obtained continuously when exhausting into the atmosphere. They are also specified to stand a 25 per cent. overload for two hours when condensing. We were privileged to see the second engine on the test-bed at Messrs. Browett and Lindley's works before shipment, and were pleased to note the solid design and construction and the evidences of fine workmanship. The cylinder diameters are H.P., 21¼ ins.; L.P., 34 ins.; L.P., 54 ins.; the stroke is 24 ins., and the flywheel weight just over 13 tons. The shaft is 13 ins. diameter, and 14 ins. at the thrust-bearing end. United States metallic packing is employed.

The chief feature of interest in the engines is Messrs. Browett, Lindley & Co.'s improved expansion gear, the main object of which is to utilise oil pressure for actuating a relay motor to move the gear. By this means great power can be obtained for actuating the gear without putting any extra work upon the governor. The general arrangement of the gear as applied to the engines is shown in Fig. 4. The piston A is connected up to the expansion gear lever C by connecting link B, the lever C being keyed to the upright shaft D, which actuates the valve. The piston A is operated by the valve E, oil under pressure entering at F. For instance, if the valve moves to the right, oil under pressure is admitted at X, and the oil is exhausted through the port Y. Mechanism placed between the valve E and the governor brings the valve E into its central position, after the piston A has moved through an amount proportionate to the movement of the governor spindle G. To provide an ample supply of oil to operate the gear instantaneously, independently of the supply delivered by the oil pumps, an accumulator W is fitted. It consists of a spring-loaded piston J, the load of the spring being such that the piston is allowed to move a considerable amount, at least equal to twice the capacity of the relay cylinder, with a pressure of 5 lbs. per sq. in. Although the pressure in the pipe may be intermittent, the piston J of the accumulator will be gradually raised, as the oil passing the check valve H cannot again return to the oil main.

The throttle valve is actuated from the governor by the lever K and the spindle G in the usual way. The lever K is also extended, as shown at L, and by means of the link M a bell crank lever N and the link O the valve of the relay cylinder is actuated.

The valve E is operated from the link O through a rocking lever P (see end view also Diagram (b)). This lever P is mounted on another similar lever Q, which is pivoted at R, and engages with a pin S fixed in a lever C, which actuates the upright shaft D. Referring to Diagrams (a), (b), and (c), assume, for instance, the engine was running fully loaded and the whole load was thrown off, the lever C would be in the position shown by Diagram (a); immediately the load was thrown off the throttle valve would be closed and through the mechanism P L M N already referred to, the lever P, which lies above the lever Q in position, shown in Diagram (a), would be pushed over to the position shown in Diagram (b). This would open the valve E and admit oil pressure to one side of the piston and open the other to exhaust, thus causing lever C to be immediately moved over to the position shown in Diagram (c). In moving over, this lever carries with it the pin S to which lever Q is connected, and as lever P is centred at T on lever Q, the valve is caused to move over again to its central position, the lever C thus remaining in that position until altered by another movement of the governor.

The two extreme positions of the levers only are shown in Diagrams (a) and (b), but when the governor only moves

Digitized by Google

through a portion of its travel, the lever *C* moves only a proportional amount, as the valve is returned to its central position automatically as just described.

As a safeguard, a spring is fitted at *U* on the link *M*, and is sufficiently strong to make the connecting link, this link being practically a positive connection; but should, through any unforeseen cause, the valve of the relay cylinder stick, it will not in any way interfere with the control of the engine by the throttle valve. For instance, should this occur, and the whole load of the engine be thrown off, the lever *K* would close the throttle valve, and the arm *L* would move downwards, simply compressing the spring at *U*.

The guaranteed steam consumption per kw.-hr. at unity power factor, and with the steam pressure, superheat, and vacuum already mentioned, are as follows:—25 per cent. overload, 17·68 lbs.; full load, 17·58 lbs.; three-quarters load, 18·14 lbs.; half-load, 19·15lbs.; and quarter-load, 22·99 lbs.—not including steam for auxiliaries.

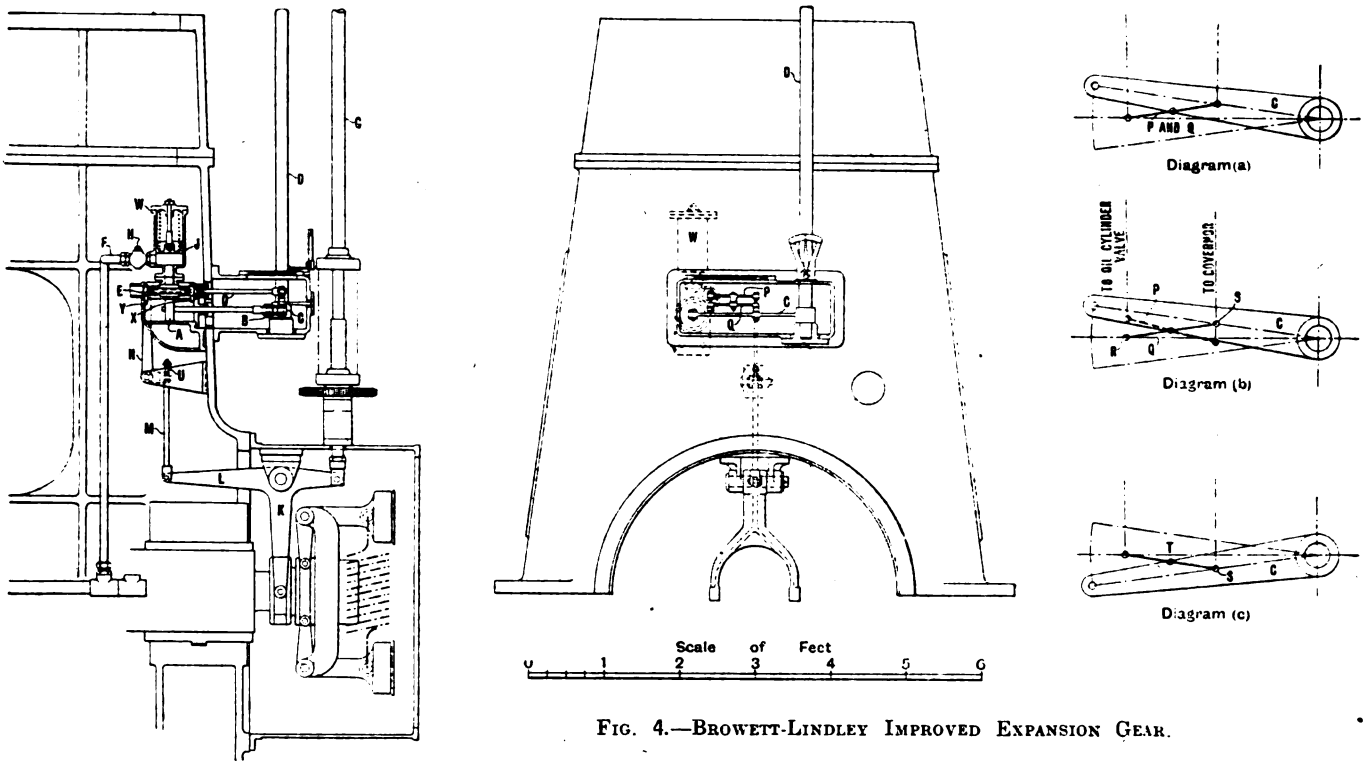

Fig. 4.—Browett-Lindley Improved Expansion Gear.

Reciprocating engines were employed rather than steam turbines for these sets, at the particular instructions of Mr. Snell's clients.

Each engine is coupled direct to a Westinghouse three-phase revolving field type generator, the rated output of each machine being 1,000 kw. continuously at 80 per cent. power factor, and 6,600 volts between phases. The frequency is 50 cycles per second. Each generator is also designed to carry an overload for two hours of 1,250 kw. at the same power factor. The high temperature which prevails at Bahia Blanca in the summer has already been mentioned, and in addition the atmosphere is at times extremely humid (85 per cent.) and dusty. It was, therefore, necessary to give most careful consideration to the selection of suitable forms of insulation for the generators and electrical plant. This subject was very carefully investigated by the consultant and the contractors, and a large number of tests were made before the work was put in hand in order to ascertain the best possible combination of insulating materials and method of insulation to be adopted. Before shipment the stator coils of the generators were tested for five minutes at 13,000 volts between the windings and the frame, and the rotor windings for the same length of time at 1,000 volts.

The main generators are separately excited by two 75-kw. Westinghouse dynamos driven by Browett-Lindley engines.

The piping is being supplied by Messrs. Aiton & Co., of Derby, the steam pipes and hot and cold feed mains being of weldless, solid-drawn, open-hearth steel. These pipes are tested before shipment under an hydraulic pressure of 400 lbs. per sq. in.

Each of the main engines has its own condenser, designed for giving a 25½-in. vacuum with 25,000 lbs. of steam per hour, cooling water being supplied from cooling towers at a temperature of 36° C. The condensers are of the surface type, with centrifugal circulating pump, Leblanc rotary dry air pump, and turbine water extracting pump; a general view of one of these plants is shown in Fig. 5. The pumps are all driven by one motor, which is direct coupled to the Leblanc air and the circulating pumps, while the water extracting pump is driveu by Morse chain from the end of the air pump spindle.

The condensers are of the usual surface type in which the steam passes over the nests of tubes; the cooling water enters at the bottom and leaves at the top, after having passed twice through the length of the tubes. However, as the Leblanc air pump is operated as a dry air pump, special arrangements are necessary to cool the air and incondensible gases coming from the condenser, and also to ensure that no steam is taken away with the air. These special arrangements consist of baffle plates placed inside the condenser, so as to cause all the steam and air to pass right down to the bottom, where the condensed steam is drawn off. The air and incondensible gases are then drawn to the air pump over a nest of tubes, through which the coldest circulating water is passed.

The construction of the Leblanc air pump is shown in Fig. 6. It may be regarded as a reversed Pelton wheel in conjunction with an ejector. Sealing water is introduced through the inlet at the left into the central chamber, from which it passes through the port *C*, is caught up by the blades *D* of the Pelton wheel, which is rotated at a suitable speed, and is finally ejected into the discharge cone *E* in the form of thin sheets having a high velocity. These sheets of water cover the sides of the discharge cone and thus form absolutely tight water pistons, which entrap the air coming from the condenser through the suction branch *E*, and carry it out against the atmospheric pressure.

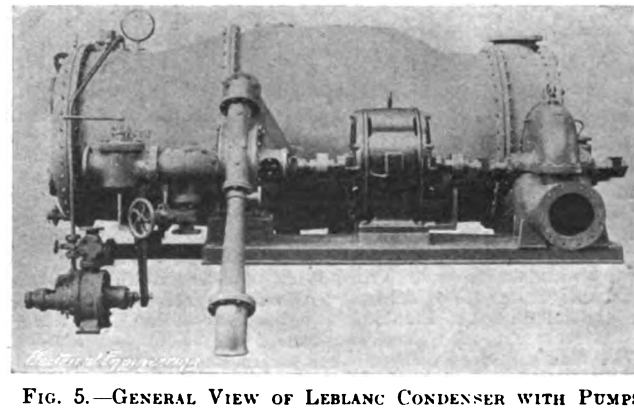

Fig. 5.—General View of Leblanc Condenser with Pumps.

As there are no reciprocating parts, valves, waste clearance spaces or pistons to wear and cause leakage, the efficiency of the Leblanc air pump is extremely high. The satisfactory and efficient transference of the heat in the steam to the water depends to a very great extent on the removal of the air which enters the condenser with the steam, so that the use of the

Digitized by Google

Leblanc air pump reduces the cooling surface and the quantity of cooling water required, the respective figures for the Bahia Blanca plant being 2,500 sq. ft. and 1,900 gallons of cooling water per minute.

The turbine pump, which withdraws the condensed steam from the condenser, delivers the water straight to the hot-well tank, which is placed in the boiler-house with about a 15-ft. head. The motor driving the pumps is of the standard Westinghouse squirrel-cage type for three-phase current at 50 periods and 720 r.p.m.

Oil is removed from the condensed steam by mechanical oil-separators and a Paterson plant.

Before shipment, one of the condensing plants was tested in the maker's works under conditions as near as possible to those actually obtaining on site, and the results obtained were, we are informed, appreciably better than the guarantees.

Two cooling towers are being supplied of the Balcke natural-draught pattern, constructed of brickwork and ferro-concrete, and containing a water distributing system consisting of special impregnated wooden laths and troughs. The duty of each tower

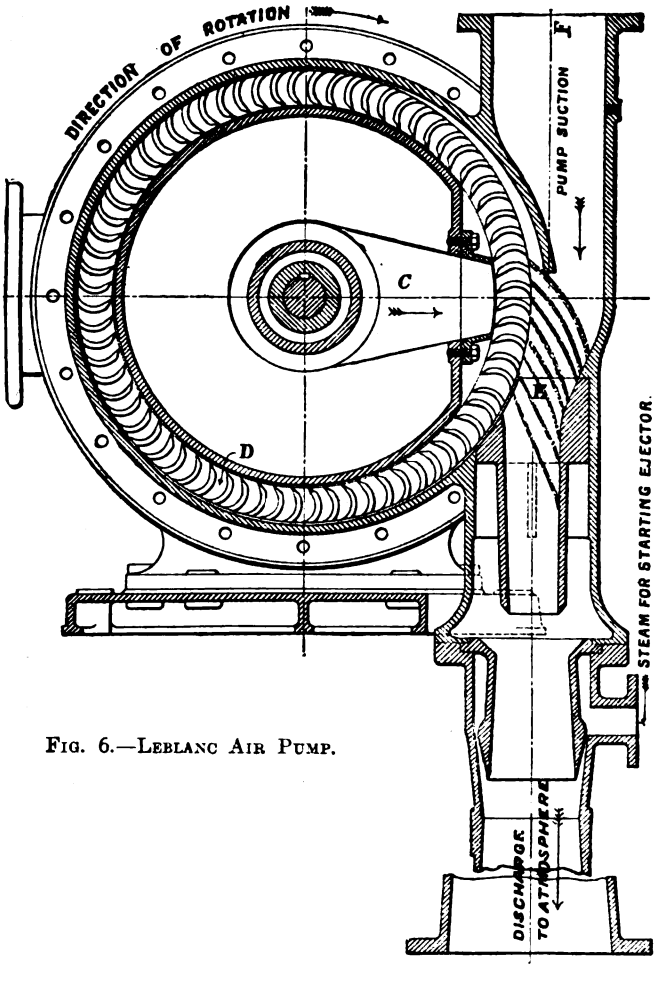

FIG. 6.—LEBLANC AIR PUMP.

is a capability of cooling 175,000 gallons of water per hour from 54° C. to 36° C., with a temperature of the surrounding air at 32° C., and 85 per cent. average humidity. Each chimney will be 48 ft. in height and 30 ft. in diameter, the total height of the structure being about 83 ft. from the ground level. The structure is designed to withstand a lateral winding pressure of 50 lbs. of sq. ft. of surface. At certain periods of the year the district of Bahia Blanca is swept by severe hurricanes, and dust storms are also very frequent.

The make-up circulating water is taken from an artesian well, and the make-up feed water from the town mains.

That portion of the power-house which is devoted to switch-gear is divided into three floors, of which the basement floor will be used as a cable tunnel; the middle floor will be the high-tension switch-room, containing the oil-immersed circuit-breakers, each enclosed in a separate cubicle; and the top floor the desk control-boards. Each of the neutral points of the generators will be connected to earth through isolating link switches and heavy resistances, one of which will only be connected to earth at any time.

Arrangements are being made at first for the equipment of five sub-stations in the positions shown in the map given in Fig. 1. The one in the centre of the town near the Plaza will have rotary converters for the tramways, but the others are equipped only with static transformers. The secondary A.-C. pressure for the motors in the town is 380 volts between phases, and a fourth wire is used for the lighting, which is therefore at 220 volts. This fourth wire is earthed at one point of the distributing system. In the rotary sub-station, each rotary is fitted with a starting motor, so that it can be started direct from the secondary of the main transformers. The Mole sub-station will be equipped with four 500-k.v.a. transformers, the primary windings being mesh-connected; the secondary star-connected, the secondary pressure in this case is 500 volts. There will be about 2,000 h.p. of motors connected to this sub-station, chiefly for grain elevators, jib-cranes, and capstans.

From the generating station to the Mole an overhead H.T. line is being erected. Steel lattice poles spaced about 75 metres apart are used, and the wires are of 0000 S.W.G. copper, forming two triangles, as the feeder is in duplicate. The tramway feeders and the remaining lighting and power cables are underground. Messrs. W. T. Henley's Telegraph Works Co., Ltd., are supplying the cable, and are also laying it. With the exception of the tramway feeders, which are V.B., all the mains are paper-insulated lead-covered, laid solid on bitumenised wood bridges in stoneware troughing. The high-tension trunk feeders are three-core, being coloured red, white, and blue, and the L.T. cables are four-core. One hundred and eighty-eight arc lamps have been erected, forming ten circuits, which will be operated on the series system from constant current, 2,250-volt, automatically regulated transformers. Single-core cables are employed for these circuits, looped into the base of each lamp-column. The tramway feeders are also single-core. Messrs. Henley's contract includes some 130 km. of cable: 83 km. of H.T. and L.T. lead-covered for feeders and distributors, 38 km. of V.B. cables (including the telephone cables as well as the tramway feeders), and 18 km. of vulcanised rubber service cables, which have been prepared especially to withstand the extremely high temperature. The conductors of some of the larger cables are made on Henley's patent "laminæ" system.

The existing tramcars in Bahia Blanca were driven by petrol and steam, and have just been converted to electric traction, while at the same time considerable extensions are being carried out. On account of the rigorous climate and the liability to dust storms which prevails in this district, a special design of tramcar was necessary, and it was finally decided to use a semi-convertible single-deck car with double windows. The car bodies and trucks have been furnished by the United Electric Car Co., of Preston, they have standard Westinghouse double tramway equipments comprising two 35-h.p. motors, and the cars are fitted with the Westinghouse magnetic track brakes.

THE TRAMWAYS AND LIGHT RAILWAYS ASSOCIATION

ALTHOUGH the Annual Congress of the Tramways and Light Railways Association, which was to have been held at Dublin last week, has been postponed until further notice as a mark of respect to the late King, the five Papers which are down for reading have been published in the Association's Official Circular for May.

The first Paper describes the system of the Dublin United Tramways Co., and is by Mr. R. S. Tresilian, secretary to the company. The history of the undertaking, from the laying of an experimental length of horse tramway in 1867 to the conversion of the last section of the system to electrical working in 1900, is given, and the plant at the Ringsend power station and at the various sub-stations is described. The financial position of the company is also outlined. Mr. J. A. Panton, rolling-stock superintendent of the Liverpool Overhead Railway, contributes a Paper entitled "Brake-Shoe Standardisation." The author points out that the cost of brake-blocks amounts to some 10 per cent. of the total car maintenance, and suggests that greater precautions should be taken to ensure even wearing in order that a smaller proportion of material may be returned to the scrap heap. After comparing the relative advantages of the various different materials, the author describes a proposed standard shoe and brake-head, the use of which he estimates would effect a saving of 50 per cent. in material. "Tramway Economics" is the title of a Paper by Mr. J. R. Salter, General Manager, South Lancashire Tramways Co., who discusses the relationship between the receipts, car mileage, and working expenses of a tramway undertaking, and the general commercial principles which should govern the operation of a tramway system. The Paper includes some interesting curves. Mr. H. England, General Manager, Wakefield & District Light Railways Co., has written a Paper on the subject of railless traction. The various systems are briefly described and criticised, and a detailed comparison of the working costs of a railless and an ordinary tramway service is made. For a four-mile route, the capital cost is placed at less than one-third in the former case, while the working costs are also estimated to be slightly lower. The last Paper is by Mr. F. Coutts, General Manager, Paisley District Tramways Co., and introduces the question of the advisability of a revision of the Tramways Act of 1870.

WATER-POWER INSTALLATIONS IN SWEDEN

ON Thursday, April 21st, a long Paper describing some of the typical water-power installations of Sweden was read before the Institution of Electrical Engineers in London by Mr. A. V. Clayton. The amount of water-power available in Sweden is equivalent to 3,800,000 h.p., of which only 550,000 h.p. is at present harnessed. In 1900 only 253,000 h.p. was utilised, or less than half of what is now employed. In the neighbouring country, Norway, there is available 4,800,000 h.p., of which in 1906 only 250,000 h.p. was utilised. The author gives brief descriptions of some of the earlier installations, including those at Hellsjön, Alby, and Ringdalen. In the last-named there are five 1,100-h.p. single-phase generators supplying power at 10,000 volts to carbide furnaces at Alby. Each generator supplies one furnace and has its own transmission line with step-down transformers, so that they form five complete separate and independent units.

One of the newest stations is at Gullspang, in the south, between the lakes of Skagen and Vanern. The power is transmitted to a number of towns,

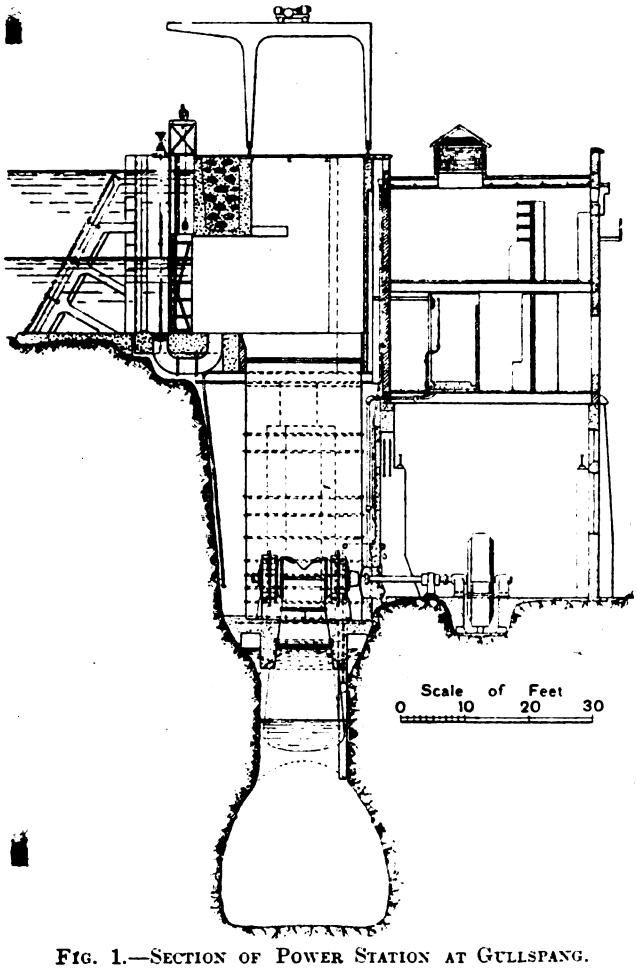

FIG. 1.—SECTION OF POWER STATION AT GULLSPANG.

ironworks, and other industrial undertakings, at 40,000 volts, the greatest distance at present being 50 miles. The level of the water in Skagen is about 79 ft. above the level of the water in Lake Vänern. Lake Skagen has an area of 50 square miles, and forms an ideal natural storage for the water. The mean water flow at Gullspang for high- and low-water periods is about 2,550 cu. ft. per second. Where the power station is situated the river runs through steep walls of rock, and in order to build a dam the water had to be diverted through a temporary tunnel, about 60 yards long and 30 ft. diameter, blasted through the rock. The water is led from the head race to the turbine house in an open canal. The power station and the forebays are built close together. Fig. 1 shows a section of a forebay with ice-racks, sluices, turbine flume, turbines with draft tube, tail race, tunnel, and power house. The turbines are of the twin type, and are placed in open vertical flumes. When completed there will be six turbine flumes, each constructed for a pair of 4,500–5,000-h.p. turbines for driving the main generators, beside the auxiliary turbines for the exciters. Only four pairs are installed at present. Each flume is provided with its own forebay, ice-rack, and head-gate. The gates are raised or lowered by a travelling crane, which can be moved over each sluice. The power house building is in three storeys. Above the generators are the transformers and switchgear, while the top is devoted to the lightning protection devices and outgoing lines. The first floor is level with the ground outside, and on this floor run rails connected with a siding on the main railway lines. A 20-ton electric crane can take goods off the railway trucks and deliver them on to this floor, or drop them through an opening into the machinery hall below, which is provided with another 20-ton electric travelling crane. A complete system of ventilation has been arranged to keep the machinery hall cool, and channels running under the floor conduct cool air to the generators. The runners of the turbines are made with boiler-plate buckets cast into a cast-iron hub and ring. This ensures a smooth bucket, and minimises skin friction. At the same time the bucket is stronger than a cast-iron bucket. This style of making runners is much employed for turbines working on falls up to about 65 ft., and up to sizes about as large as these—*i.e.*, 2,000 to 2,500 h.p. per wheel. For larger sizes and bigger falls cast-steel runners should be used. The guides or chutes leading the water into the wheel are movable on pivots, and the amount of water admitted is regulated to suit the power required. The efficiency is 85 per cent. at 3,500 h.p., falling

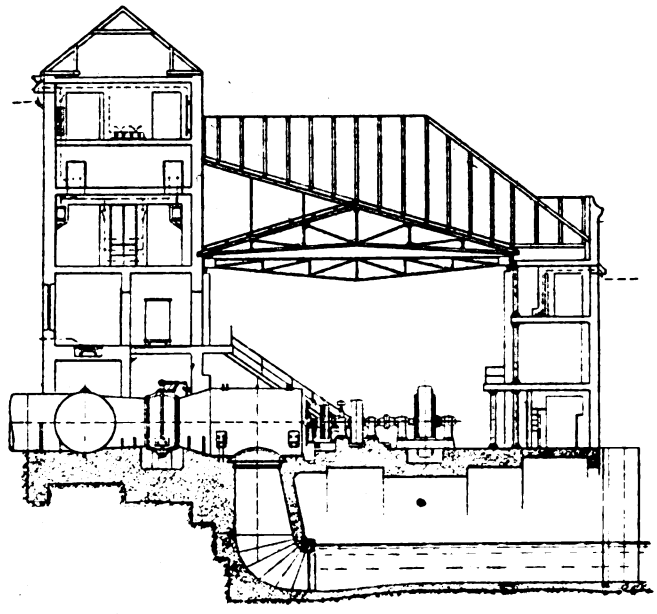

FIG. 2.—SECTION OF GRANINGE POWER STATION.

to 81 per cent. at 4,500 h.p. Regulation of speed is effected by automatic hydraulic regulators operating directly on the shafts connected to the links of the movable chutes. The governor balls are driven from the turbine shaft. Records taken on the Gullspang turbines show that with the instantaneous application of full load to the turbine running light, or the throwing off of full load, there is a variation of only 5½ per cent. in speed; while for load variations of half or full load the speed varies only 2 per cent., and, what is still more important, there is absolutely no hunting.

At the present time there is installed in this station machinery aggregating 16,500 h.p., exclusive of excitation, and this has been erected at a total cost of £173,000, or about £10 10s. per horse-power. When completed for its full capacity of 25,000 h.p., the power station will cost £192,000, or about £7 15s. per horse-power.

In the north of Sweden, continued the author, a new power station has been completed at Graninge. This is built for a capacity of 10,000 h.p., of which 5,000 h.p. is now at work. The units are each of 2,500-h.p. capacity, running at 300 r.p.m., and generate at 5,000 volts, at which voltage part of the power is used in the immediate neighbourhood, while the remainder is transformed up to 40,000 volts for long-distance transmission up to 40 miles. Fig. 2 shows an elevation of the power house. In this case there are not separate feeder tubes for each turbine, but three tubes lead into a common header from which the four turbines are fed. All the 5,000-volt bus-bars, appa-

Digitized by Google

ratus, and outgoing lines have been kept on one side of the building, and all the 40,000-volt apparatus on the other. The central portion is devoted to the turbines and generators. The transformers are situated over the feeder pipes of the turbines, while the three floors above the transformers contain the 40,000-volt bus-bars, switching apparatus, and outgoing lines. The turbines operate under a 60-ft. head, and consist of twin wheels mounted on horizontal shafts. Heavy flywheels are placed between the turbines and the generators. These flywheels have their own bearings, and are connected through leather band flexible couplings to the turbines, and through flange couplings to the generators. On test the speed variation was found to be 2½ per cent. for sudden variations of load equal to 20 per cent. of full load. The three-phase generators are of 2,150-kw. capacity each, 50 cycle, 20 pole, 300 r.p.m., and generate at 5,000 volts. Their tested efficiency is 95·4 per cent. on full load of unity power factor, and 94·2 per cent. on full load of power factor 0·8. The inherent regulation is 1·5 per cent. for unity power factor, and 6·3 for power factor 0·8. In general the regulation of generators employed in Sweden is not nearly so good, 7 per cent. and 16 per cent. being the more usual figures. The rotating magnet-wheel with poles, arms, and boss, is in one single steel casting, and the pole-shoes are of forged steel screwed to the poles with countersunk bolts. The flanges former by the pole-shoes hold the field-spools in place. The stator winding consists of bars, two in each slot, and the slots are partially closed. With the exception of a few electro-chemical works, 50 cycles has generally been accepted as the standard periodicity in Scandinavia. The new State power scheme at Trollhättan is, however, designed for 25 cycles, partly with a view to the use of the power for railways.

An interesting generator of 10,500-kw. capacity, 10,000 volts, 50 cycles, and 250 r.p.m., built by the General Electric and Manufacturing Co. of Sweden, has been supplied to the Notoddens Saltpetre Works in Norway. The steel poles and ring are cast together, and are supported on a cast-iron arm system. The magnet ring and poles are divided transversely, and an air duct is left between the halves. The width of the iron axially in this machine is no less than 49 in. The bearings are of the ring lubrication type, and are provided with water cooling in case it is required—this has, however, never been necessary.

Turning to lighting and excess pressure protection devices, the author mentions that in the case of Graninge zinc roller tension limiters and horn lightning arresters are used, while impedance coils are placed between these devices and the 40,000-volt bus-bars. On each phase there are two horn arresters in series, one of which is connected in parallel with a water resistance. The latter consists of a very large glazed earthenware bent pipe filled with water. It has been found that a gap of 32 mm. for the first horn and one of 40 mm. for the second horn, which is in parallel with the resistance, give the best results. Another method is to make connections from the lines to earth through fixed resistances. The resistances are adjusted so as to allow a very small current constantly to flow to earth, and these connections to earth lead off the small static charges which would otherwise accumulate on the line. Experiments have been made with carbon resistances for this purpose, but a circulating water resistance has proved best. The cooling coils of the transformers at Graninge present some novelty, in that instead of one or a few circulating pipes of large diameter, or a water jacket, they consist of a number of small diameter copper tubes placed in parallel, like a little water-tube boiler. The tubes are expanded or sweated into headers which form one side of distribution boxes for the inlet and discharge of the circulating water. The tubes are attached to the transformer box lid, so that when the lid is removed the coils are removed with it. The latest pattern of box is built up of wrought-iron plate, and constructed with deep radial corrugations to assist the cooling. The radiation surface is concentrated towards the top of the box where the oil is hottest. A small cistern on the top of the box is provided to allow for the extra space required by the oil when hot and to keep a constant head of oil pressure against the lid. This is necessary to prevent moisture condensing on the under side of the lid in cold weather, which happens if an air space be left between the top of the oil and the lid of the box. Such drops of moisture will fall through the oil on to the transformer, and may cause serious damage. The oil in this cistern is connected to the oil in the box by a small tube, the upper end of which is some inches above the bottom of the cistern, so that any moisture that may condense on the under side of the lid of the cistern will not be drawn into the transformer box, but will lie at the bottom of the cistern, and can periodically be drawn off. The bottom of these boxes is circular and is of ¼-in. boiler plate, and the top part is corrugated and of 14-gauge sheets. The whole box is galvanised after it is riveted and complete. The makers of these boxes were Messrs. John Fraser & Sons, of Millwall.

In order to get a reasonable speed on low falls, continued the author, some remarkable designs have been evolved. At Nyqvarn, the 500-h.p. turbine units consist of two pairs of wheels—that is, four runners—with vertical shafts. The fall in this case is 13½ ft., and the speed of the turbines is 150 r.p.m. At Korsnäs no less than four pairs of turbines—that is, eight wheels—are used on one shaft. The fall in this case is only 6 ft., and the speed is only 107, while the power is 420 h.p. Installations with such very low falls are very costly. The same turbine wheels used in this case would, on a fall of, say, 40 ft., develop, not 420 h.p., but about 7,000 h.p. On high falls single wheels having high peripheral velocity are used. A 3,300 h.p. turbine of this class is in operation on a 290-ft. fall at the works of the British Aluminium Co., at Stangfjorden, Norway. The speed is 300 r.p.m., and the D.-C. generators had to be divided into two units of 1,100 kw. each. On still higher falls Pelton or impulse-type wheels must be used. There are two such installations being carried out in Norway. One of these is at Tya, where a head of about 3,300 ft. is utilised to develop about 70,000 h.p.; the other is at Rjukanfos, where the head is about 1,000 ft. The units at the latter station will be of 14,500 h.p. each. The installation at Tya is estimated to cost about £525,000, or £7 10s. per electrical horse-power developed.

DISCUSSION.

Mr. J. F. C. SNELL asked the author to amplify his figure of capital cost, viz., £7 15s. per horse-power installed. Could he also give the price charged per h.p. year or per kw. year that obtained in Scandinavia. With a power station at such a low cost as that mentioned, it would seem a very difficult matter for a steam station to compete unless the cost of transmission was unnecessarily high. Finally, he asked whether the figure for available h.p. in Sweden was estimated upon the drought rating or upon the average rainfall for the year.

Mr. STJERNBERG drew attention to the figures in the Paper relating to regulation of generators. It seemed to him that an inherent regulation of 1·5 per cent. at unity power factor and 6·3 per cent. with a power factor of 0·8 was very low. Of course, theoretically, machines could be designed for even lower regulation if made large enough, but he did not think it desirable to have machines of this description in connection with long transmission lines where short-circuits were frequent. If the regulation were not so good, it would reduce the short-circuit effects very considerably, and with automatic regulators the pressure could be kept as constant as might be required. He disagreed with the author that there were no short-circuit troubles in water installations in Sweden. He had been told that in several places choking coils without iron were provided specially for the purpose of decreasing short-circuit effects. He did not think the design of transformer case described by the author, with the deep cooling ribs, tended to produce good circulation in the transformer, although it might cool the oil very well. Further, in view of the thinness of the plates, he doubted whether it would be possible to get the riveting perfectly tight.

Mr. H. BRAZIL, after learning from Mr. Clayton that the neutral point of the Graninge system was not earthed, stated that the arrangement of the arrester horns was not satisfactory, as it would require double the pressure to cause the horns to spark than it would if one pole were earthed. With regard to the resistances used, failures with the carbon rod type were due either to the resistance per unit length not being uniform, or to cracks in them. When a discharge occurred the potential was concentrated at the point of high resistance, and the rod got hot and broke. A modified form of carbon resistance due to the speaker consisted of a fireclay slab 12 in. square by 1½ in. thick, with a zigzag groove ¾ in. deep, and ⅝ in. in width, moulded in it. A special carbon powder was placed in the groove, and carbon electrodes were provided at each end. With 10,000 volts across this, the current rose to a maximum of 2·4 amperes, and then decreased to 1·8 amperes at the end of one minute, the maximum load being 24·2 kw. These were very severe conditions, and improbable in practice. After such a severe discharge, the powder should be mixed and redistributed. Objections to water resistances were that they introduced moisture into the E.H.T. chamber, they varied in resistance to a very great extent, the range of temperature and the capability of absorbing power was very limited, and in cold weather they would freeze. A carbon resistance on a number of slabs as described above, with grooves ¼ in. wide, might be used in place of the water streams of the permanent leak arrester mentioned by the author. For a current of 1/50th of an ampere, the resistance would have to be some two million ohms. There would be about 20 slabs per phase stacked one on top of the other and connected in series.

Mr. W. H. PATCHELL said the author did not mention whether the water leak protective devices were put in, as was done in Northern Italy, when they saw a storm coming on, or whether they were in all the year round. On the question of transformer cooling, the design described did not lead him to

Digitized by Google

believe that the best oil circulation would be obtained. He did not see how the cold oil could thoroughly circulate down to the bottom. The author had mentioned that the magnet wheel, boss, and poles of one of the generators were cast in one piece, but the photograph did not show that the boss was split. This seemed to him very risky, and considerable trouble must be experienced in getting the castings out sound without tearing the arms from the boss. On the question of cradles underneath transmission lines where they cross public highways or railways, Mr. Patchell mentioned a conference in America between railway and electrical companies with the object of avoiding their use, at which it was agreed that it was better to spend money in making the overhead lines stronger than to use cradles.

Mr. A. V. CLAYTON, in reply, said the figure of £7 15s. per h.p. mentioned in the Paper should have been turbine h.p. The price of energy per h.p.-year was very variable; in many cases it came down to 25 kronen (27s. 6d.) per h.p.-year, whilst in some cases with a 24-hour supply it would be 120 kronen. An average figure might be struck of 55 kronen (about 55 shillings) per h.p.-year, which would entitle the consumer to a 24-hour supply, so long as the water lasted, of course. This was provided for in the contracts. Some industries in Sweden, such as wood pulping, took power when the station had a surplus available, the conditions of such industries being that this did not seriouly interfere with the labour question. The figure for the regulation of the Graninge generators was partly due to the entire ring and poles being cast in one piece, as the density was driven up to an extraordinarily high figure so that the working part of the curve was practically flat. The air gap was only about 4 to 5 millimetres, and partially closed slots were employed. The figures for regulation were obtained by the Elektra Prôfnings Anstalten, the recognised testing authority of Sweden. He agreed with Mr. Stjernberg that short-circuit currents would be large, and if he were given a free hand he would advocate generators with large impedance and with automatic regulators. But such machines had not, as yet, made much advance in Sweden. He thought Mr. Stjernberg had been misinformed on the point that choking coils had been installed in connection with short-circuit effects. He knew they were used between the generator or transformer and the horn lighting arrester with the idea of choking the current from lighting discharge in the station, but he did not know of any instance in which they had been used for the purpose stated by Mr. Stjernberg. With regard to the criticisms of the circulation of oil in the transformers, careful tests had been made, and the circulation had proved to be very good indeed. The oil used was thin, and gave a better insulation than the heavier and cheaper oils. As to the water resistances, they were merely required instantaneously, and on the whole they had been more satisfactory than carbon, which suffered from inequality and cracked. The protective devices were put on in the summer and taken off during the winter. Mr. Patchell criticised the casting of the arms and ring in one piece. With iron he would not attempt to do such a thing, but with cast steel it was possible, the casting being carefully annealed afterwards to remove any internal stresses. There was a feeling in Sweden against the use of cradles when the pole line crossed railways and roads.

CORRESPONDENCE

THE COUNCIL OF THE INSTITUTION OF ELECTRICAL ENGINEERS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Along, I presume, with other members of the Institution, I have received a letter signed by Mr. W. A. Chamen asking for my "vote and interest" on behalf of Mr. H. Faraday Proctor for the forthcoming election for the Council of the Institution of Electrical Engineers.

I think that with certain safeguards the participation of the members in the election of the Council has many advantages, but I am strongly of opinion that the innovation of circularising the general body of the members in favour of a particular candidate, however eminent that candidate may be, is one that cannot be too strongly condemned, and I sincerely trust that, for the well-being of the Institution, the present unfortunate attempt to influence the members by circular may receive such a set-back as may prevent any recurrence of it in the future.

If this practice is allowed to take root and grow, then I fear it will cause a rivalry between the members of the various Local Sections with regard to representation on the Council that will seriously detract from the usefulness of the Institution.

I do not say that the method adopted by the Council of putting forward a bare list of the names necessary to fill the vacancies on the Council is an ideal one, but I think that in nominating three prominent members of Local Sections they have taken a step in the right direction, and one that is likely to commend itself to the general body of the members.

I have no personal feeling with regard to Mr. Faraday Proctor, who, I believe, would make an extremely good member of Council, but I do think that this attempt to influence members is one that will seriously affect the influence of the Institution, and I trust therefore that it will not receive the support of the general body of the members.

Yours faithfully,

709 Tower Buildings, Water Street, Liverpool, May 14th, 1910. THOS. L. MILLER.

STORAGE BATTERIES.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—With reference to the notice of a pamphlet issued by the D.P. Battery Co. in your paper of April 28th, we notice that mention is made of the load-regulating plant at the Gary Works of the Indiana Steel Co., described in a Paper by Mr. Woodbridge, Chief Engineer of the Electric Storage Battery Co., Philadelphia, of which an extract was given in your issue of September 16th, 1909.

To prevent misunderstanding, we should like to mention that the plant described by Mr. Woodbridge consists of a battery of "Chloride Accumulators" and special A.-C. regulating apparatus, for which we hold the patent rights in this country. Your notice does not make this clear, and is therefore misleading.

The striking economies obtained from "Chloride" battery-booster plants are well known to engineers, and the number in operation runs into hundreds. It is satisfactory to note that the Gary plant is taken as a typical case by our friends the D.P. Battery Co.

Yours faithfully,

THE CHLORIDE ELECTRICAL STORAGE CO., LTD.

Pendlebury, May 14th, 1910. *W. S. Naylor*, General Manager.

GLASGOW MAIN DRAINAGE. SHIELDHALL OUTFALL WORKS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Many of the articles which have appeared lately in the Press on the above works contain a great deal of misleading information.

For example, it is stated that :—

"The machinery, buildings, and mechanical plant at the Southern Purification Works, Shieldhall, are on lines generally similar to the corresponding installation at Dalmuir for the North-western Works."

While it is quite true that it is precipitation methods that are adopted at Dalmarnock, Dalmuir, and Shieldhall, the general arrangements and details of sub-structures, super-structures, and correlative machinery as designed by me are quite original and entirely different in principle to the arrangements and details of the other works. An inspection and comparison of the three works above mentioned will obviate the necessity of further argument with engineers.

As a matter of fact, many of my details of the Shieldhall plans were completed before similar details were completed for the Dalmuir works.

Yours truly,

WM. D. HAMILTON, *Consulting Engineer.*

59 Bath Street, Glasgow, May 11th, 1910.

[The statement objected to did not appear in ELECTRICAL ENGINEERING.—ED. *E.E.*]

Institution of Mining Engineers.—A meeting of this Institution will be held in the rooms of the Geological Society, Burlington House, London, on June 2nd and 3rd, when the President (Dr. J. B. Simpson) will deliver an address. On June 2nd the following Paper of electrical interest will be read: "A Storage Battery Extension to a Three-phase Colliery Power Plant," by W. Maurice.

South African Institute of Electrical Engineers.—The *Transactions* of this Institute for March, 1910, contains a short Paper by Mr. A. E. Scott on "Rotary Converters." Mr. E. Dew contributes "Some Notes on the Erection and Maintenance of Electrical Plant on a Gold Mine." Abstracts from London engineering periodicals, including reviews of books, take up a large proportion of the publication.

Glasgow Local Section of the Institution of Electrical Engineers.—As no further nominations have been received, the candidates nominated by the Committee to hold office for the ensuing session, of whom a list was given on page 267 of ELECTRICAL ENGINEERING of April 21st, have been duly elected. The annual report of the section submitted at the general meeting on Tuesday records an increase during the year of the members of all classes from 299 to 304.

Free Trade v. Protection.—Mr. F. B. O. Hawes, Secretary of the National Electrical Manufacturers' Association, asks us to state that should any Member, Associate Member, or Associate of the Institution of Electrical Engineers not have received a ticket for the meeting at Caxton Hall on Monday, May 23rd, when the question of free trade and protection in relation to the electrical industry will be discussed, he will be pleased to forward one on hearing to this effect. It is feared that some of the tickets sent out may have miscarried.

ANNUAL PATENTS REPORT

THE annual report of the Comptroller-General of Patents for the year 1909 contains some interesting matter. It commences with a brief survey of the history of patents legislation, concluding with the Act of 1907, which has now been in force for two years. Referring to Section 27, which provides for the revocation of patents insufficiently worked in this country, the Comptroller states that the provisions of this section are not so stringent as in some other countries. In both Germany and Canada the obligation to work after a definite period is directly enforced; and the jurisdiction of the Court to revoke is not dependent, as in this country, on proof of the fact that the patented article or process is manufactured or carried on mainly or exclusively outside the country. Up to the present, there have been 73 applications to revoke, and 17 patents have been actually revoked. The patents revoked relate to very various inventions, including steam generators and motor cars, but none of an electrical nature. Under the present practice the applicant for revocation must give some *primâ facie* evidence that the article is mainly or exclusively manufactured abroad. For this purpose the whole foreign manufacture is considered, and to found jurisdiction something more than a mere percentage below one-half of the total manufacture must be shown; the question for the tribunal is "Is the patented article manufactured in the United Kingdom to as great an extent as can reasonably be expected, having regard to the industrial developments of other countries?" If a *primâ facie* case on this point is made out by the applicant, the patentee must defend himself by showing what he has done with his monopoly rights in this country. He must prove "adequate working," or give satisfactory reasons for his inaction. It may be noted that an application may be repeated, if new facts emerge or new grounds for revocation arise. There appear to have been many indirect results of the Act. The cases already tried show that, even when the patentee does not manufacture himself, orders have been given to British firms, and licences offered for the manufacture or carrying on of the article or process in order to meet the requirements of the section. The operation of the section has, however, not diminished the applications for patents.

As in former years, locomotion in general is the subject claiming the greatest number of applications, and it is interesting to note that the applications relating to aeronautics are over three times as many as in the year 1908. Considerable attention has been given to electric railway signalling systems in which the track rails are electrically continuous, and are used for both the signalling and the power circuits. The textile industry is also responsible for a noticeable increase in invention. Applications dealing with conveyors and transporters are much in evidence, particularly in connection with the carrying of coal and ores in mines from the working face to the bottom of the shaft.

The number of applications in 1909 was 30,603, as against 28,598 in 1908, an increase of 7 per cent., as against a decrease of 3 per cent. last year. The largest number of applications made on any one day was 155, and the smallest 52. Applications received from women inventors numbered 648, as compared with 572 in 1908. The total number of specifications of both kinds (provisional and complete) received in the year was 40,258, as compared with 37,241 in 1908, an increase of 3,017. There was a large increase in the number of applications from England and Wales, a slight increase in those from Scotland, and a decrease in those from Ireland. There were 1,509 applications communicated from abroad; of these, 731 came from the United States of America, 431 from Germany, 54 from France, 42 from Canada, 30 from Switzerland, and 28 from Austria-Hungary. These represent an increase in the cases of the United States and Canada only. Out of 14,170 patents sealed upon the applications made in the year 1896, 470, or 3·3 per cent., were maintained for the full period of 14 years. The total number of patents which expired (chiefly owing to non-payment of renewal fees) in 1909 was 15,276, and the total number of new patents sealed 15,065. Thus the number of patents in force was decreased during the year by 211.

The receipts from patents fees were £267,985, as compared with £262,890 in 1908, an increase of £5,095, and from Designs and Trade Mark fees £23,825. The receipts from the sale of Patent Office publications were £12,029, as compared with £11,898, an increase of £131. The total receipts were £302,839, as compared with £297,335, an increase of £5,504. The total expenditure on behalf of the Office was £208,536, as compared with £179,531, an increase of £29,005. This increase is principally due to a payment of £30,000 in connection with the purchase of site for the new office buildings. The amount paid for salaries increased by £5,242, and the expenditure upon stationery, &c., decreased by £6,075. This results in a surplus of over £94,300. The total number of persons employed in the office was increased during the year from 648 to 664. The number of readers who made use of the library was 157,235, as compared with 152,221 in 1908, an increase of 5,014, or 3·3 per cent., and the largest number recorded in any one year. The names of nine patent agents were added to the register during the year, the total number on the register on December 31st, 1909, being 265.

During the last ten years the number of hearings upon oppositions to the grant of patents was 1,304, and the number of appeals to the Law Officer in these oppositions 254, of which 43 were withdrawn or abandoned and 32 are still outstanding, while in one case the application for the patent was abandoned. The number of appeals heard by the Law Officer in these cases was therefore 178. In 103 of these appeals the decision of the Comptroller was supported, in 52 varied, and in 23 reversed. During the same period the number of hearings upon oppositions to amendments in specifications was 61, and the number of appeals 24, of which five were withdrawn, and four are outstanding. In the 15 appeals which were heard by the Law Officer, the decision of the Comptroller was supported in 10 cases, varied in two, and reversed in three.

ELECTROMETALLURGY AND ELECTRO-CHEMISTRY

THERE is an interesting article on the South Chicago Electric Furnace Plant of the United States Steel Corporation in the April number of *Metallurgical and Chemical Engineering*. It will be remembered that in February of 1909 the United States Steel Corporation adopted the Héroult electric furnace for steel refining. It was decided, in the first place, to erect two furnaces, each having a capacity of 15 tons, one furnace at the South Chicago works of the Illinois Steel Co., and the other at the Washburn and Moen works of the American Steel & Wire Co., at Worcester, Mass. The furnace at South Chicago is employed to refine molten metal from the Bessemer Converter, the one at Worcester to refine molten metal from the basic open hearth furnace. The object of the first combination is to produce steel of the open-hearth quality (or better) at a lower cost. The object of the second combination is to produce steel superior to the best acid open-hearth quality, at a slightly greater cost. Before the advent of these furnaces the largest Héroult furnaces had a capacity of only 5 tons, so that these have three times the capacity. Another point of difference is that previously the Héroult furnaces in America had cold charges or molten metal from the open-hearth furnace. But in South Chicago the combination with the Bessemer converter has been adopted for the first time. But perhaps the most important point is that previously the Héroult process had been employed as a substitute for crucible steel, for the manufacture of high-grade tool steels, &c., but now it is being used for the manufacture of rails, axles, and wire.

The plant at South Chicago has been in continuous operation since last May, and the Worcester plant since the beginning of this year. With the advent of and the continuous operation of these furnaces the Héroult furnaces can no longer be said to be in the experimental stage, and there is no doubt that in a short time larger and larger furnaces will be built. The furnaces are operated throughout the whole week, except on Sundays, when the Bessemer converter plant is not working. On the average twelve heats are made each day. In cases where the furnace was employed to dephosphorise and desulphurise, the energy used was 194·5 kw.-hours per metric ton; where the original phosphorus content was low 103·8 kw.-hours per metric ton.

The electrical supply is obtained from gas-driven generating plant, run with blast-furnace gas. The charge for energy supply is ¼d. per kw.-hour. Some little trouble was at first experienced with the electrodes, which were of amorphous carbon. It was found a difficult matter to bake evenly such large electrodes, and they frequently cracked, and this caused great trouble. The difficulty has been got over by using the more expensive Acheson graphite electrodes. They are made up of rods 48 in. long and 8 in. in diameter. Three such rods are butt-connected to a total length of 144 in., and three such rods are arranged side by side to form a single electrode. The outer part of the electrode is kept cool by means of a water jacket.

Four attendants are required for working the furnace, one head melter, one assistant, and two workmen. During tapping a little extra help is obtained from other workmen in the works.

Arc Lamp with Mercury Electrode.—A patent has been taken out in America by Dr. C. P. Steinmetz for a flame arc lamp with mercury as one electrode, and iron or aluminium as the other. The arc is enclosed in a long glass vessel containing the mercury at the bottom, and is struck and regulated by moving the other electrode in a vertical direction by suitable electromagnetic mechanism. A silicon compound of lithium is introduced into the globe. This material dissociates and sets free lithium which improves the colour of the arc. Silica salts are formed on the interior surface of the globe, but these are translucent, and do not absorb any appreciable percentage of the light.

A NEW TESTING SET

THE testing set illustrated below (Fig. 1) has been designed by Mr. R. W. Paul (New Southgate, London, N.) as a *multum in parvo* for the central station engineer and mains man to perform practically every test that can be required of a portable instrument.

It consists of a "unipivot" moving coil micro-ammeter and sets of resistances and switches. The pivoting arrangement of the instrument, which is particularly interesting, is shown in Fig. 2. The coil swings round a fixed iron sphere between the poles of the permanent magnet, and the pivot which supports it is at the centre of this core, and works in a jewelled cup. The top connection to the coil is a light spiral spring,

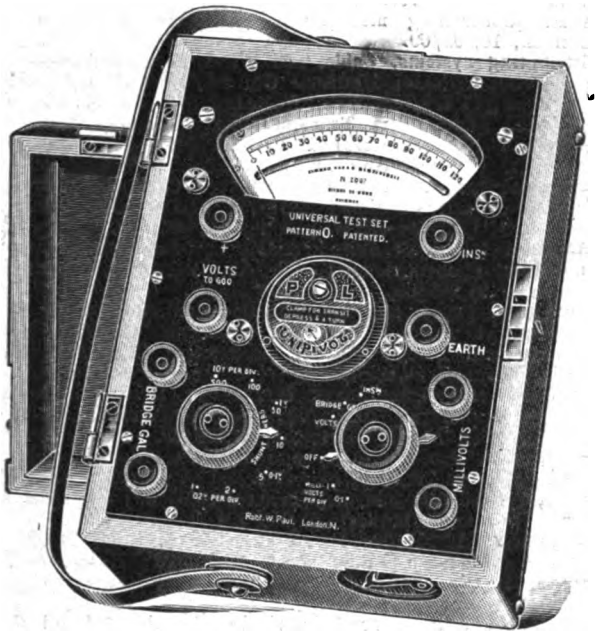

FIG. 1.—GENERAL VIEW OF SET; COVER REMOVED.

which tends to maintain the coil in its normal position when the instrument is tilted. This micro-ammeter has a resistance of 60 ohms, and reads from 0 to 120 micro-amperes on an equally divided scale.

A resistance of 20,000 ohms is connected in series with it, and a universal shunt is provided so that it may be used as a voltmeter reading from 0·02–2·4 volts (without a shunt) to 10–600 volts, with seven different ranges.

For use as an ammeter, two special low resistance shunts (one of which is shown in Fig. 3) are provided in the box, enabling currents up to 120 amperes to be measured, also in several ranges, so that it may be employed either for measuring the current through a single lamp or that taken by a whole consumer's installation. The screw part of the shunt terminals are bored conically so that a heavy cable may be inserted at the

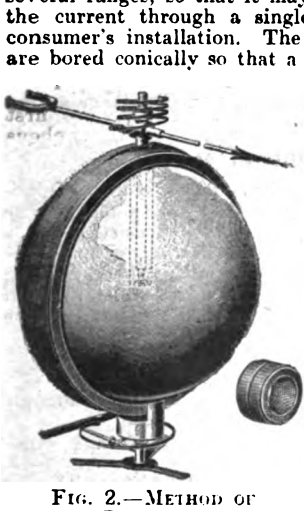

FIG. 2.—METHOD OF PIVOTING.

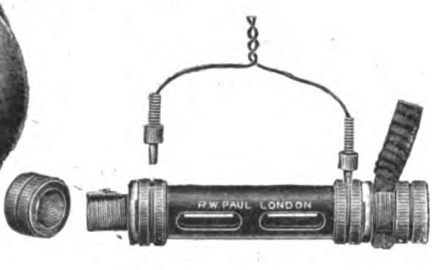

FIG. 3.—THE SHUNT.

end, and the milled nut, as it is screwed down, causes the split screw to come together and grip the cable.

For measuring insulation resistance, the instrument is first connected as a voltmeter across the battery or the mains employed for testing, and by turning a switch is then connected as a micro-ammeter in series with the insulation resistance to be measured: the insulation is then given by dividing the volts by the amperes, and, if necessary, subtracting the 20,000 ohms resistance which is in circuit with the instrument. By their being a high resistance permanently in circuit there is no danger of damage even if the proper shunt is not employed in the first instance; the resistance coil will withstand 600 volts. Small resistances may also be measured, from 10 ohms down to 0·00001 ohm, by the fall of pressure method.

By the use of switches the changes of connections for all these tests are of the simplest possible description.

Instructions are also given with the set for using it to localise faults on mains by the fall of potential method, or (by employing it in conjunction with a bridge) by the loop method.

An interesting detail is the provision of a small lamp, which can be inserted in the box beneath the micro-ammeter scale and can be lighted by a pocket 2-volt battery; it thus converts the instrument to an illuminated dial instrument, a facility which will be much appreciated, as tests have often to be carried out in dusky places.

Altogether, Mr. Paul's set is one of the handiest we have seen, and those mains men whose equipment is not complete in this respect should not fail to write to him for further particulars, which he will be happy to supply to any of our readers.

ELECTRIC WIRING IN MARYLEBONE

THE overhauling of the electric wiring of the Marylebone Baths, referred to on page 311 of our last issue, has been discussed at a special meeting of the Marylebone Borough Council. It will be remembered that the Electricity Department offered to do the work at cost price, *plus* a small sum for superintendence after completion, a rough estimate of the cost being £400. On the other hand, some Councillors are in favour of inviting tenders for the work from local wiring contractors. Councillor Duncan Watson, as usual, took a leading part in the debate, and complained that although the question was brought up some months ago, as a matter of urgency, it had been postponed from time to time.

Incidentally, Mr. Watson accused the Electricity Department of using foreign cables. Alderman Debenham denied this, but later in the discussion he admitted that he had been misinformed, and that the Marylebone Electricity Department did use foreign cable for the reason that there was a ring among British makers to keep the price up.

Mr. Watson further stated that, after an inspection of the baths, he would undertake to do the work in question for £250, and another Councillor later on suggested that this offer should be accepted. Mr. Watson pointed out, however, that this was impossible, as he, as a Councillor, is, of course, debarred acting as a contractor for the Council's work. This remark brought the unkind retort that this was probably why Mr. Watson had mentioned such a low price. Several members also ridiculed the suggestion that he could, in half an hour's inspection of the baths, arrive at an accurate estimate of the cost. Alderman Debenham said it had taken a man from the mains department—it was not proposed to do the work through the Sales Department—three days to work out the estimate of £400, but this was an outside price; the work would be thoroughly well done, and cost price charged as mentioned above.

The discussion also brought out an interesting conflict of opinion as to the duties of a municipal electrical engineer. Several members argued that Mr. Seabrook, having been appointed manager of the Electricity Department, should be at the service of all other Committees of the Council on electrical matters, and should not be allowed to say he would not draw up the specification if the Electricity Department were not given the work to do. This matter, however, was not pursued, and eventually the recommendation of the Baths Committee that the Electricity Department should be entrusted with the work was carried, only four voting against.

Institution of Electrical Engineers, Students' Section.—According to the annual report for the session just concluded, eleven meetings of the Students' Section have been held, the average attendance being twenty-five. The Papers read covered a wide range of subjects and elicited interesting discussions. The summer tour this year will take place from July 25th to 30th, when works and places of interest in and around Birmingham will be visited.

The Telewriter.—The Telewriter Syndicate will shortly open a public exchange for the use of subscribers to their system. A portion will be set aside for communication with the cable companies' offices. Subscribers will thus be able to transmit an urgent cable in writing direct to the cable companies' offices.

Russian Electrical Exhibition.—The Imperial Russian Technical Society is organising an exhibition to be held in St. Petersburg this year. The exhibition will run for three months, but the date of opening has not been fixed, but British electrical and other firms are being invited to send exhibits. The main intention of the exhibition is to demonstrate the application of electricity to steam railways; electric traction on main lines, on light railways, and on tramways; and the utilisation of waterfalls as natural sources of electric energy. Intending exhibitors are requested to communicate with the Organisation Committee, Panteleimonskaja-street 2, St. Petersburg.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 12th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

8,875/09. **Storage Battery Plates.** G. Okill. Plates for cells of the rolled grid pattern consist of lead grids with bars of triangular section. After the paste has been inserted the grids are converted into negative plates and successively charged and discharged at a high rate. After each reversal the plates are subjected to pressure. Two such plates, with a separating sheet of perforated celluloid, are then rolled up into a scroll, with the wider parts of the tapered spaces at the inner surfaces of the scroll. Finally, one of the plates is converted into a positive plate. The grids, which are intended for positive plates, are provided with slots in their margins to prevent buckling. Three claims, two figures.

11,304/09. **High-tension D.-C. Series System.** T. von Zweigbergk. When a number of H.-T. d.-c. motors are connected in series with one circuit-breaker, a flash-over may occur on the commutator of one machine without the breaker operating, as the back E.M.F. of the other motors may keep down the current. An arc may thus be formed across the commutator in question. In order to avoid this, insulated terminals connected direct to the circuit-breaker are provided above each commutator. Should any machine flash over, the arc is immediately transferred to the terminal above the commutator, and the circuit-breaker is operated. Four claims, one figure.

15,115/09. **Reflector Lamps.** C. C. Regnart. The trough is of porcelain, with the concave surface glazed. Bare wire conductors are arranged in longitudinal holes in the body, and terminate in split pins and sockets respectively at the two ends. The sockets for the lamps are integral with the porcelain body, and are provided with contacts in connection with the conductors. A metal reflecting surface may be added. By means of the pins and sockets, any number of these units may be connected end to end to form a long rigid trough. Two claims, four figures.

15,158/09. **Protection of Telephone Circuits from Disturbances Due to A.C. Traction Systems.** J. Sayers. Both electrostatic and electromagnetic induction are neutralised by providing an auxiliary insulated conductor parallel to the trolley wires and the telegraph or telephone wires to be protected. In the case of a double line railway with a trolley wire over each track, two insulated wires are run parallel to the trolley wires, and are connected at both ends so as to form a closed circuit. At the point where current is fed into the trolley wires, the auxiliary circuit is connected to one pole of a small A.C. generator, which charges it at the same frequency as that of the system, but at a lower pressure and 180 degrees out of phase. The other pole of this generator is earthed. Further to neutralise the electromagnetic induction, the auxiliary circuit includes the secondary coil of a transformer, the primary of which is connected to the secondary of another transformer, the primary of the second transformer being in series with the main trolley-wire circuit. By this means a low-pressure current proportional to the main traction current, but 180 degrees out of phase with it, circulates in the auxiliary circuit. Four claims, one figure.

3,400/10. **Telephone Exchange Apparatus.** Siemens Bros. & Co., Ltd. (*Siemens & Halske A.-G.*). In telephone exchanges in which a register records the time of conversation between subscribers, the operator completes the circuit of this register, which is worked by current impulses received at intervals from a rotating device common to all the registers of the exchange. In order that the register shall start recording only after speaking begins, two contacts are provided in the circuit; one is closed by the calling relay of the calling subscriber, and the other by the calling relay of the called subscriber. Further, to reduce the current required by the registers, they are sub-divided into groups with separate rotating devices to give the impulses. These devices rotate synchronously, but supply the current impulse to the different groups of registers in succession, so that current is required for one group at a time only. Three claims, one figure.

4,095/10. **Insulated Shaft Coupling.** J. R. Grundy. Each of the shafts to be coupled is provided with a flanged hub, apertures being cut in the flanges. A disc of leather, raw hide, or other suitable insulating material is placed between, and is provided with projections on both faces, which fit into the apertures on the flanges. The projecting pieces may be integral with the disc, or rivetted on. The lugs are undercut, and the sides of the apertures inclined so that the two flanges are drawn together, and a direct transmission of the torque through the faces of the flanges is effected. Two claims, four figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Brush Electrical Engineering Co. and Bastian [Vapour rectifiers] 10,409/09; Grote, 11,282/09; Weaver [Controlling mechanism] 14,674/09; Messenie and Slaughter, 16,292/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: British Thomson-Houston Co. and Wedmore [Distribution systems] 11,285/09; Sharp [Manholes] 22,187/09.

Dynamos, Motors and Transformers: Parsons, Law and Stockbridge [Commutators] 10,588/09; Siemens Schuckertwerke Ges. [Transporting machines] 25,627/09.

Electrometallurgy and Electrochemistry: Girtin [Electrolytic production of salt solutions] 20,192/09; Langbein-Pfanhauser Werke A.-G. [Ductile electrolytic iron] 24,841/09.

Incandescent Lamps: Felten & Guilleaume Lahmeyerwerke A.-G. [Metal filament lamps] 17,960/09; Zschocke [Metal filament lamps] 21,285/09.

Switchgear, Fuses, and Fittings: Jackson and Hurst [Controller contact fingers] 9,829/09; Electric Control, Ltd., Macmillan and Dryer [Switch mechanism] 12,395/09; Rush [Lighting fixtures] 24,599/09.

Telephony and Telegraphy: Mulligan [Driving automatic telegraphic apparatus] 10,223/09; Amalgamated Radio-Telegraph Co. (*Von Bronk*) [Detector] 27,689/09.

Traction: J. Stone & Co., and Darker [Electric lighting, heating, and ventilating of vehicles] 7,425/09, 10,511/09, 7,468/10, 7,470–1/10; Simpson [Brakes] 9,404/09; Gresham and Kiernan [Vacuum brakes] 11,236/09; Smith and Watson [Trolley head] 12,607/09; Rizzo [Electric braking] 21,669/09; Wheatley (*Hoadley*) [Brake shoes] 23,997/09; Herbert [Rail joints] 26,460/09; Elorza [Brakes] 27,086/09; Boirault [Automatic brakes] 30,088/09.

Miscellaneous: Perrett [Electrical extraction of oil from water] 26,477/08; Bailey [Aluminium solder] 9,654/09; Dyhr [Current generators actuated by movements of the body] 11,107/09; Reiner and Whitehead [Illuminated signs] 11,112/09; Zabski [Electric locks] 14,164/09; Michaelson [Trolley clips] 22,904/09; Robillot [Fire and burglar alarm] 26,623/09; Steiger and Besancon [Electric clock] 27,154/09; McElhinney [Electro-therapeutic apparatus] 1,883/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: Allgemeine Elektricitäts-Ges., 9,209/10.

Electric Ignition: Weckerlein and Stocker [Contact breakers] 6,033/10.

Electrochemistry: Politz [Protection of pipes from electrolysis] 9,094/10.

Incandescent Lamps: Beuttell, 9,615/10.

Telephony, &c.: Colin and Jeance [Wireless telephony] 18,436/09; Neuhold [Automatic telephone systems] 7,659/10.

Traction: Dibble [Air brakes] 8,953/10.

Miscellaneous: Akt.-Ges. Brown, Boveri et Cie. [Condensing plants] 19,295/09.

Opposition to Grant of Patent

12,844/09. **Magneto Massage Machine.** B. Seacombe. Opposition has been entered to the grant of this patent. The specification describes a massaging apparatus consisting of a roller with a corrugated metal surface, driving a magneto-generator through a gear train. By means of a contact-making device, an intermittent current is passed from the roller through the part being massaged, and back through the hands. Three claims, five figures.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: A. F. Berry [Insulation of transformer windings] 1,526/05.

Heating and Cooking: J. M. Herrgott [Fabrics with embedded heating wires] 2,377/02.

Switchgear, &c.: Otis Elevator Co. (*Otis Bros. & Co., U.S.A.*) [Push-button lift control gear] 1,883/98; N. Rowe [Transformer regulating switch] 18,366/98.

Telephony, &c.: P. Picard [Telegraph relays] 2,382/98.

Traction: G. T. Hyde (*New York Air-Brake Co.*) [Brakes] 2,158/03; S. A. Russell and E. Ford [Controller and brake mechanism] 1,732/05.

Miscellaneous: H. H. Cooper [Table-cloths with embedded conductors] 2,284/02; R. Taylor [Ventilation of tramcars] 2,286/04; R. Peters [Utilisation of carbon ends] 2,558/04.

NEW GENERATING STATION IN WESTMINSTER

THE new station of the Westminster Electric Supply Corporation, which has been erected in Horseferry Road, Westminster, to replace the company's original station in Millbank Street, is now complete, and has been dealing with the whole of the load formerly supplied by that station since the beginning of the month.

The Millbank Street station was opened in 1890, but its site came within the area recently acquired by the London County Council for the extension of the Thames Embankment. The Bill under which the site was acquired contained clauses requiring the Council to provide an equivalent site for a new station for the Company, to bear the cost of erection of a new station equivalent to the existing station at the time of removal and of the necessary alterations of mains, and to make good by a lump sum as compensation any loss due to the facilities for coal supply and condensing water. The new site provided under these conditions is some 300 yards away from the river. Arbitration was resorted to in order to decide the sum payable to the Company in connection with the transfer, and Mr. J. A. Simon, K.C., M.P., who was umpire, awarded a total sum of £181,371, including £12,500 in respect of the cost of cartage of coal and £3,100 for other matters agreed upon between the parties. These sums do not include the cost of constructing a subway, in which the pipes for conveying condensing water from the River Thames are laid. The subway and pipe-work between the station and the river has been carried out by the Council itself, and under the arrangement the Council have acquired the plant and equipment of the old station, which was ready for handing over by the date specified, viz., May 1st. The two stations were run in parallel for a short period before the old station was given up, but the whole load was taken over by the new station on May 2nd.

The buildings of the new station are particularly substantial and elaborate, both as regards the exterior, with its ornamental stone frontage, and the interior arrangements. They were designed by Mr. C. Stanley Peach, architect, and were erected by Messrs. Mowlem and Co. A distinctive feature of the arrangement is the disposition of the plant in two floors. The lower floor contains the turbine-driven continuous-current generating plant, while the upper floor is devoted to motor generators for dealing with the additional supply from the station of the Central Electric Supply Co. at Grove Road. The station is thus a combined generating station and sub-station. Its ultimate capacity is 6,600 kw. of generating plant, of which 3,600 kw. are already in place, and 15,000 kw. of converting plant, of which 3,000 kw. has already been put down. The building is of considerable height, for even though it has another floor above it, the engine-room is commodious, lofty, and particularly well lighted by large windows. Otherwise the general arrangement calls for little remark; the boiler-house is parallel to the engine-room, and the switchgear and offices are on the opposite side. Upstairs, in addition to the motor generators, there is a battery-room and provision for the booster and other auxiliary plant.

All coal has to be carted, but, as already mentioned, the company are compensated for this disadvantage. The coal-conveying arrangements are simple and straightforward; coal is tipped from the carts into a hopper, and taken direct to the bunkers over the firing floor by a bucket-conveyor. This does not pass under the boilers for reception of the ashes, as is often the case, but these are hoisted in skips and taken away by a small transporter.

The boilers at present installed are four in number, arranged in a single row, and each consisting of a double-drum Babcock & Wilcox water-tube land-type unit, capable of evaporating 20,000 lbs. of water per hour, with a working pressure of 200 lbs. per sq. in., and a superheat of 150° F. They are fitted with internal superheaters without any means of adjusting the superheat, but the novel arrangement is adopted of providing a mixing valve by which the superheat of the steam supplied can be kept constant by adjusting the proportions of saturated and superheated steam delivered. A thermometer dial is provided at each boiler front for that purpose. Chain-grate stokers are used, and positive clutches permit of the stoker shaft being driven by a motor from either end. The economisers are made with steel tubes that do not require continual scraping. Provision is made, however, for their being cleaned occasionally by compressed air. They are fixed immediately behind the boilers, and embody the counter-flow principle. A special feature is the use of steel-cased flues, lined with slabs of firebrick, bolted on to the steel casing with a packing of sand at the top. Messrs. Kennedy & Jenkin, the consulting engineers, have used this type of flue with great success elsewhere, and believe that it secures a considerable saving in upkeep, and is considerably more airtight than the more usual brick construction. The steam piping arrangement permits of each boiler being used, either on its own turbine or to supply a common steam main. The feed-pump room is at the end of the boiler-house. In addition to a pair of ordinary Wier steam pumps there is a specially designed vertical shaft electrically-driven centrifugal pump, supplied by Messrs. W. H. Allen, Son & Co., of Bedford. A long shaft permits of the motor being mounted well away from the pump on a sort of upper floor of the pump-room. Lea recorders measure both the air-pump discharge and the make-up feed, and the whole feed is further passed through a Kennedy water meter, and heated by the feed-pump exhaust. The make-up feed water is passed through the oil-coolers of the turbines. Feeder water can be obtained either from a well, or in emergency from the town mains. Both steam and electric pumps are provided for the well, and another electric pump drains the hot sump into which the boilers are blown down.

The three main turbines are on the Zoelly principle, constructed by Messrs. James Howden & Co., of Glasgow, and each drives a pair of 500-kw. continuous-current generators, manufactured by Messrs. Siemens Brothers Dynamo Works, Ltd. Two smaller turbines of similar construction are used for the steam balancers. (A description of the Howden Zoelly turbine was given in ELECTRICAL ENGINEERING, Vol. V., p. 927.) The condensing plant is placed immediately under the turbines in the usual way, and a water-sealed expansion joint is provided between each exhaust flange and condenser. The condensers are of Messrs. Willans & Robinson's "contraflo" type, with electrically-driven Edwards' air-pumps, and can easily maintain a 95 per cent. vacuum without any vacuum augmenting devices.

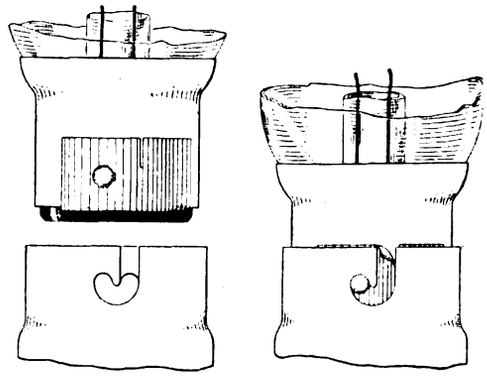
The circulating water is obtained from the river through four 20 in. pipes about 300 ft. long, laid in a subway constructed by the County Council from designs of Mr. Maurice Fitzmaurice. These are arranged on Messrs. Bailey & Jackson's principle, so that the direction of flow in either can be altered at will. Fixed and rotary strainers are used, and steam ejectors are provided for priming the pipes. Very complete precautions are taken for avoiding air locks in the pipes by the provision of connections at suitable points, taken to a sealed catchpot on the roof, which is kept exhausted by a vacuum pump, and drained by a barometric leg.

The main generating sets, as already mentioned, consist each of a pair of 500-kw. machines in tandem. We understand that Messrs. Siemens Brothers Dynamo Works, Ltd., were willing to supply single machines for the output, but for various reasons double sets were preferred. Each machine is quite independent from its fellow, and has entirely separate switchgear. The machines are shunt wound, but can be separately excited from the battery if desired. Each pair is designed

Digitized by Google

for an output of 1,000 kw. continuously, or 2,440 to 2,175 amperes at from 410 to 460 volts respectively at a speed of 1,850 r.p.m., 25 per cent. overload for half an hour, and 40 per cent. overload for three minutes. They are provided with compensating windings, as well as commutating poles, and carbon brushes only are used. The machines are enclosed and ventilated by fans carried on the armatures. Air is drawn in through a series of filters through ducts from a closed chamber under the switchboard containing the rheostats, &c., and fed by further ducts from the roof. The hot air rises from the "chimneys" of the machines into the engine-room. A steam consumption of 17·1 lbs. per kw.-hour has already been obtained on full load, and even better results are anticipated. The two steam balancers are similar to the main sets, but of 300-kw. capacity each.

Turning now to the converting plant, we find in the motor-generator room on the first floor three 1,000-kw. Oerlikon induction motor-driven sets. The motors are of the slip ring type, with the resistances attached to the rotors, and a very neatly designed internal starting short-circuiting and brush-lifting arrangement. There is also a 300-kw. balancer, driven by an induction motor from the Grove Road supply. This, like the steam balancers, is entirely hand regulated. Further auxiliary plant comprises two battery booster sets by the British Thomson-Houston Co., Ltd., and a small milking booster.



The battery is arranged in two sections of 100 cells each, one for each side of the three-wire system, and the boosters are connected to the middle wire side of each section of the battery. It was supplied by the Tudor Accumulator Co., and its rated capacity is 950 amperes for three hours, 1,200 amperes for two hours, and 2,100 amperes for one hour. Although the actual connections to the cells are of copper, the leads from the battery to the switchboard are entirely of solid aluminium. The battery can be used to assist in the peak load if desired, but its main function is to serve as a stand-by to maintain continuity of the station auxiliary service and the supply to the Houses of Parliament in cases of emergency. It should be mentioned here that all the battery and booster regulation is entirely by hand, and indeed the complete absence of any form of automatic electrical regulation is an important feature of the station.

The continuous-current switchgear is necessarily somewhat intricate, as it has to provide for both the generating and converting plant, the battery and its boosters, the balancers, and the outgoing feeder arrangements, including a special independent feeder to the Houses of Parliament. The arrangement, however, is really simple and straightforward, and without undue complication. Practically the whole of the main D.C. switchgear is together on a large board in a gallery in the turbine house, and the motor-driven balancers, the boosters, and the battery are all controlled from this point. What may be regarded as extensions to the bus-bars is taken up to the board in the motor-generator room, but the whole direct current feeder arrangements are downstairs. The battery and its boosters are also controlled entirely from the main board. It is not necessary to describe each panel in detail. The whole gear was supplied by the British Thomson-Houston Co., and is of the ordinary vertical board type with slate panels. One point of special interest is the extensive use of aluminium connections supplied by the British Aluminium Co. Although for the sake of compactness the actual bus-bars and actual connections on the backs of the panels themselves are of copper, all other connections, including the main connections to the generators, &c., are of aluminium rod. On the board itself mechanical connections are used, but elsewhere the rods are all connected by butt welded joints. The bus-bar system is arranged in two sections, which can be coupled together or worked separately. Vertical plug-bars permit of any generator, balancer, or feeder being connected to either bar through its main automatic cut-outs. These in the case of the generators are fitted with reverse current releases, and in the case of the feeders with overload releases. The special House of Commons feeder is connected to the lower bus-bar without plug-bars, and this part of the bar can be isolated, so that the supply can be given independently from the rest of the system by two balancers or the battery. The battery main circuit-breaker is arranged to cut it off from the upper bus-bar in case of overload, but to leave it connected to this section of the lower bar. At the House of Commons there is a change-over switch, so that the supply can be taken either from the general network or from its special feeder. There are in all six generator panels, twelve feeder panels, two steam-balancer panels, one motor-balancer panel, one middle-wire and bar-coupling panel, the House of Commons feeder panel, two battery panels, two booster motor panels, an excitation-circuit panel, and two auxiliary-circuit panels. The high-tension switchgear in the motor-generator room is of the British Thomson-Houston Co.'s standard pattern, with all H.T. gear in cells behind the board. It is combined with the D.C. motor-generator switchgear by arranging the oil-switch operating levers between the D.C. panels. There is also a small milking booster board in the motor-generator room.

In conclusion, we wish to express our thanks to Mr. C. O. Grimshaw, Chief Engineer to the Westminster Electric Supply Corporation, Ltd., and to Messrs. Kennedy and Jenkin, the consulting engineers, to whose designs the station was built, for permission to describe the station and for much kind assistance.

A SIMPLE LAMP LOCK

A VERY simple device known as the "Lamlok," which has recently been introduced, is illustrated here. It consists of a small curved piece of sheet metal of such a thickness as to fit in between the lamp-cap and the holder, and provided with a hole to pass over one of the lamp pins, and an ear to lie over the edge of the cap, and so to keep the plate straight. There is a slit in one side of the plate, and when the lamp has been put in it can be locked by turning up the side of this slit in the plate by a knife in the manner shown in the figure. The

LOCK READY FOR INSERTION. LAMP LOCKED.

lamp can then only be removed by bending the plate down again with a suitable tool, but to anyone not knowing how the lamp is locked, this method would not be likely to suggest itself. The joint patentees of the device are Messrs. C. M. Bennett and C. N. Jeffcoat. All inquiries should be sent to the latter at 2 Marchmont Court, Addison Gardens, W. The patent, which has been applied for, also covers an alternative method of locking by forming an L-shaped slit in the lamp-cap itself, which can be bent up in a similar way.

The Society of Engineers.—We have been requested by the Secretary of the Society of Engineers (Incorporated), 17 Victoria Street, S.W., to remind our readers that the last date on which essays in competition for the Status Prize can be received is Tuesday, May 31st, 1910.

LOCAL NOTES

ACTON: *The Electricity Undertaking.*—The Electricity Committee have had under consideration the position of the Electrical Engineer, and the electrical undertaking generally. As announced in our last issue the Council referred back a recommendation that the electrical engineer should hand in his resignation. At the last Committee meeting the Chairman said the real question was whether the undertaking should be transferred to the Metropolitan Electric Supply Co., and a resolution was passed recommending the Council to come to an immediate decision in connection with the matter.

AUSTRALIA: *Melbourne: Tramways.*—The tramways in Melbourne and its suburbs were constructed by the Melbourne Tramways Trust, representing the various municipalities, and were leased to the Metropolitan Tramways & Omnibus Co. for 32 years from July 1st, 1884. There are thus six years unexpired. At present the lines are mainly cable, with a few miles horse tramway. A movement is being made to take over the undertaking and convert it to electric traction without waiting for the natural expiry of the concession.

COVENTRY: *Electricity Accounts.*—The profit for the year to March 31st was £10,238, compared with £3,765 in the previous year. After handing over £2,500 to the relief of rates, the balance is to be applied to writing off the cost of superseded and obsolete plant. In view of the satisfactory result of the year's working, each employee is to receive a bonus of a fortnight's pay.

FIFE: *Tramway Extensions.*—An inquiry was held last week at Edinburgh, under the Private Legislation Procedure (Scotland) Act concerning the extensions proposed by the Dunfermline & District Tramways Co. The main extension will be from Dunfermline to Rosyth. Mr. W. C. C. Hawtayne gave evidence on engineering questions, and the promoters having agreed to carry out certain road widenings, the preamble of the provisional order was found proved.

FROME: *Proposed Transfer of Electricity Works.*—A large sum of money has been due from the Council to Messrs. Edmundson's Electricity Corporation, Ltd., in respect of the electricity works for about two years. Recently a proposal was made that the company should take the works over, but the Council has delayed coming to a definite decision. The company is now getting impatient at the delay in a settlement one way or the other, and has demanded a settlement.

GLASGOW: *New Telephone Exchange.*—The Commissioners of H.M. Public Works and Buildings are arranging for the erection of a new telephone exchange in the Bridgeton district.

Smoke Abatement Exhibition.—A smoke abatement exhibition, under the auspices of the Corporation, will be held in Glasgow from Friday, September 16th, to Saturday, October 8th. Electric or gas power will be supplied to exhibitors free of charge. The charge for space will be 2s. 6d. per square foot.

GRIMSBY: *Street Electric Lighting.*—It is proposed to convert 282 street gas lamps to electric lamps. The Council intend to convert all gas lamps in streets where electric mains are laid, and to charge the same price as for the existing gas lamps. Mr. Hooper, of the Local Government Board, who recently held a local inquiry, said the Board desired to have evidence that the present lighting was defective, or at any rate that the new lighting would be equally effective at no greater cost. Mr. W. A. Vignoles, the Borough Electrical Engineer, said information on this point had already been sent to the Local Government Board, and he did not wish to read out the detailed figures in public. The Inspector agreed.

LEICESTER: *Proposed Tramway Extensions.*—A scheme for extending the tramways will shortly be considered by the Tramways Committee.

LIMERICK: *The Electricity Undertaking.*—At the last meeting of the Corporation it was decided to obtain the services of a competent expert, "with a practical knowledge of the working of a successful power station," to examine and report on the municipal electric lighting station.

The loss on the undertaking for the year to March 31st was £1,255, making a total deficit since the commencement of the undertaking of £8,140.

LONDON: *London County Council: Through Tramway Running.*—Arrangements have at last been concluded for a through service of tramways from Aldgate to Ilford, over the lines of the West Ham, East Ham, Walthamstow, Leyton, and Ilford Councils.

Fulham: Free Wiring.—The Borough Council has sanctioned a proposal for the free wiring and fitting of consumers' premises. The Council will wire for approximately six lights per house or flat, and supply the necessary plain fittings, free of charge, in connection with the prepayment meters. The wiring will be done by local contractors. The wiring will, if necessary, be upon the "Stannos" system. The estimated capital cost of wiring and supplying the necessary fittings for six lights, including a transformer, is £3 3s. per consumer. If the landlord undertakes to be responsible for all renewals of lamps, other than those necessitated by fair wear and tear, the charge will be 5½d. per unit; but where the provision and renewal of lamps is not included in the scheme, the charge will be 5d. per unit. It has been ascertained, as a result of preliminary circular and canvass in some four streets, that about 112 new consumers may be expected to at once adopt electric light if this system is introduced, and the probabilities are that a very much larger number will be connected to the mains within the first year. The Committee recommend making provision in the first instance for wiring 500 houses at a total estimated expenditure of £2,000, made up as follows:—Wiring and fitting, 500 at £2 8s., £1,200; 500 transformers at 15s., £375; 3,000 lamps at 2s., £300; provision for extra points where required, £125.

Hackney: Sales Department.—The Electricity Committee have been inquiring into the possibility of extending the usefulness of the sales department. Since 1908, when this was commenced, over £6,000 worth of work has been executed at a profit. The department, however, possesses no show-room, and there is only one permanent staff officer, assisted by a temporary clerk and an assistant engineer. Premises have now been taken in Mare Street, Hackney, for the purposes of a show-room.

Hampstead: Street Lighting.—A proposal by the Electricity Committee to convert all the remaining street gas lamps to electric lamps has been referred back in consequence of an offer by the Gas Light & Coke Co. to fit up a trial installation of twenty inverted gas burners. There are already 340 lamps lighted by electricity in Hampstead, and the Council have sanctioned the conversion of 700 more. Apart from the fact that new lighting consumers are immediately secured when mains are laid for street lighting, the proposals of the Electricity Committee were such that after 1918 the cost of lighting the borough would be £3,747 against £7,242 at present. The recommendation to refer back was carried by one vote, the figures being 18 to 17.

PENMAENMAWR: *Electric Lighting.*—The Council have been granted an extension of twelve months in which to put their electric lighting order into force. Negotiations are being carried on with the North Wales Electric Power Co., who will shortly be extending their transmission lines into the district.

READING: *Tramway Profits.*—The net profit on the tramways for last year was £3,159, which the manager recommends should be carried to reserve.

SOUTHAMPTON: *The Barber Radial Truck.*—The Tramway Manager reports having obtained very satisfactory results with the "Barber" radial axle truck, its behaviour round curves having exceeded his expectations.

SOUTH SHIELDS: *Tyne Tunnel Railway.*—The proposition of the Parliamentary Committee that the promoters of the North and South Shields Electric Railway Bill should deposit a sum of money equal to two years' interest on the purchase price of certain land required, such sum to be forfeited in the event of the promoters not putting into force the compulsory powers of purchase, has not been accepted. The Bill is consequently to be opposed.

STOKE-UPON-TRENT.—*Management of Electrical Undertakings.*—The Electricity Supply Committee of the new County Borough of Stoke-upon-Trent have selected a sub-committee to consider the appointment of a chief electrical engineer. In the meantime, the appointment of the existing chief engineer is being continued.

TORQUAY: *Stud Tramway System.*—It is reported that an intimation has been received at Torquay that the Board of Trade will not renew the licence for the present surface-contact system of tramways unless considerable improvements are effected, especially in respect of the working of the studs, after October 30th next, when the present term expires. It may be remembered that the National Electric Construction Co. some time ago recommended the Council to allow them to replace the Dolter system by the overhead system.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BATLEY.—A lighting and traction switchboard is required for the electricity works. Particulars from the Borough Electrical Engineer, and tenders by June 2nd.

BELFAST.—The Local Government Board have authorised a loan of £6,000 to the Board of Guardians in connection with an electric power-house at the White Abbey Sanatorium.

In connection with certain extensions of the tramways, the Electrical Engineer is to prepare estimates of cost of the additional generating plant.

BRIDLINGTON.—An inquiry has been held concerning a loan of £3,000 for extensions at the electricity works.

BULGARIA.—It is reported that the communal authorities of Philippopolis will shortly invite tenders for an electric light installation and for the construction of electric tramways.

Digitized by Google

BURY.—A proposal of the Electrical Engineer for extensions to the generating plant was reported upon unfavourably by the Electricity Committee at the last meeting of the Council. The view of the committee is that the spare plant is sufficient for the present, but an amendment to adopt the Engineer's proposal was carried.

COPENHAGEN.—The Corporation require two 1,000-kw. converters or motor generators. Particulars from Elektrisk Station, Gothersgade 30, Copenhagen, and tenders by June 2nd.

CORNWALL.—The Cornwall Electric Power Co. are about to erect a power station at Hayle.

COVENTRY.—A 2,500-kw. turbo-alternator with condensing plant, four water-tube boilers, and two fuel economisers are required. Particulars from the Borough Electrical Engineer, and tenders by May 30th.

DUBLIN.—Howth Castle, the ancient seat of the now defunct Earls of Howth, is to be electrically lighted, under a scheme prepared by Mr. A. M. Porte.

DUNDEE.—Notice has been received from the Scottish Office granting the Electricity Department increased borrowing powers to the extent of £50,000.

RHYL.—The Council have sanctioned mains extensions, at an estimated cost of £642.

ROTHERHAM.—Mains are to extended in Wellgate, Gerrard Road, and Moorgate at an estimated cost of £620.

SHEFFIELD.—Mains are to be extended in the Meersbrook district at an estimated cost of £925. Other extensions to cost £485 are to be carried out.

WAKEFIELD.—An inquiry was held on Thursday concerning a loan of £7,150 for extensions at the electricity works. Mr. H. R. Hooper, the Inspector, questioned whether the Local Government Board would grant a further loan until the present loss on the undertaking had been cleared off. He also required further information with regard to the accounts. The inquiry was consequently adjourned *sine die*.

WALSALL.—The Local Government Board has sanctioned loans for £8,345 for the following purposes :—Land, £1,000; sub-station, £1,250; sub-station plant, £1,404; mains, £3,691; services, £1,000.

Miscellaneous

LYNTHWAITE.—The Local Government Board have sanctioned a loan of £30,000, repayable in 30 years, for the reconstruction of the tramway track, a matter which has been in dispute with the Huddersfield Corporation for some time.

YARMOUTH.—It is proposed to convert 192 gas lamps to electric lamps. The Surveyor suggests converting 186 arc lamps to flame arcs, with some 400 candle-power glow lamps, which will effect a saving of £200 per annum.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

PROVINCES.

BOURNEMOUTH.—Library, Lansdowne (£7,000). F. W. Lacey, Surveyor, Town Council.

BURNLEY.—Partial reconstruction of works (£2,400) for the Burnley Paper Works Co.

CREWE.—School (800 places), Derby Street. Education Committee.

Theatre, for the Crewe Theatre Co.

CROYDON.—Enlargement of Central Polytechnic (£5,600). Geo. F. Carter, Engineer, Town Council.

GATESHEAD.—School, Brighton Avenue (£6,808). Education Committee.

NORTH SHIELDS.—Theatre (£3,700). H. Gibson & P. J. Steinlet, Architects, 56 Camden Street, North Shields.

PETERBOROUGH.—School (£7,250). Architect, A. H. Brownrigg, Hazelmere.

POOLE.—School, South Road (£7,300). Education Committee.

WATFORD.—Grammar-school, Cassiobury Park. Russell & Cooper, Architects, 11 Gray's Inn Square, W.C.

YARMOUTH.—Rebuilding refreshment rooms, Fish Wharf (£2,500). Borough Surveyor, Yarmouth Town Council.

A Rapid Piece of Emergency Work.—Mr. P. P. Wheelwright, Engineer and Manager, Blackburn Electricity Department, has sent us some particulars of a temporary installation of motors totalling 186 h.p., which his department has recently put down at the Struan Mill of 870 looms. Part of the main driving gear of the mill had broken down. Information of the breakdown was given to the Electricity Department on the Saturday at noon, and by Monday morning a motor in the top shed was driving 100 looms; on the Tuesday another 100 looms were started by another motor, and by the Thursday 500 more looms were at work. In one case a single motor could not be obtained large enough for the work, so two motors were belted to one shaft, care being taken to adjust the sizes of the pulleys so that the load was properly shared.

TENDERS RECEIVED AND ACCEPTED

BELFAST.—The tender of Messrs. Hamilton & McMaster (Belfast) has been accepted for alterations to the circulating pumps at the electricity works.

BRISTOL.—The Corporation have accepted the following tenders :—General Electric Co., Ltd., annual supply of meters, £546 4s.; Bruce, Peebles & Co., Ltd., 500-kw. converter for Underfall Yard sub-station, £1,230.

DARTFORD.—The Council have accepted the following tenders :—Messrs. Johnson & Phillips, Ltd., 900 yards 0·15 sq. in. and 450 yards 0·07 sq. in. lead-covered and paper-insulated cable, £141; The Universal Electrical Manufacturing Co., one 12-way feeder pillar, £31.

DUNDEE.—The electric lighting contract for the lighting of St. Paul's Cathedral has been given to Mr. T. C. Keay.

LONDON: *London County Council.*—The Highways Committee recommend the acceptance of the tender of Mr. A. N. Coles at £123,676 for the roadwork and platelaying of Tooley Street to Greenwich tramways.

The tender of Messrs. David Bridge & Co., Ltd., for shafting, bearings, brackets, pulleys, &c., at the Central Car Repair Depôt at £457 is recommended for acceptance.

The tender of Messrs. Alley & MacLellan, Ltd., at £187 10s. for air compressor and receiver is also recommended for acceptance by the Highways Committee.

The tender of the Patent Shaft & Axletree Co., Ltd., for the supply of 4,800 steel driving-wheel tyres at 21s. 6d. each, and Messrs. John Batt & Co., Ltd., for 1,600 steel pony-wheel tyres at 15s. 9d. each, are recommended for acceptance by the Highways Committee.

Hammersmith.—The Council received the following tenders for cables :—Standard Cable Co., £625 (foreign); Union Cable Co., £658 (Germany); Western Electric Co. (accepted), £660; Aubert Grenier & Co., £672 (foreign); Callender's Cable & Construction Co., £700; Siemens Bros. & Co., £700; Johnson & Phillips, £700; British Insulated & Helsby Cables, Ltd., £705 9s. 4d.; W. T. Henley's Telegraph Works, £710; W. T. Glover & Co., £715; General Electric Co., £735 8s. 9d.; Craigpark Electric Cable Co., Ltd., £948 16s. 6d.

Hampstead.—The Council have accepted a tender for a 350-kw. "disc and drum" type turbine from Willans & Robinson, Ltd., Rugby. The turbine is intended for working both with exhaust and high-pressure steam.

Woolwich.—The tender of Messrs. Ferranti, Ltd., for the annual supply of A.-C. meters has been accepted as follows :—3-ampere, £1 8s.; 5-ampere, £1 9s.; 10-ampere, £1 10s.

NEWPORT.—The Corporation have decided to instal a 1,500-kw. turbine of the "disc and drum" type, running at 1,500 r.p.m., built by Willans & Robinson, Ltd., of Rugby, and coupled to an alternator built by the General Electric Co., Ltd.

NORWICH.—The Corporation have accepted a tender for a 500-kw. "disc and drum" type turbine from Willans & Robinson, Ltd. The turbine is intended for working both with exhaust and high-pressure steam.

NUNEATON.—The Electricity Committee have accepted the tender of Messrs. E. Danks & Co. for a water-tube boiler at £710, and that of Mr. Friedenthal for a feed pump at £109.

WALSALL.—The Council have accepted the following tenders :—Rees Roturbo Manufacturing Co., Ltd., transformer and switchgear, £715; Callender's Cable & Construction Co., Ltd., trunk main, £1,286 14s. 2d.; extending feeders and laying L.T. cables, £1,075 13s. 7d.

COMPANIES' MEETINGS AND REPORTS

RIVER PLATE ELECTRICITY CO.—At the annual meeting last week, it was stated that the company have entered into a contract with the La Plata Electric Tramways Co. for the supply of power required by that company.

ELECTRIC SUPPLY CORPORATION.—Mr. J. Stone, presiding at the annual meeting last week, said that the introduction of the metal filament lamp soon after the flotation of the company had upset all their calculations, which had been based upon the use of carbon filament lamps. In future the company will have to depend upon its earnings, as the final payment under the debenture guarantee has now been paid.

CITY OF BIRMINGHAM TRAMWAYS CO.—After meeting debenture interest and preference dividend, there was a profit for 1909 of £38,516. The directors recommend a dividend of 10 per cent. for the year on the ordinary shares, and to repay £4 per share in reduction of capital upon 6,047 ordinary shares. The arbitrator fixed the purchase price of the Handsworth tramways at £72,174, and the Council have paid this sum over. Negotiations are in progress for taking a lease of the lines when they are electrified.

CALLENDER'S CABLE & CONSTRUCTION CO.—The accounts for 1909 show a net profit of £68,452. After paying a dividend of 10s. per share and a bonus of 5s. per share on the ordinary shares, there is a balance of £42,202 to be carried forward. The report mentions that no new contract of any magnitude was carried out at home during the year, and that the orders for extensions to existing mains were less in number and smaller in value than usual. Although foreign and Colonial

Digitized by Google

business was not so extensive as in previous years, it did not suffer to the same extent as the home trade. During the year several important contracts were secured in Belgium in face of the strong Continental competition. Both factories at Erith and Leigh are well supplied with orders at present.

JOHNSON & PHILLIPS.—At the annual meeting last week it was stated that during the last four or five months of the year all orders seemed to cease, and business was practically at a standstill. Furthermore, the price of copper and rubber ruled very high. Satisfaction was expressed at the return of Mr. Claude Johnson to the Board, together with Mr. Thomas Dence. The latter gentleman said he did not regard electrical engineering as an effete industry, but a thing of the future. He looked forward to great progress and to the company securing a fair share of the new business which was bound to come. Without paying any dividend on the ordinary shares, the net balance is £942, which is carried forward. The shops are busier at the present time than they have been for a long while.

BERGMANN-ELEKTRICITATS-WERKE A.-G.—The report for the past year recommends a dividend of 18 per cent., as in the previous year. The turnover was 60 per cent. greater than that of the previous year. It is proposed to raise the share capital from 21 to 29 million marks, in order to allow the firm to carry out new schemes and extension of their works. The contracts secured in the present business year are said to exceed in value those of the corresponding period last year by 30 per cent.

DELHI ELECTRIC TRAMWAYS & LIGHTING CO.—At the annual meeting on Thursday, it was stated that a Diesel engine and other plant has arrived at Delhi and erection is nearly completed. The cost of this plant has been about £5,000. Whilst the tramway receipts have been unsatisfactory, the electric supply portion of the undertaking shows satisfactory increases month by month. An agreement has been made with the municipality for public lighting for three years, and negotiations are in progress with a Government department for a large extension of lighting.

PARA ELECTRIC RAILWAYS & LIGHTING CO.—The profits for 1909 enable the directors to pay the arrears of dividends on the preference shares for the years 1906 and 1907, and to carry forward a balance of £954, after providing for debenture interest and preference dividend for 1909.

MUSSELBURGH & DISTRICT ELECTRIC LIGHT & TRACTION CO.—After providing for debenture interest, there is a balance of £3,811 for 1909. The sum remaining, after transferring £2,000 to renewals, will permit of a dividend of 2½ per cent. on the preference shares.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 15s. to £59 5s. per ton (last week, £58 to £58 10s.).

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—The Davey Electric Co., Ltd., 706 Tower Building, Water Street, Liverpool, is to be wound up voluntarily. Mr. J. Andrews, 20 North John Street, Liverpool, is liquidator. The first meeting of creditors was on May 17th, at 3 p.m., at 112 Whitechapel, Liverpool. Particulars of claims by June 9th.

The last day for receiving proofs in the bankruptcy of J. G. Cunnington, electrical engineer and contractor, 7 Newport Street, London, is May 24th. Mr. Alfred Page, 28, King Street, Cheapside, London, is the trustee.

The statement of affairs in the bankruptcy of R. E. Joy, 143 Cheltenham Road, Bristol, trading as the Bristol Electrical Co., shows gross liabilities amounting to £649 and a deficiency of £514. The cause of the failure is said to be "keen competition, taking contracts at unremunerative prices, and being unable to purchase materials at low cost through want of capital."

The last day for receiving proofs in the bankruptcy of W. H. Jenkinson, electrical engineer, Rodbury, near Stroud, Gloucester, is May 24th. Mr. Charles Scott, Station Road, Gloucester, is trustee.

The public examination of W. H. Palmer, electric light contractor, late of Great Castle Street, London, W., was concluded last week. In April, 1909, his business was sold to a company, which took over the assets but not the liabilities. The debtor stated that he owed £1,070 to unsecured creditors and has no assets.

HART ACCUMULATOR CO.'S LONDON OFFICE.—For the convenience of their customers in the South-west London district, the Hart Accumulator Co., Ltd., have opened a branch at 36 Victoria Street, Westminster, S.W., which is in charge of Mr. W. Howard Tasker, M.I.E.E. The branch is in telephonic communication with the works at Stratford.

Obituary.—We regret to hear of the death at Port Said, from appendicitis, of Mr. W. G. Moore, a sea-going member of the P. & O. Batti-Wallahs' Society. Mr. Moore leaves a widow and family.

APPOINTMENTS AND PERSONAL NOTES

The salary of Mr. G. A. Tough, the Borough Electrical Engineer at Coventry, is to be increased from £350 to £450 per annum.

The salary of Mr. E. M. Hollingsworth, Borough Electrical Engineer at St. Helens, is to be increased by increments of £50 per annum from £400 to £500 per annum.

The salary of Mr. F. Ayton, Borough Electrical Engineer and Tramways Manager at Ipswich, has been increased from £500 to £600 per annum.

The salary of Mr. F. V. L. Mathias, Borough Electrical Engineer at Warrington, has been increased from £350 to £400 per annum.

MISCELLANEOUS CITY NOTES

COMPANIES STRUCK OFF REGISTER.—The names of the following companies have been struck off the register of Joint Stock Companies :—Electrical Bleaching Co.; Electrical Regulating & Lighting Syndicate; Electrical Supplies, Rubber & Ebonite Co.; Electric Lamp Regenerating Co.; Electric Railways Co.; Electrical-Voelker Co.; and Meyra Electric Co.

DIVIDENDS ANNOUNCED.—Chloride Electrical Storage Co., 6 per cent. per annum upon preference shares.

CANADIAN GENERAL ELECTRIC CO.—The Board have decided to issue 9,400 of the 10,000 $100 shares at present held in reserve. The new shares will be offered at par in the proportion of one for every five shares now outstanding, the current price of which is $110.

Wireless Telegraph Notes.—The Marconi Wireless Telegraph Company of America are reducing their share capital by writing the shares down from $100 to $25. The present capital is $6,650,000.

Wireless telephone equipments on the Colin and Jeance system have, according to *l'Electricien*, been installed on the French battleships *Justice* and *Vérité*.

In a short time communication between Paris and all the French colonies and dependencies in North and North-West Africa will be effected from the Eiffel Tower station. Stations have already been established at Oran and Bizerta on the north coast and at Port Etienne, Dakar, and Rufisque on the west coast. Additional stations are being constructed at Timbuktu, Konakry, and Monrovia. It is also proposed to establish communication between Port Etienne and the South American continent.

Experiments have been carried out between the Eiffel Tower and ships at Brest to determine the practicability of the scheme formulated by MM. Guyon and Bouquet for transmitting hourly signals from the Paris Observatory to ships at sea. According to the *Matin*, these have been successful and a regular service is to be inaugurated on Monday next. A special clock will be used to send out three successive signals at midnight every night, and it is also stated that apparatus is to be installed for sending out signals regularly every second. This arrangement will enable ships at sea fitted with wireless apparatus to determine readily their bearings without recourse to the chronometer. Similar experiments are being carried out by MM. Claude and Driancourt at Paris with a view to determining accurately the longitudes of various wireless stations in Africa and elsewhere.

The Times states that the French Government has announced that in accordance with the International Convention, all French wireless stations are now open to receive communications for or from ships at sea. The following stations are open day and night :—Boulogne, Ushant, Porquerolles, Sainte-Marie-de-la-Mer for Marseilles, and Fort de l'Eau for Algiers. The naval stations at Ajaccio, Brest, Cherbourg, Dunkirk, Lorient, and Rochefort will be open for public messages only from 7 a.m. until 10 p.m. Rates are fixed at 40c. a word for all messages with certain exceptions.

Telegraph Traffic.—The "*viâ* Hanekin" route was interrupted on the 10th inst., but was repaired on the 13th inst.—The Bagdad-Bassorah line was restored on the 12th inst.—Communication between Madagascar and Reunion was interrupted on the 12th inst., messages being sent at sender's risk to Madagascar by the best means available, without change of rates.—Reductions in charges have been made on all routes to Uruguay, Argentine, Paraguay, Chili, Peru, and Bolivia. This may be due to the new German competition in the Western Co.'s territory.

OSRAM-LAMPS

Wiring Contractors

The following firms will be pleased to submit estimates to carry out electric light and power installations, and also extension and repair work:—

LONDON.

Electrical Installations, Ld., 27, Martin's Lane, Cannon St., E.C.
F. A. Glover & Co., Ltd., Vine Street, E.C.
Rashleigh Phipps & Co., 147, Oxford Street, W.
Rawlings Bros., Ltd., 82, Gloucester Road, Kensington, W.
Rowland & Hulton, Ltd., 62, King William Street, E.C.
Speedy, Eynon & Co., 6, Duke Street, Adelphi, W.C.
F. Troy & Co., 194–196, Finchley Road, N.W. (opposite L. & N.W. Railway Station).

ABERDEEN.

Aberdeen Electrical Engng. Co., 17, Belmont Street
Claud Hamilton (Aberdeen), Ltd., 254, Union Street.

BURNLEY.—Simpson Brothers, Curzon Street.

CARDIFF.—R. Nance, 2, Dock Chambers.

EDINBURGH.—Cole & Co., 42, Frederick Street.

GLASGOW & DISTRICT.

J. A. Allan, 241, Main Street, Bellshill.
Grindlay, Ross & Co., 278, St. Vincent Street.
R. D. Livingston & Co., 3 & 5, Buchanan Court.
Wm. McWhirter & Son, 212, 214, & 216, Holm Street.

HULL.—Alexander Shaw, 18, Story Street.

MANCHESTER.—G. Harland Bowden & Co. (Wiring Dept.), 196, Deansgate, also London and Glasgow.

NEWCASTLE-ON-TYNE.—Falconar, Cross & Co., 7 & 9, Ridley Place.

WINDSOR & SLOUGH.—The Windsor & District Electrical Co., 53, Thames Street, Windsor.

WOLVERHAMPTON.—Wolverhampton Electric Fittings & Installation Co., 28, Darlington Street.

Firms desiring to have their names added to the above List should communicate with the Kilowatt Publishing Co., Ltd. (Publishers of "Electrical Engineering"), 203-206, Temple Chambers, Temple Avenue, London, E.C.

SUMMARY

An example of the latest pattern of the Moore vacuum tube lamp, adapted by the use of carbonic dioxide in the tube, for colour matching, has recently been installed at Bradford. (Page 339.)

A Paper by Mr. G. W. Worrall, read recently before the Birmingham Local Section of the Institution of Electrical Engineers, contained the result of an investigation into commutation in continuous-current machines by observations of the magnetic oscillations produced in various parts of the machine. (Page 340.)

The following books are reviewed in this issue:—"The Central," memorial number; "Dynamo Electric Machinery" (vol. ii.), by S. Sheldon, R. Mason, and E. Hausmann; "Wireless Telegraphy and Wireless Telephony," by A. E. Kennelly. (Page 341.)

A photograph of a shop wrecked by a gas explosion appears on page 341.

An apparatus for automatically recording the deviations of a ship from the true set course has been introduced. The compass card is slotted, and is suspended in a conducting liquid. Any movement varies the resistance between fixed electrodes above and below the card, and the resulting fluctuations in current are caused to influence mechanism, so that any deviation is recorded. (Page 342.)

A wireless station has been erected at the Crystal Palace by the Helsby Wireless Telegraph Co., who have developed a system embodying several novelties. The spark gap used is comparatively noiseless. By an ingenious method of supplying the oscillatory circuit with impulses at a definite frequency, a continuous series of wave trains is generated at a high group frequency. This results in a pure musical note in the receiving telephone. The Company has also developed a system of wireless telephony by earth conduction, with which communication has been established over a considerable distance with the expenditure of only a few watts and with very simple apparatus. (Page 342.)

The Key Engineering Co. have now fully developed the metal conduit system of surface wiring which was shown at the Manchester exhibition. The conduit is divided longitudinally, the top half being sprung over the lower portions after the cables have been inserted. (Page 344.)

We give details of the programme of the Glasgow Convention of the Incorporated Municipal Electrical Association, which will be held from June 14th to 17th. (Page 344.)

Several lawsuits of interest to the electrical industry are down for hearing during the Trinity Sittings which commenced on Tuesday. (Page 345.)

Marconi's original wireless telegraph patent will have completed its fourteen-year life next Thursday, and will expire in the ordinary course unless an ex-

Digitized by Google

tension is granted. Application for an extension has been made in the ordinary course, but the date for the hearing is not yet fixed. The ground upon which an extension of the term of a patent may be granted for a period not exceeding seven years, or in exceptional cases fourteen years, is that the patentee has been inadequately remunerated for his patent. (Page 346.)

AMONG the Specifications published by the Patent Office on Thursday last was one by C. A. Parsons and others for commutators for high-speed machines. Dove-tail projections on the hub fit into corresponding recesses in the bars, and no external rings are required. —A simple flame arc lamp mechanism is covered by H. D. Weaver. This has no clockwork, but the carbons are hung freely, and not supported from below.— The Felten & Guilleaume Lahmeyer Werke A.-G., cover the introduction of a nitrogen compound free from hydrogen into metal filament lamps to prevent disintegrating. (Page 346.)

A DISCUSSION upon the question as to whether a free trade or protectionist policy would be of greater benefit to the electrical industry, took place at the Caxton Hall, Westminster, on Monday. Mr. J. E. Kingsbury, Mr. J. S. Raworth, and Mr. E. Cowan spoke in favour of free trade, and Mr. H. Hirst, Mr. J. Harland Bowden, and Mr. Russell Fitch were in favour of protection. (Page 347.)

AN effort to compel the Aberdeen Corporation to supply an hotel company, which is in arrears with its payments, has been unsuccessful.—Perth (W.A.) City Council propose to acquire the Perth Tramways Co.— Birmingham Corporation Electricity Department is contributing £10,000 to relief of rates, and the Tramways Department £33,000.—Edinburgh Corporation have fixed the charge for supply for tramway purposes at 1½d. per unit.—Construction of tramways in Watford has been postponed in order to gain experience of the trackless trolley system.—There was a net profit of £15,000 on the Newcastle tramways last year.—It is said that the Victoria Falls Power Co. are to construct a new power station at Vereeniging. (Page 348.)

NEW plant will shortly be required at Birmingham and Barking.—Cable is required at Barnes, and a fuel economiser at St. Anne's-on-Sea.—Extensions of plant are proposed at Fleetwood, Wimbledon, and Wolverhampton.—Tramway extensions costing £300,000 are contemplated at Belfast.—An electric power station will shortly be erected by the Waihi Gold Mining Co. (New Zealand).—Stores are required by the Liverpool Overhead Railway Co., and motors and starters by the Swansea Corporation. (Page 348.)

THE Anglo-Argentine Tramways Co. propose to raise an additional £8,000,000 capital.—The Typewriting Telegraph Corporation is to be wound up. (Page 350.)

An Electrical Violin Player.—The ingenuity of an American inventor named Sandell has been applied to the elaboration of a complicated apparatus for "playing" a violin from a perforated music roll, which is described in the *Electrical World* (New York). A group of 60 fingering magnets take the place of the performer's left hand, and the bow is represented by a set of four revolving discs ¾ in. diameter, each made up of a bundle of 50 flexible celluloid washers. One of these discs acts on each string, and electromagnetic devices controlled by contacts governed by the perforation of the roll produce expression by varying the speed of the discs and their pressure on the strings, and a special magnet provides a bouncing bow action when required. There is also a set of four magnets for pizzicato effects, while a vibrato effect is obtained by the action of a large magnet with a weighted armature arranged to shake the tail-piece sideways. The same roll actuates the contacts of electrical piano player movement in the same case, which provides the accompaniments. The apparatus is stated to take about half an ampere at 110 volts.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MAY 26TH.

Institution of Electrical Engineers.

8 p.m. Annual meeting at the Royal Society of Arts.

FRIDAY, MAY 27TH.

Physical Society.

5 p.m. At Imperial College of Science, South Kensington. (1) "On an Oscillation Detector actuated solely by Temperature Variation of Resistance," by Dr. W. H. Eccles. (2) "Exhibition of a Resonance Transformer," by A. Eagle. (3) "The Limitations of the Weston Cell as a Standard of Electromotive Force," by S. W. J. Smith.

SATURDAY, MAY 28TH.

Institution of Mining Electrical Engineers.

3.30 p.m. Notts and Derbyshire Branch at University College, Nottingham. "Rule 8 and the Use of Electricity," by L. W. de Grave.

4 p.m. Lancashire Branch at Grand Hotel, Manchester. "Colliery Cables," by W. Bolton Shaw.

MONDAY, MAY 30TH.

Institution of Electrical Engineers: Newcastle Section.

8 p.m. Annual General Meeting at Armstrong College.

TUESDAY, MAY 31ST.

Faraday Society.

8 p.m. In Chemical Society's Rooms, Burlington House, Piccadilly, London. Messrs. C. V. Biggs and W. Pollard Digby will exhibit and give short demonstration of (1) Apparatus for the Rapid Determination of the Resistance of Liquids; (2) Apparatus for the Determination of Specific Resistance of Oil.

THURSDAY, JUNE 2ND.

Institution of Mining Engineers.

10 a.m. In Geological Society's Rooms, Burlington House, Piccadilly, London. "A Storage Battery Extension to a Three-phase Colliery Power Plant," by W. Maurice.

Röntgen Society.

8.15 p.m. At 20 Hanover Square, London. (1) "Practical Observations on Everyday X-Ray and Electrical Work," by Dr. Howard Pirie: (2) "Recent Improvements in Radiographic Technique," by Dr. R. Knox. A new form of apparatus for producing rhythmical variations in the strength of electrical currents will be shown by Dr. Hampson.

FRIDAY, JUNE 3RD.

Lancashire Branch. Visit to the Manchester School of Technology.

Royal Institution.

3 p.m. Tyndall Lecture I. "Electric Heating and Pyrometry," by Prof. J. A. Fleming, F.R.S.

Telegraph Traffic and Movements of Cable Ships.—All provincial telegraph offices, except Bristol, are, for the present, sending telegrams for Guernsey *via* London, and not *via* Bristol. —The Bagdad–Bassorah line was down on the 17th inst., and the El Arich route followed suit on the 19th inst., the break being between Gaza and El Arich.—The lines of the Indo-European Telegraph Co. were disorganised between Tiflis and Tauris on the 21st inst.—The German South American Telegraph Co. has reduced its rates to the Republics on the west coast of South America, including the Argentine Republic.—In the Canadian Parliament an Act to incorporate the Maritime Telegraph & Telephone, Ltd., has been passed. The telegraph companies have succeeded in gaining exemption from the Act regulating the number of hours of work in the Province of Nova Scotia.—The Bill introduced in the Canadian House, providing for the control of cable rates, &c., by the Board of Railway Commissioners, was passed on March 30th, and by the Senate on April 26th, with two amendments. One of these provides that the Act shall come into operation conditionally on the passing of similar legislation in Great Britain, and the other deletes the clause repealing privileges accorded in special Acts to cable companies, which would be inconsistent with the control of rates of the Railway Commission.—The Atlantic cable companies were all represented at Ottawa at a hearing of witnesses by the Railway Committee.—The Hon. Fielding, in the Canadian House, has given notice of a resolution providing for the payment of subsidies towards a press cable service from Great Britain to Canada for five years. They will be paid yearly in the following amounts: $12,000, $10,000, $8,000, $6,000, and $5,000.—The c.s. *Mackay Bennett* has been engaged on the repair of the short section between Canso and Coney Island at a distance of about 240 miles from Halifax, N.S. It is reported that the cable was found to be in a very bad mechanical condition, and that it was impossible to lift it. A gap of very nearly 50 miles was made in the attempted repair.—The c.s. *Minia* left for a repair at the end of last month.—The *Contre Amiral Caubet* of the French Atlantic Cable Co. did not leave port during April.

THE MOORE VACUUM LIGHT FOR COLOUR MATCHING

COMPARATIVELY little has been seen of the Moore vacuum tube method of lighting in this country, apart from one or two temporary experimental installations, but it appears that a good deal of progress has been made with this form of illumination in America, particularly in the direction of producing a pure white light suitable for colour matching. This is a matter of considerable importance in the dyeing industries, and an installation for demonstrating its uses for this purpose has recently been put up at Bradford at the new offices of the Electricity Department in the extension to the Town Hall Buildings.

The first installation was, however, a rectangular tube about 110 ft., giving a yellowish light for illumination of the large general office; and it was after this had been proved satisfactory that the special colour matching tube, which is about 98 ft. long, and arranged in zig-zag fashion, was put up in an adjoining room. The lamp in the general office is illustrated in Figs. 1 and 2.

A general description of the Moore system of lighting was

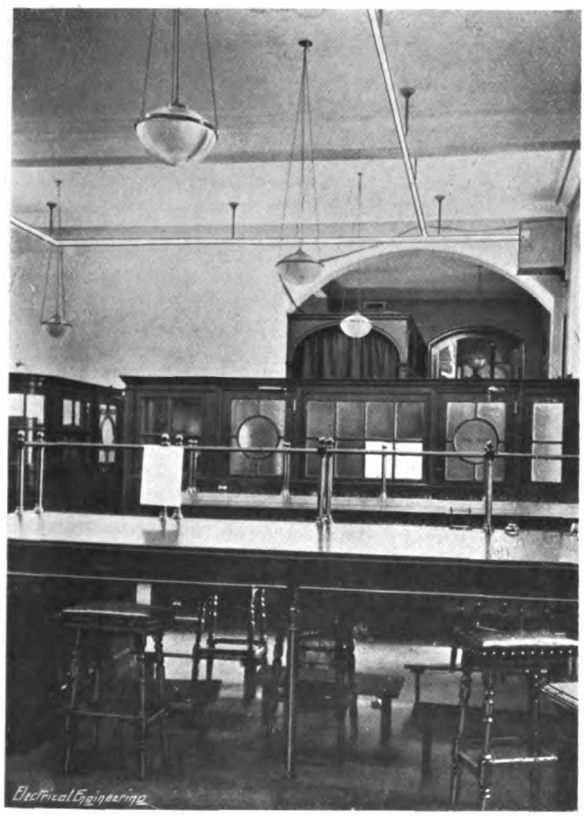

FIG. 1.—MOORE TUBE LAMP IN GENERAL OFFICE.

given in ELECTRICAL ENGINEERING, Vol. II., page 138 (July 25th, 1907), in an abstract of a Paper read by Mr. D. McFarlane Moore before the American Institute of Electrical Engineers. The long, continuous exhausted glass tube is arranged with the ends containing the electrodes inside a box, which also contains the step-up transformer for exciting the tube and an automatic valve for allowing a small quantity of air to enter the tube whenever the absorption of gases within the tube causes the vacuum to be too high to allow a sufficient discharge to pass. This valve is controlled by the strength of the current in the primary of the transformer. The colour of the light emitted depends entirely on the nature of the gas in the tube, and an effect most akin to daylight is obtained by the use of carbon dioxide. In order to obviate changes in the colour of the light, it is necessary to prevent the entry of air through the feed valve and to keep up a small supply of carbonic acid. Various ways in which Mr. Moore sought to accomplish this are described in a Paper read before the American Illuminating Engineering Society last March.

In the latest Moore lamps for white light which appear to have stood the most exacting tests from the colour matching point of view, a special carbonic acid generator is attached to the feed valve as shown in Fig. 3. On the right is seen the feed valve, which acts by the lifting of a plunger by a solenoid, causing the top of a porous carbon plug to be uncovered by the mercury normally sealing it. In practice, the feed valve comes into action for a second or two about once

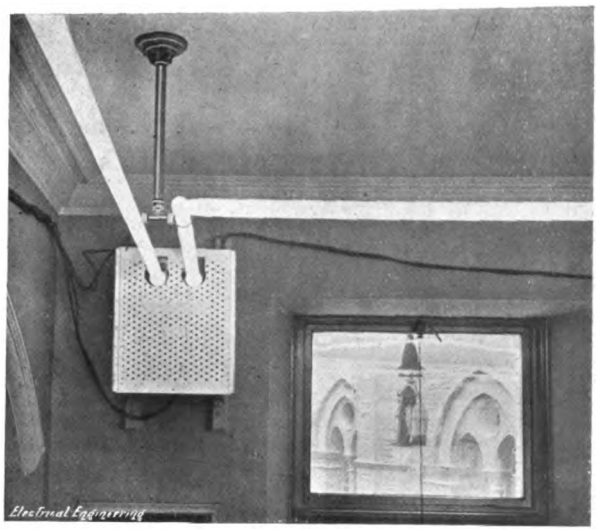

FIG. 2.—ENDS OF TUBE AND BOX CONTAINING TRANSFORMER AND FEED VALVE.

a minute. The action of the gas generator is very simple. When the gas above in the upper part becomes rarefied, due to the action of the valve, atmospheric pressure causes the hydrochloric acid to rise and to come in contact with the calcium carbonate in the upper part, and a sufficient amount of carbonic

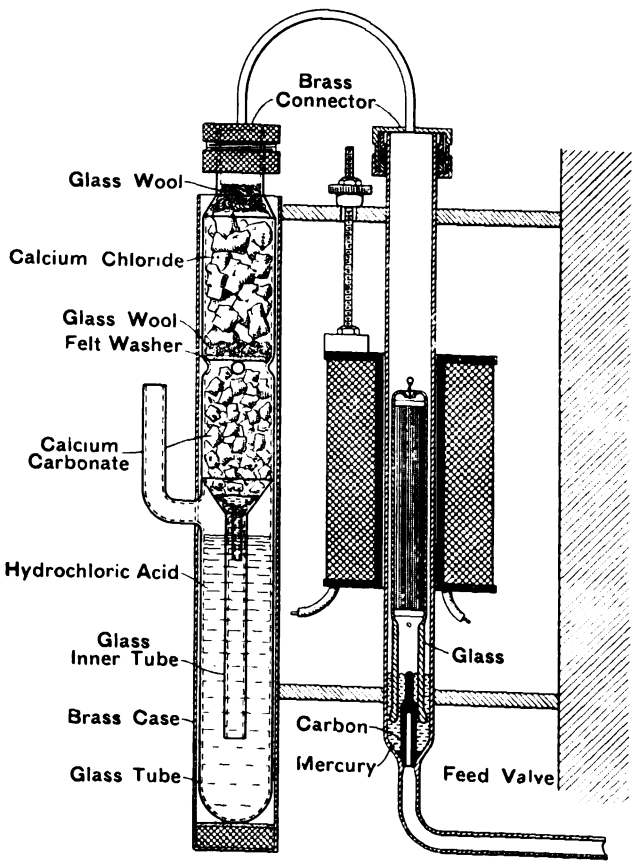

FIG 3.—CARBONIC ACID GENERATOR AND FEED VALVE.

dioxide is set free to equalise the pressure. The gas is dried by passing through calcium chloride in the top of the vessel. The working pressure is from about 0·085 mm. to 0·1 mm. of mercury, and at the latter pressure the efficiency of the tube is about 1·5 watts per Hefner c.p. The candle-power produced

Digitized by Google

is about 11 Hefner c.p. per ft. run of tube. It is said that the colour value remains constant throughout a life of about 5,000 hours, after which new electrodes may be required.

The value to the textile and dyeing industries, as well as to other arts and crafts, of a source of light which will enable colour matching to be done at night as well as by day cannot be over-estimated, and to judge by reports as to its use in America, the latest Moore lamp has gone further than any other method of illumination to accomplish this.

The Bradford installation was put in by Messrs. Heymann & Alexander, 80 Emm Lane, Bradford, and Mr. E. A. Lassen, manager of this firm, will doubtless be pleased to give fuller information of this method of lighting to any of our readers mentioning this article.

COMMUTATION AND MAGNETIC OSCILLATIONS IN CONTINUOUS-CURRENT MACHINES

A LONG Paper by Mr. G. W. Worrall, read before the Birmingham Local Section of the Institution of Electrical Engineers, on Wednesday, April 27th, described a series of experiments upon commutation phenomena and magnetic oscillations occurring in continuous-current machines.

The magnetic oscillations were observed by means of E.M.F.'s induced in search coils placed on the machine parts in such positions as to link the oscillating flux. The E.M.F. waves were photographically recorded by means of a Duddell high-frequency oscillograph and revolving drum camera. The machine employed in the investigation was a two-pole generator with adjustable commutating poles; the brushes were of carbon, and of a width equal to one commutator segment plus insulation.

The experiments were confined chiefly to oscillations due to the commutation of the armature current in the short-circuited coil. The nature of these oscillations depends upon the nature of the commutation taking place, and since the flux at each instant is proportional to the current in the short-circuited coil, the E.M.F. induced in a search coil linking the flux forms a picture of the commutation taking place.

Before describing the experiments, the author goes into some theoretical considerations regarding commutation which he summarises as follows:—In order to neutralise or render non-existent the self-induction E.M.F. of a coil at any instant the relative movement of the field and coil side must take place along the line of action of the resultant field at that instant. Efficient commutation may be effected by a suitable adjustment of the natural period of the coil, and this may be done by properly disposing the contact resistance over the brush surface. When the contact resistance is properly disposed the resistance to the forward segment is relatively high at an early stage of the commutation period. Sparking at the forward tip of the brush is due to the available period being shorter than the natural period. For every machine there is a critical speed at which the available and natural periods are just equal to each other, and below which the machine runs sparklessly. A reduction of the natural period accelerates commutation during the early part of the short-circuit period, and increases the efficiency of commutation by lowering the maximum rate of change of the current, thereby causing a better distribution of current over the contact surface, accompanied by a reduction of temperature. The acceleration may be effected by a commutating E.M.F. If the natural period exceed the available period and the commutating E.M.F. be too small, sparking takes place at the forward tip of the brush, and if the commutating E.M.F. be gradually increased, the commutation is shifted backwards until sparking takes place at the rear tip of the brush. The natural period of the coil when short-circuited by the positive brush is not necessarily the same as when short-circuited by the negative brush.

These theoretical conclusions were found to be experimentally true, but some difficulty was experienced in finding a brush-holder which gave sufficiently constant and evenly distributed contact pressure to ensure regular results. The commutation phenomena were studied by search coils placed on various parts of the pole-shoes. Oscillations due to the movement of the teeth in the main magnetic field were superposed upon those due to commutation, but were easily distinguishable. The commutation oscillation consists of a single peak; the magnitude of the peak is proportional to the maximum rate of change of current in the short-circuited coil, and its magnitude and position in relation to the contact-maker indicates the nature of commutation taking place. When the peak is small and occurs early, the commutation is efficient, but when the peak is large and occurs late in the period, the commutation is completed by a rush of current, and sparking is liable to take place.

The experiments were directed to investigation of the influence of contact resistance and speed on commutation, the effect of a commutating E.M.F., due to auxiliary poles, the difference in the behaviour of wide and narrow commutating poles, and the cause of the difference in behaviour of the positive and the negative brushes. In connection with the last-mentioned subject, some observations of brush temperature were taken. The general conclusions arrived at from the results of the experiments are given below.

The natural period of the short-circuited coil may be varied by varying its contact resistance, or by properly disposing the resistance over the brush surface. Sparking depends upon the relation of the natural period to the available period. The maximum rate of change of the current during commutation may be reduced by reducing the natural period, and at the same time the overload capacity of the machine as regards sparking will be improved. The maximum rate of change may also be reduced by accelerating the commutation during the early portion of the short-circuit period by means of a commutating E.M.F., and this has the same effect as reducing the natural period of the coil. The ampere-turns necessary on the commutating poles may be reduced if the flash across the slot be used to generate the commutating E.M.F. The E.M.F. generated in such a manner possesses approximately the correct wave shape, and the magnetic oscillations in the armature teeth during commutation are thereby reduced. If only one commutating pole be fitted, the ampere-turns necessary are less than when two are in use. The commutating pole flux fulfils two functions: (1) to generate the commutating E.M.F., and (2) to oppose or press back the armature reaction flux.

The negative brush is hotter than the positive; the higher temperature causes the negative to take a higher polish than the positive, thereby reducing its contact resistance. The lower contact resistance increases the natural period, and renders the negative brush more liable to sparking than the positive. The higher temperature of the neagtive brush caused it to expand more than the positive. The forward tip is generally the hottest part of the brush surface because it is shielded from draughts. The forward tip is alternately heated and cooled as the segments pass under it, and vibrates with the frequency of the segments. This vibration renders the brush unstable and the commutation irregular. The importance of keeping the front tip cool cannot, says the author, be over-estimated, for in it lies to a very great extent the secret of successful commutation. The overload capacity of a machine can be very greatly increased if the brush-tip be kept cool. The metal case in which the brush is usually fitted is not sufficient unless the case almost touches the commutator, and is in very good contact with the carbon. The forward tip may be cooled, the vibration avoided, the commutation made regular, and the sparking limit raised by a piece of metal in good contact with the brush at the forward tip and provided with a relatively large radiating surface. The results in 10 may also be obtained by preventing the rush of current at the end of commutation, either by reducing the natural period of the coil or by accelerating the commutation during the early stages by means of a commutating E.M.F. The vibration of the forward tip of the brush causes a minute arc to be periodically set up between the carbon and the commutator, which causes a brown band to form on the brush and a deposit on the commutator.

The Paper also contained some results of experiments on the oscillations occurring in the main poles due to the teeth of the armature, and on the oscillations in the armature.

DISCUSSION.

The discussion was opened by Dr. KLOSS (Siemens Bros. Dynamo Works, Ltd.). He asked whether it was possible to eliminate the oscillations due to the teeth of the armature so as to obtain only the oscillations due to the changes of current during commutation. If instead of a two-pole, a four-pole machine with lapwound armature were used with one pair of brushes in commission and the other pair removed, it might be feasible by connecting up in series the search coils placed on the two negative pole pieces to obtain the curve due to commutation alone, since the coil on the pole piece with the brush would record the oscillations due both to teeth and commutation, whilst the coil on the pole piece without brush would only show the oscillations due to the teeth. In practice it was not usual for the brush to cover only one segment, and it would be of interest to know what effect would be caused by the brush covering, say, two segments at once. Good commutation depended on the proper distribution of contact resistance over the surface of the brush and not entirely on the current density, as was often assumed to be the case. In fact, it was often

Digitized by Google

found that commutation was better with a higher current density, and it was a mistake to handicap design by too rigidly specifying the current density in the brushes.

Mr. T. F. WALL (Messrs. Siemens Bros. Dynamo Works, Ltd.) observed that from the records of oscillations occurring in different parts of the machine, it was obvious that the field coil shields the pole piece and yoke, since the search coil on the magnet ring showed practically no oscillations at all. It therefore occurred to him that by altering the constant of the field coil the commutation might be improved. Mr. Wall also discussed the question whether the coil during the period of commutation has any self-induction, and was of opinion that it was very probably in a zero magnetic field.

Mr. WORRALL replied briefly.

REVIEWS OF BOOKS

The Central. Memorial Number. Part I. (The City and Guilds of London Central Technical College Old Students' Association.) 2s.

THIS special number of the magazine of the old students of the Central Technical College of the City and Guilds of London Institute, South Kensington, is devoted to an interesting series of articles dealing with the life and work of the late Prof. W. E. Ayrton. It opens with a brief sketch of the professor's life, from the pen of Mr. Maurice Solomon. This is followed by a most interesting article on his work by his colleague and successor, Prof. T. Mather, divided into sections, dealing respectively with his personality, his method of teaching, the college course which he initiated, and his joint work with Prof. Perry and with the writer of the article. There is also a complete list of Ayrton's published works, compiled by Mr. F. E. Meade.

Dynamo Electric Machinery: Vol. II. Alternating-Current Machines. By S. Sheldon, R. Mason, and E. Hausmann. Eighth Edition. 353 pp. 8 in. by 5¼ in. 236 illustrations. (London: Crosby, Lockwood & Son.) 12s.

THIS book has been extensively adopted in American colleges as the standard text-book on alternating-current working for students in electrical and other engineering courses, and this, the eighth edition, has been completely rewritten to bring the matter up-to-date. Numerical examples have been inserted at the conclusion of each chapter, and a quantity of new matter has been introduced. Somewhat over a quarter of the book is devoted to the principles of alternating-current working, and though graphical methods are employed to a certain extent, the reader will require a good knowledge of mathematics, including the elementary calculus. With the exception of a short chapter on power transmission, which includes methods of calculating line drop and capacity, and the most economical section of conductor, the rest of the book is concerned with alternating-current machinery and transformers. Only American alternators are described, and these are by no means representative of modern practice, all of them being slow-speed machines. There is a good chapter on transformers, and the induction motor is dealt with in a very thorough manner. The theory of the synchronous motor and the rotary convertor is given at some length, and various types of single-phase commutator motors are briefly described.

Wireless Telegraphy and Wireless Telephony. By A. E. Kennelly. Second edition. 271 pp. 7¾ by 5¼ in. 84 illustrations. (London: T. Fisher Unwin.) 4s.

ONE may divide this book into three parts, dealing with electromagnetic waves, wireless telegraphy, and wireless telephony respectively. The first part is a remarkably clear introduction to the difficult subject of electromagnetic theory, and can be recommended to anyone who wishes to obtain such knowledge of the nature, method of generation, and propagation through space of electromagnetic waves, as will enable him to understand the principles of wireless telegraphy and telephony. No mathematics are employed, the various phenomena being explained by means of well-chosen analogies and diagrams. The latter are, however, badly reproduced, the reference letters, in some cases, being hardly legible. The second part is somewhat out of date, and does not seem to have been well revised. The only form of transmitter described is the ordinary induction coil, and the reader is left with the impression that the spark method is the only system of wireless telegraphy, although the arc oscillation generator is described later in connection with wireless telephony. The different types of detectors are very clearly explained. The complete suppression of names of inventors and systems throughout the book seems to be a mistake, as the reader has no means of identifying the different systems. There is an interesting chapter on tuning and selective signalling. In the last part the production of continuous oscillations by means of an arc generator or a high-frequency alternator is explained, and an outline of the principles of wireless telephony is given. Apart from the shortcomings mentioned, the book is an excellent and reliable introduction to the subject, and affords most interesting reading.

GAS EXPLOSION IN DERBY

THE illustration below is from a photograph showing the disastrous results of a gas explosion which took place on Monday last week in Derby. It is not our practice to make capital out of the misfortunes of our gas rivals, yet in this case we cannot refrain from calling attention to this explosion in view of one particular circumstance. We are informed that

the shop in which the explosion occurred is the only one of the Midland Drapery Company's extensive premises which was not yet lighted by electricity. The photograph is an excellent one, taken by the Dereské Studio of Derby, and gives a good idea of the shop after the accident. The shop was closed at the time, although there is no trace of the roller shutters on the photograph; these were blown into a shop across the road.

Electrical Association of Victoria.—A proposal to change the name of this association to the Australian Institute of Electrical Engineers, is under consideration.

Birmingham Local Section, I.E.E.—The report of the committee for the past session records seven meetings and nine Papers, including that read yesterday by Mr. H. W. Kefford on the standardisation of fuses. The average attendance at the meetings has been 54. An increase in membership from 330 to 398 is recorded. The committee for 1910-11, given in our issue of May 5th, has been duly elected.

The Institution of Civil Engineers.—In consequence of the death of His Majesty King Edward VII., the Council have decided that the Institution conversazione will not be held this year. The eighteenth "James Forrest" lecture will be delivered at the Institution on June 22nd, at eight p.m., as already announced.

Electric Power in South Africa.—A Government Commission, appointed to inquire into the use of electric power on the Witwatersrand Gold Fields, have issued a report stating that the supply of cheap power would lead to an expansion of the mining industry. Evidence was put before the Commission that the application of electric drive to the ore crushers would increase the output by 40 per cent. over the whole of the reef. This would make it profitable to work low-grade ores, and increase the life of the reef.

Steel Manufacture in South Africa.—An official report on the possibility of developing an iron and steel industry in South Africa has been prepared by Mr. F. W. Harbord. He states that though there are large iron ore deposits, the quality is poor, and the demand for pig iron very small. It would be necessary to instal steel plant, and, taking all things into consideration, Mr. Harbord concludes that the manufacture of steel would not be commercially successful. Export would be out of the question, and competition with imported material near the ports only possible with the financial support of the Government. Even pig-iron could not be manufactured commercially in the electric furnace with current at the present price in the colony.

SHIP'S COURSE RECORDER

AN interesting piece of apparatus known as the Hennah and Rissel course recorder and indicator has been introduced by Messrs. Sharland & Co. (Eldon Street House, London, E.C.). The device is for the purpose of recording and indicating the fact of a vessel deviating from the true set course, and for ringing an alarm bell when the deviation exceeds a certain pre-

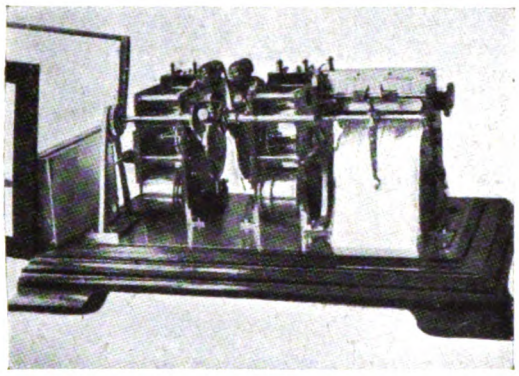

FIG. 1.—RECORDING MECHANISM.

arranged limit. It consists of a clockwork-driven recording mechanism controlled by a special compass placed in the commander's cabin. The recording mechanism illustrated in Fig 1 comprises two clockwork movements with fusee drive to ensure a constant speed, geared differentially to a horizontal shaft. The latter rotates if there is any difference in the speed of the two clockwork movements, and produces a lateral movement of the recording pen. This pen marks a line on a band of paper, which moves under it at the rate of about 4 inches per hour. Two alarm contacts are placed above the pen, and are capable of being set in the required positions by means of a right- and left-handed screw. The last wheel of each clock movement is provided with an iron rim and rotates at a high speed between the poles of an electromagnet. Should the electromagnets be unequally excited, one wheel will go faster than the other, and the recording pen will, if the difference continues long enough, move laterally.

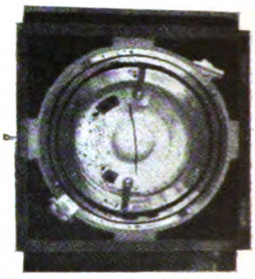

FIG. 2.—COMPASS.

The compass, illustrated in Fig. 2, has a disc of mica slotted at the periphery in two places as shown. This is freely suspended in a dilute solution of copper sulphate, and has the magnet needles attached to it in the usual manner. Above and below each slot is an electrode, and, when set correctly, equal currents pass through the slots. The two sets of electrodes are connected in series respectively with the two electromagnets, and the two circuits are connected in parallel across a battery of such a pressure that the voltage across the electrodes is insufficient to produce electrolytic action. Only a current of some 45 to 90 milliamperes passes under normal conditions. Should the vessel deviate from its course after the compass has been set, the disc will move, and one slot will come towards its pair of electrodes, while the other will move farther away from its pair. This will result in an increase of current in one circuit and a decrease in the other. One clockwork movement will be retarded and the other accelerated; a large deviation is sufficient to stop one movement entirely. A continued deviation or a succession of deviations will cause the pen to touch the limit contacts and ring the alarm. As the pen records the angle and time of the deviation, the actual distance out of the true course can be readily calculated.

THE HELSBY WIRELESS TELEGRAPH AND TELEPHONE SYSTEMS

A WIRELESS station equipped with apparatus differing in many important respects from that of the systems at present in use, has been erected in the grounds of the Crystal Palace, at the base of the North Tower. The station is solely for experimental purposes, and is the property of the Helsby Wireless Telegraph Co., which has been formed jointly by British Insulated & Helsby Cables, Ltd., and Telegraph & Telephone Instruments, Ltd. The latter is a syndicate owning the patents of Mr. A. W. Sharman. These cover various improvements in wave telegraphy, as well as a new system of telegraphy and telephony by earth conduction. On Monday last we were given an opportunity of inspecting the station, which, we understand, has been in working order for some two months.

Wave Telegraphy.

One of the most important features of the Helsby system consists in the production of a spark discharge with a high and uniform group frequency by an electrical method instead of by mechanical means as in other systems. Not only does this give a very high efficiency, but a pure musical note is obtained, enabling the operator to differentiate readily between signals and accidental disturbances and also between messages from stations using the same wave-length. The method consists in rectifying high-tension alternating current and charging condensers with a high D.C. potential, a small proportion of the charge being withdrawn continuously to energise the actual oscillatory circuit. In the diagram of Fig. 2 the secondary circuit of a transformer supplied at a normal frequency is connected to two condensers, A, A, and two electric valves, B, B, in such a manner that the condensers are kept charged to constant direct potential. As the condensers are in series, the total potential across the spark-gap G is equal to twice that of the rectified A.C. potential. The condensers are connected to the spark-gap through resistances R, which determine the rate at which the potential rises across the gap. Thus the group frequency or the interval between the discharges or the successive wave trains is governed by the capacity of the condensers A, A, the break-down voltage of the spark-gap, and the value of the resistances R. A group frequency of about 4,000 per second can be obtained which corresponds to a fairly high note. The wave-length of the transmitted radiations is

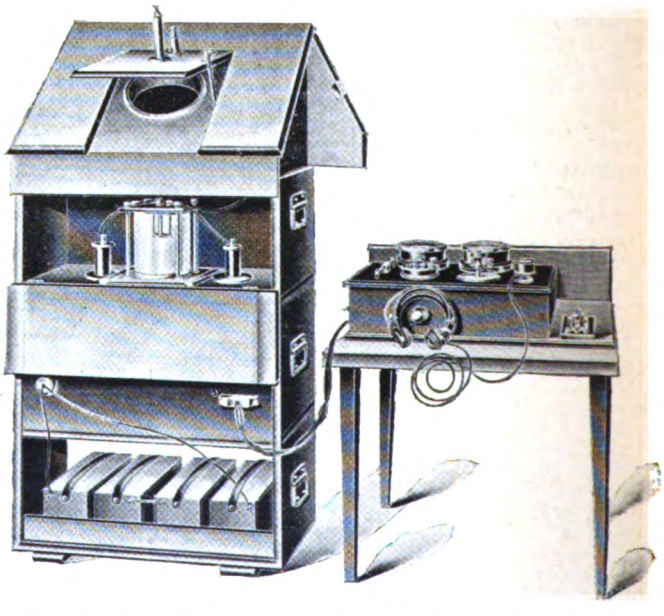

FIG. 1.—SEMI-PORTABLE WIRELESS APPARATUS FOR SHIPS.

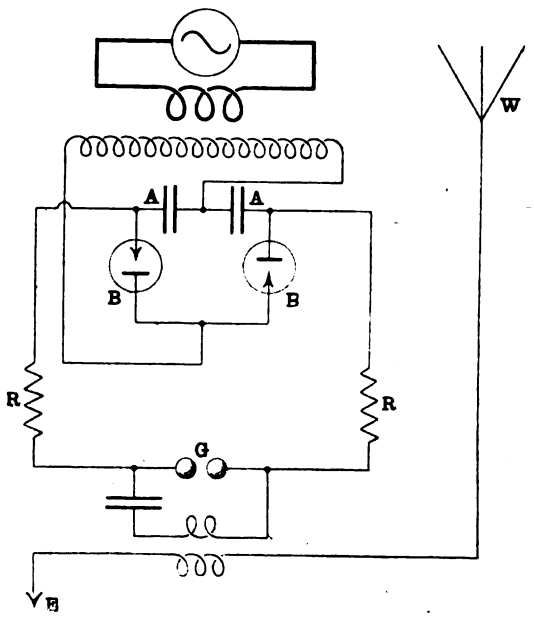
determined mainly by the dimensions of the aerial which is inductively coupled to the oscillatory circuit in the usual manner. Resistances formed by distilled water, covered with vaseline to prevent evaporation, are employed for R, R, but rotary carriers can be used for transferring the charge from the condensers A, A, to the spark-gap electrodes thus obviating C²R

Digitized by Google

losses. The apparatus was shown in use on Monday with Lodge valves, and valves of a German type have been also used with success. Condensers of French glass with copper electrodes immersed in vaseline are employed, and relief gaps are provided to prevent the perforation of the glass.

A novel feature of the apparatus is the multiple spark-gap. The discharge is broken up into four portions in series. The central rotating system of knobs is adjusted by means of a lever, and it will be seen that there are no contacts on this, the only moving part. The device is enclosed in a glass cylinder, and though no precautions are taken to prevent noise, its



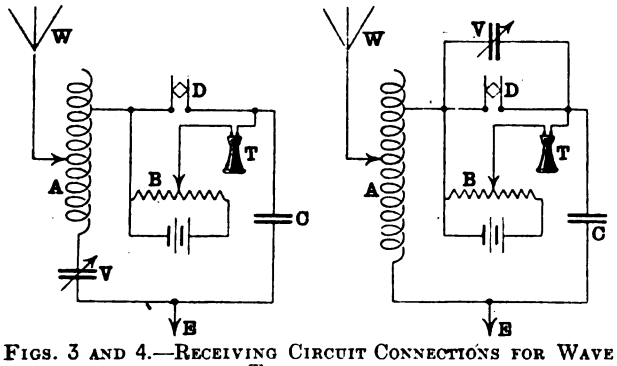


Fig. 2.—Transmitting Circuit Connections for Wave Telegraphy.

comparative silence when working is remarkable. The reason for this is not quite clear, but may be due to the breaking up of the discharge causing interference of the sound waves in the cylinder, or the absence of moisture. This latter is effected by placing a hygroscopic substance in the cylinder, which absorbs not only the moisture, but any nitrogen oxides or other gases produced by the discharge.

A semi-portable apparatus suitable for ships is installed in the Crystal Palace station, and is illustrated in Fig. 1. With this, messages are exchanged with the Bellini-Tosi station at Boulogne, while signals have been picked up even from the Marconi station in Newfoundland. The apparatus has a

Figs. 3 and 4.—Receiving Circuit Connections for Wave Telegraphy.

nominal range of some 300 miles, and consumes less than a quarter of a kilowatt. The receiving and transmitting board is connected to the transmitting apparatus (which is enclosed in a cabinet) by flexible leads with multiple-pin plugs, and a special combined H.T. and L.T. switch is provided. The variable magnetic coupling with the aerial can be seen on the top of the cabinet.

The induction coil used in this apparatus is of the open magnetic circuit type of a new design to give very low losses. The iron wires or strips are built up in several bundles and laid peripherally round a core of insulating material. All the wires are enamelled and eddy currents avoided. Demagnetisation is more rapid, and the efficiency is claimed to be higher. This coil can also be used off an A.C. supply.

The aerial consists of two 7/22 phosphor bronze stranded cables, each strand being enamelled. These are suspended from an insulated hanger attached to the top of the tower, 240 ft. above the ground level. An earth consisting of 150 sq. ft. of 1/16 in. copper plate, arranged as three radiating strips 50 ft. in length, and buried about two feet below the surface, has been put down.

The receiving apparatus employed does not contain any unusual features, except in the construction and arrangement of the tuning devices. On Monday, a carborundum crystal rectifying detector was used, and clear musical signals were obtained from Boulogne. The connections are shown in Figs. 3 and 4, where W represents the aerial, A the variable inductance, V a variable condenser, C another condenser, D the detector, and T the telephone. B is a potentiometer provided for obtaining a suitable P.D. across the detector terminals. Fig. 3 shows the connections usually employed, while Fig. 4 shows a variation.

A disadvantage of the present systems of wireless telegraphy is the fact that no record can be obtained of the signals received, as the filing coherer is the only detector, which permits of this being done, and this is now rarely used, as all signals of the same wave-length affect this detector in the same way, independent of the group frequency. As a means of reducing this disadvantage, it is proposed to use a recorder at the transmitting end, and an instrument of this type was shown us on Monday.

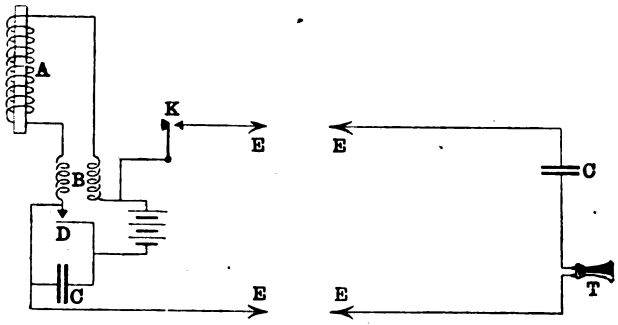

Fig. 5.—Transmitting and Receiving Circuit Connections for Earth Conduction Telegraphy or Telephony.

An extension of the lever of the transmitting key causes a Morse printer to ink the tape every time the key is depressed. The printer is driven by clockwork, and is interlocked with the main transmitting switch of the station and the transmitting key. It is started when the main switch is closed and the key is dead unless the printer is wound up and running. All messages and signals transmitted are therefore recorded.

The method described above, in which valves are used to give a high-potential D.C. current, has proved very suitable for permanent wireless stations, but a system has been devised which secures the same advantages combined with portability and even greater simplicity for small power stations. This system was shown in operation, but cannot be described, owing to patents pending. A combined transmitting and receiving apparatus capable of effecting communication over five miles with a 50-ft. aerial, can be carried by one man, and measures only 8 in. by 8 in. by 15 in. Besides this and the aerial, a 6-volt accumulator is the only apparatus required.

Earth Conduction Telegraphy and Telephony.

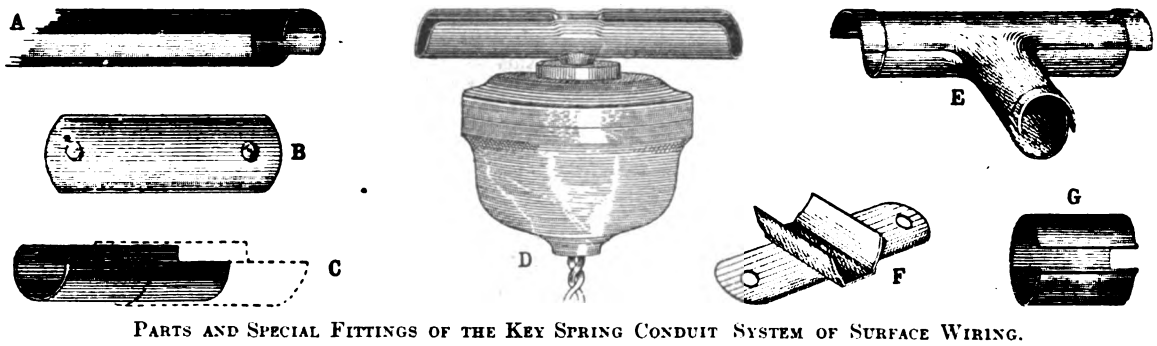
The company's system of telegraphy and telephony by earth conduction marks a considerable advance on previous systems of this nature. A powerful momentary current impulse is sent between the extreme points of a base line by means of earth plates or rods buried in the ground, and the stream lines spread out on both sides of the base line. If two further earth plates are sunk within a certain distance so as to form a corresponding base line parallel or nearly parallel to the first, a difference of potential will be produced between them, and if the plates are joined up by a telephone, a current impulse will be received. The effective distance of transmission can be increased by increasing either the length of the base lines or the power employed. The first method is very inconvenient, and can only be employed up to certain limits, while the second method has in the past lead to expensive and heavy apparatus. In the present system, a strong current impulse of very short duration is produced with the aid of an inductance with a very small total expenditure of energy. The connections for both the transmitting and receiving ends for Morse telegraphy are shown in Fig. 5. It will be seen that there is a local circuit comprising a battery, an inductance A, and a high-frequency trembler D with its two exciting coils B.

When signalling, this circuit is permanently closed, and the inductance is continually discharging into the condenser C, which prevents serious sparking across the trembler contact. The core of the inductance A is constructed in a similar manner to that of the induction coil used by the company for wireless

Digitized by Google

work, and as the eddy currents are reduced to a minimum, the flux built up by the excitation of the inductance on the closing of the contact at *D* collapses very suddenly at break, inducing a very high momentary back E.M.F. A series of these momentary high-tension impulses is thus produced, the frequency being of the trembler. Now, if the key *K* is depressed, a train of these impulses is sent through the earth from plate to plate, and the lines of flow cutting across the two receiving earth plates cause a similar succession of very feeble current impulses to pass through the telephone *T* and the condenser *C*. The trembler is adjusted so that a musical note is heard in the telephone. With 14-yard base lines and an expenditure of only a few watts, communication has been effected with this apparatus over a distance of nearly four miles.

For wireless telephony on the same principle, the trembler *D* is replaced by a microphone, and the transmitting circuit is closed permanently at *K*. When spoken to, the microphone practically makes and breaks the circuit of the inductance at frequencies corresponding to the sound waves impinging on the diaphragm. The high-tension impulses produced are conveyed to the transmitting earth circuit, and these cause corresponding current impulses in the telephone *T* of the receiving circuit. Thus the sound waves impinging on the microphone diaphragm are reproduced by the receiving telephone. Speech has been transmitted clearly by this method up to distances of one and a half miles with the expenditure of only a few watts, and using base lines of only 14 yards. A portable apparatus with both transmitting and receiving devices was shown to us on Monday, and we were able to carry on a conversation over a distance of 200 yards, with a receiving base only 15 inches long. In this case the "earth-plates" consisted merely of two brass rods driven a few inches into the ground. The apparatus is enclosed in a box measuring 8 in. square, and weighs about nine pounds. The cost of the apparatus is very low.



With the aid of a form of telephone relay, it has been found possible to work a bell call. A special telephone, the diaphragm of which works on a microphone diaphragm, is substituted for the receiving telephone, and when the minute impulses are received, the microphone operates a very delicate vibrating relay tuned to the frequency of the impulses, and this closes a bell circuit.

In conclusion, we should like to express our indebtedness to Mr. A. W. Sharman, Mr. H. H. Harrison, and other gentlemen connected with the company, who kindly explained the features of the above systems to our representative on the occasion of our visit to the station.

METAL CONDUIT WIRING SYSTEM

THE metal conduit system of surface wiring which was shown in its initial stages at the Manchester Exhibition by the Key Engineering Co., Ltd., has since then undergone considerable modifications and improvements, and the firm are now prepared to supply this conduit and the necessary fittings in large quantities. The tube which forms the conduit is formed as shown at *A* in the accompanying figure, in two portions, each slightly over a semicircle, so that one half can be sprung over the other. There are two or three different methods of putting up the conduit, but in all cases the cable is laid in and not drawn in. The simplest way is to fix the under portion or a tool, but a special key is provided for this purpose. This key is sprung over the conduit until the free ends engage beneath the edges of the cover when a slight depression of the handle levers one end of the cover off. Bends and tees are constructed on the same principle. A T-joint is illustrated at *E*, and it will be seen that every elbow or joint, or, indeed, any portion of the conduit, can readily be opened up for inspection. These inspection elbows and bends are also applicable to the ordinary screwed barrel system of wiring, and the company expect a considerable demand for them for this purpose.

Where bonding is not thought necessary, the separate lengths of conduit and the various fittings are connected together by means of a spring clip connector as shown at *C*. If a thoroughly bonded system is required, all the joints are electrically connected by means of short steel bonding pieces like that shown at *B*. The two copper rivets are expanded into the bonding piece and into holes punched in the conduit. To punch these holes, a special screw punch is slipped over the end of the conduit, and this cuts a clean hole in the exact position required. To expand the rivets, another special tool is used. Tests have shown that the ohmic resistance of a long run of conduit made up of 12-ft. lengths bonded in this manner is only 4 per cent. greater than if the conduit were continuous. While the overlap of the cover prevents direct access of water, free evaporation of moisture due to condensation is permitted. The system must be inspected and the various special fittings handled to appreciate the many advantages of the system, and a room wired on the system can be seen at the offices of the Key Engineering Co., Ltd. (4 Queen Victoria Street, London, E.C.). In order to encourage the use of the system, the firm offer a special and exceptionally high trade discount.

PARTS AND SPECIAL FITTINGS OF THE KEY SPRING CONDUIT SYSTEM OF SURFACE WIRING.

troughing to the wall or ceiling by screws passing through it, and then to spring on the cover after the cable has been laid in. If it is thought undesirable to pierce the under portion for screws, it is supported on a simple bracket, *F*, screwed or nailed to the support, and is held temporarily in position by special spring clips. The cable is then laid in the troughing and the cover sprung on. Finally, a spring clip, *G*, is sprung over the complete conduit and the edges of the bracket, thus rigidly holding the respective sections together. All the fittings are attached by means of standard nipples to steel clips as shown at *D*, which represents the ceiling rose fitting used in this system. It is practically impossible to pull the cover off without

THE GLASGOW CONVENTION OF THE I.M.E.A.

AS we have already announced, the 1910 Convention of the Incorporated Municipal Electrical Association will be held in Glasgow from June 14th to 17th next, under the Presidency of Mr. W. W. Lackie, Chief Electrical Engineer to the Glasgow Corporation. The full programme is now available.

The Convention will be opened on Tuesday, June 14th, by the Hon. A. Shaw McInnes, Lord Provost of Glasgow, in the Rankine Hall of the Institute of Engineers and Shipbuilders in Scotland, Elmbank Crescent. Mr. W. W. Lackie will then deliver his Presidential Address, which will be followed by a Paper and discussion on "Commercial Progress," by A. C. Cramb (Chief Electrical Engineer, Croydon) and H. Collings Bishop (Chief Electrical Engineer, Newport, Mon.). The Tramways and Electricity Committee will entertain the members and delegates (including ladies) to luncheon at the City Chambers at 1.15 p.m. At 3 p.m. brakes will leave the City Chambers to visit the following works:—(*a*) Springburn sub-station of the Electricity Department; (*b*) Pinkston power house of the Tramways Department; (*c*) Port Dundas electricity works of the Electricity Department. The Lord Provost, Magistrates, and Town Council will give a reception and conversazione at the City Chambers at 7.30 p.m.

On Wednesday, June 15th, the meeting will be in the Free Gardeners' Hall, Picardy Place, Edinburgh, a special train leaving Glasgow (Queen Street) at 8.25 a.m. The following Papers will be read and discussed, after a welcome by the Rt. Hon. the Lord Provost of Edinburgh:—(1) "Exhaust Steam Turbines and Condensing Plant," by F. A. Newington (Chief Electrical Engineer, Edinburgh); (2) "Mixed Pressure Turbines," by Ashton Bremner (Chief Electrical Engineer, Burslem). After the meeting, the Corporation of Edinburgh will entertain the Association to luncheon at the Music Hall, George Street, and at 2.30 p.m. a visit will be paid to the Macdonald Road electricity works of the Corporation.

At the meeting on Thursday, June 16th, in the Rankine Hall of the Institute of Engineers and Shipbuilders, Glasgow, discussions will take place upon the following subjects:—(1) "Advantages of Continuous Records of Costs and of Steam Consumption," to be opened by G. Wilkinson (Chief Electrical

Digitized by Google

Engineer, Harrogate) and C. E. C. Shawfield (Chief Electrical Engineer, Wolverhampton); (2) "Cheapening of the Cost of Mains and Services," to be opened by S. E. Fedden (Chief Electrical Engineer, Sheffield) and S. J. Watson (Chief Electrical Engineer, Bury). At 2.30 p.m. visits will be paid to the following works:—(1) St. Andrew's Cross electricity works; (2) Coplawhill Car works; (3) Govan electricity works. An alternative series of visits includes the power stations of the Partick Corporation, and the Clyde Valley Electric Power Co., and Messrs. Beardmore's shipbuilding works. The annual dinner will be held at the Windsor Hotel at 7 p.m.

The Annual General Meeting will be held on Friday, June 17th, at the Institute of Engineers and Shipbuilders.

The headquarters of the Association will be at the Windsor Hotel.

Arrangements have been made by the Association with the railway companies for the issue of railway tickets at fare and a quarter, on presentation at the booking office of a voucher to be obtained from the Association.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

BELLS.—A leaflet from Messrs. Julius Sax and Co., Ltd. (24A High Street, New Oxford Street), describes a redesigned series of trembling bells with patent rubbing contact. A continuous ringing attachment is made, and the bells can, if desired, be arranged for working direct on lighting and power circuits in series with the ordinary incandescent lamp. For this purpose a lamp-holder is provided on the bell base, suitably connected, so that it is only necessary to take the wires to the terminals in the ordinary manner. By a special arrangement breaking at the full circuit voltage on the contacts is avoided.

TELEGRAPH AND TELEPHONE LINE MATERIAL.—Messrs. Siemens Bros. & Co., Ltd. (Caxton House, Westminster, S.W.), have sent us a copy of a new issue of their pamphlet, No. 11, relating to telegraph and telephone lines. This consists of 124 pages, and has been divided into six sections, dealing respectively with iron poles, insulators and stalks, brackets, arms and fittings, stay tighteners, tools, and bolts and screws. All patterns of iron poles, from the simple tubular iron pole with buckled plate down to the very latest types, are represented, and a number of extra long poles are listed, the heights varying from 22 ft. to 80 ft. The insulator section contains, beside examples of telegraph and telephone insulators, designed to meet the requirements of practically every Government and telegraph company, a large selection of porcelain reels and knobs. The pamphlet is coded and provided with a system of cross references, so as to facilitate the drawing up of specifications.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ELECTRICITY IN THE HOME.—The South Metropolitan Electric Light and Power Co., Ltd., have sent us an illustrated booklet, which they have issued as a souvenir of the model electric home at Catford. This house, in which all kinds of electrical domestic apparatus can be seen in daily operation, was described in ELECTRICAL ENGINEERING, Vol. V., p. 1028.

FANS.—We have received an advance copy of a new fan list issued by the Edison & Swan United Electric Light Co., Ltd. (Queen Street, London, E.C.). Particulars and prices of the various standard patterns of table, ceiling, and porthole fans are given. An improved type of oscillating desk fan is described, and fans with friction gear of both the table and porthole types are listed. These latter have a high efficiency, the current consumption of a 24-in. D.-C. fan being only 75 watts, and run very quietly as the blades revolve at the most efficient speed without churning the air.

FANS AND VENTILATORS.—A list from the British Department of the Maschinenfabrik Oerlikon gives particulars of a number of patterns of electric fans and ventilators of the desk, wall, bracket, and porthole patterns, both for continuous-current and single-phase circuits, all fitted with provision for speed regulation.

The Dublin Tramways Congress.—The Congress of the Tramways and Light Railways Association in Dublin, which was postponed on account of the death of King Edward, will be held on Thursday and Friday, June 9th and 10th. The arrangements previously announced will hold good. We gave an account of the Papers to be read on page 324 of our last issue.

National Electrical Manufacturers' Association.—At a meeting recently held at Manchester, the formation of a northern section of the Association was decided upon, and Mr. B. Longbottom (Electromotors, Ltd.) was elected Honorary Secretary. Among firms who have joined the Association as a result of the movement are Messrs. E. Brook, Ltd., H. T. Boothroyd, Ltd., Clarke, Chapman & Co., Ltd., Evered & Co., Ltd., Liverpool Cable Co., Ltd., Bertram Thomas, and Wright & Wood. Some changes in the bye-laws to make the Association more national in character have been approved.

PENDING ELECTRICAL LAWSUITS

(Compiled by our own Editorial Staff, and Strictly Copyright.)

SEVERAL legal actions of interest to the electrical industry are down for hearing during the Trinity Sittings, which commenced on Tuesday. The Gravesend & Northfleet Tramways Co., Ltd., had entered an appeal against the judgment of Mr. Justice Hamilton in regard to the reading of the meters in the Gravesend Corporation's power station, which measure the energy supplied for working the tramways (ELECTRICAL ENGINEERING, January 20th, p. 49, and February 3rd, p. 75), but we understand that the parties have come to terms. The only other case in the Appeal Courts is an appeal by the Eccles Corporation against a judgment of Mr. Justice Eve in connection with the working of certain tramways by the South Lancashire Tramways Co. (ELECTRICAL ENGINEERING, February 3rd, p. 75).

In the Chancery Division, the action by the British Thomson-Houston Co., Ltd., against the Midland Railway Co. for alleged infringement of their patents covering the multiple unit control system for electric traction, is early on the list of cases in Mr. Justice Warrington's Court.

Before Mr. Justice Neville there are two actions, viz., the Attorney General *v.* Leicester Corporation, and the Attorney General *v.* West Ham Corporation. In the former, the Electrical Contractors' Association are seeking to restrain the Leicester Corporation from selling fittings or wiring houses, &c., for electric light and power. The action against the West Ham Corporation is at the instance of the India Rubber, Gutta Percha, & Telegraph Works Co., Ltd., and is to restrain the Corporation from enforcing the payment of a rate to meet certain overdrafts for the purposes of the electricity undertaking. The India Rubber Co. are large ratepayers in West Ham, but have their own generating plant, and do not buy their electric power from the Corporation. At the Local Government Board inquiry last year concerning a loan for the electricity works, the company opposed on the ground that the Corporation were selling electricity for power purposes at less than cost. The Local Government Board have deferred granting this loan pending the result of the action above referred to. But for this, we understand, the loan would have been granted with certain unimportant reservations.

Two actions by Messrs. Babcock and Wilcox, Ltd., will also be dealt with by Mr. Justice Warrington. One is against Messrs. E. Danks and Co., Ltd. (Oldham), in relation to an alleged infringement of patent; the other is against the Water Tube Boiler Co., and is a re-hearing of an action *re* an agreement.

In the King's Bench Division is an action, *Electrical Press, Ltd., v.* Mountain, in respect of alleged fraudulent misrepresentation. It will be remembered that the *Electrical Press, Ltd.*, as advertising agents, placed the prospectus of Messrs. Mountain, Gibson and Thornewill, Ltd., and were the largest creditors in the subsequent liquidation of the company.

The action for libel by Mr. W. Griffiths against the proprietors of the *Daily Chronicle* arising out of articles on the G.B. surface-contact system in the Mile End Road is still in the list, and should be reached very shortly.

Among other actions is one by the National Electric Construction Co., Ltd., against the South Metropolitan Electric Light and Power Co., in relation to a contract, and there are, as usual, a few actions brought against tramway and railway undertakings for recovery of damages for injuries in street accidents, &c.

Illuminating Engineering Society.—At the annual general meeting of this society held in London on Monday last, the report of the Council for the past session was presented. Prof. S. P. Thompson, F.R.S., has been re-elected President, and the present Council will also remain in office with one or two additional members.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 19th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

10,588/09. **Commutators for High-speed Machines.** C. A. Parsons, A. H. Law, and J. P. Stockbridge. To avoid taking up useful brush surface by external rings, the segments are held in against centrifugal force internally by providing the hub with dove-tail or T-shaped longitudinal projections which fit into corresponding recesses formed by cutting pieces out of two adjacent segments. The projections are insulated from the segments, and wedges are provided. An alternative method consists in passing radial bolts through the hub. The bolts may either lock or screw into the bars. Another construction is described in which the adjacent bars are locked into one another forming a stiff ring capable of supporting itself. Five claims, twelve figures.

11,285/09. **A.-C. Distribution.** British Thomson-Houston Co., and E. B. Wedmore. In A.-C. stations supplying current at different frequencies, automatic apparatus is provided to prevent the paralleling of a live feeder with bus-bars of a different frequency. Five claims, five figures.

14,674/09. **Arc Lamp Mechanism.** H. D. Weaver. A very simple feeding and striking mechanism for flame arc lamps of the converging carbon type. A twisted rod is mounted vertically in the centre of the lamp so as to be capable of axial rotation and a small longitudinal movement. On this rod is a loosely threaded nut to which the carbons are attached by cords passing over pulleys. The weight of the carbons tends to draw up the nut and rotate the rod, but rotation is normally prevented by a brake block attached to the usual form of rocking lever and bearing on a horizontal disc on the top of the rod. The disc is pressed upward by a spring. When the solenoids cause the disc to be released, the carbons feed, and when they touch the series solenoid causes the disc to be held, and then depresses both disc and rod, thus lifting the carbons and striking the arc. Four claims, six figures.

17,960/09. **Metal Filament Lamps.** Felten & Guilleaume Lahmeyer-Werke A.-G. In order to prevent disintegration of metal filaments, a nitrogen compound free from hydrogen, such as phosphorus nitride, is introduced into the bulb in the form of a paste on some part of the interior. This gradually liberates nitrogen throughout the life of the lamp. It has been found that hydrogen introduced for this purpose became ionised and conducted a comparatively large current, thus short-circuiting the filaments. Nitrogen is said to be free from this objection owing to its smaller molecular velocity. To increase the absorption of oxygen, amorphous phosphorus may be mixed with the phosphorus nitride. Two claims.

21,285/09. **Metal Filament Lamps.** H. Zschocke. The separate filament loops are passed over rigid thick wire supports at the bends, and are attached to resilient strip supports at their extremities, the latter supports being in the circuit. One claim, one figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Jaburg, 15,881/09; Binet and Guenne [Arc-lamp casings] 28,849/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Gray [Electric conductors] 7,791/09; Wildermann [Chlorine-resisting ebonite] 12,424/09.

Dynamos, Motors, and Transformers: Dawson and Pyne [Motor control] 11,445/09.

Electric Ignition: Mowatt [Ignition of gas lamps] 18,243/09; Bellem and Brégéras [Driving of magnetos] 6,962/10.

Electrometallurgy and Electrochemistry: Cowper-Coles [Electro-deposition of iron] 10,655/09; Schauli [Electrolyte for primary or secondary cells and resistances] 10,791/09.

Instruments and Meters: Kallman [Meter testing] 7,754/09.

Storage Batteries: Somers and Crawley, 5,062/09.

Switchgear, Fuses, and Fittings: Sykes and Cooke [Conduit joint boxes] 26,021/09; France [Conduit fittings] 29,811/09.

Telephony and Telegraphy: Peticky, Suchánek and Cizek [Automatic telephone exchange] 11,497/09; Murray [Photographic type-printing telegraph] 22,457/09; Erdmann [Wireless telegraph apparatus] 28,545/09; Thorrowgood [Polarised relays for selective signalling] 30,579/09; Siemens Bros. & Co. (*Siemens & Halske A.-G.*) [Telephone exchanges] 3,118/10.

Traction: Newton [Brakes] 11,127/09; Blackall and Jacobs [Electric staff signalling] 11,460/09; Morrison [Electric transmission for motor vehicles] 16,331/09; Munro and Railless Electric Traction Co. [Hangers for trolley wires] 17,326/09; Rote and Shee [Brakes] 24,448/09; Hintz and Schmidt [Automatic stopping of trains] 3,918/10.

Miscellaneous: Tierney [Vacuum cleaner] 10,115/09; Greenhill and Goddard [Electric locks] 10,345/09; Nicholas [Ships' compasses] 10,925/09; Tscherkassoff [Electrotherapeutic apparatus] 13,542/09; Verney [Electromagnetic couplings] 26,574/09; Baillie [Vacuum cleaner] 28,775/09; Curtis and Beamand [Lubrication of conductors for mining cages] 3,693/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, &c.: Felten & Guilleaume Lahmeyer-Werke A.-G. [Prevention of currents in shafts and bearings] 7,463/10; Balachowsky and Caire [Regulation of machines] 9,375/10; Alexanderson [High-frequency alternator] 9,637/10; Von Kando [Marine propulsion] 10,169/10; Meynier [Machine] 10,208/10; Allgemeine Elektricitäts Ges. [Motors] 10,607/10.

Electric Ignition: Reno and Bois [Distributers] 4,666/10.

Electrochemistry: Schoop [Depositing metals] 5,712/10.

Traction: Haasted [Electrical control of points] 10,375/10.

Miscellaneous: Bellem and Brégéras [Electromagnetic control of petrol supply to engines] 9,496/10; Friese [Selenium cell fire-damp detector] 9,545/10.

Opposition to Grant of Patents

6,936/09. **Metal Filaments.** The Westinghouse Metal Filament Lamp Co., Ltd. (*A. Lederer, Vienna*). The opposition to this patent, covering a process of decarbonising tungsten filaments, has been withdrawn. (*See* Electrical Engineering, March 10th, 1910, page 172.)

12,289/09. **Fan.** J. Keith. This patent has been granted in spite of opposition. It covers an ornamental table-centre fitted with an electric fan and lamps.

12,966/09. **Electric Furnace Reaction.** E. C. Marks (*T. L. Wilson*). Opposition has been entered to the grant of this patent, which covers a process for producing a silicide of an alkaline earth by heating a carbide of the earth with silica and without carbon in an electric arc furnace.

Application for Amendment

12,135/07. **Magneto-Generator.** W. Roos desires to amend this patent in order to limit the scope of the invention, which is for a method of oscillating the armature of a magneto-generator with a minimum return oscillation past the point of equilibrium.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years, unless an extension of their term is granted:—

11,958 of June 2nd, 1896. **Electric Target.** J. L. McCullough. A dummy gun carries a contact arm which moves over a disc. Different circuits are completed according to the direction of the gun, and the point aimed at is indicated on the target.

12,039 of June 2nd, 1896. **Wireless Telegraphy.** G. Marconi. This is Marconi's original patent relating to wireless telegraphy with coherers, the metal filing coherer, the use of mercury in coherers, methods of decohering, the combination of a relay with a filing coherer, spark-gap transmitters of various forms, and various arrangements of transmitting and receiving apparatus. The Marconi Co. has applied to the Courts for an extension of the term of this patent, including the connection of the transmitter and the coherer to earth.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: British Thomson-Houston Co. and E. J. Murphy [Lamps with two arcs in series] 2,715/04.

Dynamos, &c.: M. Latour [Self-exciting, A.-C. machines] 2,471/04; H. Leitner and H. Hill [Brush-rocking gear] 2,341/05.

Electrometallurgy, &c.: F. Fisher and B. J. Round & Sons [Electroplating] 2,684/98; W. C. Wood and B. Oaksford [Electrolytic apparatus] 2,001/05.

Heating and Cooking: Linotype Co., J. Place and M. Barr [Electric heating of melting-pots of linotype machines] 2,904/98.

Switchgear, &c.: R. W. Bill and F. W. Abbott [Circuit-breaker] 2,543/05; W. A. Clatworthy and J. H. Holmes & Co. [Motor starter] 2,190/05; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Fuses] 2,491/05.

Traction: R. Carnegie and A. Beevers [Trolley wheel] 2,397/04; H. Leitner and R. Lucas [Train-lighting system] 2,342/05; E. Peckham [Brakes] 2,488/05.

Miscellaneous: F. McGloin [Fire and burglar alarm] 2,453-4/01; M. A. Codd [Trembler for induction coil] 1,891/05.

Digitized by Google

THE ELECTRICAL INDUSTRY AND TARIFF REFORM

A DISCUSSION upon the question as to whether a free trade or protectionist policy would be of the greater benefit to the electrical industry of this country took place at Caxton Hall, Westminster, on Monday. There was an attendance of about 200. Mr. J. E. Kingsbury and Mr. Hugo Hirst opened the debate for free trade and protection respectively, and after a few other speakers had expressed their views the meeting was adjourned until Monday, June 6th, when the discussion will be continued, and Messrs. Kingsbury and Hirst will reply to the arguments put forward. The discussion was promoted by the National Electrical Manufacturers' Association, which, however, does not identify itself with either party. For this reason no resolution will be put to the meeting.

Mr. H. W. Butler (of the Electrical Power Storage Co., Ltd.), who presided, explained that whilst the Association exists for dealing with all commercial questions which are of general interest to the electrical trade, it also forms a common platform where all members of the trade might meet to discuss various questions of policy. Consequently, the Association accepts no responsibility for any of the opinions expressed by the speakers.

Mr. J. E. Kingsbury (late Manager of the London office of the Western Electric Co., Ltd.), in opening the debate, said that, taken as a whole, the electrical industry in Great Britain had a higher efficiency than in any country in the world. Our free trade policy, he contended, permitted us to apply at once any advance made elsewhere, and as soon as the demand became large enough to permit economical manufacture, we abandoned importing and manufactured for ourselves. Protected States, he said, are behind in the development of enterprises originating in other countries. Mr. Kingsbury deprecated the policy of detraction which had been adopted by protectionists, by which Great Britain was held up as exceptionally backward. On this point he quoted figures, which, however, hardly supported his contention that protected States were backward. In 1904, the electrical products in the United States amounted to 6s. 10d. per head of population, whilst ours in 1907, i.e., three years later, were still less, viz., 6s. 2d. He thought he was fairly stating the protectionist argument when he said that it claimed to make a foreign manufacturer sure of his home market, and that he could consequently organise with confidence for the supply of that market; that he could arrange for the production of a surplus to dump in our market, and could secure for his employees continuity of employment. Dealing with the British home electrical market, he said that in 1907 we imported about 17½ or, say, even 20 per cent. of our consumption. This he would divide into two, and assume that 10 per cent. of the imports were wanted to maintain our efficiency, and that 10 per cent. were competing with our own standard manufactures. The value of this second 10 per cent. of electrical goods, however, had a value which amounted only to three-quarters of a million pounds, and the retention of this proportion of our trade might possibly result in the ruin of our export market. The dependence of the electrical industry upon the general trade and commerce of the nation could not be questioned, and it was to be regretted that more attention was not given to this. The argument for the continuity of employment, he said, was negatived by the facts. It was a well recognised fact that the trade of a free trade country was less disturbed, and employment was more regular than that of a protectionist country. The employees of the electrical trade in Great Britain had not been subject in recent years to such sudden and such extensive reductions as had taken place in the United States and Germany. The more moderate policy of retaliation Mr. Kingsbury regarded as useless to the electrical industry, for he did not believe that any of our foreign competitors were so poorly equipped electrically that the operation of a retaliatory tariff would lead to a reduction in their duties on any item which would facilitate our exports to them. He sympathised with the trader who found his sales affected or his profits reduced by imports from a country from which his own products are rigidly excluded, but if we were to legislate for hard cases we should start on the road to ruin. The continual decrying by protectionists of our powers in open competition had resulted in Great Britain's loss in goodwill in the last few years being serious, and it would have been more serious still but for the fact that our customers, our friends, and our competitors had not taken us quite so seriously as we had taken ourselves.

Mr. Hugo Hirst (Managing Director of the General Electric Co., Ltd.) referred at the outset to the indecisive results of the last election on the subject of Tariff Reform, which were largely due to the loud and insistent voice with which the cotton industry clamoured for Free Trade, but it was not generally recognised that the cotton industry enjoyed a special form of protection in the ideal climatic conditions of Lancashire for this particular work. Further, the cotton industry only represented 20 per cent. of the total production of the country. In a final reference to the cotton trade, Mr. Hirst referred to the report recently published by an important section of the cotton industry, that they considered electric driving unsuitable as another instance of a characteristic policy in the cotton trade of *laisser aller* instead of *savoir faire*. Electrical engineers knew that the cost of production could be considerably reduced by the introduction of electricity and modern plant in cotton mills. Mr. Hirst thought a striking example of the process of falling back in the world's industrial race was afforded by the electrical industry. In the early years the electric cable and telegraph industry was exclusively in British hands. The manufacture of dynamos and of incandescent lamps was a flourishing industry in England, whilst on the Continent that branch of technics was still considered only suitable for laboratory research. It was in the early 'eighties that Messrs. Crompton & Co. fitted up the Opera House at Vienna and the Emperor's Palace, whilst a large number of other installations in Germany and elsewhere abroad were being fitted up by British engineers. He himself was connected with the largest accumulator works in this country, and he well remembered Oskar Miller, one of the directors of the Allgemeine Elektricitäts Gesellschaft, visiting this country and raising his hands in astonishment at the great things we were doing here. The arc lamp industry, transformers, &c., were all developed in this country. Instead of a foreign country sending cables to the United Kingdom they had to buy the machinery from us before they could make them. Now, alas, that position was reversed; but if we could keep out the foreign manufactures, and make all we require at home ourselves, we should then be on the high road to economic perfection. He was quite satisfied that it did not require a large percentage of duty to secure our market. With a duty of only 10 per cent. foreign competing firms would well understand that this figure could be varied. Under such conditions they would probably, in organising their works, be more careful to avoid over-production. The net result would be that we could turn out from our existing works continuously larger quantities, securing regular profits, giving regular employment, and at the same time be able to reduce our cost of production. Assuming that last year we imported eight to ten million incandescent lamps, he was bold enough to say that under a tariff of only 10 per cent., the bulk of those lamps would never have been imported, but would have been manufactured in the existing English workshops, many of which last year were running short time. The cost of production would have been reduced by at least the amount of the duty, and nobody would have been a penny the worse. The greater and more regular wages, however, would result in the operatives acquiring an increased power of expenditure in the home market which would benefit every other industry. As a proof that lack of technical education was not the cause of our industrial decline, Mr. Hirst referred to the large works established by certain German and American firms in this country. In spite of unlimited capital and the employment of the best technical and commercial men which these competitors had been able to produce, some of these businesses had not proved financially successful in our free trade country. Mr. Hirst said he was at heart a believer in free trade, not of the spurious type that obtained in England to-day, but free trade amongst all nations, and this might even now be brought about by the erection of a tariff barrier as impregnable as those which protect foreign countries. Probably then the absurdity of running tariff walls against us would become apparent, and trade would become free in the best sense. He claimed that Great Britain had prospered in spite of her free trade policy. At the close of the period of protection which culminated in 1846 she was the chief producer among civilised nations. From 1848 to 1878 nearly all the Continental nations were strenuously fighting for national existence, an opportunity for industrial development of which Great Britain took full advantage. Moreover, the introduction of free trade in this country tallied with the development of steam power.

These were the main points of Mr. Hirst's argument. Incidentally, he referred to the question of rates of wages. He admitted that wages were higher here than abroad—owing to the fact that under free trade the proportion of skilled to unskilled labour tended to decrease—but, although British labour was dearer per head, it was not dearer in proportion to the quantity of the manufactured article.

Mr. J. S. Raworth (British Electric Traction Co., Ltd.) said that in spite of what Mr. Kingsbury had said, the electrical industry had not had free trade. The Electric Lighting Acts and the Tramways Act of 1870 were protective measures in the interests of the municipalities. What we wanted was freedom from legislation, and this was a form of free trade for which he asked. Mr. Raworth also mentioned that 90 per cent. of the tramway machinery in this country came from America.

Mr. E. Cowan (Cowans, Ltd.) said no one could deny that the electrical industry was suffering from disease, but he did not think general protection would be beneficial. A tariff on electrical imports only might have a good effect, but there was no chance of getting this. Whenever any change took place in our fiscal policy, the unemployment of both capital and labour would, he contended, be temporarily increased. He suggested the possibility of a compromise, with the object of avoiding destructive competition, and to bring about economies by regulation and organisation of output. In order to achieve

Digitized by Google

the former, the manufacturers would need the assistance of municipal electrical engineers, electricity committees, and consulting engineers.

Mr. J. HARLAND BOWDEN regarded protection as absolutely essential to the future industrial prosperity, both of the electrical industry and of the nation generally, and mentioned the iron and steel trade as an industry which could be revived with attendant advantages to the electrical industry. He disagreed with Mr. Hirst, however, on the question of the relative wages in this country and abroad, and said that he had seen a certificate in London, signed by a British Minister, to the effect that wages were higher in protected countries. He was sorry that no resolution was to be put to the meeting, and asked the Chairman whether it would not be possible to put one. Members of the electrical profession holding free trade views frequently spoke at festive boards, and there was an erroneous impression that these speakers represented the views of the industry as a whole.

Mr. RUSSELL FITCH supported Mr. Hirst's view that Great Britain had prospered in spite of free trade.

Mr. E. GARCKE then proposed that the meeting should be adjourned, and this was carried on a show of hands.

The discussion will be continued at Caxton Hall on Monday, June 6th, at 8 p.m.

LOCAL NOTES

ABERDEEN: *Supply to Consumer in Arrears.*—The Aberdeen Station Hotel Co., which is in liquidation, last week sued the Corporation for cutting off the supply of electrical energy. For the Corporation it was stated that the company were in arrears of payment, and that under the Aberdeen Corporation Act, 1907, they had absolute power to cut off the supply. The Court held that there was no obligation on the Corporation to supply.

ARGENTINE: *Tramway Reconstruction.*—The plans of the National Tramway Co. for the reconstruction of the tramways from horse to electric traction have been approved.

AUSTRALIA: *Purchase of Perth Tramways.*—According to the *Standard*, the Perth City Council is conducting investigations with a view to purchasing the Perth Electric Tramways Co.

BIRMINGHAM: *Electricity Accounts.*—The accounts of the Electricity Department for 1909-10 show a revenue of £186,345, compared with £175,896 in the previous year. After meeting all revenue and capital charges, there is a balance of £19,255, of which £9,000 has been carried to renewals and the balance paid over in relief of rates. In view of the fact that the Local Government Board only allows five years for loans of meters, the Electricity Committee have decided to meet the cost of these out of revenue. The accounts, therefore, bear a charge of £4,000 for meters and £1,520 for service switches installed on consumers' premises, as only a very short period is allowed in this case also. Additional plant will be required to meet the increasing demands (see Tenders Invited). The committee propose to appoint a secretary to the electricity undertaking at a salary of £600 per annum, to take charge of the commercial, secretarial, and accountancy sides of the undertaking, in order to allow the engineer more time to develop the engineering side.

Tramway Accounts.—The net profit from the tramway undertaking for the past year was £56,442, and after placing £23,528 to reserve, the balance goes to the relief of rates. The latter item is £3,500 more than in the previous year. This result is achieved in spite of the fact that the wages' bill has increased by about £8,000 per annum, owing to decreased hours of working on the part of the employees.

Tramways to Harborne.—A deputation waited upon the Tramways Committee last week in opposition to the proposals of the Committee to extend the tramways to the Harborne and Quinton districts.

BRIDLINGTON: *Electricity Profits.*—The electricity undertaking made a profit of £437 last year, against a loss of £188 in 1908-9.

BRIGHTON: *Tramway Accounts.*—After meeting all capital charges, the accounts of the tramways department for 1909-10 show a net profit of £1,190, against a deficiency of £2,420 in the previous year. The receipts increased by £3,549.

BROMLEY: *Electric Lighting Order Revoked.*—The Board of Trade have revoked the Bromley Rural Electric Lighting Order, 1903.

BURY: *Electricity Accounts.*—The profit on the electrical undertaking for last year was £3,569. The number of units sold during the year increased by 700,000.

CLITHEROE: *Electric Lighting Order.*—The Board of Trade have decided to defer revoking the Council's electric lighting Provisional Order for twelve months.

CREWE: *Electricity Profits.*—A profit of £1,219 was made upon the electrical undertaking for the past year. Of this £500 have been handed over in relief of rates, and £305 have been carried to reserve.

DARLINGTON: *Electricity and Tramway Accounts.*—The electricity accounts for last year show a net profit of £2,190, against £1,933 in the previous year. The costs of production are the lowest on record for any undertaking having an output of less than 2,000,000 units per annum.

DEVONPORT: *Electricity Accounts.*—The net profit on the electricity undertaking for 1909-10, after meeting capital charges, was £1,011. The Electricity Committee recommend a reduction in the price of current for lighting purposes from 4d. to 3½d. per unit.

DUNDEE: *Tramway Accounts.*—The revenue from the Corporation tramways for the year to March 31st was £61,235, a decrease of £636 compared with the previous year. The passengers carried, viz., 16,836,571, decreased by 151,760.

EDINBURGH: *Supply to Outside Districts.*—The Electricity Committee are considering the advisability of extending the electric supply mains outside the city boundaries. The permission of the Midlothian County Council, and also that of the Board of Trade, will have to be obtained. A large number of applications for supply have been received.

Charge for Tramway Energy.—The Electric Lighting Committee recommend that the charge for electrical energy supplied to the first electric tramway in Edinburgh shall be 1¼d. per unit for the first year.

FARNWORTH: *Electricity Deficit.*—The accounts of the electricity department for the past year show a deficit of about £1,000. The net loss on the undertaking since the commencement, after allowing for small profits in one or two years, now amounts to £1,701.

HERTFORDSHIRE: *The Trolley Omnibus.*—The construction of tramways in Watford by the Hertfordshire County Council (whose lessees are Metropolitan Electric Tramways, Ltd.) has been deferred for six months in order to gain experience of the working of the trackless trolley system.

HESSLE: *Electric Lighting.*—An offer by the Hull Corporation to acquire the Council's Electric Lighting Order, on payment of £200 by the former, is under consideration. The offer is conditional upon the Council adopting electricity for street lighting.

HULL: *Municipal Telephone Accounts.*—The Corporation telephone accounts for 1909-10 show gross receipts of £11,670, an increase of £1,978 over the previous year, and a gross profit of £4,825, an increase of £380 over the previous year. Capital charges amount to £1,994, and government royalty £1,188. The cost per station now stands at £20·58, compared with £21·42 last year, and it is now regarded as certain that the actual cost of the scheme will be below the estimates. The net profit for the year's working was £1,171.

ILKESTON: *Tramway and Electricity Accounts.*—There was a deficit of £2,086 on the past year's working of the tramways. On electricity account, there was a deficit of £86.

LLANELLY: *Light Railways.*—An application is to be made to the Light Railway Commissioners for certain amendments in the Llanelly and District Light Railways Order, 1907.

LYTHAM: *Electric Supply Company.*—The Lytham Electric Light & Power Co., Ltd., have written a letter to the Council, in which they state that they had anticipated a certain amount of financial support locally, and in this they had been greatly disappointed so far, hence the delay in carrying out the provisions of their Provisional Order. They were, however, hopeful of being able to complete the necessary financial arrangements, and will advise the Council immediately there is progress to report.

NEWCASTLE-ON-TYNE: *Tramway Accounts.*—The accounts of the municipal tramways department for the past year show a net profit of £15,136.

SOUTH AFRICA: *New Power Station.*—According to the *African World*, arrangements have been made for the Victoria Falls & Transvaal Power Co. to construct a power station at Vereeniging for supplying the Western Rand mine with electric power.

TURKEY: *Constantinople: Electric Lighting.*—With reference to the tenders for the electric lighting concession in Constantinople, it is stated that the leading competitors will be the Union Ottomanne (which, together with the A.E.G., the Siemens Schuckert Co., and a French group, put up an installation some years ago) and the Westinghouse Co. So far no information is available as to whether any British firm will tender for the concession.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BARKING.—The Electrical Engineer has prepared a report upon three alternative schemes for the extension of the present generating station or the removal of same to a new site. The matter is to be considered shortly, and in the meantime the report has been circulated amongst the members of the Council.

BARNES.—The Council require low-tension, triple-concentric cable. Particulars from the Engineer and Manager, and tenders by June 14th.

Digitized by Google

BIRMINGHAM.—The annual report of the Electricity Committee draws attention to the necessity for installing additional plant in the near future at an estimated cost of £143,000. The plant proposed includes 11,000 kw. of generating plant.

CALCUTTA.—The Calcutta Electric Supply Corporation are proposing to erect a new power station. (See Companies' Meetings.)

FLEETWOOD.—Extensions of the generating plant will be required very shortly.

NEW ZEALAND.—The Waihi Gold Mining Co. have obtained a concession for using the Hora Hora Rapids for the purpose of generating electricity.

ST. ANNE'S-ON-SEA.—The Electricity Committee require a fuel economiser. Particulars from the Engineer.

WIMBLEDON.—An inquiry was held last week concerning a loan of £5,800 for electrical extensions.

WOLVERHAMPTON.—Mains extensions are to be carried out at an estimated cost of £400.

Miscellaneous

ARGENTINE.—The *Diario Oficial* of April 14th contains particulars of a Bill laid before Parliament on April 12th relative to a contract with Mr. Edwin Steer for the construction and working of an electric railway, to be called the "Ferro-carril Expreso Elétrico Montevideo-Buenos Aires." The line will run from Montevideo *via* Libertad, Santa Ecilda, La Paz and Rosario to Colonia, whence there will be a steamship service to Buenos Aires. The concession includes powers for the carrying out of irrigation and water works, and also for hydro-electric works. The concession is for a term of ninety years.

AUSTRALIA.—The Australian Minister for external affairs is, says a Reuter telegram from Melbourne, inviting tenders for the erection of medium power wireless telegraph stations at Port Moresby, on the South Coast of New Guinea and Cape York, the most northerly point of Australia, preliminary to the carrying out of a larger scheme for linking up the Pacific Islands with Australia.

Tenders are invited, by the Deputy Postmaster-General, Adelaide, for the supply of cordless switchboards. Copies of specifications, &c., which have to be in by July 6th, from the High Commissioner, 72 Victoria Street, London. A copy may be seen at 73 Basinghall Street, London.

BELFAST.—Mr. Andrew Nance, the tramway manager, has prepared a report in which he recommends a number of tramway extensions, the estimated cost of which amounts to nearly £300,000. As we have already announced, the Electrical Engineer has been asked to prepare estimates of the cost of the additional generating plant which will be required.

LIVERPOOL OVERHEAD RAILWAY.—Tenders are invited by June 7th, for stores, including electrical fittings, &c. Particulars from 31 James Street, Liverpool.

SWANSEA.—Tenders are to be invited for the annual supply of motors and starters.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

W.—Building, Royal Academy of Music, W. (£30,000). Wallis & Sons, builders, Maidstone.

S.E.—Public meeting hall, Newington Butts. Architect, H. A. Gissing, 1 Finsbury Circus, E.C.

N.E.—Church hall for the Parish of St. Mary (£4,000). The Vicar.

PROVINCES.

BARNSLEY.—School, Grove Street. W. P. Donald, sec., Barnsley Education Committee, Town Hall, Barnsley.

BIRMINGHAM.—Theatre, High Street. Builders, Dallow & Son, Blackheath.

Theatre, Lozells. Builders, Hamson & Smith, Dolman Street, Birmingham.

CANTERBURY.—Extensions, school of art (£2,500). C. Mount, builder, Canterbury.

DARTFORD.—School, Maypole Estate (300 places). Sec., Education Committee, Kent C.C.

DUNDEE.—Extension, lunatic asylum (£3,500). Architect, T. M. Cappon, 32 Bank Street, Dundee.

EDMONTON.—The Guardians require an installation of three-phase motors and accessories, including connection and cable connection, at the Workhouse, Bridport Road, Upper Edmonton. Particulars from Messrs. May & Hawes, Caxton House, Westminster, and tenders by June 2nd.

WEST HAM.—Tenders are to be invited for the electric wiring at the boys' department of the West Silvertown School.

GLASGOW.—Warehouse for John Watson & Son, Black Street (£3,000). C. A. Patterson, Walton Street, Lenzie.

Factory, New City Road, for Steven & Sons (£5,000). A. R. Crawford, architect, 107 West Nile Street, Glasgow.

Store buildings for Johnstons, Ltd. (£4,000). Architects, John Burnet & Sons, 239 St. Vincent Street, Glasgow.

JARROW.—School (£14,930). T. Lumsden, builder, Durham.

LUTON.—School, Beech Hill (£4,488). J. Saunders & Son, builders, Luton.

MERTHYR TYDVIL.—Masonic temple (£2,800). Architect, C. M. Davies, 112 High Street, Merthyr. Builder, J. Jenkins, Merthyr.

NORTH STAFFORDSHIRE.—Alterations to infirmary (£30,000), for the Governors of the North Staffordshire Infirmary.

TENDERS RECEIVED AND ACCEPTED

CHICHESTER.—The tender of the local electric light company has been accepted by the Council for the lighting of the new elementary schools. The voting of the Electricity Committee was equal, and a decision was left to the Council.

The following tenders have been accepted during the past month by the Government Departments named:—Admiralty, Contract, and Purchase Department:—Lampholders, Edison & Swan, &c., Co., Ltd., Evered & Co., Ltd., the General Electric Co., Ltd., W. McGeoch & Co., Ltd. War Office:—Electric cranes, Craven Bros., Ltd.; electric motors, &c., Lancashire Dynamo & Motor Co., Ltd.; installation of electric light, Royal Army Medical College, Millbank-Foote & Milne, Ltd. India Office, Store Department:—Cables and electric light stores, Siemens Bros. & Co. General Post Office:—Electric light fittings, General Electric Co., Ltd.; telephones, Peel-Conner Telephone Works, Ltd.; house telephones, Gent & Co., Ltd.

APPOINTMENTS AND PERSONAL NOTES

Councillor Dudley Stuart has been appointed Chairman of the Electric Lighting Committee of the Wimbledon Corporation in place of Alderman A. Holland, J.P., who has resigned. Mr. Stuart is on the engineering staff of the National Telephone Co., and is a Member of the Institution of Electrical Engineers.

The Finance Committee of Hampstead Borough Council have concurred in a recommendation of the Electricity Committee that the salaries of the following officers be increased:—Mr. George H. Cottam, chief electrical engineer, from £775 to £825 per annum; Mr. Egerton Sayer, chief assistant, from £365 to £390 per annum; and Mr. John Leadbeater, chief indoor assistant, from £325 to £360 per annum.

We regret to record the death of Mr. George Bremer, which took place quite suddenly on May 17th, from heart disease. Mr. Bremer has been in the service of Mr. G. Braulik for over 20 years as country representative.

In consequence of the resignation of Sir George Gibb, managing director of the Metropolitan District Railway Co., the following appointments have been made:—Mr. A. H. Stanley has been elected a director and appointed managing director; Mr. J. Carter, the secretary, has been appointed assistant to the managing director, and Mr. W. E. Mandelick, secretary of the Underground Electric Railways Co. of London, and of the various tube railway companies, has, in addition, been appointed secretary of the District Railway Co.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 to £59 10s. per ton. (Last week, £58 15s. to £59 5s.)

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—A meeting of the Electric Tramways Construction and Maintenance Co., Ltd., will be held at 79, 80 and 81 Queen Street, Cheapside, London, on June 29th, at eleven a.m., to hear the liquidator's account of the winding up.

The last day for receiving proofs of claims in the bankruptcy of R. E. Joy, electrical engineer, 143 Cheltenham Road, Bristol, is June 3rd. The trustee is Mr. F. L. Clark, 26 Baldwin Street, Bristol.

An application for the discharge of Arnold Roberts, electrical engineer, 21 North Parade, Bradford, will be held on June 21st, at ten a.m., at the County Court House, Manor Row, Bradford.

A meeting of the Birmingham Guild of Handicraft will be held at 33 Waterloo Street, Birmingham, on June 21st, at three p.m., to receive the liquidator's account of the winding up.

The Polkey Automobile Electric Lighting Syndicate, Ltd., is to be wound up voluntarily. Mr. A. R. Lancaster, Queen's College, Birmingham, is liquidator.

The Automobile Electric Lighting Syndicate Ltd., is to be wound up voluntarily. Mr. A. R. Lancaster, Queen's College, Birmingham, is liquidator.

J. F. Davie, Electrician, late of 10 Great Castle Street, London (present residence unknown), has been adjudicated bankrupt.

Creditors of the Southport & Lytham Tramroad Co. are requested to send particulars of their claims to Mr. J. T. Wood, 5 Cook Street, Liverpool, before June 30th.

A meeting of creditors of the Lepel Wireless Syndicate, Ltd., will be held on May 28th at the Cecil Chambers, (West) Strand, London, at 11 a.m.

Digitized by Google

COMPANIES' MEETINGS AND REPORTS

CALCUTTA ELECTRIC SUPPLY CORPORATION.—At the annual meeting last week, the need for erecting new plant was emphasised. The mill-owners in North Calcutta have been threatening to combine and erect an electricity works, and consequently Messrs. Kennedy & Jenkin were called in to advise. Mr. B. M. Jenkin recommends the erection of a new power station. The Corporation have decided to light six miles of streets by electricity as an experiment.

The profit for 1909 amounted to £70,326. After meeting the preference dividend, the directors recommend placing £17,000 to depreciation, and a dividend of 8 per cent. for the year on the ordinary shares.

ANGLO-ARGENTINE TRAMWAYS CO.—The report for 1909 shows a net profit of £140,973, and a dividend of 6 per cent. per annum is recommended on the ordinary shares, carrying forward £10,348. In view of the concession which the company have secured from the Buenos Ayres municipality for the construction of shallow subways for tramways, the directors propose to issue an additional £6,000,000 5 per cent. debenture stock, £500,000 second preference shares, and £1,500,000 ordinary shares. It is also proposed to increase the dividend on the first and second preference shares from 5 to 5½ per cent. Careful estimates by the manager show that the profits from the subway tramways will be considerably in excess of the amount needed for the interest and sinking fund on the cost of construction.

TYPEWRITING TELEGRAPH CORPORATION.—In their report for 1909, the directors say they cannot hold out any hope of improvement in business, and recommend a voluntary liquidation.

POTTERIES ELECTRIC TRACTION CO.—The profit for 1909, after deducting debenture interest, is £27,291, compared with £21,781 for 1908. The directors recommend the full five per cent. preference dividend, the transfer of £2,000 to reserve, and £7,090 to renewals, and the payment of 2 per cent. on the ordinary shares, carrying forward £1,050. During the year £8.996 has been expended on permanent-way renewal, and additional expenditure will have to be incurred during the present year. The resumption of dividends on the ordinary shares indicates a satisfactory improvement in the position of the company.

LEAMINGTON & WARWICK ELECTRICAL CO.—A dividend of 2 per cent. is recommended on the ordinary shares for 1909, placing £800 to depreciation and reserve, £350 to redemption of debentures, and carrying £119 forward.

CITY OF BIRMINGHAM TRAMWAYS CO.—Mr. E. Garcke presided at the annual meeting on Thursday, and pointed to the fact that, notwithstanding that the lines were being gradually taken over by the local authorities, and that the company was exposed to increasing competition from municipal tramways, the net profits for 1909 showed an improvement over those for the previous year. The position of the company was quite satisfactory, for they had in liquid assets, apart from the remaining tramways and properties, more than the whole of their debenture share capital and the liabilities to creditors. The meeting passed a resolution paying back out of accumulated profits £4 per share to the 6,047 full-paid ordinary shareholders by way of reduction of capital. This step has been taken in order to put all the ordinary shareholders upon the same basis.

SOUTH STAFFORDSHIRE TRAMWAYS (LESSEE) CO.—The accounts for 1909 show that, after providing for debenture and loan interest, there is a loss of £1,493.

CALLENDER'S CABLE & CONSTRUCTION CO.—Mr. Henry Drake, presiding at the annual meeting on Thursday, said that at no time for many years past had the conditions under which the company's operations were carried out been more difficult than in 1909. The quantity of work available was even less than usual, and the struggle for orders was consequently severe. This was especially the case in the home trade, where no new contracts of any magnitude were carried out, and where even the orders for extensions to existing mains were less in number and smaller in value than customary. Whilst this was doubtless due in part to the extended use of metal filament lamps, it was greatly intensified by the universal depression which prevailed, and by the uncertainty in the financial outlook throughout the country generally. It was, therefore, with considerable satisfaction that the directors noticed the improvement in trade which had taken place since the beginning of this year, with the consequent increase in orders which had been placed with the company. In order to increase the company's scope, the Board are extending outside the cable business, and among a number of side lines have taken up a battery which, the chairman said, is largely used for motor-cars.

WAIHI GOLD MINING CO.—At the annual meeting on Thursday, it was stated that the company has obtained a concession for using the Hora Hora Rapids for the purpose of generating electricity.

GRAVESEND & NORTHFLEET ELECTRIC TRAMWAYS CO.—At the annual meeting last week, Mr. W. G. Bond, the chairman, stated that the company had settled its differences with the Gravesend Corporation in regard to the reading of the meters at the power house which register the tramway current. It will be remembered that the company took action in the High Courts to enforce the Corporation to replace the meters by some other type, but Mr. Justice Hamilton decided against the company by reason of a clause in their agreement with the Corporation that all matters of difference should go to arbitration.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED. — Oesterreiche Siemens-Schuckertwerke-Ges., 6 per cent. for 1909. Felten & Guilleaume-Lahmeyerwerke, 6 per cent. for 1909, against 8 per cent. for 1908. Oldham, Ashton & Hyde Tramways Co., 6 per cent. for 1909. Sao Paulo Tramway, Light & Power Co., 10 per cent. for 1909.

Leamington & Warwick Electric Co., 2 per cent. on the ordinary shares for 1909.

MORTGAGES AND CHARGES.—Particulars of the following have been filed:—Ferabin Lamp and Electrical Accessories. £2,500 Debentures, created May 4th, 1910. Property charged—Certain patents relating to galvanised dry cells and any other patents which the company may become entitled to relating thereto under an agreement dated January 28th, 1910. No trustees.—Berry Construction Company. £2,000 Debentures, created April 11th, 1910. Property charged—The company's undertaking and property, present and future, including uncalled capital. No trustees.

ATLANTA HYDRO ELECTRIC POWER CO.—Subscriptions are invited for an issue of $3,000,000 first mortgage 6 per cent. sinking fund gold bonds, and $1,500,000 ordinary stock. The company is erecting a 25,000 h.p. electric power transmission plant, and has a fifty years' concession from the Atlanta City Council for the supply of electricity for all purposes.

NEW COMPANIES

BRITISH ALUMINIUM CO., 109 Queen Victoria Street, London. Capital, £1,000,000 in £1 shares (300,000 preferred). To acquire the Loch Leven Water & Electric Power Co., Ltd., and to adopt an agreement with the British Aluminium Co., Ltd. (in liquidation).

ELECTRICAL ADVERTISING CO.—Registered by C. F. Kennedy & Co., 13 and 14 Abchurch Lane, London, E.C. Capital, £1,500. To carry on the business of engineers, machinists, electricians, advertisers, advertising agents and specialists, advertising machine makers and dealers, &c.

A. WARD.—85 Shaftesbury Avenue, London, W. Capital, £3,000. Electrical and general engineers.

NU-ADS.—Registered by Jordan & Sons, Chancery Lane, London. Capital £2,000. To take over certain patent rights from F. J. Blacksley, C. C. Chapman, A. C. Harris, and F. A. Blacksley, in connection with electric advertising signs.

A. DEAN & CO.—London House, London Road, Norbury, Surrey. Capital, £1,000. Electrical engineers, dealers in electrical fittings, cables, wires and sundries, contractors for electric installations, &c.

FELGATE INSTALLATION CO., Broadway Buildings, Reading. Capital, £1,000 in 100 deferred shares of 1s. each and 995 ordinary shares of £1 each. Electricians, dealers in electricity, motive power and light, &c.

LOVIS PATENT PROPELLER SYNDICATE. Registered by H. E. Warner & Co., 10 Finsbury Circus, London. Capital, £1,400. Marine, electrical and mechanical engineers, &c.

FOSTER & PULLEN, Bradford. Capital, £5,000. Electricians, lighting specialists, &c.

SUMMARY

OUR Monthly Supplement on Electrical Engineering in Mines is included in this issue. It opens with an article by a colliery electrician on signals and telephones in mines. Reports are given of meetings at some of the branches of the Institution of Mining Electrical Engineers, including an abstract of a Paper on "Colliery Cables," by Mr. W. J. Richards, discussed at Cardiff. Other Papers read before societies include an account of the electrical equipment of Murton Colliery, and an interesting description of a large exhaust steam turbine plant at a German colliery. Notes are also given on the causes of some recent colliery accidents.

AT the annual meeting of the Institution of Electrical Engineers last Thursday, a resolution containing a message of condolence with the Royal Family was passed, the annual report was adopted, and the following gentlemen were elected to fill vacancies on the Council (a ballot having been necessitated by the proposal of one additional name to those put forward by the Council)—Messrs. McMahon, Pearce, Dickinson, Morcom, and Faraday Proctor. At a special meeting on the same evening some additional expenditure on the new building was authorised. (Page 353.)

SOME notes are given on the electrical equipment of the latest class of French submarines. (Page 354.)

ALUMINIUM has been used successfully in place of copper for commutators. The lower conductivity is of little importance, as brush area and cooling surface are the determining factors as to size. Experiments appear to show that the oxide surface film offers no objections. (Page 354.)

SOME experiments on the use of the Brown telephone relay in a receiving wireless telegraph circuit are described in a short article by Mr. C. C. F. Monckton. (Page 355.)

WE give a brief analysis of the accounts of the North Metropolitan Electric Power Supply Co., which shows average works costs of 0·513d. per unit sold, a figure which is brought up to 0·649d. by the inclusion of management expenses, &c., but not including capital charges. (Page 355.)

SOME experiments made by Mr. E. B. Wedmore, of the B.T.-H. Co., to demonstrate the working of a new system of automatic protective switchgear for colliery and other distribution networks, are described. Cables in branch circuits were mechanically damaged so as to produce short-circuits. The apparatus cut out the faulty circuits only, the main supply remaining unaffected. (Page 356.)

SUBSTANTIAL reductions are announced in the prices of tantalum lamps. (Page 356.)

WE publish a letter calling attention to the fact that a man purporting to represent an exhibition in Brussels, but having no connection with the International Exhibition, is calling upon manufacturers in this country. (Page 356.)

MR. GERRARD'S Paper on electric braking has been further discussed by the Glasgow Local Section of the

Digitized by Google

Institution of Electrical Engineers, when the design of the brake magnets was considered in relation to the production of surging. (Page 357.)

A PAPER read by Mr. W. Jamieson before the Glasgow Local Section of the Institution of Electrical Engineers, described a curious effect in the production of electrification of celluloid sheets. (Page 357.)

A COMPANY is to be formed for supplying electricity in Rosario.—There was a net profit of £6,251 upon the Brighton Electricity Undertaking for the past year.—At Dundee, the net profit was £1,260.—The Sunderland Electricity accounts show a loss of £112, and the Tramways accounts a profit of £3,588.—The Board of Trade have refused to renew the licence for the Dolter surface-contact system at Torquay.—Hackney Council have agreed to contribute £15,000 towards the cost of widening Ball's Pond Road.—Bradford Tramway accounts show a record profit of £30,000. (Page 358.)

LARGE extensions of generating plant are contemplated at Belfast and St. Pancras. A water cooling tower is required at Wallasey; motors and motor starters at Swansea; surface condensing plant at Ealing; conduit at Ilford; and tramway stores at South Shields. Loans are required at Wimbledon (£800) and Watford (£7,000). (Page 359.)

MESSRS. Mirrlees, Bickerton & Day show a profit of £5,577 for 1909. Brush Electrical Engineering Co. made a loss of £21,230 last year. Satisfactory results were shown by the first year's working of the Fife Tramway Light & Power Co. A dividend of 4 per cent. is announced by Messrs. Siemens Bros. & Co. (Page 361.)

IN a Paper read recently before the Association of Teachers in Technical Institutions, Dr. R. Pohl (Chief Engineer, Phœnix Dynamo Manufacturing Co.), advocated the reorganisation of technical education on a national basis, and emphasised the importance of a due admixture of theory and practice, and the need for better correlations of the work of technical universities. (Page 363.)

AMONG the Specifications published by the Patent Office on Thursday last was one by A. W. Somers and R. J. Crowley for an accumulator in which the positive plates only are recharged. New charged positive plates are substituted for the old ones when the latter are discharged.—A method of increasing the self-induction of submarine telephone or telegraph cables by covering a solid conductor with a braiding of interlaced copper and iron wires is covered by R. K. Gray.—An electrolyte for batteries for obviating crystallisation and creeping is described by G. Schauli.—The patent by C. A. Parsons and others for a low-pressure system of electrical marine propulsion is opposed.—As a result of opposition Messrs. Dick, Kerr & Co. have surrendered a patent for magnetic track brakes. (Page 364.)

Wireless Telegraphy.—As will be seen from our advertisement columns, Marconi's Wireless Telegraph Co., Ltd., are taking action against the British Radio-Telegraph & Telephone Co., Ltd., for infringement of their Letters Patent Nos. 7777 of 1900, 10245 of 1902, and 4593 of 1907, and against the United Wireless Telegraph Company of New York for infringement of their Letters Patent Nos. 12326 of 1898 and 7777 of 1900.

At a meeting at Newcastle on Friday, under the auspices of the Newcastle and Gateshead Chamber of Commerce, the question of the construction of a wireless station on the north-east coast was discussed. Lieut. Loring, Inspector of Wireless Telegraphy, G.P.O., London, who was present, said he thought there was a demand for such a station, which could be brought into line with the government organisation. If some arrangement could be made between the shipowners whereby the Post Office would be guaranteed against loss, the Postmaster-General would take the matter up. The representatives of the North of England Steamship Owners' Association, the Tyne Shipbuilding Association, and the Tyne Repairers' Association, who were present, resolved to report to their associations and to hold a further meeting, when a report would be drawn up and forwarded to the Postmaster-General.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JUNE 2ND.

Institution of Mining Engineers.

10 a.m. In Geological Society's Rooms, Burlington House, Piccadilly, London. "A Storage Battery Extension to a Three-phase Colliery Power Plant," by W. Maurice.

Rontgen Society.

8.15 p.m. At 20 Hanover Square, London. (1) "Practical Observations on Everyday X-Ray and Electrical Work," by Dr. Howard Pirie; (2) "Recent Improvements in Radiographic Technique," by Dr. R. Knox. A new form of apparatus for producing rhythmical variations in the strength of electrical currents will be shown by Dr. Hampson.

FRIDAY, JUNE 3RD.

Institution of Mining Electrical Engineers.

10.30 a.m. Lancashire Branch. Visit to the Harlton Colliery, Bolton.

SATURDAY, JUNE 4TH.

Institution of Mining Electrical Engineers.

11 a.m. Lancashire Branch. Visits to Manchester Corporation Electricity Works and Municipal School of Technology.

Royal Institution.

3 p.m. Tyndall Lecture I. "Electric Heating and Pyrometry," by Prof. J. A. Fleming, F.R.S.

Institution of Mining Electrical Engineers.

4.30 p.m. Warwickshire and South Staffordshire Branch. At Imperial Hotel, Birmingham. (1) "Earthing of Coal-cutting Machines," by J. R. English; (2) "Resistance of the Human Body to Electrical Currents," by W. Foster.

MONDAY, JUNE 6TH.

National Electrical Manufacturers' Association.

8 p.m. At Caxton Hall, Westminster. Continued discussion on "The Effects of Free Trade or Protection upon the Electrical Industry."

THURSDAY, JUNE 9TH.

Tramways and Light Railways Association.

10.30 a.m. Annual Congress in Dublin. (1) "The Dublin United Tramways," by R. S. Tresilian; (2) "Brake Shoe Standardisation," by J. A. Panton; (3) "Tramway Economics," by J. R. Salter; (4) "Railless Traction," by H. England; (5) "Should the 1870 Act be Revised," by F. Coutts.

FRIDAY, JUNE 10TH.

Tramways and Light Railways Association.

Annual Congress. Visits to works, &c.

SATURDAY, JUNE 11TH.

Royal Institution.

3 p.m. Tyndall Lecture II.: "Electric Heating and Pyrometry," by Prof. J. A. Fleming, F.R.S.

Telegraph Traffic.—The land-line routes *via* Fao and Hanekine were interrupted between Alep and Bagdad and between Mossoul and Bagdad on the 24th ult.—Two days later the cable between Lattagin and Palura failed.—On the 28th ult. telegraphic communication beyond Catumbella in Angola was restored to working order.—On the 30th ult. the cable between Bonny and Duala was once more on the active list, as well as the routes *via* Fao and Hanekine.—Telegraphic communication with Reunion is still interrupted.—The Western Union Telegraph Co. is, it is said, about to lay another Atlantic cable, which will probably be landed in Newfoundland. The *Faraday*, owned by Messrs. Siemens, was recently chartered by the company, but this may be in connection with repairs of the existing cables.—The South American Cable Co. has reduced rates to the South American Republics.

Damages for Electric Shock.—In the King's Bench Division last week, before Mr. Justice Grantham and a special jury, Mr. J. J. Wheeler, a builder and contractor, of Woodford, was awarded £581 damages against the Marylebone Borough Council for injuries caused by an electric shock. Early last year some premises in Devonshire Place, W., were being rebuilt by plaintiff. When the old premises were demolished, only the cellar was left, and the Borough Council, as the electric supply authority, had been given notice to discontinue supply and withdraw the service. The employee of the Council to whom this instruction was handed, finding that the cellar was not to be rebuilt, did not actually withdraw the service, but disconnected at the main fuses, leaving a wire in a lead pipe remaining in the cellar. During the progress of rebuilding, the plaintiff, seeing what appeared to be a lead pipe in the cellar, commenced to cut it away with a chisel, with the result that he received a severe shock, which burned his arms and brought about a temporary withering of the muscles. He was in bed for four months, and was ordered away for another two months. Mr. Justice Grantham, in addressing the jury, said the Borough Council could not justify their action in not withdrawing the service after having been specially instructed to do so, and the jury found as stated above, the damages for loss of business being assessed at £450, for pain and suffering £75, and for special damages £56.

THE INSTITUTION OF ELECTRICAL ENGINEERS

Annual Meeting and Report

AT the annual general meeting of the Institution of Electrical Engineers last Thursday the following resolution, passed by the Council, was confirmed, before proceeding to the other business of the meeting.

"That the Council of the Institution of Electrical Engineers, in Special Meeting assembled, hereby record their sense of the deep loss which the British Empire has sustained through the lamented death of his Majesty King Edward VII., and their sorrow that one who spent his life for the good of his people, and to whom his subjects were affectionately devoted, has been removed from the scene of his unremitting labours, and that a reign marked by unparalleled social, scientific, and industrial progress is thus brought to a close. The Council humbly beg permission to express to his Majesty King George V., and the Queen-Mother and the members of the Royal Family, their sincere condolence and sympathy, and further to lay before his Majesty an assurance of their unswerving loyalty and devotion, and their earnest wishes that he may, with her Majesty Queen Mary, long be spared to reign in happiness and peace over a loving and united people."

ELECTION OF COUNCIL.

A ballot was held for the election of five members of Council. It will be remembered that, in addition to the five candidates nominated by the Council, Mr. H. Faraday Proctor (City Electrical Engineer, Bristol) was nominated by Messrs. W. A. Chamen and W. W. Lackie. The names of the remaining officers and members of Council were given in ELECTRICAL ENGINEERING, April 28th, page 277. The result of the ballot is given below:—

Mr. P. V. McMahon, 859 votes (elected); Mr. S. L. Pearce, 852 votes (elected); Mr. H. Dickinson, 846 votes (elected); Mr. R. K. Morcom, 842 votes (elected); Mr. H. Faraday Proctor, 696 votes (elected); and Mr. J. E. Kingsbury, 488 votes (not elected).

PREMIUMS.

The following awards were announced:—

Mr. MILES WALKER, the *Institution Premium*, value £25, for his two Papers, "Short Circuiting of Large Electrical Generators and the resulting Forces on Armature Windings," and "The Design of Turbo Field Magnets for Alternate-current Generators, with Special Reference to Large Units at High Speeds."

Professor A. SCHWARTZ, the *Paris Electrical Exhibition Premium*, value £10, for his Paper, "The Testing of Rubber for Electrical Work."

Mr. S. G. BROWN, the *Fahie Premium*, value £10, for his Paper, "A Telephone Relay."

Messrs. W. P. DIGBY and D. B. MELLIS, a *Premium*, value £10, for their Paper, "Some Properties of Switch and Transformer Oils."

Mr. G. W. WORRALL, a *Premium*, value £10, for his Paper, "Commutation Phenomena and Magnetic Oscillations occurring in Direct-Current Machines."

Mr. F. HOPE-JONES, a *Premium*, value £5, for his Paper, "Modern Electric Time Service."

Mr. F. H. R. LAVENDER, a *Premium*, value £5, for his Paper, "Research on Metallic Filament Lamps."

Mr. ALBERT CAMPBELL, a *Premium*, value £5, for his original communication, "On Magnetic Testing of Iron with Alternating Current."

Mr. C. F. SMITH, a *Premium*, value £5, for his original communication, "The Relation between the Stator and Rotor Circuits of the Single-phase Induction Motor."

Mr. L. W. WILD, a *Premium*, value £5, for his original communication, "The Production, Measurement, and Effect of Variable Wave-Form."

In addition to the above, a Willans Premium has been awarded to Mr. J. H. Rider, for his Paper on "The Electrical System of the L.C.C. Tramways."

[This premium, which can be awarded triennially by the Institutions of Electrical and Mechanical Engineers alternately, is of the value of £25.]

STUDENTS' PREMIUMS AND SCHOLARSHIPS.

Scholarships.—Mr. B. C. Clayton, Salomons Scholarship (£50); Mr. G. W. P. Page and Mr. A. D. Peacock, David Hughes Scholarships (£50 each).

Premiums.—Mr. R. C. Plowman (£10), Mr. A. P. Young (£5), Messrs. P. J. Cottle and J. A. Rutherford (£5), Messrs. P. Kemp and W. A. Stevens (£5), Mr. W. H. Young (£5).

MEMBERSHIP.

The report records an increase in the total membership, including students, from 6,097 to 6,222 during the year.

RULES FOR PROFESSIONAL CONDUCT.

The Council have decided to adopt the regulations relating to professional conduct recently incorporated in the bye-laws of the Institution of Civil Engineers. These rules read as follows:—

1. He shall act in all professional matters strictly in a fiduciary manner with regard to any clients whom he may advise, and his charges to such clients shall constitute his only remuneration in connection with such work, except as provided by Clause 4.

2. He shall not accept any trade commissions, discounts, allowances, or any indirect profit in connection with any work which he is engaged to design or to superintend, or with any professional business which may be entrusted to him.

3. He shall not, while acting in a professional capacity, be at the same time, without disclosing the fact in writing to his clients, a director or member of, or a shareholder in, or act as agent for, any contracting or manufacturing company or firm or business with which he may have occasion to deal on behalf of his clients, or have any financial interest in such a business.

4. He shall not receive, directly or indirectly, any royalty, gratuity, or commission on any patented or protected article or process used on work which he is carrying out for his clients, unless and until the receipt of such royalty, gratuity, or commission, has been authorised in writing by those clients.

5. He shall not improperly solicit professional work, either directly or by an agent, nor shall he pay, by commission or otherwise, any person who may introduce clients to him.

6. He shall not be the medium of payments made on his clients' behalf to any contractor or business firm (unless specially so requested by his clients), but shall only issue certificates or recommendations for payment by his clients.

The British Electrotechnical Committee.—The work of this committee has now been transferred to the Institution. An informal meeting of the committee of the various countries is to be held in Brussels this summer.

Wiring Rules.—It is hoped that the further revised edition will be ready before the end of the year.

Electricity in Mines.—A letter embodying the Council's views, after the consideration of several suggestions, has been forwarded to the Home Office Committee, and Mr. W. H. Patchell has attended to give evidence before the committee.

Electric Lighting Act, 1909.—A deputation from the Council, urging certain modifications in this Bill, waited on the Board of Trade. The clause objected to did not receive the sanction of Parliament.

Special Committees.—Committees have been appointed to consider examinations for associate membership, alterations in the Articles of Association, and electrical driving in textile mills.

BENEVOLENT FUND.

The Committee of Management report that the Benevolent Fund of the Institution shows a satisfactory increase for the past year. On December 31st, 1909, the capital account of the fund stood at £3,500, as compared with £3,000 at the end of 1908. The donations to the fund in 1909 include one of £25 from the Committee of the Electrical Engineers' Ball. Grants in aid amounting to £77 were made during 1909.

The Wilde Benevolent Trust Fund stands at £1,744 16s. One grant in aid of £25 was made during 1909.

At a special general meeting on the same evening the following resolution was passed:—

"That, in addition to the sum of £20,000 authorised by special resolution of the 29th of July, 1909, to be expended, a further expenditure of a sum not exceeding £10,000 in connection with the Institution building on (*a*) structural alterations, furniture and fittings, and (*b*) outlays during present or future structural alterations, including ground rent, rates and taxes, less rents received or to be received from tenants in the building, be sanctioned and approved, and that the Council be authorised to make such financial arrangements (including the borrowing of money on the security of the Institution building and on the Institution property in Tothill Street) as the Council may consider necessary for the above purpose."

It was explained by Mr. R. Hammond (Hon. Treasurer), partly in reply to some questions by Mr. W. B. Esson, that there was no intention of raising and spending all this money at once. The estimates for the building alterations had not been really exceeded, but there were certain losses on realisation of securities, &c., which it was considered would be better met out of the building fund than out of the general fund. The Council also wish to have the means of meeting certain eventualities which might occur in event of a change of tenants.

ELECTRICAL EQUIPMENT OF THE LATEST FRENCH SUBMARINES

IN connection with the regrettable loss of the ill-fated *Pluviôse* outside Calais Harbour last week, some details recently published in the French technical Press of the electrical equipment of the latest type of submersibles will be found of interest. The latest three boats, the *Mariotte*, the *Archimède*, and the *Amiral Bourgeois*, are much larger than the 12 boats of the *Pluviôse* class, and displace about 800 tons, as compared with the 398 tons of the latter class. The equipment is also more powerful. The engines are of about 2,000 h.p., against 700 h.p., and they are capable of travelling 10 knots, using the electric motors only, either on the surface or submerged, while the *Pluviôse* and its sister boats were designed for a submerged speed of 7¾ knots.

Although these boats are often spoken of as submarines, as in radius of action, &c., they correspond to the larger submarines of the British Navy, it is important to remember that the French under-water craft is divided into two classes, "submarines" proper, for home defence, propelled only electrically by accumulators, and "submersibles," equipped with petrol or other engines for use on the surface for long voyages, as well as the electrical equipment for under-water propulsion. The boats we are speaking of should thus strictly be spoken of as submersibles.

Each of the new boats which are now undergoing their trials is provided with two propellers, each driven by a separate shaft upon which is mounted an engine and an electric motor, which during surface cruising acts as a generator to charge the batteries used for under-water propulsion. For manœuvring purposes these shafts are controllable separately. On account of their greater ease of control, the electric motors are often used even when on the surface for such manœuvres as entering harbours, for going astern, &c., and it will be readily understood that a considerable range of speeds must be provided for in the controlling system. The arrangement adopted is somewhat different in the three boats. In the *Mariotte*, which was electrically equipped by the Breguet firm, the battery is divided into sections, placed sometimes in series and sometimes in parallel, and motor field rheostats and series resistances are also used for further speed adjustments. On the *Archimède*, on the other hand, which was equipped by the same firm on a different system, the battery is permanently connected up, and motors with two armature windings but one field system are employed. These windings have separate commutators, which can be coupled in series or in parallel. The arrangement has considerable advantages over the use of two separate motors placed in series or parallel, as it precludes unequal sharing of the load due to inequalities of flux. It has also advantages over the arrangement used on the *Mariotte* in that better conditions of commutation are secured, small and stronger commutators are possible, and less wiring is required for the connections. The arrangement is also preferable as it enables the battery to be charged always with its cells in series, avoiding inequalities of charge liable to be produced with the two halves in parallel. For this purpose both armature windings are put in series, when a sufficient voltage to charge the whole battery can be obtained, even when the boat, and therefore the engines, are running at a comparatively low speed. An article on the subject by M. J. Breguet, in *La Lumière Electrique*, points out some of the special difficulties of this class of work, due to the extreme dampness which affects the insulation, the difficulties of ventilation of the motors, and the confined space. Details of the motors and controlling system are not given, but in some general remarks as to future designs, such as those of the 1,000-ton submersibles now projected, the author states that the directions to which these are tending include the use of voltage up to 480 volts for the main circuits, to reduce the size of conductors and connections, the employment of contactors, breaking under oil and operated by 120-volt control circuits, and the use of enclosed water-cooled motors.

ALUMINIUM FOR COMMUTATORS

IN connection with the increasing use of aluminium for electrical purposes, which has now extended from overhead lines to station 'bus-bars, insulated cables, and even switchgear, it is interesting to note that experiments have already been made with an aluminium commutator, and we are indebted to Mr. Aubrey V. Clayton (the author of the paper read before the Institution of Electrical Engineers on April 21st) for the following particulars of these tests, which were made in 1900. Mr. Clayton, who, after a ten years' residence in Scandinavia, has returned to London to carry on a consulting business, was at that time designer and chief of the continuous-current department of the Magnet Co.'s works, Ludvika, Sweden, and the machine on which the aluminium commutator was used was designed by him. The machine was a 7½ h.p. 220-volt. D.-C. motor running at 1,450 r.p.m., and was placed in service in the works and run continuously day and night for several months, afterwards being used daily in the shops for over a year in order to test whether aluminium commutators could be relied upon under ordinary industrial conditions.

During this time the machine proved quite satisfactory, and the results obtained from the commutator were excellent in every respect. The bars were made from drawn aluminium, and although the metal was very soft, there was practically no wear observable on it, as particles of the carbon brushes seemed to become imbedded in the soft aluminium and prevented its rapid wearing away. It ran quite sparklessly, and without any cleaning of the commutator or attention during the whole of the period under observation.

Mr. Clayton adds that, on account of his severing his connection with the Magnet Company in 1903, he lost sight of the machine, but that in 1907, when the Magnet Company was taken over by some other works to form the Amalgamated Electrical Companies, and he returned to Ludvika as manager, he tried to trace the machine and found that it had been sold as an ordinary commercial machine. No complaints were ever heard about it, so it may be taken for granted that it turned out quite satisfactory.

The chief trouble in using the aluminium bars was, he says, the difficulty in making connections between the copper conductors on the armature and the commutator bars. These were made by wedging the copper conductor into a slot milled in the segment and the fusion of aluminium at the joint by means of a blow-pipe. If the commercial manufacture on a large scale of such machines had been taken up, screwed, or other mechanical connections, would have been necessary. The use of aluminium for commutators and other purposes had, however, to be dropped because of the very large copper commercial interests which were at work against the employment of the new material, and hence this one trial machine having an aluminium commutator was the only one made.

We understand that the British Aluminium Co., Ltd., will supply aluminium commutator segments, drop-forged or drawn as required, from their Milton Works. If the difficulties of connection to the armature conductors can be satisfactorily overcome, it would seem that this should provide a useful field for aluminium. The lower conductivity is of little importance in this case. Brush area and cooling surface are the determining factors as to size, and it does not seem that the oxide surface film offers any objections.

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203–206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

SIGNALS AND TELEPHONES FOR MINES

By "Durham"

THE installation of a reliable system of signals and telephones is one of the most important factors in regard to the safe and efficient working of a colliery. Quite recently this was exemplified by a fatal accident which happened to a workman in one of our large coal-mines in Durham due to faulty signalling arrangements. At the inquest it was stated that the engineman received the wrong signal, and in consequence the deceased was crushed between two full tubs. It was afterwards found that the lad who at the time had charge of the bell cabin, instead of "rapping" the signal from the cabin to the engineman in the proper manner, did so by crossing the bell-wires on the engine plane, and as a result the engine-man's bell did not ring distinctly.

Any colliery electrician knows that signals are a continuous source of trouble, and the electrician who has charge of this particular department generally holds a most unenviable position. In many colleries this work is undertaken by a "bell-man," who in the majority of cases is nothing more than a jointer or fitter, and who knows but little of the working of bells or telephones. This is probably the principal cause of the trouble with signals, and it would be better to appoint a qualified electrician to look to the proper installation and maintenance of this department of the colliery plant. The following are practical points which are the result of the author's experience :—

All bell-wires on the engine planes should be fixed to porcelain insulators, fastened to the timbers (either props or baulks) by means of coach-screws. The insulators ought not to be more than 6 to 10 yards apart, or the wires will very likely on occasions be made to come in contact with each other. More care in fixing the insulators in this manner would be the means of keeping both the wires and batteries in a much better condition.

All batteries should be of the "Leclanché" type. A good method of getting satisfactory results from a set of batteries is to have them erected in a wooden box, the lid of which is fastened by means of screws, and as an extra precaution it is wise to secure the lid further by means of a small padlock, the key of which is kept by the electrician who has charge of the system. Another important thing is to connect a tumbler switch in circuit with positive of the battery and the battery wire. The electrician should examine every box at least once a week and make sure that there are no faulty zinc rods or broken porous pots. The idea of the tumbler switch mentioned above is to cut the current off the lines whenever the signals are not in use, and then in case the stonemen or shifters happen to cross the wires through fixing timber, &c., the batteries do not become discharged.

The bells themselves, in the writer's opinion, should be of the "single stroke" and not the trembler variety. The single-stroke bell gives a distinct ring, which is most important, whereas trembler bells are liable to give a ring which is not very clear. The bells will be found to work very satisfactorily if they are mounted on the battery box at the out-bye side and on an iron bracket (which has a wood base for the bell to rest on) which can be easily fastened to the props at the in-bye side.

Care should be taken with the insulated wires connecting the bells to the engine plane wires. In a good many cases faults are caused through wires getting broken. In a good many collieries these wires are G.P. insulated. This class of wire may be satisfactory under some conditions, but it sometimes becomes affected in a very dry pit, and the insulation peels off.

Whenever it is necessary to "rap" on the wires, a "push" should be put in circuit with them, and this would do away with such accidents as that mentioned above.

Perhaps the most important part of a signalling or telephone circuit is the "earth" connection, and one which is the cause of a good deal of trouble. It is often possible to make a very good "earth" connection by means of the rails, but sometimes it is not successful, especially in a dry mine. In a case

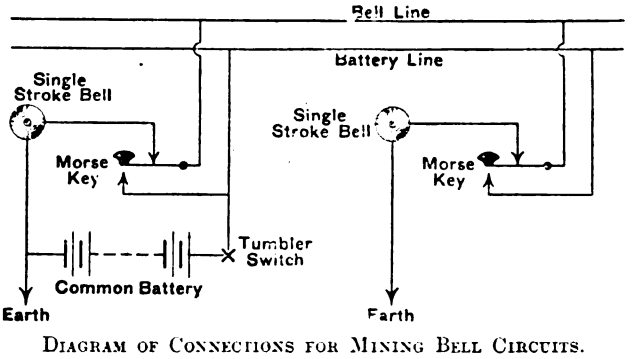

DIAGRAM OF CONNECTIONS FOR MINING BELL CIRCUITS.

of this sort a satisfactory "earth" can be made by filling a hole in the ground, about a yard deep and 2 ft. wide, with coke breeze and fixing an iron rod in the hole.

The writer does not think that there is much fear of any explosion being caused through bells not being "gas-proof," but at the same time it may be the wisest thing to have all signals gas-proof.

A system of wiring bell circuits which can be recommended is shown in the accompanying diagram.

In regard to shaft signalling, all the wires should be in the formed of a cored cable, and an advantage is to have the cable made up so that it contains at least three spare cores, which can be used in case any faults should occur on any of the other cores. Paper-insulated and lead-covered cable is quite satisfactory for signalling work, and may be secured to the brick wall of the shaft by means of wooden clamps about 1 in. to 2 in. off the wall and fastened by means of "rag bolts."

For communicating between different collieries under the same management and between different parts of the same mine the simplest and best method is that of the telephone exchange. I find that the most satisfactory way to arrange a system of this kind is to have built as near to the shaft bottom as possible a "telephone room" to act as an "exchange." Telephones should be installed in all the "haulage houses," pump rooms, &c., the wires from each of these places being brought to the telephone room at the shaft bottom, where they are connected to a central telephone switchboard. From this board connection is also made between the shaft bottom and the manager's office at bank, power-house, engineer's office, &c. It will be seen from this that communication can be made between any of the departments at bank and any of the different places in the mine, and also by means of "double plugs" in the telephone room at the shaft bottom. Any two places in the mine can be connected together.

When running the wires for the telephones it is always ad-

Digitized by Google

visable to fix the wires whenever possible in travelling ways, so that in case of accident on the engine planes, such as are so often caused by falls of stone, &c., the wires do not get broken. An important point is never to allow telephones to be connected to the bell wires.

Both the battery and magneto types of telephones will be found to work very well in mines, but in the author's opinion the magneto instruments are the most suitable. They have the advantage that it is only necessary to have at the most two cells for speaking purposes at each point. The apparatus should be of a make which will stand rough usage, and the loud-speaking pattern is preferable, although the ordinary office type of telephone has worked very well in mines. The majority of "inter-communication" systems are quite unsuitable for mining conditions.

INSTITUTION OF MINING ELECTRICAL ENGINEERS

NOTTINGHAMSHIRE AND DERBYSHIRE BRANCH

AT a meeting held at University College, Nottingham, on May 28th, the discussion on Mr. L. Routledge's Paper on "Earthing," referred to in ELECTRICAL ENGINEERING IN MINES, May 5th, was resumed. The chairman, Mr. J. C. Thomson (Mansfield), described a method of testing earth connections at the working pressure. The use of a small accumulator battery for this purpose was discussed. Mr. L. de Grave (Derby) and Mr. Lee (Mansfield) also described methods of earthing. Mr. F. Cusworth suggested that, for mechanical reasons, nothing less than 7/18 stranded cable should be used for earth connections. He also suggested that manufacturers should provide earthing screws on motor frames.

A short Paper on the subject of flame-proof apparatus was then read by Mr. L. W. de Grave, who described several forms of flame tight motors, including those with baffle plates so arranged that any hot gases produced by combustion within the motor case are cooled by passing between the plates before reaching the atmosphere. He considered it advisable to provide the covers of switchboxes with lips to prevent the entrance of dust. A wide lip also made them flame-proof if a gap of about 1/64 in. was employed. Some device should, he thought, be provided to indicate when gas had been ignited inside a switch-box or motor case. Referring to ignition of gas or coal-dust, he mentioned that the knives of a coal-cutter had been known to cause this, presumably by causing sparks by friction. In the discussion Mr. F. Cusworth expressed the opinion that of the various types of flame-proof motors, the plate protected type was the best.

The next meeting will be held on June 25th, when Mr. Williams-Ellis will read a Paper on the cascade motor as applied to mining work.

Colliery Plant destroyed by Fire.—On Saturday, May 21st, the generating plant of the Wernos and Rhos collieries at Wernos, Pantyffynon, Carmarthen, was destroyed by an outbreak of fire. Power is supplied from this station to drive the washing and crushing plant of the collieries. Arrangements have been made for a temporary supply.

The Institution of Mining Electrical Engineers.—A meeting of the Warwickshire and South Staffordshire Branch of this Institution was held on Saturday, April 30th, at Birmingham. The local president, Mr. A. Hall (Nuneaton), read a short Paper on mining switchgear, and Mr. J. R. English described some experiments he had made respecting the earthing of coal-cutting machines, which were most instructive. The discussion was adjourned.

South Wales Branch of the I.M.E.E.—The first annual dinner of this branch of the Institution of Mining Electrical Engineers was held on Saturday, April 30th, Mr. S. F. Walker occupying the chair. The toast of "The Industries of South Wales" was acknowledged by Mr. L. Watkins, manager of Bargoed Colliery. Mr. T. Schonthiel proposed the toast of the Institution, and Mr. G. Humphrey that of the Press, acknowledging the assistance and encouragement which had been given by the technical papers to the new Institution.

Mining Patent.—Among the specifications published by the Patent Office last month was one by J. Gillies and C. D. McPhee, of Ontario, describing an electrically ignited fuse for blasting purposes. The wires pass into a short tube through a plug of wax mixed with chlorate of potash, and terminate in a short length of fine wire enclosed in a button of highly inflammable composition. The fuse enters the tube from the opposite end, and can be readily inserted or removed. There is a space between the fuse end and the igniting button, and a slit is made in the wall of the tube for the escape of the gas during ignition of the fuse.

CABLES FOR COLLIERIES

AT a recent meeting of the South Wales branch of the Institution of Mining Electrical Engineers in Cardiff, Mr. W. J. Richards read a Paper on cables for colliery purposes. After referring to the fact that the majority of electrical accidents in mines are traceable to cables, the author states that overhead cables are most usual for surface work, although, perhaps, not always the most economical, and calls attention to the suitability of aluminium for this purpose. The constant alterations at the pit-head render buried cables unsuitable.

Shaft cables should be double-wire armoured and covered with a non-hygroscopic material. They should be placed in the down-cast shaft as the gases rising in up-cast shafts have an injurious effect on them. It is often advisable to divide the cables up into two or more sets in parallel as heavy cables are difficult to handle, especially in deep shafts, and the risk of complete cessation of supply is lessened. A preservative coating should be applied annually. Vulcanised bitumen cables are gaining in favour for shafts, but with these there is a risk of decentralisation with high temperatures, though they withstand the action of water well. In armouring cables, compounded jute should be applied between the layers of armouring, and a final covering of jute serving or Hessian tape over the whole. Jute packing round the cores increases the resilience, but is liable to absorb moisture and increase the risk of break-down. Lead-covered cables are not to be recommended for shafts, as the weight of the lead produces a creep. Junction-boxes often give trouble in shafts, and joints should therefore be avoided whenever possible.

For cables in-bye, continued the author, the ideal method is to use conduit, but the heavy capital cost and the occasional movements of the strata render this method only rarely practicable. The usual methods are suspension from the timbering or merely laying along the surface of the roadway. Cables should, as far as possible, be fixed in in-take air-ways so as to be in a pure atmosphere. If laid on the ground, they are liable to get covered up, and then damaged by picks when sought for. Other causes of damage are derailed trams, and sawing by haulage ropes. Suspended cables should be strung high up by leather or tarred rope slings, fixed by oak cleats impregnated with tar, or attached to heavy porcelain insulators. They should be loosely strung to avoid damage by falls of roof. Joint-boxes should be placed in man-holes and supported on pillars. In wall-arched in-take roadways, armouring is not necessary; but along ordinary roadways, where there are occasional falls of roof, armoured cables, well bonded and earthed, are best. Armouring adapts itself to automatic leakage protection, and in general unarmoured cables are more dangerous when damaged.

Trailing cables, continued Mr. Richards, are subjected to particularly severe conditions. They should be tested for insulation every day before use, and should be taken out of the pit and thoroughly examined every month. A standard covering comprises (1) mattress twine braided and waterproof compounded, (2) hard cord braid specially manufactured to prevent unravelling when cut, (3) compounded hard cord braid interwoven with galvanised steel wire, (4) raw-hide or leather strip braiding or a wrapping of stout marline.

DISCUSSION.

The President, Mr. S. F. WALKER, suggested that the evening's discussion should be confined to shaft cables.

Mr. L. THOMAS (Bargoed Colliery) did not think paper or bitumen insulation could be much improved upon. He had tried "dialite," and after a few months the cable was found to be stripped bare for about two yards by the action of falling water. He suspended his cables by cleats, but had found that tightening them up caused the armouring to become embedded in the lead sheathing.

Mr. S. FOKES (Treharris) agreed with the author in the matter of shaft cables. He had had difficulty in properly filling the joint-boxes, but now obtained good results by first thoroughly drying the box, and then pouring in Diatrine compound in a very liquid state, so as to expel all the air and moisture. He had had no troubles due to decentralisation of the cores.

Mr. G. HUMPHREY (Cardiff) advocated impregnated paper cables, lead-covered and armoured, for H.-T. work, having used such successfully for over sixteen years. Care had to be taken to avoid the absorption of moisture, and the occurrence of resonance effects.

After a few remarks from Mr. S. F. WALKER, Mr. T. SCHONTHIEL showed a novel method of jointing cables, and an interesting form of joint-box, and the discussion was then adjourned.

The Whitehaven Disaster.—We are glad to be able to state in contradiction to certain rumours which have been circulated that the explosion at Whitehaven was in no way due to electrical causes. A certain amount of cable has been laid in the mine for the supply of power for ventilation, but at the time of the accident the electrical plant was not running, and, indeed, the cable in question has not yet been used. There was a telephone system in the mine using the iron wire haulage signal wires, but these appear to have been broken by the explosion.

ELECTRICAL EQUIPMENT OF MURTON COLLIERY, DURHAM

A PAPER, by Mr. E. Seymour Wood, read on April 9th, before the North of England Institute of Mining and Mechanical Engineers, described the electrical equipment of the South Hetton Coal Co.'s Murton Colliery, which consists of three pits, two used for coal drawing and the third for ventilation only. Ventilation was formerly carried out by means of an underground furnace, assisted by the heat from 20 underground boilers, which supplied steam for working the underground pumping and haulage plant.

After the establishment of the Durham Collieries Power Co., with their generating station at Philadelphia, a distance of eight miles from Murton Colliery, it was decided to dispense with the whole of the boilers underground, substitute electric power, convert the haulages to electric drive, put down ram pumps driven by motors, and do away with the underground furnace. A three-phase alternating supply at 5,500 volts 40 cycles is given through duplicate cables to a sub-station on the surface. This sub-station is equipped with three switchboards. The main high-tension switchboard distributes the fan-circuit, four 2,000-volt transformers for underground work, and a 500-volt transformer for the surface screening machinery. The medium-tension (2,000 volts) switchboard, which distributes to the three shaft cables, connected to a distribution board underground, and the low-tension (500-volt) switchboard supplies the motors for driving the screening machinery at the surface.

The 5,500- and 2,000-volt switchboards are built of granite-concrete, and are of the cellular type, with enclosed bus-bars, each panel being equipped with an oil-break switch, overload relay, time-limit fuse, and isolating switches to separate the switchgear of any panel from the bus-bars. The fan installation consists of two duplicate single-inlet Capell fans, each capable of passing 300,000 cu. ft. of air, with a 4-in. water gauge, at a speed of 200 r.p.m., rope-driven, by two 12-pole 400-h.p. slip-ring induction motors, with a synchronous speed of 400 r.p.m.

The weight of each motor with pulley and slide irons is 11¾ tons, and the efficiency given is 92·8, and the power factor as 89·5 on full load. Liquid starters are used. Current is taken to the 2,000-volt underground board through three 37/14 double-armoured dialite cables, which are carried in the shaft by wooden cleats resting on wrought-iron clamps attached to steel-wire ropes suspended in the shafts of the mine. Six three-phase induction haulage motors have been installed, representing a total rating of 1,550 b.h.p.

One of these is among the largest underground haulages known. The distance to the farthest landing is 13,464 ft., the average gradient being 1 in 33·5, and the maximum 1 in 9 against the load. The load consists of 60 tubs, the total weight of the set being 45 tons, and the maximum speed is at the rate of 16½ miles per hour. In addition to the coals, sets of empty tubs are run for the purpose of conveying the men and boys in- and out-bye at a speed of six miles per hour, an auxiliary motor being used operating the same drums. The main motor is of the protected ventilated type, with a capacity of 400 b.h.p., working at a speed of 285 r.p.m. The auxiliary motor is of 200 h.p., and is connected to the shaft of the main motor with a clutch, the gear operating the clutch also working a change-over switch, which cuts off the current from the stator of the 400-h.p. motor, and switches it on the auxiliary motor when required. The controller is of the liquid type, having a high-tension reversing switch, and three movable electrodes operated with a wheel gear by the attendant. The cooling is done by water from the shaft tubbing passing through a coil above the electrodes. The switch panel is fitted with an overload relay and a wattmeter.

The second haulage is a converted one, driven by a 300-h.p. motor, and has a similar controller, but a metal type controller is used in the case of two other haulages, with 150 h.p. and 200 h.p. respectively. This pattern of controller is combined with a high-tension reversing switch. The secondary switch is connected to the rotor circuit, which is two-phase wound, and consists of six fixed and two movable contacts, each fitted with four fingers, the tips of which are fitted with sparking-pieces. The whole of the contacts operate in oil. The resistance frames are enclosed in well-ventilated cases, placed as near to the controller as possible. The first movement of the wheel closes the primary switch, and allows the current to enter the stator; in this position the fingers are all clear of the contacts, with all the resistances in series. The second movement is on to the first contact with the first fingers, and this cuts out the wire resistance. The third movement cuts out the multiplying resistance, and leaves the main resistance in series. The fourth movement brings the second fingers on to the first contact, and puts the first step of the main resistance in parallel with the multiplying resistance, whilst the fifth and sixth steps of the main resistance are in series with the multiplying resistance. The movements over the six contacts result in cutting out or putting in sections of resistance, working the section in parallel or series according to the speed required, and this arrangement gives a range of 25 speeds to the motor.

The remaining haulage has a 300-h.p. motor, and a liquid controller.

The pumping equipment is arranged to pump the water from the lowest seam to the large standage in the main seam, where the water from that seam is collected, the whole then being forced 1,224 ft. to the surface.

The pump in the lowest seam is a three-throw ram pump driven by through-gearing by a 30 b.h.p. enclosed induction motor with slip-rings in a gas-tight case.

The main pumps consist of two three-throw ram pumps, each with a capacity of 200 gallons per minute, running at 45 r.p.m. The driving is done from each end of the crank-shaft with machine-cut cast-iron spur-wheels from an intermediate shaft, this being driven from the motor by eight cotton driving ropes, 1¼ in. in diameter. The pumps are driven, partly by gearing and partly by ropes, by two induction motors of the slip-ring protected type, each of 120 b.h.p. at 385 r.p.m. The starting arrangements consist of two rheostats, with resistance and contacts immersed in oil. Thorough tests have been made with these pumps, and careful measurements of current and water show an overall efficiency of 73 per cent.

There is also a drift pump driven by a 60-h.p. motor, eight motors varying in size from 10 to 50 h.p., and aggregating about 175 h.p., are used on the surface for driving screening machinery, &c. The whole of these motors are of the slip-ring type, totally enclosed, and dust-proof. Each motor is equipped with a switch-panel, fitted with an oil-break switch, a wattmeter, and a starting switch with cast-iron grid resistances.

The whole installation was put in under the supervision of Messrs. D. Selby Bigge & Co., consulting engineers, Newcastle, and has been at work with good results since August, 1908.

RECENT COLLIERY ACCIDENTS AND THEIR CAUSES

ON May 5th, a boy of 16, R. Walker, engaged as a putter at the Bardykes colliery of the Summerlee Iron & Coal Co., was killed by electric shock. The system is three-phase 500 volts, with insulated neutral. The boy was found dead near a triple-pole oil switch, and there is no positive evidence as to how he received the shock. It is believed that he inserted a piece of wire under the cover protecting the terminals of the switch, as one of the terminals showed signs of arcing, and a piece of wire partly fused was found hooked on to the switch box. The switch was found to be in order. As a precaution against similar accidents, the openings between the terminal covers and the switch case in these switches have been filled up. The terminal box of one has been filled up with compound, and this also protects the terminals from corrosion and dirt.

Two accidents occurred on May 12th. At the Blantyreferme colliery, near Uddingston, a roadsman, J. Bellingham, was engaged on the main haulage way in repairing the damage caused by a runaway hutch, and received a fatal shock from a steel girder which the hutch had caused to fall by displacing its props. It appears that the girder had fallen on to an unarmoured 400-volt three-phase bitumen-insulated cable, the flange cutting through the insulation into the core. The neutral of the system was earthed, but the other end of the girder had fallen on to a wooden sleeper. It was thus practically insulated, and so the man received a 230-volt shock. The electrician and one of the owners of the mine have agreed that it is desirable to use armoured cable in this and similar steep roadways with girder supported roofs.

The other accident on May 12th was at the Auchengeich colliery, near Lenzie, Lanarkshire, where a man, J. Martin, received a fatal shock by touching a transformer case. The system is 440 volts three-phase, and armoured cables are employed. Examination of the transformer showed that the cable inside the case had become bared, and had come in contact with the case, but that the latter was not connected to the armouring. The armoured cable was led into the case through a gland, and it appears that the man had placed his hand on the cable and caused the bare part to touch the case and the armouring to come out of the gland at the same time. The gland was not designed for use as an earth connection to the armouring.

Wire Ropes.—We have received from Messrs. W. N. Brunton & Son (Musselburgh, Scotland) a new catalogue of wire ropes for mining, containing full particulars of a variety of types of rope for use under different conditions, with various fittings, &c., and some useful notes on the handling and care of wire ropes, fixing of attachments, sockets, &c.

ELECTRICAL EQUIPMENT OF A GERMAN COLLIERY

A Large Exhaust Steam Installation.

AMONG the Papers read at the meeting of the North of England Institute of Mining and Mechanical Engineers on April 9th was one by Mr. H. M. Hudspeth, describing the electrical equipment at the Shamrock I. and II. Colliery at Herne, Westphalia, Germany. The plant generating station is driven partly by live steam and partly by exhaust steam, and consists of the following sets:—One 1,000-kilowatt live-steam Curtiss turbine, with Allgemeine-Elektricitäts-Gesellschaft generator, running at 3,000 r.p.m.; one 1,800-kilowatt live-steam Parsons turbine, with Brown-Boveri generator, running at 1,500 r.p.m.; one 1,500-kilowatt exhaust-steam Parsons turbine, with Brown-Boveri generator, running at 1,500 r.p.m. One of the live-steam turbo-generators usually stands as a reserve. The turbines exhaust into a main receiver, which is connected to the three condensers, of the surface-cooling type, through valves. Usually, two only of the condensing plants work at one time, the third standing as a reserve. The exhaust steam turbines work with the steam from two main winding engines, two auxiliary winding engines, two steam-driven ventilating fans, and five air compressor engines.

The winders exhaust immediately into a receiver (an old cylindrical boiler), which serves as a feed-water heater and to steady up the intermittent flow of steam due to the winders. From this receiver is carried the main exhaust-steam range, which is joined by the exhausts from the ventilators and compressors before reaching the accumulators. Before entering the accumulators, the whole of the exhaust-steam is passed through an oil-extractor.

There are two regenerative accumulators, each having a diameter of 157 inches and a height of 236 inches, and consisting of a wrought-iron shell, the interior of which is so arranged that the exhaust-steam entering nearly at the top of the vessel descends down one side to the bottom, and then ascends through the downcoming water. The latter is kept in circulation by means of two small centrifugal pumps. Delivering in at the top of the accumulators, the water falls down to the bottom, being baffled on its way so as to allow it to come into contact with the ascending steam as much as possible; a self-regulating apparatus keeps the level of the water at the bottom of the accumulators at a depth of about 18 inches.

From the accumulators the steam passes through water-separators before entering the turbine. The latter develops 1,500 kilowatts, which is probably the largest load developed by such a plant. The steam is supplied at a pressure varying from 1 to 1·2 atmospheres absolute, equal to from 14·7 to 17·6 lbs. per square inch. The turbine is coupled to a three-phase Brown-Boveri 5,000-volt 50-cycle generator. The steam consumption with a 90 per cent. vacuum and a load of 1,100 kilowatts equals 37·4 lbs. per unit. Under ordinary working conditions, all the engines above-mentioned are supplying steam, with the exception of the reserve ventilator. The turbo-generator is always running when the pit is working. During the night-shifts it runs on a very light load, there being only three to four compressors and the ventilator supplying exhaust-steam. An automatic live-steam inlet-valve is in process of being fitted to the plant for the purpose of keeping the turbine loaded up to 1,500 kilowatts. The capital cost of the whole exhaust-steam plant was £17,500.

This power station is one of five situated at the other collieries of the same company, all inter-connected by 5,000-volt trunk mains, so that they can work in parallel or supply each other in case of breakdown. The larger motors about the mines are run direct off the 5,000-volt three-phase circuit, but 1,000-volt motors are used for the screening and washing plant, &c., on the surface.

Practically all the underground haulage is done by electric locomotives worked on the overhead-trolley system at 220 volts continuous current, from a circuit supplied by underground motor-generators. Each locomotive is equipped with two compound-wound motors of about 12 h.p. each, and is capable of exerting a normal tractive force of 970 lbs. They travel at 8 miles per hour and weigh about 5 tons each. The cost of haulage by this method is worked out as 1·46d. per ton mile, with power at 0·3d. per unit.

The pumping arrangements are at present undergoing alterations, the old steam-driven forcing pumps being taken out to be replaced by electrically-driven high-speed centrifugal pumps and an electrically-driven forcing set. For lighting, three-phase current at 110 volts is mostly used, from transformers from the 1,000 volts circuit. Underground on the electric haulage-roads 220-volt lamps are simply put between the trolley-wire and the rail. Osram metallic-filament lamps are largely used both above and below ground.

We understand that the Louis Schwarz & Co. A.G., of Dortmund, Germany (whose London representatives are Messrs. Michael Pal & Co.), were the main contractors for the exhaust-steam installation at the Shamrock I. and II. Collieries, and erected the plant.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during May.

May 5th.—Supplement on "Electrical Engineering in Mines," opening with a letter on the desirability of employing competent men as colliery electricians, and containing reports of a number of discussions in various parts of the country of the Institution of Mining Electrical Engineers. The Papers discussed include one on the relative merits of continuous and alternating currents for colliery work by Mr. C. R. M. Young, read at Newcastle. Mr. J. Glynn Williams handled some aspects of the same subject in a Paper on storage batteries for colliery work at Whitehaven, and the question of earthing was introduced for discussion by Mr. Routledge at Nottingham. A report of a discussion before the Mining Institute of Scotland on Mr. Nelson's Paper on electricity in mines; an abstract of a further contribution on the subject of electricity and coal-dust explosions by Prof. W. M. Thornton and Mr. E. Bowden are also given. Reports of the discussions at the Newcastle and London meetings of the Institution of Electrical Engineers on Mr. W. W. Wood's Paper on earthing of the neutral of three-phase colliery installations are also included. A summary of electrical mining patents which have been published in April is given, and notes explaining the circumstances of one or two colliery accidents are included.

May 12th.—Descriptions of some new switches, wall plugs, &c. Report of Paper discussed by the Iron and Steel Institute dealing with the production of electric power from waste heat.

May 19th.—Illustrated description of a large electric power station in the Argentine.—A new testing set.—Description of a large new steam turbine driven generating station in London.

May 26th.—Details of a metal conduit wiring system.

A NOTE ON THE BROWN TELEPHONE RELAY

By C. C. F. Monckton

A TELEPHONE relay lent to the writer by Mr. S. G. Brown was placed in a receiving radiotelegraphic circuit as shown in Fig. 1. By means of switches S_1 S_2 an eight thousand ohm Sullivan hand telephone combination T_1 or the three thousand ohm primary coil of the relay A could be switched into the detector circuit. The detector D_1 was of the silicon type, and generally a potentiometer was also connected with a battery of either one or two accumulators C_1 and resistances of R_1 100 ohms and R_2 6,000 ohms. The secondary winding of the relay B was taken through a resistance box R_3, which was generally short-circuited, a dry cell C_2, a microammeter M suitably shunted, and a pair of Sullivan telephone receivers T_2 (40 ohms).

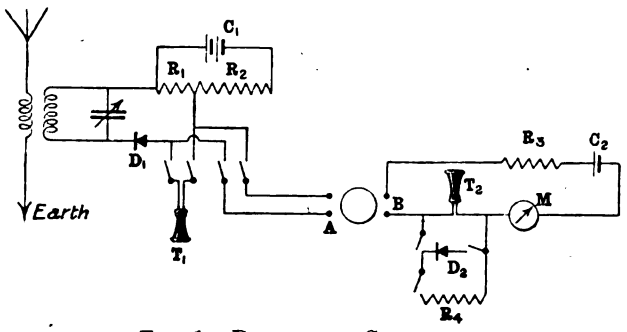

FIG. 1.—DIAGRAM OF CONNECTIONS.

The novel conditions consisted in placing switches so that this telephone combination T_2 could be shunted either by a crystal detector D_2 or a resistance R_4. The adjustment of the relay was purposely altered fairly frequently. It was found quite easy to obtain an adjustment with the relay, such that signals could be heard in T_2 which could not be heard in T_1 with S_2 open. Closing S_1 made no apparent difference to the loudness of the signals heard in T_2.

Under most conditions of working, shunting T_2 with the detector made no difference to the sounds. Shunting with a resistance R_4 diminished the sensitiveness. If, however, the relay were in a more than usual sensitive state, shunting the telephone T_2 with the detector still further increased the sensitiveness of the combination.

Under the same condition, shunting the telephone with a resistance increased the sensitiveness, but on account of singing noises the relay current had to be increased by turning the milled head W (Fig. 2). The best results with shunted resistances were obtained with R=70 ohms, but better results were obtained by shunting the telephone with a detector. The best combination tested for this detector was a metal point against iron pyrites. With this as a shunt, signals were lost when R_3 was 13-14 ohms; the same signals were lost without the shunt with R_3=7-8 ohms.

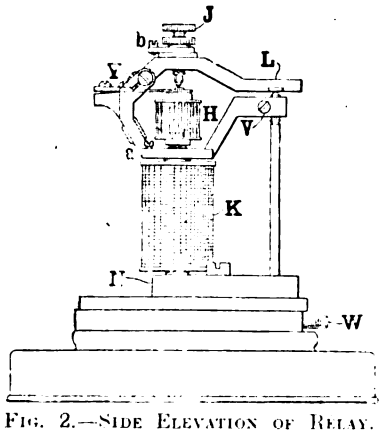

FIG. 2.—SIDE ELEVATION OF RELAY.

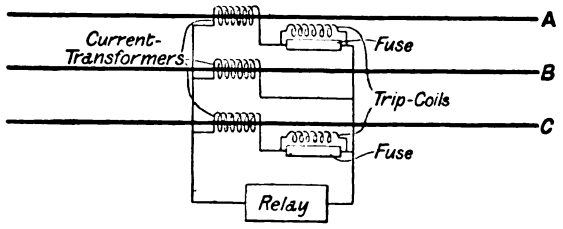
A method of testing the sensitiveness was placing the telephone T_1 on a separate table, closing the switch S, and placing a watch on the table about two feet away from the telephone. Under the best conditions the tick could be heard in T_2 when shunted by the detector, but could not be heard without the shunt.

With a little practice it might be possible to tell from the sounds in T_2 whether shunting the telephone would be of advantage. It was found only possible to obtain this extreme sensibility by trial. J (Fig. 2) was first altered; then the adjustments Y and W could be made in five minutes. If the relay were not sufficiently sensitive it was found best to readjust J, so as to bring the point against another part of the flat contact piece.

ACCOUNTS OF THE NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.

THE report and accounts of the North Metropolitan Electric Power Supply Co. for the year ended December 31st, 1909, show a considerable increase in the connections and output over that of the previous year, and some remarkably low generating costs. The total number of units sold during the year was 16,402,447, which, compared with the previous year's figure is an increase of 16·5 per cent. Particulars of the maximum demand are not included in the report, so that it is impossible to work out the load-factor. It is also impossible to give the generating costs of the Brimsdown and Willesden stations independently, as they are not separated in the accounts, nor are particulars of the units generated at each station and used in conversion given. The following table gives an analysis of the revenue account showing the costs per unit sold for the whole undertaking:—

	£	Pence per unit sold.	
Generating Costs—			
Coal	21,292	0·312	
Oil, waste, water, stores, &c. ...	950	0·013	
Salaries and wages...	5,335	0·078	
Repairs and maintenance	3,446	0·050	
	31,023		0·453
Distributing Costs—			
Salaries and wages...	2,524	0·037	
Repairs and maintenance—Mains.	270	0·004	
,, ,, Substations, &c.	693	0·010	
,, ,, various	652	0·009	
	4,139		0·060
Total works cost	**35,162**		**0·513**
Management Expenses, &c.—			
Rent, rates and taxes ...	4,067	0·059	
Salaries, fees and establishment charges	4,617	0·067	
Law and other charges (including insurance	657	0·010	
	9,341		0·136
Total, excluding capital charges	**44,503**		**0·649**



The total receipts (including £87,834 for the supply of current) amounted to £88,925. Of the balance, interest on debentures, loans, &c., absorbed £10,725, and £2,000 was carried to reserve, so that with the addition of £603 remaining from last year's account, after payment of dividends and allowing for depreciation, and with the addition of £2,016 interest received, the net balance is £34,315. Of this the directors recommend the transfer of £7,000 to depreciation, the writing off of £3,500 against preliminary expenses, and the payment of dividends on preference stock amounting to £1,977. This would leave £21,838, out of which a six per cent. dividend is recommended, with £837 carried forward.

The capital expenditure amounts to £535,968, of which £510,380 has been spent on works, £22,610 on special Acts and Orders, and the remainder on special items.

AUTOMATIC PROTECTIVE SWITCHGEAR

SOME interesting experiments made with a special arrangement of leakage protective devices were described in a Paper read recently by Mr. E. B. Wedmore, of the B.T.-H. Co., before the Institution of Mining Engineers. In the author's arrangement, there are current transformers in each phase, but one trip-coil is transferred from the usual position into a return circuit common to the three transformers. This coil operates only on faults to earth, as there is then a resultant current in the common circuit, and the other two operate with overloads or faults between phases. Independent adjustment for operation on faults and overload is obtained. With a sensitive relay, similarity of the three transformers is necessary, as if their ratios were to differ, say, on a momentary overload, a current would flow in the relay, representing a spurious leak. This current is kept within limits by the use of a trip-coil shunted by a low-resistance fuse, as indicated in the accompanying figure. This

ARRANGEMENT OF TRIP-COILS FOR DISCRIMINATING BETWEEN OVERLOADS AND LEAKAGE.

prevents the trip-coil from operating until an overload of sufficient magnitude has lasted sufficient time to melt the fuse, when the coil instantly takes the current and trips the switch. When relays are employed, the oil switches are operated by trip-coils excited preferably independently of the A.-C. supply. Where individual motor circuits are furnished with a low-voltage release, this may be utilised for the purpose, the relay short-circuiting the winding. A resistance is used in series.

The author proposes to use such leakage devices in series, on the main feeder, on every branch feeder, and again on each motor or group of motors. In this case, some discriminating arrangement is necessary, or a leak on any one motor will affect all the devices. This may be obtained by grading the settings of the devices; thus, on a 3,000-volt circuit, a 100-ampere feeder may be equipped with a relay operating at 10 amperes; the switch controlling a branch circuit carrying 25 amperes may be set to open on a leak of 1½ amperes, and an individual motor of, say, 30 h.p., may have an automatic switch operating at ¼ ampere. The tests show that even in the rare event of sudden and extensive damage to a cable, discriminating action can be obtained in some measure. The cables employed were supplied by Messrs. Callender & Co., and were paper-insulated three-core, with vulcanised-bitumen shield, and double-wire armoured, 2·5 in. diameter. The apparatus employed corresponded to the equipment of a main feeder of 100-amperes capacity, and a local circuit of 25 amperes, and leakage relays were employed as described above. The following are some of the results :—A 2,000-volt cable had a 15-cwt. pug dropped on to it from a height of 5 ft. This resulted in the immediate disconnection of the branch circuit, but the main-feeder switch was unaffected, and the overload devices did not operate. On restoring supply without removing the faulty portion, the branch-circuit switch was again opened by the leakage relay, and the branch-circuit time-limit fuses also blew, indicating a short-circuit between the phases. Another sample was damaged in a similar manner, and on restoring supply the relay cleared the fault four times. On the fifth test, however, the fuses blew. A 500-volt cable, with bitumen sheath, was damaged by repeated hammer blows. Only the branch-circuit relay operated. Neither flame nor smoke appeared outside the cable. Another 500-volt cable, with bitumen sheath, was cut through with a blunt tool to a depth of ⅛ in. On the insulation breaking down, both relays operated without disturbing the overload devices. In order that fire and smoke might issue, it was found necessary to damage the cable very severely, and the most effective means proved to be successive blows of a heavy hammer. When the relays were not in use, smoke and flame issued in several instances; but in no case was it possible to produce any sign of flame, or even of smoke, when the relays were in service. Where the relays are employed, the problem of the proper time-limit for a given service can be solved without regard to the conditions accompanying a fault. It is necessary on some occasions to supply overload devices, which delay the opening of the switches for several minutes on moderate overloads. The author designed such a device for haulage work to act when one of a number of trucks became derailed, and the man in charge did not notice the fact at once. With such a device in use, every leak would develop into a severe short if no leakage relays were employed.

The author concludes that leakage is the principal source of danger in mines, and that this danger may be reduced to a minimum if a thoroughly armoured and well-earthed system be employed. In this case leakage currents will be confined to the metallic covering, thus removing all risks except those arising from actual rupture of, or severe arcing in, the cable. With the author's system, even when an earthed neutral is employed, the supply should not be disturbed except at and beyond the point where the fault exists. The majority of faults develop, in the first instance, as faults to earth, whether arising from moisture, electrolysis, abrasion, or from any other external cause. In the past where the neutral has been earthed, it has been necessary to employ a connection capable of passing sufficient current to operate the overload device with the heaviest setting on the largest feeder. Where leakage relays are employed, however, it is possible to employ a resistance in the earth-connection, which limits the leakage current under the severest conditions to a fraction of normal load.

REDUCTIONS IN THE PRICES OF TANTALUM LAMPS

SOME important reductions in the prices of Tantalum lamps are announced to take effect from the beginning of this month. The discounts, terms for contracts, &c., will remain exactly as hitherto, but the new list price of the popular 16-c.p., from 100 to 120 volts, is now reduced to 2s., to which price the 50-130 volt 25-c.p., the 60-130-volt 32-c.p., and the 100 to 130-volt 50-c.p. lamps have also come down. Still cheaper is the 50-80-volt 10-c.p. lamp at 1s. 6d., to which price all the 20-40-volt lamps have also been reduced. The 200-250-volt 50-c.p. lamp has been reduced to 3s. The above prices are for standard bulbs. Spherical bulbs are, as a rule, 3d. higher. All other sizes remain as heretofore.

CORRESPONDENCE

THE BRUSSELS EXHIBITION.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—A Mr. Max Kaiser, describing himself as "Commissioner for England and Great Britain," is soliciting manufacturers and traders in respect of an exhibition at Brussels which may be mistaken for the Exposition Internationale et Universelle now in being. The forms of application for space are headed "International Exhibition, Brussels, 1910."

It is therefore necessary to say that Mr. Max Kaiser has no connection with the International Exhibition in which the British Government and the Governments of other nations participate, and to appeal to your esteemed courtesy for publicity in the matter.

I am, Sir, your obedient servant,

Bruxelles, May 26th, 1910. F. MANDER BURCH.

Municipal Telephones.—The annual report of the National Chamber of Trade, presented at the annual meeting last week at Bradford, dealt with the question of telephones. It pointed out that the average cost per station throughout the National Telephone Co.'s system is £30, in the local areas served by the Post Office £52, and in the municipal exchange area at Hull £21. This illustrated in the most striking manner possible what might be expected as between municipal and State administration of local telephone areas. Mr. J. W. Clark, of Halifax, urged that municipalities should be given an opportunity of purchasing the local telephone areas at the price paid by the Government in 1912 to the National Telephone Co. What could be done in Hull could be done in all the other large cities, where at present the charges were higher. The report was adopted.

Tramway Running Powers in Lancashire.—Before the Master of the Rolls and Lords Justices Farwell and Kennedy in the Appeal Court on Thursday, an appeal against a judgment of Mr. Justice Eve in regard to tramway running powers was heard. The Eccles Corporation wish to restrain the South Lancashire Tramways Co. from using a section of the Corporation lines in the Worsley Road, Eccles, of a length of about 500 yards. The company were running their cars over this section of the Eccles lines under a licence from the Salford Corporation, with whom there was an agreement, and there was also an agreement between the two Corporations. The company contended that under the agreement the power to grant such a licence was vested in the Salford Corporation, but this the Eccles Corporation denied. Mr. Justice Eve held that the grant of the licence to the company by the Salford Corporation was not a breach of the agreement between the two Corporations, and was not, therefore, *ultra vires*. The Appeal Court, however, took an opposite view, and allowed the appeal, and issued an injunction restraining the company from running their cars over the line in question until authorised by Parliament to do so. The main reason for this view by the Appeal Court was that the Board of Trade consent was necessary after Parliamentary sanction, and this had not been obtained.

ELECTRIC BRAKING

GLASGOW DISCUSSION.

MR. A. GERRARD'S Paper on electric braking on the Glasgow Corporation tramway system, on which we have already reported the discussion at the London meeting of the Institution of Electrical Engineers on April 7th (see ELECTRICAL ENGINEERING, April 14th, p. 249), was further discussed by the Glasgow Local Section of the Institution on Tuesday, April 12th. In the Paper Mr. Gerrard described some experiments made on the Glasgow tramway system with magnetic track brakes. It was found that on braking at high speeds, the motor pressure rose to twice the normal, and various methods of reducing this pressure and the heavy braking currents were tried. The method finally adopted consists in shunting the motor fields in two successive steps by means of solenoid switches, and is found to prevent abnormal pressure rise and intermittent skidding, and further to reduce the braking current very considerably.

The discussion was opened by Mr. J. FERGUSON (Mechanical Engineer, Glasgow Corporation Tramways), who testified to the diminution of damage to the cars by the use of electromagnetic brakes brought about by the introduction of the solenoid control, and to the increased confidence of the motorman in handling cars equipped with the new brakes, owing to the fact that he knows he need not fear skidding. On the Glasgow system the electromagnetic brakes are only supposed to be used for emergency stops, and on that basis Mr. Ferguson estimated that the number of applications per annum would be about 18,000,000. The defects reported for last year totalled to 17 or less than one per million applications.

Mr. W. MCWHIRTER (Messrs. McWhirter & Son, Glasgow) commended the action of the Corporation in allowing the result of their experiments to be made public. He also criticised the magnetic design of several of the magnets, the older type of which he thought contained too little iron and too much copper, and emphasised some of the conclusions given by the author of the Paper as to the causes of surging.

Mr. SCOTT MAXWELL (Electric Control, Ltd., Glasgow) advocated the regular use of the electric brake for low as well as high speeds in place of the hand-brake. This would enable higher values of both acceleration and deceleration to be adopted with safety even in crowded thoroughfares, with a consequent increase in schedule speed. There was now no justification for the view that double-truck cars could not be safely used in Glasgow owing to the difficulty of securing proper braking effort. In American practice—the cars were, as a rule, very long and of the double-truck type—the brake system was usually compressed air. This system had one advantage in that the brakes could be tested while the car was standing, and it was possible to see that everything was in order by merely examining the pressure gauge.

Prof. F. G. BAILY (Heriot Watt College, Edinburgh) thought that surging was possibly due to the sluggishness of the magnets, due to the appreciable amount of time required for complete saturation or demagnetisation. He agreed with Mr. McWhirter's conclusions as to the design of the magnet, and said that very heavy iron cores were needed to give high retardation at low speeds.

Mr. SAM MAVOR (Messrs. Mavor & Coulson, Glasgow) said he would be interested to have further information as to the different effect produced by variation in the magnet's design, as it appeared to him that both the length of the magnetic path and the area of contact of the magnets were vital factors in deciding the efficiency of the brake.

Councillor HOY (Member of Works and Stores Committee, Glasgow Corporation) did not think that the last word had yet been said in brakes. He thought that a good many papers given at the various Institutions of late had been too descriptive of what had been done, and not sufficient illustrative of what might be done.

Mr. J. ROBERTSON (Glasgow Corporation Electricity Department) drew attention to the tendency for the 1908 25B brake rigging described to lift the car wheels from the rail, thereby making them cease to drive the motors as generators, and so depriving the brakes of their operating energy.

Mr. CAMPBELL MCMILLAN (Electrical Control, Ltd., Glasgow) referred to the criticisms of some of the previous speakers on the design of the magnets; he suggested that some of the differences in surging effects obtained might be more due to variations in the magnetic properties of the iron than to differences in the mass of iron used in the core as had been suggested.

Mr. GEORGE STEVENSON (British Thomson-Houston Co., Glasgow) inquired if Mr. Gerrard could give him the cost of the brake equipments and the cost of working, including wear and tear, &c.

Mr. GERRARD, in his reply, gave the dimensions of magnets and shoe area asked for by some of the speakers. The old magnet core was 3 in. in diameter, and the core of the new 26C magnet was, he thought, either 5 in. or 6 in. square. The shoe area with the old type of brake was 23 sq. in., and that of the small new brake was also 23 sq. in. The area of the new large brake was 27 sq. in. The criticisms of Mr. McWhirter and Prof. Baily as to the magnet being too large and producing sluggishness were quite correct. It had been suggested that a better effect might be obtained by designing the motors with a view to the braking duties which they would be called upon to perform, but Mr. Gerrard pointed out that the problem in his case was to apply satisfactory braking methods to all cars irrespective of the type of motor employed. It was quite possible to get high retardation with either the old or new type of brake at speeds as low as two miles per hour. His objection to air brakes was that they entailed entirely separate equipments to do work which could quite easily be done by the adaptation of the plant already in use on the car. In negotiating heavy gradients, he was of opinion that nothing surpassed the method now commonly adopted, *i.e.*, the screwing down of the track brake before starting the descent of the hill and doing the rest of the control by means of the electric brake. Mr. Robertson was quite right in assuming that the 1908 25B brake tended to lift the car and to set up surging by putting a portion of the weight of the car on to the track shoes, so robbing the generators of their propelling power. Mr. Gerrard regretted that he could not give details of cost, but he was quite satisfied that the use of the solenoid would very materially reduce the upkeep costs.

ELECTRIFICATION OF INSULATING MATERIALS

A SHORT Paper by Mr. W. Jamieson, read on Thursday, May 12th, before the Glasgow Local Section of the Institution of Electrical Engineers, describes some investigations as to the best kind of materials to use for producing electrification in a humid atmosphere. Of all the substances tried, by far the best was rolled celluloid sheet, particularly if the surface were well burnished. It was found that if two pieces of this celluloid sheet be drawn smartly between the finger and thumb, not only are the outsides electrified, but the inside surfaces as well, one being positively, the other negatively electrified. The explanation of this phenomenon appears to be that when the two strips are drawn through the fingers they are not only compressed, but bent to one side or the other. Of the two inner surfaces in contact, one is concave, the other convex—that is, the particles of the one surface are in compression and those of the other in tension. The molecular difference due to this tension and compression combined with the direct pressure evidently produces the electrification. The surface in tension becomes positively electrified, and *vice versa*. This was borne out by further experiments, which suggest the possibility of static charges being produced in electrical machines simply by vibration and rotation; it is possible, therefore, that cases of insulation breakdown may occur through these causes alone. A further practical illustration of the phenomenon is to be seen in printing machines. The author considers that much of the electrification of the paper produced in these machines is due to the combined bending and pressure exerted on the paper by rollers. The author has constructed an electrical machine in which bands of celluloid running over pulleys produce + and − charges in this way. Though the differential charges are small, they are cumulative, and may become large in a long run. This would seem to indicate that more care should be taken to consolidate insulating material used in layers, and to prevent it coming adrift, and so setting up the kind of electrification mentioned.

DISCUSSION.

Mr. W. W. LACKIE (City Electrical Engineer, Glasgow) said that it had occurred to him that the small sparks one sometimes sees between commutator segments might be due to electrostatic discharge across the edges of the mica.

Mr. J. C. MCMILLAN (Electric Control, Ltd.) referred to the well-known phenomena of electrostatic discharge from belting, which is commonly observed in very dry localities, such as the north-eastern States of America. He had seen belts running with a continuous stream of sparks 14 in. to 20 in. long. He pointed out that the very features of vibration which led to electrostatic electrification were those which called for careful mechanical design in order that distortion and breakage might be avoided.

Mr. WILLIAM MCWHIRTER (Messrs. McWhirter & Son, Glasgow) mentioned that in the early days of the paper milling industry it used to be quite common to have to fit large combs across the paper in order to discharge the electrification accumulated.

Mr. W. SUTCLIFFE (Siemens Bros.' Dynamo Works) remarked that he had on one occasion some experience with a Ferranti open coil armature, the bars of which were insulated with paper. In the dark it was quite possible to see sparks playing across the armature bars, and they found that small punctures were very rapidly formed in the paper insulation. He thought that this was very probably accounted for by electrostatic effects.

Mr. J. ROBERTSON (Burgh Electrical Engineer, Greenock) commented on an experience he had had with a machine to which

Digitized by Google

equalising coils had been fitted at one end of the armature. Frequent breakdowns on the armature coil rendered it necessary to take the equalising coils off. It was thought that the trouble was due to mechanical causes, such as friction between equalising coils and the end coils of the armature, but on examination it was found that all the coils showed signs of small punctures.

Mr. JAMIESON, in his reply, mentioned that if two layers of a band of either celluloid or paper were run over a single pulley for eight or ten times electrification was produced. If, however, the bands were stretched tightly over two pulleys, electrification was not produced. It therefore looked as though some neutralising effect was thus obtained.

LOCAL NOTES

BARROW-IN-FURNESS: *Electricity Accounts.*—The accounts for March last show a net profit of £249, after meeting interest and sinking fund charges. The total costs, exclusive of capital charges, were 1·249d. per unit compared with 1·426d. per unit in the previous year. The number of units sold were 1,130,092, and the maximum load was 925 kw. The financial result is £383 worse than in the previous year.

BRADFORD: *Tramway Profits.*—The net profit from the tramways for the past year was £30,000, which is about £10,000 in excess of the record hitherto established.

BRIGHTON: *Electricity Profits.*—The accounts of the Municipal Electricity Department for the year to March 31st show a net profit of £6,251, compared with £565 last year. The total revenue, £88,856, increased by £5,575. Works costs per unit sold are 0·70d., a decrease of 0·09d. per unit. The units sold increased by over 1,000,000, being 9,041,844. The increase was mainly noticeable in supply for power purposes due to the electrical working of the railway workshops and the charging of the batteries for the electric 'buses. There were 247 new consumers added during the year. Mr. J. Christie, the Borough Electrical Engineer, recommends that the surplus be transferred to the reserve fund, which has been sorely depleted in recent years to meet the unavoidable deficits made during the stage of transition from North Road to Southwick. The reserve, excluding the profit for last year, stands at £6,559.

COATBRIDGE: *Electricity Company's Accounts.*—A report upon the accounts of the Coatbridge & Airdrie Electric Supply Co. has been placed before the Council. It is pointed out that the net revenue account for 1909 shows a loss of £4,599, and that no provision has been made for reserve or depreciation.

DUNDEE: *Electricity Accounts.*—The profit from the electricity accounts for last year was £18,429, and after meeting capital charges and setting aside £2,750 for depreciation in addition to £1,250 to claim account, a balance of £1,260 is carried forward. The number of units sold was 6,144,956. The balance carried forward is a few pounds in excess of the previous year, but the revenue was about £3,000 in excess.

ECCLES: *Excess Expenditure.*—The Borough Treasurer has been instructed to transfer the amount of profit on the electricity undertaking for the year ended March 31st last, viz., £1,206, to the credit of the capital account, towards the excess expenditure, for which the Local Government Board refused to grant borrowing powers.

EDINBURGH: *New Electric Tramway.*—Trial runs have been made on the first electric tramway in Edinburgh. The line runs between Ardmillan Terrace and Gorgie Markets.

EXETER: *Electricity Profits.*—The net profit on the electrical undertaking for 1909-10 was £2,927, after meeting capital charges.

GLASGOW: *New Power Station.*—The Electricity Committee have authorised the Town Clerk to accept an offer to purchase the land for the proposed new power station of the Corporation at 8s. per square yard. We gave some information with regard to this power house in our issue for April 14th, p. 253.

New Tramcar.—A new type of an electric tramcar has been placed in service at Glasgow. It is of the vestibule type intended to afford protection for drivers in bad weather. In addition to this protection, the difficulty caused by the draught down the front stairs has been overcome by placing a permanent cover over two-thirds of the stairway, and enclosing the top of the staircase with a sliding door on the prinicple of the roll top desk.

GRIMSBY: *Electricity Accounts.*—There was a net profit of £3,860 on the electricity undertaking for 1909-10, the largest yet made by the Department. The gross revenue increased by £2,345. Power supply increased by 36 per cent., and the number of new consumers connected during the year, viz., 106, is a record. Costs, excluding capital charges, reached 0·921d. per unit, an increase of 0·046d. per unit. But for the fact that the Great Central Railway Co. have given notice to cease taking current from the Corporation, additional plant would have been required. Mr. W. A. Vignoles, the Borough Electrical Engineer, recommends his Committee to pay for services out of revenue, in view of the short life, viz., fifteen years, which the Local Government Board allow.

HEYWOOD: *Electricity Accounts.*—There was a small profit of £124 on the electricity undertaking for 1909-10.

Tramway Accounts.—There was a loss of £1,188 on the tramways for the past year. The number of passengers carried was less by 109,376 than in the previous year.

HUDDERSFIELD: *Linthwaite Tramways Dispute.*—The Linthwaite Council have agreed to sell the tramway track in their district to the Huddersfield Corporation for £4,000. The track, which is single, was originally laid by the Corporation, who run their cars over it. There have been continual complaints as to the maintenance of the track, but the Corporation will now relay it with double track, and maintain it.

LONDON: *Hackney: Tramways.*—The Borough Council has agreed to contribute £15,000 towards the widening by the London County Council of Dalston Lane, Ball's Pond Road and Graham Road, in connection with the conversion to electric traction of the tramways in that district, thus enabling the linking up of Hackney, Leyton, and Epping Forest with the West End.

PLYMOUTH: *Motors on Hire.*—The Borough Electrical Engineer has been instructed to consider and report upon the advisability of hiring out electric motors.

PORTSMOUTH: *Light Railways.*—The Portsmouth-Hayling Light Railway (Extension of Time) Order has been submitted to the Board of Trade for confirmation.

SHIPLEY: *Electricity Accounts.*—The electricity accounts for the year to March 31st show a net profit of £585 compared with £151 in the previous year. This reduces the deficiency on the working of the undertaking to £147.

SUNDERLAND: *Tramway Accounts.*—After meeting interest and sinking fund charges, the tramway accounts for 1909-10 show a net profit of £3,588. The total revenue was £58,546. The financial result has been improved by the reduction of the charge for electrical energy from 1 11-16d. to 1½d. per unit. The average working costs were 6·11d. per car mile. There was a falling off in traffic receipts of £1,896 compared with the previous year, and this is attributed to the continuation of the bad state of trade in the town, and to the troubles in the adjacent colliery districts.

Electricity Accounts.—The electricity accounts for the year to March show a loss of £112. The number of units sold was 7,848,815, compared with 6,584,825 in the previous year. The Borough Electrical Engineer (Mr. A. S. Blackman) states that the outstanding features of the year were a partial recovery from the depression in the shipbuilding and engineering trades, the commencement of supply to consumers at extra high tension; the introduction by the Home Office of new regulations, which are necessitating alterations to portions of the works and sub-stations; the rapid introduction of the metal filament lamp, and the reduction in the sale of electricity for lighting purposes consequent thereon; and the continued drop in the costs of production.

TORQUAY: *Surface Contact Traction.*—The Board of Trade have now definitely intimated to the local tramway company that they are not prepared to renew the licence for the running of the surface-contact system in Torquay. The present licence expires in October. The Council has therefore to decide whether it will agree to the adoption of the overhead system, for the company has stated that if this is not done they will have to abandon the undertaking. A curious feature of the position is that the inhabitants have not complained of the Dolter system, but the Board of Trade regard the defects and deficiencies as sufficiently important to withhold a licence, and the company would prefer the overhead system by reason of the expense of maintenance. When the Bill for the original tramways was passed, it contained a provision that the overhead system must not be used except with the consent of the Corporation. It is estimated that the cost of the change over to the overhead system would be £8,000, and already one local paper has evinced a desire for "squeezing" the tramway company by suggesting that the Council should require certain concessions before granting the privilege, an attitude which has been the greatest drawback to the tramway industry in Great Britain. The cost of running with the Dolter system is said to be 9d. per car-mile, against an average of 7d. per car-mile for the overhead system. The Council was informed at its last meeting that the number of live studs varied from 40 to 60 per month, or 1¼ per month per mile, having in mind that there are eleven miles of track, and between 6,000 and 7,000 studs. The view of the Tramways Committee is that the action of the Board of Trade is hardly warranted. The whole matter has been referred back to the Tramways Committee, there being a feeling among some members of the Council that the undertaking should be purchased from the company.

TOTTENHAM: *Street Lighting.*—The electric light and gas companies are to be asked to tender for public lighting.

WALTHAMSTOW: *Electricity Accounts.*—In addition to wiping off a deficit of £1,040 for 1908, the electricity accounts for 1909 show a net profit of £1,350.

Digitized by Google

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BELFAST.—Mr. T. W. Bloxam, the City Electrical Engineer, has reported upon the cost of additional generating plant in connection with the proposed tramway extensions. A sub-committee has been formed, and further consideration of the extensions has been postponed until this has reported.

BRISTOL.—Generating plant is required for the new refuse destructor at Eastville. Particulars from City Engineer, and tenders by June 13th.

DEVONPORT.—The Electricity Committee require d.c. meters, cables, wires, cut-outs, and oils. Particulars from Borough Electrical Engineer, and tenders by June 15th.

LONDON: *St. Pancras.*—A committee has been appointed to deal with a report by the Chief Electrical Engineer concerning a rearrangement of the generating plant. He proposes so arranging the generating plant at Regent's Park works that it will deal with the peak load only, and during the remaining nine months of the year will be operated at a sub-station. For this purpose it will be necessary to instal the following machinery at Regent's Park works:—Two motor converters of 1,000 kw. each, with switchboards, &c., £5,900; three-phase trunk mains connecting King's Road with Regent's Park, £9,000; at King's Road, one spare turbo set, £9,400. Total £24,300. The economies to be obtained by the foregoing arrangement would be considerable, but these economies could only be brought about by the extension of the boiler plant at the main generating station, King's Road. He submits two schemes for the latter, involving capital expenditure of £51,000 and £84,549 respectively.

SWEDEN.—The British Acting Consul at Stockholm reports that a proposal is shortly to be laid before the Swedish Diet for the electrification of the State frontier railway in the north of Sweden.

WALLASEY.—The Electricity Committee require a water-cooling tower (see an advertisement on another page).

SWANSEA.—Motors and motor-starting switches are required by the Swansea Electricity Committee (see an advertisement on another page).

WATFORD.—An inquiry was held on Thursday concerning a loan of £7,000 for electrical extensions.

Miscellaneous

AUSTRALIA.—The Melbourne City Council require 941,000 arc lamp carbons. Particulars from Messrs. McIlwraith, McEacharn & Co., Ltd., Billiter Square Buildings, London, and tenders by June 17th.

The High Commissioner for Australia in London has received tender forms, specifications, &c., for 4,200 telephone sets (Victoria), and insulators, insulated wire, copper wire, &c. (Queensland).

BIRMINGHAM.—The Tramways Committee invite tenders for 2,100 tons of grooved steel girder tramway rails, with fish plates, bolts, nuts, and tie bars. Particulars from the Tramway Manager and tenders by June 20th.

EALING.—A surface condensing plant is required at the Electricity Works. Tenders by June 4th.

ILFORD.—The Electricity Committee require 1,600 yards of conduit. Particulars from the Borough Electrical Engineer, and tenders by June 14th.

RAWTENSTALL.—The Electricity Committee have approved plans for electric tramways along Whitewell Valley. Tenders will shortly be invited.

SOUTH SHIELDS.—The Tramways Department require stores during the ensuing twelve months. Particulars from the Manager, and tenders by June 13th.

SUNDERLAND.—A recommendation of the Electricity Committee that 266 existing gas lamps upon the route of the present electricity mains be converted to electric lighting, at a cost of £465 10s. The annual cost of lighting by electricity and maintenance will be the same amount as at present.

TURKEY.—The Turkish Ministry of Commerce and Public Works invite offers for an electric tramway concession in Constantinople. Particulars from the Public Works Ministry, Constantinople, and tenders by Nov. 10th.

A concession is also offered for electric tramways at Salonica. Particulars as above.

Local representation is essential in the case of Turkish Government contracts. A list of British commission agents in Constantinople and a copy of the Constantinople specification (in French) may be seen at 73 Basinghall Street, London.

WALTHAMSTOW.—A Sub-Committee is considering the the question of providing additional tramcars.

WIMBLEDON.—The Local Government Board is to be asked to sanction the borrowing of £800 for meters.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

ABERDEEN.—Offices for the Royal Insurance Co., 28 Lombard Street, E.C.

ALTRINCHAM.—School (£8,295). Secretary, Education Committee, Altrincham Council.

AYR.—Club for S. Ayrshire Liberal Association, Blasnell Park (£10,000). Architect, J. Johnson, Troon, Ayrshire.

BELFAST.—The Committee of Management of the Belfast District Asylum invite tenders for electric lighting installations in new asylum buildings on the Purdysburn Estate. Particulars from Messrs. Watt, Tulloch & Fitzsimons, 77A Victoria Street, Belfast, and tenders by June 13th.

BIRMINGHAM.—Theatre, High Street. Builders, J. Dallow & Sons, Blackheath, near Birmingham.

BRISTOL.—Factory, Staple Hill. Architects, Fred Gardiner & Son, Barton Street, Bath.

DERBY.—Theatre. Architect, A. Eaton, 6 St. James Street, Derby. Builder, J, Dickenson, Derby.

DUBLIN.—The Trustees of the Stewart Institution, Chapelizod, invite tenders by June 6th for the electric lighting of the Institution. Particulars from Mr. T. Tomlinson, 16 Beresford Place, Dublin.

DURHAM.—Additions, Eldon Lane School (£2,000). Architect, F. E. Coates, Shire Hall, Durham.

EDINBURGH.—Teachers' training college (£60,000). Architect, A. K. Robertson, 29 Hanover Street, Edinburgh.

Hall, George Street (£30,000), for the Grand Lodge of Freemasons of Scotland.

ERITH.—Extensions of Sanatorium (£1,298). Builders, G. T. Gunning & Sons, Erith.

FOLKESTONE.—Theatre. G. S. Valentine, 19 Charing Cross Road, W.C.

GATESHEAD.—School (£6,000). Architect, F. W. Purser, West Gate, Gateshead. Builders, Raven and Hitcham, Gateshead.

GLASGOW.—School offices, Bath Street (£20,000). Architect, H. E. Clifford, 225 St. Vincent Street, Glasgow.

HEREFORD.—School (£9,950), Widemarsh Street. T. Lewis, Secretary, Education Committee, Hereford C.C.

ILFORD.—Electric theatre, High Road. Architects, Emden, Egan & Co., 2 Lancaster Place, W.C.

MANCHESTER.—The West Didsbury Guardians propose to light the G and L blocks of the workhouse by electricity. Particulars from Messrs. C. Clegg & Sons, 21 Spring Gardens, Manchester, and tenders by June 7th.

MOSLEY (Birmingham).—Fire station (£10,000). Builders, J. Dallow & Sons, Blackheath, near Birmingham.

SALISBURY.—Isolation hospital (£15,750). Surveyor, Wiltshire C.C.

WEST HAM.—The Education Committee require tenders for the electric wiring of three schools. Particulars from the Architect, Mr. W. Jacques, 2 Fen Court, Fenchurch Street, E.C., and tenders by June 20th.

TENDERS RECEIVED AND ACCEPTED

BRISTOL.—The Corporation have accepted the following tenders: Joint and junction boxes, Messrs. Sykes & Sugden, Ltd. (£214); meters, The General Electric Co., Ltd. (£546); 500-kw. converter for Underfall Yard substation, Bruce Peebles & Co., Ltd. (£1,230). Contracts amounting to £655 have also been entered into with the Union Electric Co., Ltd., Ship Carbons, Ltd., and the Oliver Arc Lamp, Ltd., for arc lamp carbons during the year 1910-11.

DERBY.—The order for replating the lighting battery, consisting of 240 cells, has been placed with the Chloride Electrical Storage Co., Ltd.

DUBLIN.—The Board of Works has given Messrs. R. Waygood, through their Dublin agents, Messrs. W. Coates & Sons, an order for the supply and erection of one of their latest pattern push-button automatic electric passenger lifts for the Viceregal Lodge.

ECCLES.—The Council has accepted the tenders of the British Insulated & Helsby Cables, Ltd., for high-tension concentric paper insulated cable at £459 11s.

GRIMSBY.—The Council have accepted the following tenders in connection with the lighting of additional streets with electricity: J. H. Tucker & Co., fuse boxes, £37 10s.; Phœnix Dynamo Manufacturing Co., Ltd., 3-wire balancer, £38; Chamberlain & Hookham, and Ferranti, Ltd., meters; W. Lucy & Co., 300 cast-iron lamp posts, £326 5s., and incandescent lamp fittings, £248 3s. 9d.

HESTON & ISLEWORTH.—The Council has accepted the following tenders in connection with the proposed extension of the electric light works: Browett, Lindley & Co., 250-kw. generating plant (Westinghouse dynamo and B.T.-H. switch panel), £1,514; 68 tenders were received; Babcock & Wilcox, steam piping and pumps, £210; Korting Bros., condensing plant, £300; Selson Engineering Co., machine tools, £102 4s. 6d.

KINGSTON-ON-THAMES.—The Council have accepted the

Digitized by Google

tender of W. T. Henley's Telegraph Works Co., Ltd., for ½-mile of 5-ampere cable at £44 10s., and ½-mile of 35-ampere cable at £87 10s. They have further accepted the tender of Siemens Bros. & Co. for ½-mile of 12-ampere cable at £58, and ½-mile of 22-ampere cable at £71.

LONDON.—Messrs. Rashleigh Phipps & Co., 147 Oxford Street, London, W., inform us that they have obtained the contract for the electrical work at Messrs. Swears & Wells' premises in Regent Street, which are about to be re-built. The new building will be equipped with electric lifts, electric heating, electric irons, besides electric lighting and automatic intercommunication telephones, and will be one of the most up-to-date buildings in London.

Southwark.—The Electric Light Committee report they have had under consideration the question of the supply of carbons for the ensuing twelve months, the market price of which has considerably increased during the past few months. The Committee have received the option of continuing the arrangement entered into in March, 1909, with the Union Electric Co. and the Sloan Electric Co., for the supply of carbons at the then existing price, viz., £2 18s. per 100 pairs, less special discount, and have accepted same.

METROPOLITAN ASYLUMS BOARD.—The tender of W. J. Fryer & Co., at £51 17s. 6d., has been accepted for installing the electric light at the assistant medical officer's quarters, North-Eastern Hospital.

MIDDLESEX.—The County Council has accepted the tender of Dick, Kerr & Co., at £429, for the laying of a double instead of an interlacing line in a portion of High Road, Willesden, to widen the road here, and set back forecourts.

SALFORD.—The Council have accepted the following tenders for annual supplies:—W. Lucy & Co., Ltd., house service cut-outs; Liverpool Electric Cable Co., rubber-covered cable; W. T. Glover & Co., Ltd., paper-insulated cable; C. Macintosh & Co., Ltd., twin workshop flexible. They have also accepted the tender of the British Westinghouse Co. for installation of electric light at the Wellington Street School, at £146 8s.

WALTHAMSTOW.—Subject to the sanction of the Local Government Board, the Electricity Committee have accepted the following tenders:—Booster set, General Electric Co., Ltd.; switchboard, Bertram Thomas, Ltd.; constructional iron-work, General Iron Foundry Co. The total cost of the extensions amounts to £950.

Siemens-Schuckert Meter.—The Board of Trade have approved of the Siemens-Schuckert alternating-current meter, type W10, and of the means for fixing same.

MISCELLANEOUS CITY NOTES

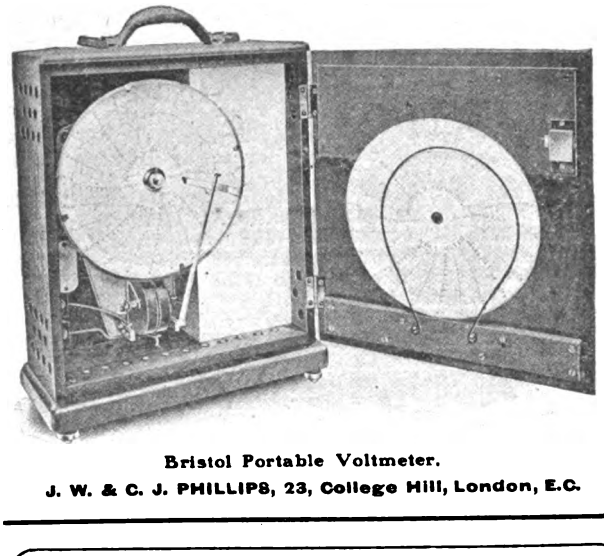
CALGARY POWER CO.—An issue of 5 per cent. first mortgage 30 year gold bonds of this company is being made at £92 per cent.

HARPER ELECTRIC PIANO CO.—An issue is being made of 22,052 participating ordinary £1 shares at par.

COMPANIES STRUCK OFF REGISTER.—The following have been struck off the register of joint stock companies: Aberavon District Tramways Syndicate, Automatic Telephone Co. (1903), British Electric Separating Co. (1904), Everyday Electricity Publishing Co., Garcin Renault Electric Cars & Accumulators, Northern Electrical Supply Stores, Reliance Electric Co.

APPOINTMENTS AND PERSONAL NOTES

The National Telephone Co. require young ladies, between the ages of 16 and 25 years, as telephone operators. (See an advertisement on another page.)



An electrician is wanted at Dudley. (See an advertisement on another page.)

Mr. J. A. Crowther, shift engineer at the Sunderland Corporation electricity works, has been appointed an assistant electrical engineer at a salary of £150 in place of Mr. Humphrys, resigned.

The late Mr. Arthur Greenwood, J.P., chairman of Messrs. Greenwood & Batley, Ltd., Albion Works, Leeds, left estate valued at £20,555 gross, with net personality £8,138.

A recommendation has been made by the Brighton Electricity Committee that the salary of Mr. G. Cloughton, power-house superintendent at the Southwick power-house, should be increased from £260 to £300 per annum, with two further annual increments of £25, making a maximum of £350 per annum.

Obituary.—We regret to hear of the death of Mr. Alfred Colson, Electrical and Gas Engineer to the Leicester Corporation. A few months ago Mr. Colson underwent an operation in London, which, although not in itself a severe one, revealed the existence of a malignant growth, the nature of which precluded any hope of a successful cure. At the same time, the suddenness of Mr. Colson's death was unexpected. Mr. Colson's first appointment under the Leicester Corporation was as gas engineer in 1882. It was in 1894 that the Corporation decided to erect an electricity works, and Mr. Colson was appointed engineer to this undertaking as well, and the deceased gentleman held this dual position until the end.

Bristol Portable Voltmeter.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 5s. to £59 15s. per ton (last week, £59 to £59 10s.).

FOR SALE.—The Torquay Corporation have a number of maximum demand indicators for sale (see an advertisement).

A patent for an improved telephone dictating machine is for sale (see an advertisement).

An electrical engineering contracting business is for sale (see an advertisement).

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—A meeting of the Automobile Electric Lighting Syndicate, Ltd., will be held at Queen's College, Birmingham, on June 28th, at 11.45 a.m., to hear the liquidator's account of the winding-up.

A meeting of the Polkey Automobile Electric Lighting Syndicate, Ltd., will be held at Queen's College, Birmingham, on June 28th, at 12 noon, to hear the liquidator's account of the winding-up.

Mr. W. H. Trentham, consulting electrical engineer, 39 Victoria Street, Westminster, S.W., has been adjudicated bankrupt.

Mr. F. W. Pixley and Mr. F. S. Salaman, 1 Oxford Court, Cannon Street, London, have been appointed trustees of the estate of the late Mr. F. H. Medhurst, electrical engineer, 13 Victoria Street, London, S.W.

The liquidator of the British Power, Traction & Lighting Co., Ltd., has been released.

An application for the discharge of Albert Clapham, electrical engineer, 101 Kirkstall Road, Leeds, will be heard at 10.30 a.m. on July 18th at the County Court House, Albion Place, Leeds.

DISSOLUTION OF PARTNERSHIP.—F. W. Richardson & J. D. Carlmark, electrical engineers, High Street, West Bromwich, have dissolved partnership.

CANADIAN AGENCIES.—A Birmingham firm manufacturing portable electric hand lanterns, electric dry cells of various kinds, electric pocket lamps, torches, accumulators, weatherproof bells, wood-cased bells, electrical accessories, dynamos, motors, switches, fittings, &c., wish to enter the Canadian market. Further particulars from the High Commissioner for Canada, 17 Victoria Street, London, S.W.

A London firm representing manufacturers of pressure turbine pumps, electric haulage engines, lifts, cages, &c., would like to get into communication with Canadian engineering firms prepared to act as their representatives. Further particulars from the Board of Trade City Trade Branch, 73 Basinghall Street, London, E.C.

THE DUSSEK BITUMEN CO.—The name of the British Electrical Trade Supply and Bitumen Co. has been changed to The Dussek Bitumen Co. The address will remain as hitherto: Canal Bank, Trundley Road, Deptford, London, and there will be no change in the management.

NEW LONDON SHOWROOMS.—Messrs. Jesson, Birkett & Co., Ltd., designers and workers in metals, have removed their London offices and showrooms from 27 Ely Place to 9 Newman Street, Oxford Street, W., and extend a cordial invitation to the trade to visit these new premises.

The London showrooms of the British Prometheus Co., Ltd., are now at 9 Newman Street, Oxford Street, W.

APOLOGY.

To Messrs. Galsworthy, Ltd., of Roberts Works, Hampstead Road, N.W., and of Nos. 15 & 16 Newman Street, Oxford Street, W.

I BEG to express my sincere regret at the infringement by W. Sitch and Co., Ltd., of your registered design No. 493,943 for an electric or gas fitting, and to assure you that this infringement was the result of inadvertence, and will not be repeated; and, to remedy as far as possible the injury caused you by my company's action, I authorise you to make this apology public in any way you think proper.

(Signed) ALFRED SITCH.
Managing Director of
W. Sitch & Co., Ltd.

48 *Berwick Street, London, W.*
May 23rd, 1910.

National Physical Laboratory Accounts.—The balance-sheet of the National Physical Laboratory of 1909 shows a profit of ordinary income over expenditure of £183 16s. 9d. The income includes a Treasury grant of £7,000, and £13,006 fees for tests, and donations and subscriptions £1,000.

P. & O. Batti-Wallahs' Society.—A general meeting will be held at the Golden Cross Hotel, Charing Cross, London, on Monday next, June 6th, at 6.30 p.m., to consider a proposal to delete "P. & O." from the title. The object is to increase the support to, and scope of, the society.

Poplar School of Engineering.—At a meeting on May 25th of the "Association of Electrical Engineering Students," formed by the students of this school, Mr. W. S. Ibbetson read a Paper on "Hydro-electric Power Plants." On June 22nd a debate on "Gas *versus* Electricity" will take place.

COMPANIES' MEETINGS AND REPORTS

MIRRLEES, BICKERTON & DAY.—The second annual meeting of this company was held last week. There was a profit of £5,577 for the year 1909, and after placing £1,000 to reserve and paying a dividend of 5 per cent. on the ordinary shares, the sum of £577 is carried forward. Mr. A. H. Baird, who presided, said that important agencies had been established in foreign countries, and the company had supplied engines to China, Japan, India, Java, Bulgaria, West Indies, and other parts of the world. The discoveries of oil and the starting up of new oil companies in so many parts of the world would doubtless have a very beneficial effect upon their business.

FIFE TRAMWAY LIGHT & POWER CO.—The first ordinary general meeting of this company was held in Edinburgh last week. The Chairman stated that with a little over one-half of the tramways running for less than two months out of the year, they were able to pay a dividend to the Dunfermline Tramways Co. of £1,111. The company have made an agreement to acquire all the shares of the Fife Electric Power Co., but as they were debarred from any interest in the Power Co. until after December 31st, no revenue from this source could be included in the accounts. New substations are being built at Cowdenbeath and Lochgelly. The company are satisfied with the position of the Power Co.'s business.

POTTERIES ELECTRIC TRACTION CO.—At the annual meeting on Thursday, satisfaction was expressed at the resumption of dividends upon the ordinary shares. The chairman, Mr. C. F. Cornwallis-West, read extracts from reports by the Board of Trade inspecting officer, which testified to the thorough repair of the company's lines, and to the satisfaction of the borough authorities, compared with two years ago. It was impossible for him to say to what extent, if any, the federation of Burslem, Hanley, Longton, Stoke, and Tunstall have upon the company's business. The fair fare system had not been in use a sufficiently long time to gauge its earning capabilities.

SIEMENS BROS. & CO.—A dividend of 4 per cent. is announced for 1909, allocating £23,600 for repairs to the c.s. *Faraday*, and carrying forward £3,689.

BRUSH ELECTRICAL ENGINEERING CO.—The report for 1909 shows net profit of £1,811. Debenture and other interest charges, and bad and doubtful debts written off, absorb £23,042, leaving a loss of £21,230. Orders secured during the latter portion of 1909 showed a considerable improvement over the previous twelve months, but was not possible to make up for the shortage of invoicing during the earlier months. The year 1910 will benefit by the larger volume of unfinished work in hand at December 31st last. The auditors point out that no provision has been made for depreciation during the three years ended December 31st, 1909.

The Committee for the Protection of Electrical Interests.—At a meeting held at Faraday House last Wednesday, Mr. Robert Hammond in the chair, Mr. Arthur Preece was elected hon. treasurer, and Mr. R. Borlase Matthews, who has acted as hon. secretary *pro tem.*, was elected hon. secretary of the committee.

The Brennan Gyroscopic Mono-rail System.—A full-size vehicle on this system can be seen running on a long track at the Japan-British Exhibition. The vehicle and its mode of working were fully described with illustrations and diagrams in ELECTRICAL ENGINEERING, Vol. V., page 977. At a press demonstration on Wednesday of last week Mr. Brennan informed our representative that he had sold the rights for the use of the system in Alaska to Major J. E. Bellaine, of Seward, who is now arranging for the construction of a line 100 miles long in Alaska. The total cost of the line, including two mono-rail cars, is estimated at £1,000 per mile. As the rates in Alaska are very high, a very substantial return for the first year of working is expected. Both goods and passengers will be carried.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the annual meeting on Thursday:—*Members:* A. A. Bion and A. Hands. *Associate Members:* S. H. Busch, P. J. Childs, H. V. Flinn, F. J. Howe, J. W. Miles, J. C. Morby, A. J. Newman, G. W. Shearer, D. H. Slack, L. W. Swainson, J. T. Tattersall, H. W. Tyler, A. L. Veitch, A. G. Watson, J. H. Wright, J. G. Bell, J. S. Brown, W. F. Duncan, J. W. Fraser, S. C. Hackney, N. Pensabene-Perez, A. J. Rayner, A. M. Robertson. *Associate:* W. H. Hunter. *Students:* R. M. Clark, J. H. Enion, José Gomes, H. E. Gough, S. M. Hill, N. G. Kapp, R. O. Kapp, G. W. McCall, D. J. Martino, A. Plowman, B. B. Pradhan, H. Rider, H. Shannon, J. Slevin, W. M. Slevin, R. Stafford, H. A. Steytler, H. Tetlow, G. H. Tilly, P. N. Varman.

TECHNICAL EDUCATION

IN a Paper entitled "The Movement towards a National System of Education" read on Saturday, April 2nd, before the West Yorkshire branch of the Association of Teachers in Technical Institutions, Dr. R. Pohl (Chief Engineer, Phœnix Dynamo Manufacturing Co., Ltd., Bradford) said that the fundamental principles for future work in technical education were as follows: There should be a thoroughly organised system of technical education, leading up from the primary and secondary schools to the technical school, and having, as its crown, the technical university, every stage of the system being in intimate contact with the next, so far as possible without overlapping, and the educational work must be carried out in the closest possible co-operation with the employer. This system should be a national one; that is to say, the Board of Education should not only inspect and supervise the individual institutions, but should ensure proper co-ordination; extend by law the leaving age for children, when and where necessary; enlist by all available means the co-operation of employers, and introduce a uniform system of examinations and degrees; and it should, from its exalted position, watch the working of the system, comparing it with that of other nations, and generally employing and developing the powerful weapon of technical education in the interests of the industries and the progress of the nation as a whole.

He did not advocate a copying of the German system, as it had several disadvantages, and tended to a centralisation which caused lack of intimate contact with local industries and insufficient amalgamation of theory and practice. There was also in Germany insufficient co-operation between the schools and the technical universities. He had great admiration for the work of evening classes in England, though in principle he was in the fullest agreement with those who object to all evening work and wish it transferred to the day. He regarded some sort of "sandwich" system as the best for training the industrial rank and file, and suggested that the present evening courses should be made more efficient by establishing co-operation with the employers, and by reducing the hours of labour to shift the centre of gravity gradually from the evening to the day.

Turning to the question of technical universities, Dr. Pohl expressed the view that better organisation and efficiency was found in Germany owing to there being national institutions, just sufficient in number for the needs of the whole nation, so as to allow of intense specialisation in all branches, instead of results of the haphazard efforts of private persons, guilds, societies, municipalities, and whosoever liked to distinguish himself in this direction. There should be full inquiry by a Royal Commission into the means of correlating the work of universities with that at other institutions. A further increase in the already excessive number of competitive institutions was not wanted, but, instead, a thorough amalgamation of the same and the replacement of mutually destructive competition by effective co-operation.

It appears not unlikely, continues Dr. Pohl, that as a result of the inquiry of the special Royal Commission appointed last year, such amalgamation may soon be brought about so far as London is concerned, and an early extension of the principle to the provinces would then be within the range of probability. The leading institutions at present existing, in each university area decided upon, would form the constituent colleges; they might have the first and second year's courses in common, which, of necessity, would be generally scientific and educational in character, including such subjects as national economy, industrial history, industrial legislation, patent laws, &c., but the higher branches would be distributed according to the nature of the institutions and the industrial activities of the districts. Higher technical education in England, if developed on such lines, would have adopted only one important point from the Prussian system, that is, organisation on a national basis, a point which, in his opinion, is indispensable to success. Other and less important points of similarity, such as the uniform system of examinations and of legally protected degrees, would come as a natural consequence.

The fees, Dr. Pohl thinks, should not be kept low, except for scholarship students, but should be, at any rate, in proportion to the cost of such institutions. Scholarship students would thus predominate more and more, which would make it possible to adjust the number of highly-trained men to the needs of the industries, and to avoid the excessive supply found in connection with the German system.

Electrical Contractors' Association.—The annual general meeting of this Association will be held at the Caledonian Station Hotel, Princes Street, Edinburgh, on Monday, June 13th, at 3 p.m., and will be followed by the annual dinner at 7 p.m. The price of the tickets for the latter is 8s. 6d., and these can be obtained from Mr. Walter Finlay (18 Frederick Street, Edinburgh), or from the Hon. Secretary, Mr. L. Tate, at the offices of the Association. Special reduced charges for members have been arranged for with the proprietors of the hotel.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

DRAWING APPARATUS.—We have received from Messrs. W. J. Brooks & Co. (Letchworth, Herts) particulars of several new appliances for the use of draughtsmen. One of these is a locking device by which the T-square can be locked in any position to the board, and released by pressure on a knob at any time. Another useful device is a metal strip with small spikes at intervals, which serves instead of a row of drawing pins. Other leaflets describe several patterns of fixed and flexible curves.

FANS.—A new illustrated folder of a size convenient for enclosing in letters, and describing various patterns of electric fans, is being issued by the General Electric Co. (67 Queen Victoria Street, London). The fans illustrated include the little "Liteweight" desk fan, which weighs only 10 lb., a universal-type fan which can be used as a bracket fan, and a ceiling fan. The company is willing to supply these in quantities to contractors and central station engineers with their name and address printed on free of charge. Applicants should refer to this notice.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ELECTRIC POWER ON THE RAND.—We have received a reprint in book form of a series of articles on the question of the working costs on the Rand, which appeared recently in the "Investors' Guardian." The various causes of the large reduction within the last few years are reviewed, and a brief reference is made to the application of electric drive to ore crushing and other machinery.

DRIVING OF PLANING MACHINES.—A booklet from Messrs. C. E. Lugard & Co. (Chester) gives a description of a simple arrangement of electromagnetic clutches for the working of planing machines without having recourse to the shifting of belts over fast and loose pulleys. The clutch can be applied to any existing belt-driven machine. The old striking gear is removed, and one of the levers is utilised to actuate a sliding switch controlling the supply of current to the clutches. The form of double clutch used can be applied to various cases of reversing machine tool drive.

FANS.—An attractive folder from the British Thomson-House Co. calls attention to desk and other fans for continuous and for alternating current.

OSRAM LAMPS AT THE JAPAN-BRITISH EXHIBITION

The accompanying illustration shows the attractive stand erected by the General Electric Co., Ltd., in the Machinery Hall of the Exhibition. It is devoted entirely to Osram lamps and fittings. Demonstrations of fancy bulb blowing, mounting Osram filaments, and fitting the completed carriers in the bulbs, are given daily. Various patterns of indoor and outdoor fittings,

THE OSRAM LAMP STAND AT THE JAPAN-BRITISH EXHIBITION.

including several types of the new Osramlite shades and reflectors, are exhibited. A number of attractive illuminated signs and Osram lamps of all sizes and patterns are also shown. Very effective literature is distributed from the stand, including a card with a concise and striking comparison between the costs of lighting with carbon filament and Osram lamps at different charges per unit.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 26th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

5,062/09. **Storage Battery.** A. W. SOMERS and R. J. CROWLEY. This is a storage cell of the type in which the positive plates only are recharged, and are taken out of the cell to be charged. The positive plates consist of the usual active material in a lead grid, and are immersed, before forming, in a solution of silicate of sodium to harden them. They are enclosed in perforated celluloid cases and placed between negative plates of zinc or zinc amalgam. The latter are formed by treating zinc plates with a solution of mercury, soda, and dilute sulphuric acid. An alternative negative plate consists of zinc granules similarly treated, and supported in an amalgamated copper grid and enclosed in a perforated celluloid case. The electrolyte is a solution of sulphuric acid and soda. A high discharge rate, absence of sulphating, and a high efficiency are claimed. The cell can be recharged by replacing the discharged positive plates by charged ones. Four claims, four figures.

7,791/09. **Submarine Cables.** R. K. GRAY. For the purpose of increasing the self-induction and reducing the capacity of submarine telegraph or telephone cables, the conductor is formed of wires of two different metals, one of which is magnetic. Thus a solid central copper core is braided with two sets of strands of copper and iron respectively, the two sets being interlaced and insulated from one another. Six claims, one figure.

10,791/09. **Battery Electrolyte.** G. SCHAULI. An electrolyte for primary and secondary cells consists of a pulp of flaked rice, dextrin, or cellulose mixed with zinc chloride, and either ammonium chloride or some metal chloride salt. The mixture is heated for pouring into the cells, and practically solidifies on cooling. It is claimed to prevent crystallisation or creeping in almost any climate. One claim.

12,424/09. **Insulating Material.** M. WILDERMANN. An ebonite capable of resisting the action of chlorine and alkalis is manufactured by mixing the rubber and sulphur with from 5 to 15 per cent of graphite or finely-divided mica or carbon. The mixture is finally over-vulcanised, as described in a previous patent, No. 18,269/08. Two claims.

15.881/09. **Arc Lamp.** H. J. JABURG. A flame arc lamp in which the arc is struck between two downwardly converging touching electrodes, and a third electrode movable in a plane perpendicular to the plane of the axes of the other two, was described in Patent No. 7,471/09 (see ELECTRICAL ENGINEERING, March 31st, 1910, p. 222). According to this patent, the electrodes are of large section to facilitate the changing over of the arc and to increase the burning hours. The third electrode is of plain carbon. To ensure uniform burning, the cores of the other two are displaced towards each other. Six claims, four figures.

26,021/09 **Cable Conduit Joints.** W. R. SYKES and C. J. COOKE. The abutting ends of two lengths of bitumen conduit are enclosed in a sleeve, and an iron bridge-piece spans across this sleeve and grips the two sections by means of split collars clamped on with bolts. A joint box constructed on the same principle consists of a wooden box encased in metal, the metal cover having split collars to grip the incoming bitumen conduit. Five claims, eight figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: DAVY, 11,482/09; SIEMENS-SCHUCKERTWERKE GES., 16,904/09; SZUBERT, 22,926/09; GRAVIUS, 29,239/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: MARTYN [Junction boxes] 10,860/09; LUCAS and WALMSLEY [Distribution] 11,201/09; TANNER and CLAREMONT [Distribution] 7,019/10.

Dynamos, Motors, & Transformers: TURNER [Machines] 2,959/09; DURTNALL [Power transmission and speed regulation for hauling and winding gear] 6,758/09; KILROY and EVERSHED & VIGNOLES, LTD. [Starting of motors] 10,680/09.

Electric Ignition: BELLEM and BRÉGÉRAS [Electromagnetic control of petrol admission] 9,496/10.

Electrometallurgy & Electrochemistry: JOHNSON (*Badische Anilin & Soda Fabrik*) [Production of nitrates] 11,274/09; LUCKOW [Electrolytic manufacture of salts of metals insoluble in the electrolyte] 408/10.

Heating & Cooking: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Heating apparatus] 11,172/09.

Instruments & Meters: GODDARD [Prepayment meters] 11,402/09; BRITISH THOMSON-HOUSTON CO. and HOLDEN [Meters] 12,689/09; SIEMENS BROS. & CO. (*Siemens & Halske A.-G.*) [Frequency meters for speed measurement] 2,726/10.

Switchgear, Fuses, and Fittings: ELIESON [Switches] 10,757/09; VON ZWEIGBERGK [Traction controllers] 11,302-3/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Rectifying apparatus] 11,539/09; LYNESS [Contact-fingers for controllers] 15,151/09; LUNDBERG [Switch and fuse boxes] 3,926/10.

Telephony and Telegraphy: LEAKE [Signalling] 11,295/09; PEDERSEN [Signalling apparatus] 25,190/09; SIEMENS BROS. & CO., and RIBER [Telephone receiver] 466/10.

Traction: LUKE & SPENCER, LTD., and WATERHOUSE [Brake-shoes] 16,404/09; DURTNALL [Power transmission and speed regulation for electric vehicles] 6,758/09; HARRISON (*Electric Railway Improvement Co.*) [Welded rail-joints] 28,617/09; SIEMENS & HALSKE A.-G. [Recording intervals and speed of trains] 376/10.

Miscellaneous: MAYOR & COULSON, LTD., and MAYOR [Coal-cutter] 11,206/09; LICHTENFELD [Burglar alarms] 28,942/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distribution Systems, &c.: TORCHIO [Cable insulation] 10,160/10.

Dynamos, &c.: ALLGEMEINE ELEKTRICITÄTS-GES. [A.-C. commutator machines] 10,692/10; A.-G. BROWN, BOVERI ET CIE. [Driving of dynamos] 11,024/10.

Electric Ignition: JUSTON [Magneto generator] 9,772/10; DELAGE and WOOD [Ignition of gas burners] 11,362/10.

Electrometallurgy, &c.: SOC. ANON. ELECTRO-METALLURGIQUE (Procédés Paul Girod) [Refining of steel] 26,588/09; SOC. D'ELECTRO-CHIMIE and HULIN [Electrolytic production of sodium] 6,063/10; FRANTZEN [Furnaces] 10,917/10.

Incandescent Lamps: KRAUSE [Metal filament lamps] 11,107/10.

Traction: COTA [Air brakes] 10,776/10; SOC. IN ACCOMANDITA PER L'UTILIZZAZIONE DELLE INVENZIONI ING. BEER [Signalling] 11,358/10.

Miscellaneous: REGINA-BOGENLAMPENFABRIK GES. [Alloy for electric soldering tools] 6,523/10.

The following amended Specifications can now be obtained.

J. C. DOBBIE [Mariners' compass] 8,305/01; C. F. SCOTT [Control of A.C. motors] 19,520/05; E. FREUND [Track brake] 28,546/07; J. KEITH [Ventilation of ships] 5,638/09.

Opposition to Grant of Patents

6,177/09. **Electrical Marine Propulsion.** C. A. PARSONS, G. C. STONEY, and A. H. LAW. Opposition has been entered to the grant of this patent. It covers a method of winding motors and generators in sections, so as to work at low pressures. (See ELECTRICAL ENGINEERING, April 14th, 1910, p. 258.)

12,289/09. **Table Fan.** J KEITH. An appeal has been lodged against the decision of the Comptroller to grant this patent. The specification was abstracted in ELECTRICAL ENGINEERING, March 10th, 1910, p. 172.

19,098/09. **Magnetic Track Brakes.** Dick, Kerr & Co., Ltd. (*R. Braun*). As the result of opposition, the right to a grant of a patent on this application has been surrendered. The specification was abstracted in ELECTRICAL ENGINEERING, January 20th, 1910, page 50.

Revocation of Patent

9,289/08. **Meter.** H. ARON. The application for the revocation of this patent has been dismissed. It covers a two-rate or multiple-rate meter, the counting mechanisms of which operate separate maximum demand indicators.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: C. A. VANDERVELL and W. H. PROCTOR [Constant-pressure variable-speed dynamo] 2,918/05.

Electric Ignition: A. DE DION and G. BOUTON [Condenser across contact breaker] 8,919/05.

Electrometallurgy, &c.: J. C. JOBLING and H. C. HARRISON [Electro deposition] 2,632/05.

Instruments, &c.: W. M. MORDEY and G. C. FRICKER [Meter] 2,710/00.

Storage Batteries: J. T. NIBLETT [Plates] 3,819/02.

Switchgear, &c.: H. LEITNER and R. N. LUCAS [Automatic voltage regulator] 3,425/03 and 3,603/04; F. TESTOR [Time switches] 3,453/03; L. ANDREWS [A.-C. reverse-current cut-outs] 3,460/04; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Ironclad switch-fuse box] 2,586/05; A. HEPKE and K. DIENER [Multiple fuse plugs] 2,858/05; H. HIRST and H. BEVIS [Lamp-holder with lock] 2,894/05.

Traction: F. B. BEHR [Electric mono-rail locomotives] 3,610/02; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Air brakes] 3,261/04.

SUMMARY

The fifteenth annual convention of the incorporated Municipal Electrical Association will be held in Glasgow next week, under the presidency of Mr. W. W. Lackie, City Electrical Engineer, Glasgow. In accordance with our usual custom, we give portraits and short biographies of members who are down to read Papers and open discussions. For the convenience of those attending the convention we also publish some general notes on the works to be visited, including an account of the electricity supply and tramway systems of the Glasgow Corporation, and short descriptions of the municipal electricity works at Edinburgh, Govan, and Partick, the Yoker power station of the Clyde Valley Electric Power Co., and Messrs. W. Beardmore's works. A list of members and visitors who, up to the time of going to press, have intimated their intention of being present is also given. (Pages 367 to 371, and 378.)

At the last meeting of the Newcastle Local Section of the Institution of Electrical Engineers, Mr. H. W. Clothier gave an interesting lecture on the historical development of switchgear from the very earliest open-type low-tension board to the modern sub-divided iron-clad system. Several interesting experiences were described, both in the lecture and in the discussion. (Page 371.)

A new line of portable A.-C. and D.-C. instruments of the dynamometer type, including a wattmeter specially designed for lamp testing, is referred to on page 373.

Our monthly article on new electrical supplies and accessories includes illustrated descriptions of a new edgewise tumbler switch for flush work, an insulating lamp-holder shield, a new pattern of tubular metal filament lamp, and several novelties in the way of heating and cooking apparatus, including a toaster and a water-heater with heating elements enclosed in quartz, and a cheap complete cooking outfit. Another interesting appliance described is an electrolytic bleaching apparatus for removing stains. (Page 373.)

Among the specifications published by the Patent Office on Thursday last was one by W. P. Durtnall for a system of electro-mechanical power transmission for vehicles or winding gears.—An automatic motor starter, in which the starter-arm is prevented from advancing on each step by a differentially wound electromagnet until the current has fallen to a predetermined value, is covered by Eversheds & Vignoles, Ltd.—J. Howden describes a method of preventing the rotor discs of impulse turbines from seizing on the rotor shaft by electroplating the interior surface of the nave with copper.—Patents by J. and E. Conradi for a wall-plug, and by K. Maxaner for a centrifugal fan with self-contained motor, are opposed. (Page 374.)

The discussion promoted by the National Electrical Manufacturers' Association as to whether a Free Trade or a Protectionist policy would most benefit the elec-

Digitized by Google

trical industry was continued on Monday. Messrs. E. Garcke, G. Byng, H. H. Berry, A. Bruce Anderson, and H. Hirst spoke in favour of Tariff Reform, and Messrs. H. Oppenheimer, R. Hammond, W. G. Bond, and J. E. Kingsbury in favour of Free Trade. (Page 376.)

THE boundaries of the city of Birmingham have been extended to include Aston Manor and a number of other places. The electricity works in these will be transferred.—The Acton Council is still undecided as to disposing of its electricity undertaking.—The Blackburn Corporation Tramway Accounts for last year show a profit of £453 against a loss of £4,804 in the previous year.—There was a net profit on the Bolton electricity accounts for last year of £7,119.—A sum of £4,000 has been transferred to relief of rates by the Croydon Electricity Committee.—The Folkestone Corporation have decided not to purchase the Folkestone Supply Co.'s undertaking.—Bethnal Green Council have decided to take a supply of electricity in bulk from Shoreditch.—A system of tube railways in Toronto is being reported upon.—Mr. C. W. Mallins, General Manager of the Liverpool tramways, is to report upon the Wigan tramways. (Page 379.)

A BOILER and generating set is required at Erith, and an electric power plant at the Knowle Asylum (Fareham).—An expenditure of £78,207 is contemplated upon extensions to the Neepsend (Sheffield) power station.—A loan of £3,234 is being taken up at Eccles, and one for £5,500 at Grimsby.—Tramway extensions are contemplated at Northampton.—The London County Council require tramcar bodies and electric equipments. (Page 380.)

AT the Brush Co.'s meeting on Monday, Mr. E. Garcke said there was nothing to do but reduce working expenses and hang on until better times came. The absence of any dividend for 1909 on the preference shares of the Imperial Tramways Co. is due to the loss on the company's holding in the London United Tramways.—The capital of the Anglo-Argentine Tramways Co. is to be increased by £8,000,000. (Page 381.)

Electrical Contractors' Association.—Mr. G. R. Ratcliff, of Messrs. Ratcliff & Co., has been elected chairman of the London Section of the Electrical Contractors' Association, in succession to Mr. Harland Bowden, who is president-elect of the Association. Mr. E. H. Freeman, of Messrs. Tyler & Freeman, has been elected vice-chairman of the London Section.

Light Railways in 1909.—The report of the Light Railway Commissioners for 1909 states that 13 orders were submitted to the Board of Trade for confirmation during the year, eight of which have been confirmed. The remainder are still under consideration. A total of 599 applications have been made to the Commissioners since the commencement of the Act, of which 199 have been rejected or were withdrawn. In previous reports attention has been drawn to the need for the construction of light railways in many parts of the country, and the opinion has been expressed that such needs are unlikely to be met unless the Act is amended. The lists show that a large number of light railways, the need for which has been established at public inquiries, and for which orders have been granted, have not been proceeded with. Whereas 46 light railways with a length of 375 miles (mostly steam), and 54 light railways with a length of 326 miles (mostly electric), have been constructed, orders have not been carried into effect in the case of 61 schemes with a length of 765 miles (steam), and of 35 schemes with a length of 210 miles (electric); in addition, powers have finally lapsed for 421 miles (steam), and 138 miles (electric). The chief difficulty in proceeding with schemes already authorised has been in finance, while the failures enumerated above have had the effect of deterring other proposals. In relation to electric light railways, experience has shown that the absence of any provision under the Act of 1896, for "submitting to Parliament" proposals which are required to be so submitted in accordance with the Act, renders the procedure unavailing, and practically unavailable, in many cases. To what exent, and in what way, the policy of the Act should be revised, the Commissioners admit, presents a difficult problem; but they draw attention to the marked success of the system adopted in Belgium, under which a total length of more than 2,000 miles of light railways, constructed with moneys raised on national credit, is already being worked without loss to the State, while a further length of some 2,000 miles has been projected.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JUNE 9TH.

Tramways and Light Railways Association.

10.30 a.m. Annual Congress in Dublin. (1) "The Dublin United Tramways," by R. S. Tresilian; (2) "Brake Shoe Standardisation," by J. A. Panton; (3) "Tramway Economics," by J. R. Salter; (4) "Railless Traction," by H. England; (5) "Should the 1870 Act be Revised," by F. Coutts.

FRIDAY, JUNE 10TH.

Tramways and Light Railways Association.

Annual Congress. Visits to works, &c.

Physical Society.

8 p.m. At Imperial College of Science, South Kensington. (1) "A Galvanometer for Alternate-current Circuits," by Dr. W. E. Sumpner and W. C. S. Phillips. (2) "The Positive Electrification due to Heating Aluminium Phosphate," by A. E. Garrett.

SATURDAY, JUNE 11TH.

Royal Institution.

3 p.m. Tyndall Lecture II.: "Electric Heating and Pyrometry," by Prof. J. A. Fleming, F.R.S.

MONDAY, JUNE 13TH.

Electrical Contractors' Association.

3.30 p.m. Annual Meeting at Caledonian Station Hotel, Princes Street, Edinburgh.

7 p.m. Annual Dinner at Caledonian Station Hotel.

TUESDAY, JUNE 14TH.

Incorporated Municipal Electrical Association.

10 a.m. Fifteenth Annual Convention in Glasgow. Reception by Lord Provost at Institute of Engineers and Shipbuilders in Scotland. (1) Presidential Address by W. W. Lackie. (2) "Commercial Progress," by A. C. Cramb (Croydon) and H. Collings Bishop (Newport, Mon.).

3 p.m. Visits to Glasgow Electricity Works and Substations.

7.30 p.m. Reception and Conversazione at City Chambers by Lord Provost.

Institution of Gas Engineers.

10.30 a.m. Annual General Meeting. "Public Lighting from a Municipal Point of View," by Jacques Abady.

WEDNESDAY, JUNE 15TH.

Incorporated Municipal Electrical Association.

10 a.m. Fifteenth Annual Convention. At Free Gardeners' Hall, Picardy Place, Edinburgh. (1) "Exhaust Steam Turbines and Condensing Plant," by F. A. Newington (Edinburgh). (2) "Mixed Pressure Turbines," by Ashton Bremner (Burslem).

2.30 p.m. Visit to Macdonald Road Electricity Works.

THURSDAY, JUNE 16TH.

Incorporated Municipal Electrical Association.

10 a.m. At Institute of Engineers and Shipbuilders, Glasgow. Discussions on (1) "Advantages of Continuous Records of Costs and of Steam Consumption," to be opened by G. Wilkinson (Harrogate) and C. E. C. Shawfield (Wolverhampton); (2) "Cheapening of the Cost of Mains and Services," by S. J. Watson (Bury) and F. Ayton (Ipswich).

2 p.m. Visits to Electricity Works, &c.

7 p.m. Annual Dinner at Windsor Hotel.

FRIDAY, JUNE 17TH.

Incorporated Municipal Electrical Association.

10 a.m. Annual General Meeting at Institute of Engineers and Shipbuilders, Glasgow.

Wireless Telegraphy.—It is stated that Mr. Marconi intends to make a series of tests shortly with a view to ascertaining the practicability of sending wireless messages across Canada.

Telegraph Traffic.—The Western Telegraph Co. on the 1st inst. put the cable between Para and Pernambuco into working order. Telegrams for Novo Redondo and Bailundo, in Angola, are no longer subject to delay. The land line between Bogota, the capital of the Republic of Colombia, and Barranquilla, in the same country, has been repaired after being down several years. On the 5th inst. cable communication between Mozambique and Majunga was restored.

Wireless Telegraph Patent Litigation.—With reference to the announcement last week of an action by the Marconi Wireless Telegraph Co., Ltd., against the British Radio-Telegraph and Telephone Co., Ltd., for alleged infringement of their patents, the latter company state that they are defending the above action and are fully prepared to indemnify all purchasers and users of their apparatus against any claim in respect of the Marconi patents.

THE I.M.E.A. CONVENTION

THE Incorporated Municipal Electrical Association will hold its fifteenth annual convention in Glasgow and Edinburgh from Monday to Friday next week, under the Presidency of Mr. W. W. Lackie, chief electrical engineer to the Glasgow Corporation.

MR. A. C. CRAMB, Chief Electrical Engineer, Croydon, who will read a Paper on "Commercial Advancement of Electric Supply."

THE PRESIDENT.

MR. W. W. LACKIE,
City Electrical Engineer, Glasgow.

MR. H. COLLINGS BISHOP, Chief Electrical Engineer, Newport (Mon.), who will read a Paper on "Notes on Commercial Progress of Electricity Undertakings."

MR. ASHTON BREMNER, Chief Electrical Engineer at Burslem, who will read a Paper on Wednesday on "Extensions to Existing Electricity Supply Stations by means of Mixed Pressure Turbines."

MR. G. WILKINSON, Chief Electrical Engineer, Harrogate, who will open a discussion on Thursday on "Advantages of Continuous Records of Costs and of Steam Consumption."

Mr. W. W. LACKIE, the President, was born at Montrose in July, 1869. He was educated at Montrose Academy, Aberdeen Grammar School, and was two years at the engineering classes in University College, Dundee, under Professor Ewing. He afterwards attended Glasgow University, studying under Lord Kelvin. After leaving college, Mr. Lackie entered the services of Messrs. Mavor & Coulson, who then owned the concern which was later to develop into the Glasgow Corporation Electricity Department. When the Corporation took over the undertaking, Mr. Lackie transferred his services, and was appointed mains superintendent of the new Department. Having been promoted to be Chief Assistant Engineer, it was natural that Mr. Lackie should be appointed to the post of chief, when Mr. W. A. Chamen left Glasgow in 1905. Mr. Lackie has been for two sessions Chairman of the Local Section of the Institution of Electrical Engineers, President of the Scientific Society of the Glasgow Technical College, Vice-President of the Institute of Engineers and Shipbuilders, and President of the Angus and Mearns Benevolent Society. Mr. Lackie's Presidency of the I.M.E.A. commenced immediately after the annual general meeting held at Manchester in June last year, and his term of office concludes with the close of the present Convention.

AUTHORS OF THE PAPERS.

In accordance with our usual custom, we publish portraits and short biographies of the members who are down to read papers and open discussions.

ALEX. C. CRAMB, who, jointly with Mr. H. Collings Bishop, will read a Paper on "Commercial Progress," was educated at the Devon County School, and received his technical training at the Northampton Institute, London, where he gained honours in electrical engineering. He served his articles with Walker & Co., Cardiff, and Easton, Anderson & Goolden, of Erith. Before his appointment as Borough Electrical Engineer at Croydon, Mr. Cramb was successively Assistant Engineer at Holloway, Islington, Huddersfield, Hampstead, and Croydon. He entered the employ of the Croydon Corporation in 1902 as

MR. C. E. C. SHAWFIELD, Chief Electrical Engineer, Wolverhampton, who will follow Mr. Wilkinson.

MR. J. S. WATSON, Chief Electrical Engineer, Bury, who will open a discussion on Thursday on "Cheapening of the Cost of Mains and Services."

Digitized by Google

Chief Assistant Engineer, and in 1904 succeeded to the position of Borough Electrical Engineer. In addition to acting as consulting engineer to the electrical undertaking, Mr. Cramb has carried out a considerable amount of extension work for the tramways committee.

Mr. H. COLLINGS BISHOP was educated at Clifton College, Bristol, and in 1888 went to America, and among other work completed two high-tension installations in the State of Oregon. Returning to England in 1894, he accepted the post of charge engineer at the Bristol Electricity Works, and two years later was appointed chief electrical engineer and manager of the Leyton Electricity Works, where he remained until 1899. He resigned this post in order to take up the position of chief engineer and tramways manager to the Wigan Corporation, and designed and erected the municipal electricity works and tramways there. Having completed this work, he proceeded, in 1902, to his present town of Newport (Mon.), in a similar capacity.

Mr. F. A. NEWINGTON, chief electrical engineer to the Edinburgh Corporation, will read a Paper on "Exhaust Steam Turbines and Condensing Plants at the MacDonald Road Station, Edinburgh." Mr. Newington was President of the Association in 1905, and is a familiar figure at all the I.M.E.A. Conventions, where he frequently takes part in the discussions. The MacDonald Road Station is described in a later portion of this article, and the method of utilising water from the main sewer for circulating purposes will doubtless form the chief matter of interest in Mr. Newington's Paper. In conjunction with Sir Alexander Kennedy, he is now engaged in working out an extension scheme, which involves the addition of cooling towers, and there is some opposition to these on æsthetic grounds. An ornamental design of cooling tower, has, however, been prepared by the City Architect, and will doubtless ultimately be adopted as a welcome addition to the other beauties of the city which the members of the Association will have an opportunity of inspecting on Wednesday.

Mr. ASHTON BREMNER, who will read a Paper on "Mixed Pressure Turbines," is chief electrical engineer at Burslem. He was educated at the Oswestry Grammar School, and was first engaged on the staff of the late J. E. H. Gordon. Mr. Bremner has since acted as consulting engineer to the Oswestry Electric Lighting & Power Co., and to the Sleaford District Council. In addition to being consulting and resident electrical engineer to the Burslem Corporation, which now forms part of the new County Borough of Stoke-on-Trent, Mr. Bremner acts in a similar capacity to the Tunstall and Wolstanton Councils, whose areas are supplied from the Burslem works.

Mr. GEORGE WILKINSON, chief electrical engineer to the Harrogate Corporation, and a Vice-President of the Association, will open a discussion on "Advantages of Continuous Records of Costs and of Steam Consumption." Mr. Wilkinson, who regularly attends the annual conventions of the Association, read a Paper on "The Distribution of Electricity in Scattered Areas," in 1900, and one on "Live Steam-Heated Feed Water: its Effect on the Output and Efficiency of Steam Boilers," in 1906. Mr. Wilkinson has recently been concentrating his attention upon a comprehensive street lighting scheme, a proposal which has caused grave concern to the gas interests in Harrogate.

Mr. C. E. C. SHAWFIELD, who will follow Mr. Wilkinson in this discussion, is chief electrical engineer and manager to the Wolverhampton Corporation. After a course at the Durham College of Science, Newcastle-on-Tyne, Mr. Shawfield was articled as a pupil for three years with the Newcastle-on-Tyne Electric Supply Co., and subsequently passed through the works of Messrs. Robey & Co., of Lincoln. In 1896 he was appointed Chief Assistant Electrical Engineer to the Wolverhampton Corporation, and in June, 1898, succeeded Mr. Harman-Lewis (who resigned through ill-health), as Chief Engineer. The addition of the tramway load, and a considerable increase in the power demand, since Mr. Shawfield became chief engineer, has necessitated very large additions to the plant, all of which he has designed and carried out. A further scheme of extension is now under consideration.

Mr. S. J. WATSON, Chief Electrical Engineer to the Bury Corporation, will open a discussion on "Cheapening of the Cost of Mains and Services." Mr. Watson was Chairman of the Manchester Section of the Institution of Electrical Engineers for the session that has just closed. In 1906 he read a Paper before the I.M.E.A., on "The Supply of Power to Tramways from Small Towns." Mr. Watson acts as consulting engineer at Bury, and on his advice a new power station has been decided upon, and is now under construction. The scheme was carried through in spite of great local opposition at the time.

Mr. F. AYTON, Chief Electrical Engineer and Tramway Manager at Ipswich, will follow Mr. Watson on the question of cost of mains and services. He supervised the erection of the Ipswich electricity works for the consulting engineers, Messrs. Kennedy & Jenkin, and was appointed chief engineer and tramway manager when the works were opened in 1903.

WORKS TO BE VISITED

ELECTRICITY SUPPLY IN GLASGOW

THE state of electrical supply in Glasgow at the present time is remarkable testimony to the rapid growth in the use of electricity by communities. Starting with the efforts of a small private company (Messrs. Muir & Mavor, now Mavor & Coulson, Ltd.), in 1879-80, electricity supply in this city grew until in 1890 the company owned plant of 300 kw. capacity, and had an annual output of somewhat over 400,000 units. These works were at this date bought over by the Glasgow Corporation, who had just obtained their first provisional order. A generating station was laid down at 75 Waterloo Street (now the site of the main offices of the department and a large substation) to the plans of Sir A. B. W. Kennedy. This plant was extended, until in 1897 the whole available space was occupied, and the plant installed aggregated to 3,300 h.p. The Electricity Department was taken out of the control of the Gas Committee about this time, and it was decided to purchase two new sites on the north and south sides of the river respectively—these are the present Port Dundas and St. Andrew's Cross stations. The system of supply, which was D.C. 3-wire 2×100 volts, was altered to D.C. 3-wire 2×250 volts. In addition, the Kelvinside Electricity Supply Co. was bought out, and their system absorbed. In 1904 it was found that the supply, especially to outlying districts, was growing so rapidly that it was necessary to lay down E.H.T. plant giving 3-phase current at 6,500 volts, to be used in conjunction with transforming and converting sub-stations.

The records of the department since its inception are a good gauge of the progress made in electricity supply generally, as may be seen from the appended table:—

Year.	Units generated.	Cost per unit.	Lb. of coal per unit
1893	854,766	2·01d.	13·04
1898	3,401,731	1·11d.	9·27
1903	17,770,488	0·51d.	5·23
1908	41,493,035	0·41d.	4·26

This cost per unit covers coal, oil, wages and repairs, but not management charges.

Another interesting table culled from the records of the department shows the relative growth of the supply for lighting and power purposes in Glasgow since 1898:—

Year.	Lighting H.P.	Motors H.P.	Total H.P.
1898	7,899	301	8,200
1902	22,407	4,597	27,000
1905	36,695	19,805	56,500
1908	36,495	29,505	66,000

In the analysis of records made by Mr. Lackie last year, it was shown that there were some 3,600 consumers using electricity for power purposes, these consumers representing 112 different trades.

Generating Stations.

The Port Dundas station was originally designed to be built in three sections, each to contain 10,000 h.p. When the second section of the engine room was built in 1904-5, it was found that owing to the introduction of large turbine-driven generating sets it would be possible to install 30,000 h.p. in this section, giving a total of 40,000 h.p. in the two sections. The capacity of the plant now installed is 29,000 h.p. All the boiler house space available is required, however, and the result is that the space destined for the third section of the engine room is being converted into a large departmental stores. As explained in ELECTRICAL ENGINEERING, 14th April (page 253) owing to difficulties with water and coal supply it has been decided to lay down a new generating station on a fresh site. The St. Andrew's Cross station is almost full of plant, and again owing to use of turbine generators it has been found possible to install much more than the 15,000 h.p. it was originally intended to accommodate.

Port Dundas.

The feature that will probably take the attention of the visitor first in the Port Dundas station, which is to be visited on the afternoon of Tuesday, June 14th, is the somewhat heterogeneous nature of the low tension continuous current generating plant. This is accounted for by the fact that in the period from 1898 to 1900 the demand has grown so rapidly that quick delivery was a primary consideration. This plant, though still used and kept in working order, is not used very frequently, as it has been supplemented by a 1,000 kw. motor generator and two 500 kw rotary converters, which tend to equalise the load and the power factor on the turbo-generators, as well as to ensure sufficient results. The range of five turbo-alternators present a very fine effect when looked at from the centre of the engine-room, but the principle points of interest

Digitized by Google

to the visitors will be the installation of recording instruments of various types for measuring the economy of the plant. On each of the five sets is fitted a "Kenotometer," supplied by Messrs. Brady & Martin, of Newcastle-on-Tyne. This instrument is designed to show the value of the absolute back pressure on the exhaust side of the turbine. It is also calibrated to a basis of a 30 in. barometer, in terms of the vacuum efficiency; this allows for barometric variations, and considerably simplifies all testing processes. One Lea V-notch recorder is already in use for measuring the hot well water from one of the turbines, and it is hoped that by the time of the Convention a Glenfield & Kennedy recorder will also be in use. Another instrument of interest in the engine room is the Tirril regulator, used for controlling the voltage on the main generators. In the boiler room the principal points of interest are the "Sarco" CO_2 recorder, which is so arranged that tests on sections of the boiler plant can be taken in detail, and the induced draught fans. The majority of the boilers are of the usual Babcock & Wilcox land type, but several of the marine type have been installed, and there are also four Stirling boilers.

St. Andrew's Cross.

In the St. Andrew's Cross generating station, which is to be visited on June 16th, the Ferranti remote-control E.H.T. switchboard is worthy of inspection, and is much more modern in every way than that of Port Dundas. Visitors will be interested in the Ferranti-Field oil switch, which is mounted on the lower floor of the engine-room, in such a way that the working can be clearly seen. Of the turbo-generators installed at St. Andrew's Cross three are A.C. machines similar to those at Port Dundas, but the remaining two machines are a Siemens' 1,400 kw. D.C. generator and a Brown-Boveri 1,700 kw. D.C. generator respectively. An interesting feature of the Siemens machine is the ventilated commutator with tunnels in the segments through which air is forced by a fan. As in the case of Port Dundas a Tirril regulator is installed, and "Kenotometers" are in use on the turbine exhaust.

Distributing Systems.

The 3-phase current is generated at 6,500 volts pressure and 25 periods, and is transformed at sub-stations throughout the city to D.C. at 250 or 500 volts for distribution in the surrounding areas. Practically the whole of the direct current networks are inter-connected with each other, and directly with the two main generating stations at Port Dundas and St. Andrew's Cross respectively, where a certain proportion of D.C. generating plant is still in use. The standard D.C. feeder is triple concentric of one sq. in. section, paper insulated, lead-covered, and armoured. The distribution cables generally are also triple concentric. For branch joints and services a special form of shell fitting is used. In two core services concentric cable is again employed. The feeder pillars were made by the department to their own designs, and are in every way worthy of examination.

Sub-stations.

Altogether there are some nine sub-stations, with a total installed plant of 24,500 kw. capacity. Four of the sub-stations are on consumers' premises, and the plant in these sub-stations aggregates about 2,000 kw., and generally consists of D.C. motor generators, transforming from 500 volts to a voltage suitable for the consumers' own plant, or rotary converters with transformers or induction motor generators transforming from 6,500 volts 3-phase to 500 or 250 volts D.C. The remaining five sub-stations each supply a district of the city, and are similar in essentials, differing only in size and detail. In general the sub-stations are arranged with the machines down the centre, the A.C., E.H.T. board, and cable tunnel being on one side, and the D.C. board and tunnel on the other, and the Springburn sub-station, which is to be visited on Tuesday, June 14th, may be taken as being typical.

Two types of induction motor generators are in use, the motors being of the slip-ring and squirrel cage patterns respectively, the latter being started up from the D.C. side. In the case of the rotary converters the use of a starting motor and the necessity for synchronisation have been avoided by employing transformers with multiple tappings. The generator ends of the motor generator sets do not call for special attention, being simply multipolar machines of substantial design. Many of these are fitted with "compensators" or static balancers, which are capable of dealing with an out of balance current of 25 per cent. of the output with a voltage drop of only 2 per cent. on the heavily loaded side.

The D.C. bus-bars are in duplicate, and the feeders are so arranged with selector switches on each pole that it is possible to run heavily loaded and lightly loaded feeders from different bus-bars at different voltages, so compensating for the extra drop when supplying to feeder points at some distance from the sub-station.

Our thanks are due to Mr. W. W. Lackie, Chief Electrical Engineer to the Glasgow Corporation, and Mr. A. Page for their courtesy in allowing our representative every facility for the preparation of this article.

THE GLASGOW TRAMWAY SYSTEM

THE Glasgow tramways have always been owned by the Corporation, who in 1871-2 laid down a tramway system and leased it to a company for a period of 23 years. In 1891 the Corporation passed a resolution in favour of the tramways being worked as a department of the Corporation, and negotiations were commenced with the lessees for the acquisition of the system and plant, but, as no terms could be arranged, the Corporation were faced with the task of providing an entirely new equipment, with premises, &c., in the space of two years, that being the length of time remaining of the company's lease. In 1896 it was decided to equip a short length of line in the centre of the city for electric traction. A small temporary power-house was constructed, and line to a total of five miles of track equipped. In 1899 the Corporation decided to proceed with the electrical equipment of the whole system. Mr. H. F. Parshall was appointed consulting engineer, and the plant was in operation in April, 1901, *i.e.*, the month before the commencement of the International Exhibition.

The Pinkston Power House.

The main generating station at Pinkston, which is to be visited on the afternoon of June 14th, is situated on the north bank of the Forth and Clyde Canal, from which circulating water for condensing purposes is obtained.

Coal is brought in wagons, which are tipped directly into bunkers by electric locomotives fitted with swivelling cranes. Two mechanical bucket conveyors, built by The Mirrlees Watson Co., take the coal to the overhead bunkers, and also handle the ashes. The water from the condensers is passed through a Harris-Anderson water purifier before going into the hot well. There are in all 22 boilers, all of Messrs. Babcock & Wilcox's make. One section of these give a superheat up to 450° F. for the new turbine plant. All are fitted with chain grates.

The original engine-room plant consists of 2,500-kw. sets driven by three cylinder vertical compound engines, made by the Allis Co. of Milwaukee, and Messrs. Musgrave & Sons, Bolton, with Corliss valve gear. Their three-phase generators are by the British Thomson-Houston Co., Ltd. These sets, which weigh about 800 tons, and have flywheels about 24 ft. in diameter, with correspondingly massive generators, each with 40 poles, look an enormous size compared with the 3,000-kw. Richardson-Westgarth turbine and Brown Boveri generator recently laid down (see ELECTRICAL ENGINEERING, Vol. V., p. 625). In addition to the three-phase generators there are two 500-kw. D.C. generators coupled direct to cross-compound Stewart engines for supplying current to the system during the times when the general car service is not in operation. They are also used in conjunction with two rotary converters to relieve the main engines at times when the load on the power station is slightly more than the full load for the main generators in use. Six 50-k.w. steam-driven exciter sets are also installed.

Three-phase current at 6,500 volts and 25 periods, which forms the main supply, is generated and transmitted to five sub-stations. The original E.H.T. switchgear with air-break switches, was replaced in 1904 by a modern electrically controlled system, with oil break switches. The feeder switches are of the Westinghouse Co.'s solenoid type, and the generator switches are of the B.T.-H. Co.'s motor control type (see ELECTRICAL ENGINEERING, Vol. V., page 628). There are two 'bus-bars, which can be put in parallel by the use of oil switches. The generator switches are non-automatic, but the feeders are controlled by automatic overload relays of the Brown Boveri inverse time element type.

Sub-stations.

The equipment of the sub-stations generally consists of single-phase static transformers and 500-k.w. rotary converters. The sub-stations are divided into three distinct parts, viz., the E.H.T. 'bus-bar and oil switch room, the transformer house, and the rotary converter house. In the rotary converter house the A.C. board is on the side nearest the transformer house, the rotary converters in the centre, and the direct-current board on the side opposite to the A.C. board. A feature of the control is that four E.H.T. feeders are laid into each sub-station, and the switching arrangements are such that it is possible to run any four of the converter units installed, one off each of the incoming feeders, without being connected anywhere on the high-tension side. Each of the rotaries is started by an induction motor fixed at the end of the rotary shaft and on the A.C. side. On the D.C. end of the machines there is fixed a negative booster for dealing with a part of the return current so as to minimise and control the drop in the rails. A shunt is placed directly across the field of the booster so as to prevent damage to the field coils should a short occur on the feeder, and also to act as a field discharge when the field is broken. The booster field panels provide means whereby it is possible to pass any feeder current round any booster field. On these panels is also mounted a rheostat which can be connected in parallel across the field so as to shunt a portion of the feeder current which is exciting it.

The whole of the feeders and telephone cables are paper insulated and lead covered. Most of the cables are in ducts,

Digitized by Google

but a certain amount of cable on the later extensions has been laid in asphalt troughing.

The Coplawhill Works.

The works and general stores at Coplawhill are used for the execution of all maintenance and repair work for rolling stock, permanent way, overhead line, and even the power and sub-stations. These works will be visited on Thursday afternoon, June 16th.

On the right as one enters is the Coplawhill sub-station and school for motormen. Passing into the works, one comes to a large space into which the shops all open. On the left are the works offices, comprising manager's rooms, drawing offices, general stores, &c. The smithy has both steam-driven and pneumatic hammers, and there is also a brass foundry well equipped with white metal pots, case-hardening furnaces, &c. Next comes the saw-mill, a feature of which is the suction plant for removing sawdust and chips. In the same bay as the saw-mill will be found the machine shops, tool room, and fitting shops. The paint shop covers an area of 2,000 sq. yds., and accommodates about 30 cars, in addition to other vehicles, such as tower wagons, &c. The light work, such as polishing and lettering, is handled in a gallery. Beyond the paint shop and in the same bay, is the shop in which the steel plate and handrail work is done. The car overhauling and repair shops cover three bays. Two of the bays are traversed by 15-ton cranes with sufficient headroom to clear the top-deck cars. The third bay is used for the motor equipment overhaul, and is provided with a remarkably complete stock of portable tools of all kinds. Above the overhaul shop is the electrical repair shop, which is also well equipped with machine tools of various kinds. It should be mentioned that all the cars in use, with the exception of about eighty, have been built and equipped in the car-works. In conclusion, we would like to thank Mr. Jas. Dalrymple (General Manager, Glasgow Corporation Tramways), and Mr. E. T. Goslin for their kindness in allowing our representative to visit the various parts of the works and for other kind assistance.

ELECTRICITY SUPPLY IN EDINBURGH

THOSE attending the meeting at Edinburgh on Wednesday, June 15th, will be able to visit the MacDonald Road Station, which is equipped with ten 750-kw. sets driven by high-speed reciprocating engines, and, what will perhaps prove of more interest, two exhaust steam turbines of the Rateau type, driving Brown Boveri 1,200-kw. generators. The main plant supplies direct current to a 460 volt three wire system. Two reciprocating sets at full load supply sufficient steam to produce the full load output of one exhaust steam turbine. A small amount of single-phase alternating current is generated and distributed to the outlying portions of the town through street transformers. A small motor alternator in the MacDonald Road Power Station deals with this supply at times of light load, in order to avoid running the A.C. steam plant at Dewar Place Station.

The condensing plant is particularly interesting, as sewage is used as a cooling medium. A large shaft is sunk into the main sewer some 200 yards away from the generating station, and from this shaft four suction pipes are laid to four centrifugal pumps placed in a basement recess adjoining the boiler house. The shaft mentioned above is about 26 ft. in diameter, and is provided with two floors at different levels. On the first of these is placed the motor and shafting which is employed to drive the automatic scraper gear which travels up and down the face of the bar screens in order to prevent them from becoming choked. The lower floor is used for access to the bar screens when they are raised, and for the operation of the artificial weir, which can be raised during times of flood. The circulating pumps are placed some 15 ft. above the level of the sewer inlet, and the total head on the discharge side of the pumps to the highest point of the return pipe from the condensers is some 40 ft. Exhausters are installed in order to assist the main circulating pumps when starting, as it can be readily understood that fluid sewage is much more difficult to lift by suction than pure water, and that gas is liable to be given off and to so fill the suction pipes. In addition, exhausters are installed to serve the return pipes from the condensers in order to extract any gas or air which may be found, the result being that the pressure on the discharge side of the pumps is only equivalent to that of about one-third of that corresponding to the actual head of water. The sewage is passed through the pumps on to the inlet side of a Bailey & Jackson strainer. This apparatus consists of a large circular drum about 10 ft. in diameter and several inches in thickness, which is revolved slowly inside a cylindrical casing which forms, as it were, two end bells, which are divided into halves internally by dividing fillets. In the drum just described there are holes which are fitted with gauze strainers. The sewage entering the top half of the casing nearest the pumps passes through the holes into the side of the casing on the condenser side of the apparatus, and thence along the pipes to the condenser. The solid matter is deposited on these gauze screens, and, by the revolving motion of the drum, is carried around until it has passed the dividing fillet already mentioned. The sewage returning from the condenser enters on this side of the chamber and passes through the holes in the drum, carrying back with it the solid matter which has been deposited on the gauze screens.

The condensers used are Messrs. Richardson & Westgarth's "Contra-flo" type. With all the precautions described it is impossible to prevent a certain amount of matter(such as hair, wool, &c.) from getting through to the condensers, and it is consequently necessary to open the end doors and remove such matter from the ends of the tubes about once in every twenty-four hours.

Another interesting portion of the plant is the Davis-Perrett electrolytic oil filtering apparatus. In brief, the system consists in passing the condensed water from the hot wells through a tank in which are placed iron plates, arranged somewhat similarly to the plates in a secondary battery, the adjacent plates being of opposite polarity. Electrolytic action takes place between the plates, and, in consequence, oxide of iron is formed. In their passage through the water the particles of iron oxide attract minute particles of oil to them, and the result is that the oxide of iron rises to the surface of the water, carrying with it the aforesaid particles of oil, in the form of scum. The whole of the hot well water is passed from these tanks through a filter, which is practically an enclosed sand bed. The sand bed tends to get choked in time by the amount of scum deposited, and a valuable feature of the method is the means whereby, when this occurs, a valve is automatically opened, admitting water under pressure to the under side of the sand bed, so flushing through it and clearing away the scum.

We would like to acknowledge our thanks to Mr. F. A. Newington, City Electrical Engineer, for his kindness in showing our representative over the works, and furnishing him with the necessary information.

THE GOVAN ELECTRICITY WORKS

THE latest extension to the plant in the generating station of the Govan Electricity Department, which, however, is not at work yet, is a three-phase, 6,000-volt, 25-period Westinghouse alternator, driven by a Howden-Zoelly turbine with the necessary E.H.T. switchgear. The present plant in the station is all D.C., and all driven by reciprocating engines, but the constant growth of the supply and radius of distribution has led to the adoption of E.H.T. plant It is intended to instal two rotary converters in the power station, and one in a sub-station to be erected at the far end of the system. Two of the three converters are to be of 250 kw. capacity each, and the third is to be of 500 kw. capacity. The two smaller converters will be started on the A.C. side only, but the larger set will be arranged to start on either A.C. or D.C. side. The larger set is to be capable of being run inverted in order to provide the necessary standby to the turbo set.

A British Thomson-Houston E.H.T. switchboard of the mechanical control type, and with concrete cell construction, is in process of erection, and on the new gallery which has been erected there will also be a D.C. board, consisting of two rotary and five feeder panels, by the same maker. Unfortunately it is possible that very little of this new plant except the switchboard will be installed by the date of the Convention.

Of the older plant there is nothing that can be described as novel, and the arrangement of the station generally does not call for any special comment. The present switchboard is of the now obsolete Ferranti cellular type.

The boiler plant is all Babcock & Wilcox, with the usual coal- and ash-conveyor gear. The arrangement of the haulage and tipping gear for the handling of the coal trucks is distinctly neat and workmanlike. A Harris-Anderson water filter is installed, and a Klein cooling tower deals with the circulating water for the Mirrlees Watson condensing plant. A Simmance-Abady CO_2 recorder is in use in the boiler room. One point of interest lies in the fact that there are three electrically-driven feed pumps to one steam-driven, the latter of Weir's make.

The works will be visited on Thursday afternoon, June 16th.

ALTERNATIVE VISITS

The following is an alternative series of visits which has been arranged for Thursday afternoon, June 16th:—

Partick Corporation Electricity Works contain about 2,500 kw. of generating plant, all driven by reciprocating engines of Messrs. Bellis & Morcom's make. The generators are all of Messrs. Bruce Peebles' make, with the exception of the last set installed, which is of Messrs. the Lancashire Dynamo & Motor Co.'s make, and is of 1,000 kw. capacity. Of the seven boilers installed three are fired by refuse. There are three condensers in all, one being installed to deal with the 1,000 kw. set. For some time attempts have been made to get water for the supply of the cooling towers by sinking an artesian well, but so far

Digitized by Google

the efforts have not met with success. The feeders and distributors are all triple concentric, armoured and paper insulated. The feeders are connected in ring main form, and the distributors are connected between distributing centres.

The Yoker Power Station of the Clyde Valley Electric Power Co. supplies a district some nine miles long by about three miles broad. The station is also interconnected with the company's power station at Motherwell, which is some 20 miles away, and so can on occasion supply the Motherwell district with a certain amount of current. Three turbo-alternators are installed, two of 3,000 kw. and one of 600 kw. capacity. The turbines are of the Westinghouse double-flow type, the steam entering at the centre and so balancing the thrust. The blading is chiefly Parsons' type, but impulse blades are adopted for the first stage of expansion. The alternators generate three-phase current, at 11,000 volts and 25 periods, which is handled through a Westinghouse E.H.T. switchboard of modern construction. The oil-break switches are electrically operated from a control desk arranged with a diagrammatic representation of the generator and feeder circuits, and fitted with pilots and tell-tales to show the position of switches at all times. From the same board it is possible to control the speed of the main sets and the operation of the field rheostats. The switch controls and some of the electrically-driven auxiliaries are operated by direct current, but most of the heavy auxiliary plant is operated from the three-phase circuits. Two motor-generators and frequency-changers are installed for the purpose of giving D.C. for exciting purposes, and 50 period current for the local Clydebank supply, the distribution in the latter case being at 3,000 volts. The condensing plant presents some interesting features, and includes a Leblanc air pump and the oil-circulating arrangement. The boilers and coal- and ash-handling arrangements are all of the Babcock & Wilcox type, and call for no particular description.

Messrs. W. Beardmores & Co.'s Shipyard at Dalmuir presents an interesting example of a producer-gas driven station, and a large scheme of distribution. The latter has points of interest in the overhead cable lines and the general lay-out of cables, and the sub-station for the conversion of the Clyde Valley Electric Power Co.'s supply. There will be much of interest in the equipment of the shipyard and workshops. Messrs. Beardmores have a fair amount of naval work in hand, and one cruiser for H.M. Navy is now approaching completion.

The following works will also be open for inspection during the Convention:—

Messrs. Mavor & Coulson, Ltd., 47 Broad Street, Mile End, Glasgow; Messrs. Babcock & Wilcox, Renfrew; the Craigpark Electric Cable Co., Flemington Street, Springburn, Glasgow; the electricity works and combined dust destructor of the Greenock Corporation (see ELECTRICAL ENGINEERING, Vol. III., page 263); the electricity works of the Paisley Corporation; the Coltness Iron Co. (installation of large gas engines); Messrs. D. Bruce Peebles, & Co., East Pilton.

A LIST OF MEMBERS AND VISITORS ATTENDING THE CONVENTION WILL BE FOUND ON PAGE 378.

THE DEVELOPMENT OF HIGH-TENSION SWITCHGEAR

AT the annual general meeting of the Newcastle Local Section of the Institution of Electrical Engineers held on Monday, May 30th, Mr. H. W. Clothier (Messrs. A. Reyrolle & Co., Ltd.) gave an illustrated lecture on switchgear construction. Twenty years ago, he said, a switchboard consisted of a flat panel with the apparatus on the front and a tangle of cables at the back. As an example of an early board he mentioned one for a 2,000-volt supply installed in 1893, a time when it was considered unsafe to run alternators in parallel. This had connections such that any circuit could be switched on to any machine by means of plugs and a change-over switch. One striking feature of the early designs was the almost touching confidence in the safety of 2,000-volt supply as evidenced by the small amount of protection on the switch handles, &c. A back view of one of these non-synchronising boards illustrated the extreme difficulty to the designer of the separate circuit arrangement. In the case shown there were no less than 60 connections on each feeder panel. In contrast to this was shown a type of switchgear which became common when engineers had become convinced of the safety of parallel running of alternators. The single-phase cellular type of gear with machine panels in the middle of the board and feeder panels at the side occupied a length of 6 or 7 ft. in contrast to a separate circuit board for the same installation occupying 40 or 50 ft. There was a common 'bus-bar of ring main type with a link between each panel. The board was divided into two halves, half the machines and half the feeders being on either side of a dividing switch provided with synchronising arrangements for paralleling the two halves of the board. The board installed by Messrs. Ferranti in 1894 at Portsmouth was the first of the cellular type of switchboards put into actual operation. Between 1895 and 1902, the period of development of the H.-T. single-phase system, the gear designed by Mr. Ferranti was largely adopted.

Mr. Clothier then drew attention to one or two designs between the period of 1900 and 1905. The first was a gear by Mr. Cowan, of Messrs. Cowans, Ltd., which included a water break switch operated by means of a handle through link work. Another example was a switchboard installed at Dresden by the Helios Co., the main switch of which was of the plunger type, having a mercury break operated by means of a handle placed on the operating gallery above the switchgear. An interesting feature was the provision of an artificial load, upon which the generators were run up previous to being synchronised and placed upon the station load. The third type was a switchgear designed by Messrs. Lowrie and Hall, of Messrs. Fowlers, Ltd., of Leeds. In this gear there was an attempt to encase dangerous conductors, and switching was accomplished by means of plugs in four way sockets. The only dangerous part of the arrangement was that the high-tension fuses, placed at the bottom of the board, were not cased in.

The history of fuses was briefly reviewed by the lecturer by reference to the old Ferranti oil-break fuses. The German fuses of the same period had insulated handles and horns so placed that when the switch-fuse was withdrawn, or the fuse blown, the horns would dissipate the arc. The Brush Company's production, embodying the principle adopted at the present day in tubular fuses, was also shown. At the power station at Deptford, the single-phase conductors were originally placed on the wall of the station, and the switches were controlled by a system of levers similar to railway signal levers, the arm of the switch being 5 or 6 ft. long. A quick air break was obtained by means of a spring attached to the switch arm and held by a catch until the arm had taken a good portion of its outward travel. An interesting slide was that of the first oil-break switch put into commercial work in 1894 at the City of London power station at Bankside. Two main switch blades engaged on the inner surface of fixed contacts. The quick-break mechanism operated in a porcelain pot containing oil, being drawn down suddenly when the main switch blade was 3 or 4 in. from the contacts. The shock of the auxiliary break was taken by a dash-pot. As a contrast to this was shown a present-day three-phase oil-break switch with over-load release coils on two phases, and a no-volt release coil on the third phase, and the oil-break switchgear used at Carville. In the latter case there were strong metal cylinders with breaking contacts on the principle of the early Ferranti switch, which were operated by a remote control with direct current.

Reference was then made to the trouble experienced on the Bristol system, involving the burning up of the station switchboard. Another power station of very large capacity was linked up to the generator side of the board concerned by two large trunk feeders. It appears probable that a fuse failed and an arc drew out, burning away metal, and causing a bigger arc 8 to 10 in. long. It was impossible to cut off the board from the supply to the trunk mains from the other generating station for a quarter of an hour or twenty minutes as the arc did not go to earth, and the other power house was not sufficiently warned of the magnitude of the trouble that was occurring. The oil from the switches and fuses on the board dropped on to the floor, and set fire to cables underneath the switch gallery; a blast of air from the window intensified the fire to such an extent that practically every panel was destroyed. The new board supplied by Messrs. Siemens was split up in a better fashion, and switches with automatic overload release were installed. About this time considerable uncertainty existed in the minds of British switchgear designers and central station engineers as to the best type to use. A typical German gear was built up of wrought-iron frames, one frame supporting the switchgear, another the fuses, potential transformers, &c., and two gangways were provided at the back of the frames. The impression given of the American practice at this period was that larger powers were handled than in Great Britain, and there was a greater appreciation of the danger of high-tension work. The leading British designs of this period were not so large as American designs, but were safer, neater, and better-thought-out than the German designs.

The position at present appears to be that oil-break switches are now standard practice. A higher safety to life appears to be obtained in this country as compared with some others, and

Digitized by Google

the tendency is still to increase this safety. In H.-T. apparatus, the use of concrete partitions, floors, and galleries has been extended, but accidents still occasionally happen, even with this precaution. A method now much used is to encase all H.T. conductors in metal, and to seal them up in compound or oil. The metal armouring formerly applied only to cables is now applied to switchgear, so that a continuous armouring from generators to load appears possible.

In speaking of the switchgear of the Newcastle-on-Tyne Electric Supply Co., Ltd., Mr. Clothier drew attention to the fact that within the last two or three years a new system for controlling the feeders had been adopted at Carville, a separate control room having been equipped with the remote control apparatus for the feeder switches, and a "power dispatcher" placed there with a diagram showing the connections to the extension feeders, and whether they are alive or dead at any time. He also showed the arrangement of switchgear which is being adopted at the new power-house at Dunston-on-Tyne, where a separate switch-house is being erected. The balanced system of protection is being used, and oil-break switches with motor control and isolating switches operated through concrete partitions are being utilised. The lecture concluded with a description of the iron-clad gear recently developed by Messrs. Reyrolle & Co., with relays for the balanced system of protection, and of a recent design of a remote control sub-station switchboard designed by Mr. Highfield for the Metropolitan Electric Supply system.

DISCUSSION.

Mr. C. FARADAY PROCTOR said, in referring to the Bristol trouble, that the reason why it was impossible to telephone to the larger power-house instructing them to cut off the supply was that the heavy current in the interconnecting cables disturbed the telephone circuits.

Mr. RISELEY said that it was interesting to notice the development which had taken place in the dimensions of the cellular boards; originally the contacts were at about 7 in. centres; this was increased to 10 in., while now spaces of 10 ft. between centres were to be found. He thought that the complication of safety devices due to fear of danger had brought up the cost per kilowatt of switchgear somewhat unduly. He also mentioned that the Author had not referred to the early Brush pillar switchgear in his historical review.

Mr. G. G. STONEY (Messrs. C. A. Parsons & Co.) could remember still earlier types of board, in which wood was very largely employed, notably that at Manchester Square station, which was about 150 ft. long. This answered quite well for capacities up to 150 kw. per generator, but on the installation of a 350 kw. turbo-set the switchboard went up in smoke.

Mr. HOLMES (Messrs. J. H. Holmes & Co., Newcastle) said that in 1883 he had an equipment to carry out at Wallsend of an installation consisting of a steam engine driving two dynamos, one for incandescent lights and the other for two arc lamps. The switches for the control of the circuits were mounted on wooden bases. On the opening night the architect remarked on the beautiful flexibility of electric light, as by turning the switch over slowly he found that the light could be lowered gently just like gas. As this was opposed to Mr. Holmes's previous experience, he investigated the matter, and found that by opening the switch slowly the architect had drawn out a beautiful arc which had burnt the wooden base to a considerable extent. The ultimate result of this was that in 1884 he designed the prototype of the present-day quick-break switch.

One or two other members referred to early switchgear.

Mr. CLOTHIER, in reply, thanked Mr. Riseley for drawing the attention of the meeting to the Brush pillar switch, which was really the commencement of ironclad gear. Its only fault was that it did not carry this principle far enough. Reference had been made to a growing complication in switchgear design, but he pointed out that it was not quite fair to contrast the switchboards of the present day designed for dealing with large powers with the simpler structures used in the early days, because as the sizes of generating stations and distributing systems grew, greater skill in design was required in order to secure continuity of supply. He did not agree in any way that it was advisable to save money by cutting down the element of safety to human life. He would, however, say that simplicity is the keynote for switchboard design. The more work which was done in designing a switchgear the less there was usually to show for it. In his opinion, a distinct step had been taken in the latest form of switchgear design—namely, that of the solid type iron-clad gear, which was the essence of simplicity and concentration.

In calling for a vote of thanks to Mr. Clothier, Mr. C. FARADAY PROCTOR said that it was of prime importance that historical records of the progress of the industry should be kept and periodically put before the members of the Institution. Mr. Clothier had obtained a marvellously complete set of historical photographs and drawings, but he (the chairman) appealed to other members who had photographs or details of switch construction of historical interest to forward them to Mr. Clothier, who would probably be in a position to make still further use of them for the benefit of the industry at a later date.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

GAS ENGINES.—We have received a pamphlet from Messrs. Sperling & Williams, 24 and 25 Fenchurch Street, E.C., sole export agents for Grice's gas engines and suction producer plants, containing particulars of these plants, and of interest as showing some of the arguments put forward by the gas industry against electric driving.

GRAPHITE LUBRICATION.—An illustrated pamphlet issued by the "Cromil" Engineering Co. (Newcastle-on-Tyne) describes the "Miller & Bennet" dry graphite lubricator and its applications. Powdered graphite is blown into the cylinder or other chamber in the form of a dust cloud by means of a sudden injection of live steam. No oil or grease is required. The system has been applied with success to the lubrication of pump and turbine glands, and a letter referring to its working in connection with a 1,600-kw. Oerlikon turbo set at Wood Lane is reproduced in the pamphlet. Lubricating mixtures, composed of graphite suspended in oil or water, a valve reseating machine, and glass fibre brushes for cleaning commutators are also referred to in the pamphlet.

LABORATORY EQUIPMENT.—An illustrated booklet is to hand from Robt. W. Paul (33 Leicester Square, London, W.C.) describing a simple laboratory equipment suitable for carrying out a number of experiments in electrotechnics. The instruments and apparatus are of the most modern type, and have been selected with special care. A list of experiments is appended. Mr. Paul informs us that the booklet has been approved by several leading technical teachers as describing a suitable equipment for an elementary laboratory.

CITY & GUILDS INSTITUTE.—The report of the Council of the City & Guilds of London Institute for the year 1909 has just been issued. This includes reports of the work carried on in the electrical engineering departments of the Central Technical College, and of the Technical College, Finsbury. Lists of scholarships and studentships and statistics of attendance, &c., are also included.

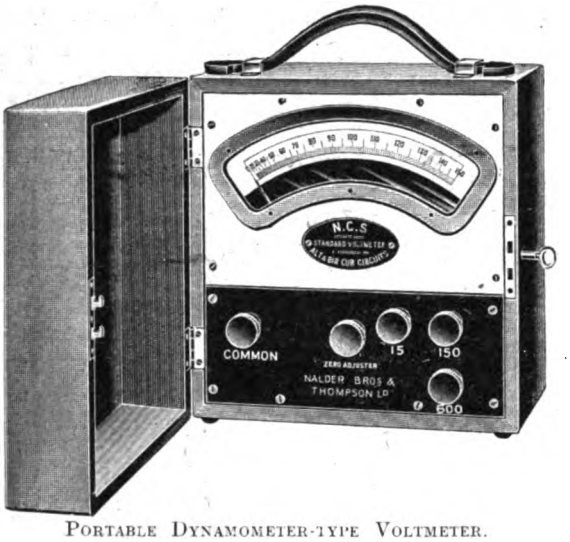
MOTOR GENERATORS.—An illustrated folder has been issued by the Allgemeine Elektricitäts-Ges., of Berlin, giving particulars and prices (German) of various patterns of motor-generators, with both D.C. and A.C.-motors, especially designed for supplying the arc lamps of cinematograph prjoectors. Tables showing the saving accomplished by using one of these machines in the place of series resistances are also given.

ELECTRIC GRINDER.—An illustrated booklet from the Phœnix Dynamo Manufacturing Co., Ltd., Thornbury Works, Bradford, describes a convenient form of double-ended bench electric grinding machine, with fully enclosed motor, fitted to take emery wheels at both ends of the shaft.

TELEPHONE APPARATUS.—Two new lists of telephone apparatus have just been issued by Messrs. Siemens Brothers & Co., Ltd. (Caxton House, Westminster). One comprises wall and table sets for central battery circuits, including a hand micro-telephone, similar to the last Post Office pattern. The other deals with telephone condensers; these are of the rolled type with tinfoil and specially prepared impregnated paper.

MOVING COIL INSTRUMENTS.—An advance price list from Messrs. Crompton & Co. (Salisbury House, London Wall, E.C.) contains particulars of several patterns of iron-cased moving-coil ammeters and voltmeters, including round, sector, and edgewise forms, and a special pattern for use on iron-clad control pillars. A new design of ebonite case portable instrument is also listed.

FANS.—We have received a copy of a new pamphlet which is being issued by the Electric Supply Department of the Borough of St. Marylebone regarding the cost and hire of electric fans for the information of consumers.



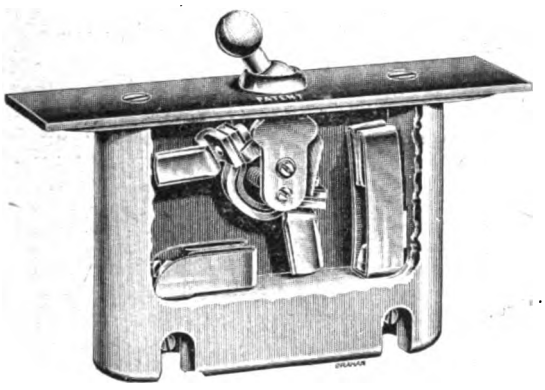
FITTINGS.—A new edition of Messrs. John Dugdill & Co.'s illustrated fittings catalogue contains particulars of a long series of jointed and other fittings made under Dugdill's patents. These include a special form of elbow joint which is easy to move, but will remain firm at any angle, and also telescopic and universal joint arrangements. These are particularly adaptable to strong works fittings, and enable the light to be placed in any position or direction. Ornamental fittings on the same principle are also made.

ELECTRICAL SUPPLIES.—Messrs. Siemens Brothers Dynamo Works, Ltd. (Caxton House, Westminster), have just issued a new price list of electrical supplies in the form of an attractive octavo volume conveniently arranged with a thumb index, so that any section can be referred to readily. The idea has been to cover all the articles used by an electrical contractor in his business, and which can be supplied direct from their supply department at 39 Upper Thames Street, or any of the branch establishments. Particulars of the reduced prices and latest types of tantalum lamps are, of course, included, and considerable space is devoted to the company's "Zed" cartridge fuses, the manufacture of which is now being taken up at Stafford. The popular Stannos system is included in the wiring material section, and mention should also be made of a new line of cheap knife switches, also made at Stafford. Various forms of lightning arrestor are also dealt with. It is needless to particularise all the contents, but reference must be made to the fine series of fittings, which includes some very artistic designs, as well as watertight and other fittings for special purposes.

Digitized by Google

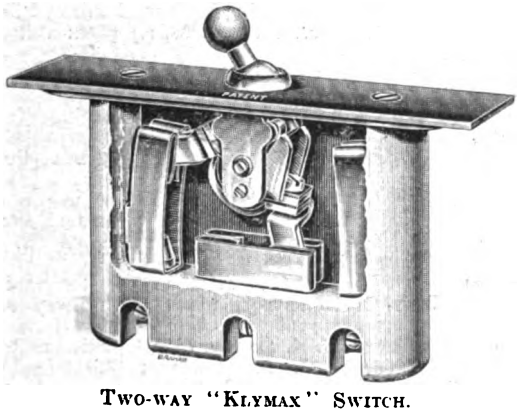
NEW PORTABLE A.C. AND D.C. INSTRUMENTS

MESSRS. NALDER BROS. & THOMPSON, LTD. (34 Queen Street, London, E.C.) have recently placed upon the market a line of portable instruments. These are of the dynamometer type, fitted with air damping to render them dead beat, and have been designed with a view to giving accuracy on either continuous or alternating-current circuits—namely, about ¼ to ½ per cent. of the top reading. Ammeters, voltmeters, and wattmeters are fitted in portable polished wood cases, with strap handle, lock and key, as illustrated in the accompanying figure. Rubber feet ensure that the instrument shall receive no sudden jar. An anti-parallax mirror is provided, and the pointers are of the usual edgewise pattern. The scales are finely divided, and diagonal lines enable observations to be taken to a considerable degree of accuracy. Zero adjustment is provided. The portable standard voltmeter illustrated has ranges of 15, 150, and 600 volts. The ammeters are wound self-contained for currents up to 100 amps., beyond which portable series transformers must be used. The drop across a 25 amp. instrument at full reading is 0·5 volt, and 0·2 volt for the 100 amp. instrument. The wattmeters are self-contained for pressures up to 300 volts, and currents up to 50 amperes. For pressures over 300 and up to 650 volts, an external resistance box is used, and for currents above 50 amperes portable series transformers. For H.-T. circuits potential and series transformers are employed. A feature of the instruments is that the air damping mechanism is arranged immediately under the face of the instrument, and is therefore easily accessible.



PORTABLE DYNAMOMETER-TYPE VOLTMETER.

Another new instrument is a portable wattmeter for lamp testing. This is also constructed on the dynamometer principle, and is suitable for A.C. and D.C. circuits. It is supplied for two voltages, with a two-way switch key. The usual sizes take ½ amp. or 1 amp. A lamp-holder and fuse on the side of the case, and a length of flexible wire fitted to a plug, are also provided. These dynamometer-type dead-beat instruments are also made with switchboard pattern cases.

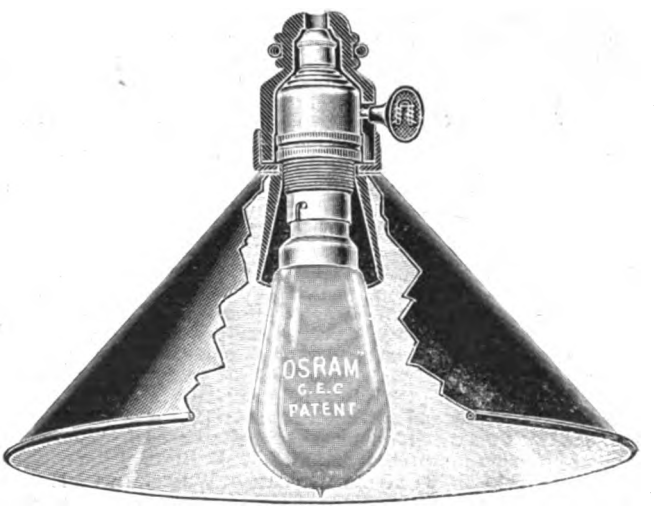


NEW ELECTRICAL SUPPLIES AND ACCESSORIES

Lamps, Fittings, Switches, and Accessories.

The accompanying illustrations show an entirely new pattern of switch, to be known as the "Klymax" panel switch, which is being placed on the market by Messrs. A. P. Lundberg & Sons for flush work to meet the demand for a narrow pattern switch of minimum dimensions. In the illustration the porcelain case, which entirely surrounds the switch, is shown broken away to enable the movement to be seen. A quite novel patented arrangement of contact springs and blades is employed, and, as in other designs of Messrs. Lundberg & Sons, mica and porcelain are the only insulating materials used. The switch is supplied in two types, single-way and two-way, identical in size and external appearance.

SINGLE-WAY "KLYMAX" SWITCH.



TWO-WAY "KLYMAX" SWITCH.

All moving parts are enclosed in a porcelain casing, and the fixing lugs are covered by a brass front plate, 3 13/16 in. by 1 in. A front of any material can be supplied to suit requirements. The method adopted allows the parts to be grouped into a very small space, and one front plate of comparatively small dimensions can be made to serve for a number of switches.

The break is quick and long, the contact arms being of the efficient knife-blade type entering double-contact springs. The switches can be fitted into suitable iron boxes to meet requirements. When double-pole and intermediate switches are required, these are simply and neatly obtained by coupling the knobs of two single- or two-way switches respectively, by a short cylinder piece. Two-pin wall connections of various gauges can also be arranged on the same porcelain parts, enabling combination sets to be made up in minimum sizes.

The accompanying illustrations show a new insulating lamp-holder shield, which the General Electric Co., Ltd. (57 Queen Victoria Street, E.C.), are placing on the market with a view to compliance with the suggestions of H.M. Electrical Inspector of Factories under the Home Office Rules. The recommendation

INSULATING SHIELD WITH SHADE ATTACHED.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 2nd, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

6,758/09. **Electrical Power Transmission Gear.** W. P. DURTNALL. A polyphase system with three different speeds. The high-speed steam, petrol, or oil engine drives the magnet-wheel of a 4-pole polyphase generator with a fixed stator. The latter supplies current to the stator of an 8-pole induction motor, which is also attached to the engine shaft. The squirrel-cage rotor of this motor is coupled to the first motion shaft of the vehicle or hoisting gear to be driven. It rotates independently of the engine shaft, or may be coupled to it by an electro-magnetic clutch for direct drive. A change-over switch between the generator and motor enables the electrically produced rotation of the motor field to be added to or subtracted from that due to the mechanical rotation of the motor-stator. Two claims, one figure.

10,680/09. **Automatic Motor-Starter.** W. D. KILROY and EVERSHED & VIGNOLES, LTD. The starter handle is operated by means of a solenoid device exerting a constant force over its range. The handle shaft is geared to a notched wheel engaging with a pivoted lever acted upon by a differentially wound electro-magnet. This is constantly excited by its shunt winding, but the series winding, which is in opposition, causes the lever to be held down against the action of a spring, and so to lock the notched wheel until the current has fallen to such a value that the shunt and series excitation are about equal. On every step, therefore, the current must fall to a certain predetermined value before the starter arm can advance another step. Three claims, six figures.

11,482/09. **Arc Lamps.** W. J. DAVY. In order to prevent the deposit of ash on the inside of the globe, an annular cup-shaped shield is provided, with its lower inner edge slightly below and close to the rim of the economiser. Baffles between the outer casing and the globe produce a draught of air along the under-side of the shield and up through the annular space between the economiser and the shield, which carries up with it the particles of ash projected from the arc. Four claims, two figures.

11,538/09. **Impulse Turbines.** J. HOWDEN. If the interior of the naves of the rotor discs of steam turbines of the impulse type are made an exact fit on the rotor shaft, the steel surfaces are liable to seize and render removal for repair very difficult. To prevent this, a thin coating of copper or copper alloy (with, in some cases, an outer layer of nickel) is deposited electrolytically on the interior surface of the nave. This gives an exact fit and obviates seizure. Further, a coating of copper with an outer coating of nickel is deposited on the outside of the naves to reduce the friction should the rotor and the stator discs come in contact. Two claims, one figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Names in italics indicate communicators of inventions from abroad.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: PEASE [Flexible cable armouring] 11,981/09; VERNIER [Electric conductors] 12,146/09.

Dynamos, Motors, and Transformers: HAEFELY [Insulation of coils, &c.] 16,457/09; ALLGEMEINE ELEKTRICITÄTS GES. [Polyphase commutator machines] 26,046/09.

Electric Ignition: BROOKS and ALSTON, 15,802/09; NOBEL'S EXPLOSIVES CO. and EVANS [Electric ignition of fuses] 16,709/09.

Electrometallurgy and Electrochemistry: COWPER-COLES [Compound electrodes for electrolytic baths] 11,843/09; HÄRDEN [Furnaces] 26,266/09; HELFENSTEIN [Furnaces] 26,845/09.

Incandescent Lamps: SOC. FRANCAISE D'INCANDESCENCE PAR LE GAZ (*System Auer*) [Metal filaments] 15,193/09; WEBER [Metal filaments] 18,808/09; KRAUS [Pocket lamps] 18,863/09.

Instruments and Meters: SIEMENS SCHUCKERTWERKE GES. [Apparatus for indicating differences of pressure] 17,719/09; SIEMENS & HALSKE A.-G. [Meters] 22,922/09.

Switchgear, Fuses and Fittings: IRELAND [Tramcar controllers] 12,139/09; STOCKALL [Automatic time switches] 14,625/09; PEARSON [Ironclad switches] 14,790/09; MIHALIK [Water-tight joint filling] 14,822/09; KELVIN & JAMES WHITE, LTD., EVANS and WILSON [Terminals for shunts] 15,006/09; MACKENZIE (*Sundh Electric Co.*) [Contacts] 15,075/09; KLEBER [Lamp-holders] 21,672/09.

Telephony and Telegraphy: SHARMAN [Master-switch for wireless stations] 11,242/09; NICHOLSON and HIGHAM [Apparatus for forming and reading telegraphic cipher messages] 12,005/09; GILL [Signalling system] 25,196/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Telephone systems] 7,211/10.

Traction: LAURIE-WALKER and NIBLETT [Tramcar ploughs] 11,540/09; LAKE (*St. Clair Air Brake Co.*) [Brakes] 11,721/09; IRELAND [Indicating controllers] 12,139/09; GAMES [Wheels] 15,132/09; MUNRO and RAILLESS ELECTRIC TRACTION CO. [Crossings and junctions] 17,106/09.

Miscellaneous: DICKSON [Illuminated signs] 17,208/09; CASTLE [Fire alarms] 22,490/09; GRAVES [Chain welding machine] 23,323/09; DOBBIE [Magnetic compasses] 2,277/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: GEB. SIEMENS & CO. [Electrodes] 9,076/10; SIEMENS SCHUCKERTWERKE-GES. [Searchlights] 11,054/10.

Electric Ignition: BARTLETT [Ignition of gas lamps] 11,479/10; COMPAGNIE POUR LA FABRICATION DES COMPTEURS À GAZ [Ignition of gas lamps] 11,722/10.

Electrometallurgy, &c.: ESTELLE [Battery electrodes and depolarising agents] 9,964/10 and 11,837/10; SEWARD, VON KÜGELGEN and VON BIDDER [Electrolytic production of sodium] 11,175/10; THOMSON and FITZGERALD [Furnaces] 11,716-7-8/10 and 11,720/10.

Incandescent Lamps: JAHODA [Metal filaments] 15,496/09.

Storage Batteries: STERN, 11,781/10.

Miscellaneous: BURSTYN [Plate condensers] 11,787/10.

The following amended Specification can now be obtained.

S. MARIETTI [Supports for metal filaments] 14,483/08 (see ELECTRICAL ENGINEERING, Vol. V., p. 714).

Opposition to Grant of Patents

14,898/09. **Conduit Manhole Cover.** R. AMES. Opposition has been entered to the grant of this patent. It is for a manhole cover designed to prevent the disintegration of the asphalte or macadam paving at the edge.

15,659/09. **Centrifugal Fan.** K. MAXANER. This patent is opposed. The specification was abstracted in ELECTRICAL ENGINEERING, April 21st, 1910, p. 274, and describes a fan, the driving motor of which has an annular armature rotating about a fixed field system.

18,228/09. **Wall-plug.** J. F. and E. S. CONRADI (British Central Electrical Co.). This patent is opposed. The specification was abstracted in ELECTRICAL ENGINEERING, April 28th, 1910, p. 290, and describes a wall-plug in which the flexible passes out of the plug at right angles to the axis of the pins.

Revocation of Patent

19,483/05. **Electric Lifts.** E. M. T. BODDAM. The application made for the revocation of this patent on the ground of inadequate manufacture in this country has been deemed to be abandoned. The patent was abstracted in ELECTRICAL ENGINEERING, March 17th, 1910, p. 194.

Amendment of Specification

8,438/08. **Prepayment Meter.** C. E. HIBBERD seeks leave to amend this specification in order to remove certain ambiguities.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: H. BAGGETT [Focussing lamp mechanism] 3,594/99; H. C. LEVIS (*General Electric Co., U.S.A.*) [Iron filing electrode] 4,134/04.

Distribution Systems, &c.: J. W. BROWN [Conduit pipe joints] 3,426/99.

Electrometallurgy, &c.: P. HÉROULT [Smelting furnace] 3,912/02; J. Y. JOHNSON (*Soc. des Produits Amylacés*) [Electrolytic production of starch] 3,930/02; C. A. KELLER [Furnace] 3,790/04.

Instruments, &c.: THEILER & CO. [Induction motor meter] 3,274/03; W. E. GROVES [D.C. combined voltmeter, ammeter, wattmeter, and testing set] 3,572/03; H. H. LAKE (*R. Arno*) [Induction motor meter] 3,891/04.

Switchgear, &c.: L. W. CROSTA [Fuse or terminal box] 4,016/03; E. TYER [Multiple-way switch for railway signals] 3,265/05.

Traction: H. H. LAKE (*E. A. Sperry, U.S.A.*) [Electric braking and controller] 4,198/97; J. S. RAWORTH [Electric braking systems] 3,657-8/03; A. SUNDH and A. MAGNUSON [Control of A.C. motor equipments] 15,045/05.

Miscellaneous: J. T. SCHAAFF [Electric operating attachment for typewriter or type-setting machine keyboards] 3,281-1A/05; A. W. KING [Aluminium solder] 3,589/05; F. RITTMEYER [Water-level indicator] 3,599/05.

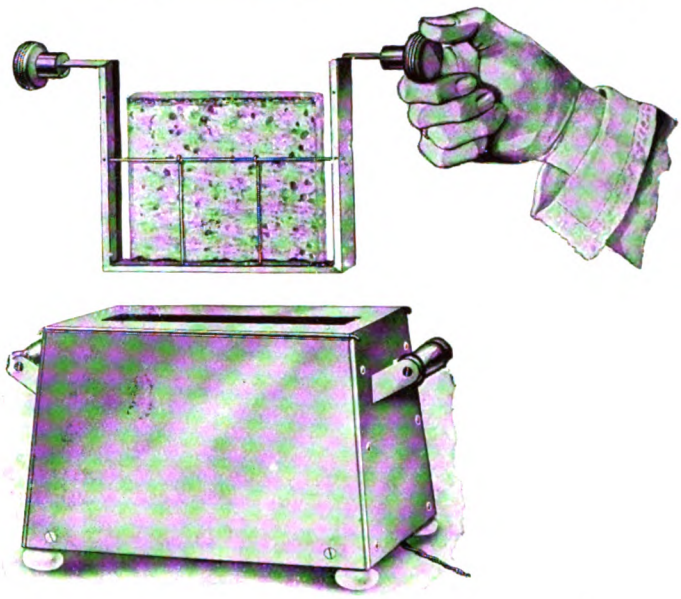
Digitized by Google

in question reads as follows:—"It is possible as an alternative to earthing, to enclose the lampholder entirely with insulating material so that neither it nor the metal cap of the lamp can be touched, and even to attach a metal shade in such a way that it is not in connection with the lampholder and could not become charged. It is essential, however, that any insulating material used for this purpose should be of a fire-resisting nature." The effective way in which the holder is shielded is apparent from the illustrations. The material used for the shield is absolutely fireproof, and a certificate to this effect has been obtained from Mr. S. G. Castle Russel (Electrical Adviser to the Phœnix Fire Office). The device secures the insulation of the shade if one of enamelled iron is used, and the shade can easily be fitted in a few seconds without unwiring the lampholder.

COATES' INSULATING LAMP-HOLDER SHIELD.

A new tubular pattern of Osram lamp, which the General Electric Co., Ltd. (71 Queen Victoria Street, E.C.), are placing on the market, is illustrated here. These are being supplied in the 17 watt (16 h.c.p.) size for 100-135 volts, with small B.C. terminals, at the list price of 3s. 6d., and their shape renders them particularly adaptable to many popular fittings now in demand. It will be noticed that a new method of mounting the filament, involving the use of an intermediate support, is used. Hitherto there has been some difficulty in adapting some forms of existing fittings with small holders to metal filament lamps, except where the use of lower voltage lamps was possible.

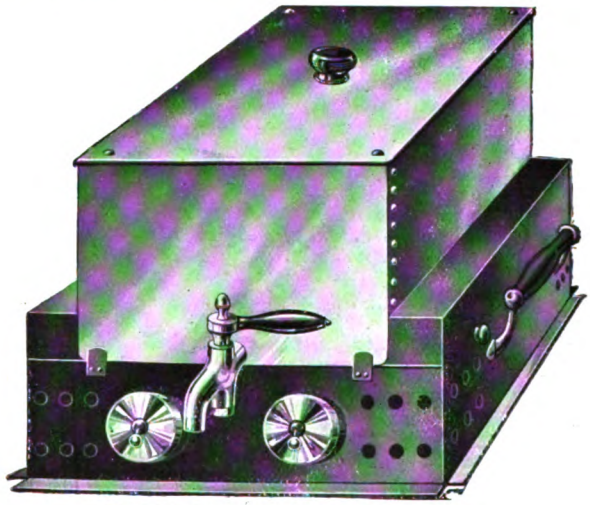
NEW TUBULAR OSRAM LAMP.



Heating and Cooking Apparatus.

Some novelties in electric heating apparatus on the Bastian quartz principle have been introduced. The simple little heater on this principle was described in ELECTRICAL ENGINEERING, Vol. V., p. 631, and the more recently introduced oven and radiators in ELECTRICAL ENGINEERING, Vol. V., p. 938. An attractive toaster is one of the latest designs. This consists of two vertical grids about 1¾ in. apart, between which is hung a wire carrier holding the bread to be toasted. Each grid consists of eight quartz tubes about 6 in. long, arranged horizontally one above the other. The wire helices are connected in series, and the complete toaster consumes from 400 to 450 watts. As shown in the illustration, the toaster is enclosed in a polished aluminium case with double walls to prevent loss of heat. The consumption is so low that the toaster can be used on the lighting circuit at the cost of only a few pence per week. It can also be used for keeping a kettle boiling, or for heating food. The quartz tubes are at a bright red heat during working, and are therefore well adapted for toasting purposes.

The second figure illustrates a water boiler with quartz heating elements. This consists of a copper bath, in the lower part of which are ten copper tubes running horizontally from side to side. Each tube contains a quartz tube with its wire helix. Eight tubes are connected to one switch and consume 2,000 watts. The other two are connected to the other switch, and, consuming only 200 watts, are left on for keeping the water boiling. Two gallons of water can be boiled in from 25 to 35 minutes according to the starting temperature. A four-gallon size consuming 4,000 watts is also supplied. The wire helices can be readily replaced without taking out the quartz tubes, but they run at a comparatively low temperature, and are stated to have a life of three years.



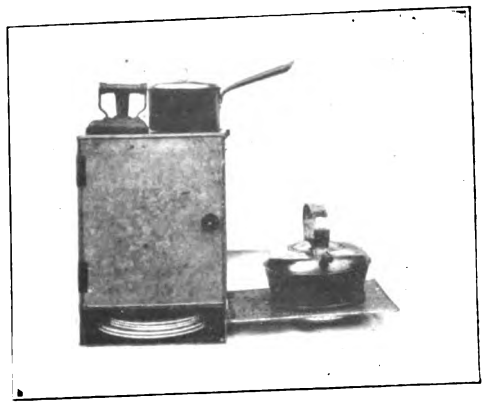
Electric flat irons on the same principle can also now be obtained. In these, the quartz tubes are laid side by side close up against the metal face of the iron; above the tubes is asbestos packing to concentrate the heat at the face. A 6 lb. iron of this pattern consumes only 335 watts. A novelty is an iron which can be converted from a 5 lb. to a 3 lb. iron by removing a portion attached by a thumb screw.

In the early part of this year, "Nichrome" wire, an alloy

THE "QUARTZALITE" TOASTER.

of nickel and chromium, was substituted for pure nickel wire in all the Bastian heaters. The resistance is higher, and so shorter lengths of wire are required. The life is also increased considerably. Lastly, this wire has practically no temperature coefficient, so that the sudden rush of current experienced when switching on a cold heater of pure nickel is avoided.

THE "QUARTZALITE" WATER HEATER.



The "Quartzalite" heating and cooking devices can be obtained from Messrs. Drake & Gorham, Ltd., the British Westinghouse Co., Ltd., the Wardle Engineering Co., Ltd., the Electrical Co., Ltd., the Edison & Swan United Electric Light Co., Ltd., and other well-known firms.

The illustration on the next page shows a complete electric cooking outfit, designed by Messrs. F. A. Wilkinson & Partners, Ltd. (Harpenden, Herts), and placed on the market at the extremely low price of 39s. 6d. The outfit comprises a sheet metal oven 12 in. wide by 12 in. deep by 17 in. high, fitted with shelves. A 1,000-watt heating element consisting of a wire helix laid in a spiral groove in an earthenware plate is fitted to a flap hinged to the side of the oven. When the flap is up, the oven takes less than 8 minutes to attain a cooking temperature. All the ordinary operations are carried on with the flap up, but for rapid boiling the flap can be lowered and a kettle or saucepan placed direct on the element

Digitized by Google

as illustrated. Ordinary cooking utensils are employed, and the heating element works at a bright red heat, both of which facts should tend to make this oven popular with the general public. The life of the wire coil is said to be well over 1,000 hours, and it can be readily replaced when burnt out.

A heavy cast-iron oven for general domestic purposes can also be obtained. The internal dimensions are 13 in. wide by 13 in. deep by 20 in. high. Two heating elements similar to that described above are enclosed in cast-iron caps which are screwed over apertures in the two sides of the oven. They can thus be readily removed to replace a coil without dismantling the oven. The latter is provided with a sheet steel lining, the space between the oven walls and the lining being filled with

THE 1,000-WATT "ECONOMIC" COOKER.

lagging. The heaters generally consume about 1,000 watts each, but any desired consumption can be arranged for. Tests showed that starting with a cold oven and using heaters consuming just under 1,400 watts together, a temperature of 402° Fahr. was reached in 40 minutes, the outside temperature being 50° Fahr. On opening the oven to insert a 4½ lb. joint, the temperature fell to 320° Fahr., but during the next 50 minutes, while the joint was cooking, it rose to 373° Fahr., the consumption being gradually reduced from 1,350 watts to 875 watts. If a hot water supply is required, a boiler is inserted in the bottom of the oven with an additional heating element. The hot water circulates, and is stored in a hot water cistern. The list price of this oven is £7, and the extra cost of the hot water equipment is £2.

A heating element similar to those used in the ovens is supplied, adapted for use as a hot-plate or stove. This was described and illustrated in ELECTRICAL ENGINEERING, Vol. V., p. 451. In another form, the heater is supported on a cylindrical aluminium base, and forms a neat and artistic radiator. In all cases, the heating coil is protected by an expanded metal cover clipped on to the grooved plate. Several improvements have recently been made in these devices, and a new pattern of plug has been designed. They are made in two sizes, for 700 and 1,000 watts respectively.

All the above apparatus is suitable for both A.C. and D.C. supply systems, and can be supplied for any pressures between 50 and 500 volts. Messrs. Siemens Bros. Dynamo Works, Ltd., are selling agents for the "Economic" stoves and their component parts.

Miscellaneous.

An electrolytic bleaching apparatus for removing stains from white linen or cotton articles, and suitable for use in laundries, hospitals, hotels, and private houses, is being placed on the market by the Electrolytic Apparatus Syndicate, Ltd. (47 Queen Anne's Chambers, Broadway, Westminster, London, S.W.). This apparatus, which has been designed by Mr. J. T. Niblett, consists of an 8-volt accumulator or battery of dry cells, to which is connected a device, called the electrolyser, similar in shape to a telephone receiver. On the face of the electrolyser are arranged six concentric platinum rings connected alternatively to the positive and negative poles of the battery and protected by a perforated disc of insulating material. The stained portion of the article to be treated is placed over a saucer and a solution (prepared from a special mixture of chlorides supplied in the form of a powder) is poured over it. The electrolyser is then rubbed gently over the stain, which disappears in a few minutes. What happens is that the solution is electrolysed at the surface of the electrolyser and hypochlorites are formed.

ELECTROLYTIC BLEACHING APPARATUS.

The feature of the apparatus is that the hypochlorites are produced locally and brought into contact with the stain in a nascent condition. The chloride preparation is neither corrosive nor poisonous, and will not injure the most delicate fabric. Ink, wine, tea, fruit, and mildew stains can be treated successfully with this apparatus, but most mineral stains cannot be eradicated. Stains on silk cannot be dealt with, as the solution is injurious to silk.

A complete apparatus with an accumulator or dry cells, suitable for private houses, is supplied in a box at a very moderate price. For large hotels or laundries an apparatus, as illustrated in the accompanying figure, is supplied. This consists of an 8-volt accumulator arranged on a board, in series with a lamp and switch. The accumulator is charged from the D.C. lighting mains with the lamp in series, and the electrolyser is worked from the accumulator. It is not advisable to work the electrolyser direct off the mains, as the operator might easily get a shock. When the article to be treated is small it can be wholly immersed in a bath of the solution. A rod with two electrodes at its extremity for electrolysing the solution is placed in the bath as shown. This rod electrolyser can be connected to the mains through a lamp, as the operator does not handle it or come in contact with the solution. The rod takes 0·5 amp., and the small electrolyser 0·25 amp. For large laundries, special electrolysers taking 1 and 1·5 amps. are supplied. In all cases the voltage required is 8 volts or a little less. The apparatus is being put on the market under the name of the "Bleqtos" system.

THE ELECTRICAL INDUSTRY AND TARIFF REFORM

THE discussion (promoted by the National Electrical Contractors' Association) as to whether a Free Trade or a Protectionist policy would be of the greater benefit to the electrical industry of this country, was concluded at the Caxton Hall, Westminster, on Monday. As already reported in ELECTRICAL ENGINEERING (May 26th, p. 347), the first part of the debate took place on Monday, May 23rd, when Mr. J. E. Kingsbury, Mr. J. S. Raworth, and Mr. E. Cowan spoke in favour of Free Trade, and Mr. H. Hirst, Mr. J. Harland Bowden, and Mr. Russell Fitch in favour of Protection.

Mr. E. GARCKE (Joint Managing Director of the British Electric Traction Co., and Chairman of the Brush Electrical Engineering Co.), in opening the resumed discussion, asserted that the average percentage of unemployment in this country was double that of Germany, that England was suffering more than other countries from trade depression, and that emigration was greater here than from any other country. The principles of the Trades Unions were of a distinctly Protectionist nature, but though the British workmen were careful to limit competition amongst themselves, they did not trouble to protect the products of their combined labour. It was admitted that too much competition was bad, and he would ask Mr. Kingsbury how competition could be regulated, so far as the foreigner was concerned, except by a tariff. Free exchange of commodities was an ideal for which the world was not ready. The Tariff Reform party advocated tariffs not because they liked them, but because other nations continued to maintain them. It was argued that all imports must be balanced by exports, but how if the imports were the products of skilled manufacture and the exports were chiefly coal? The effect of Free Trade was that profits were being gradually eliminated, as, though we could buy in the cheapest market, we were obliged to sell in the cheapest also. The manufacturing trade of the country might show a large turnover, but there was little profit on it. No country could subsist on consumption alone, and all ultimately depended on profit. Free Trade encouraged the formation of trusts and monopolies abroad. We were getting poorer and poorer, and were only living on the wealth accumulated in prosperous times. Our exports of home produce to France, Belgium, Germany, and the United States were less than half our imports from the same countries. Imperial preference was essential if we were to maintain our trade with the colonies. Finally, he urged that no

Digitized by Google

laws were immutable, and that what was once the best policy might not be so now.

Mr. H. OPPENHEIMER (Manager of the International Electrical Co., representatives in Great Britain of Mix & Genest, Ltd., Berlin) stated that the beginning of Germany's industrial development dated with the founding of the Zollverein in 1868, and the internal establishment of Free Trade. Before that date each of the twenty-seven States was separately protected. Another help to Germany's progress was the introduction of the metric system in 1872. The reason of the apparent decline of Great Britain's industrial supremacy since 1880, as referred to by Mr. Hirst, was that about that time other countries began to realise that they could manufacture. Their progress could not be stopped. One of the greatest legislative blunders was the Merchandise Marks Act, which, he considered, was an expensive free advertisement to Continental manufacturers. The electrical industry was not what it should be, but it would become beyond recovery if Tariff Reform were to come to the rescue.

Mr. GUSTAV BYNG (Chairman of the General Electric Co.) disputed Mr. Kingsbury's assertion that Free Trade gave advantages for cheap production. In his experience Free Trade did not enable him to get his raw materials, such as copper, glass, porcelain, &c., cheaper than in protected countries. He was told that labour was cheaper under Free Trade on account of cheap food and clothes, but the Free-Trader told the working man that his wages were higher under Free Trade. He (Mr. Byng) thought that wages would go down and down if Free Trade continued. But there were other factors besides material and labour; quantity, skill, capital, and invention were all increased by Protection. There was no doubt that manufactures were carried on on a larger scale and with lower costs of production in protected countries. It was a false law that if one industry was killed by competition another would rise in its place. No new industry could be established under Free Trade, and no industry could grow under Free Trade.

Mr. R. HAMMOND said that this was a question which could only be discussed from a national point of view, and not from the standpoint of any particular industry. England was in a unique position, and the returns for last year proved the success of its Free Trade policy. These returns showed that 242 millions of food-stuffs came into the country during the year. Besides the food-stuffs, 166 millions of raw materials were imported, making a total of 408 millions to be paid for. This was not paid for in gold. Out of the 378 millions of exports, only 37 millions was coal (and the bulk of this even was for use in our own ships). The remainder represented for the most part goods manufactured in this country, which were still preferred to foreign goods, as the quality and price were right. There were 125 millions of foreign manufactured goods imported into the country, which were balanced by another 125 millions exported in exchange. Exports would fall off to the extent to which imports were kept out. With regard to decaying industries, the boot trade was at one time decaying, and under Protection would have been only temporarily improved. Under Free Trade, however, they had brought in American machinery, had thoroughly improved their methods, and were now able to compete with the American manufacturers.

Mr. H. H. BERRY (Berry, Skinner & Co.) referred to himself as a victim of Free Trade. When the Swan lampholder patent expired, he equipped works in this country to manufacture lampholders, but found it impossible to compete with foreign manufacturers, who had their own market as well as ours, in spite of the fact that the whole manufacture was originally in this country. Now only 20 per cent. of the lampholders supplied were manufactured here. Any success he had achieved in other directions was due to the protection afforded by the Patent Office. Free Trade caused unemployment and waste of capital, because we were not competing with the foreigner on equal terms.

Mr. W. G. BOND (Director of some of the Associated Companies of the British Electric Traction Co.) pointed out that, according to the Board of Trade returns, our trade had increased 19 per cent. between 1902 and 1908, and that the profits had risen from 487 million to 509 million, or by about 5 per cent. in the same period. The years of greatest imports corresponded with what were known as "boom" years. Again, in 1908, Great Britain's exports were £9 10s. per head, while those of Germany were only £5 8s. per head. In the recent revision of the American tariffs, it was the most flourishing industries which got the most protection, and not those which needed it most. It was to the benefit of all to buy in the cheapest market.

Mr. A. BRUCE ANDERSON (Managing Director of Ferranti, Ltd.), referring to Mr. Kingsbury's appeal to consider the matter from the standpoint of the effect on the whole nation and not on the electrical industry only, said that there was no reason why the benefit of the electrical industry should not mean a benefit to the whole nation. After referring to the increase in the agricultural population in Germany and comparing it with the decrease in this country, Mr. Anderson pointed out that the unemployment returns of the Trades Unions only referred to one-tenth of the working population, and that the unemployment outside the Unions was appalling. He refuted the accusation of selfishness on the part of Tariff Reformers, saying that they only wanted a fair field against foreign competition.

Before calling upon Mr. Kingsbury and Mr. Hirst to reply, the Chairman, Mr. H. W. Butler, stated that the meetings had been so successful that the Secretary of the Association had decided to organise meetings to discuss the same and similar subjects next winter.

Mr. J. E. KINGSBURY, answering the various criticisms of his views, stated that unemployment was a social question which would not be affected by fiscal policy. With regard to Mr. Byng's instances of raw material being dearer in this country than elsewhere, he mentioned that copper wire was cheaper in this country than in protectionist France. Mr. Raworth had stated that 90 per cent. of the tramway machinery in this country came from America, but he had been making enquiries himself, and one of his informants said that the figure did not exceed 5 per cent. In the case of a certain large tramway undertaking completed within the last ten years, he was assured that the machinery was wholly of British manufacture. Mr. Raworth had criticised the Electric Lighting Act of 1882; this was a protective measure, and was now known to have been very harmful to the industry. Continuing, Mr. Kingsbury stated that our business was in a sounder condition to-day than ever it was. With regard to the use of machinery, the prejudice of the workman against machinery had not been quite overcome, and he felt it his duty to emphasise the fact that machinery increased production and eventually the labour required. He did not wish to depreciate England's work, but he did not agree with Mr. Hirst that practically all inventions come from England. The arc lamp, the telephone and the dynamo all came from abroad. The value of our market to foreign manufacturers was, as a rough estimate, about 1 or 2 per cent. of their total output. It was not possible to estimate so close as this, and so the argument that the certainty of our market was of value to them was fallacious. Manufacturing in large quantities was certainly the root of the whole question, but, if the consumption was not large enough to justify the expenditure of the necessary capital, it was better not to manufacture but to purchase cheap from abroad. Finally, Mr. Kingsbury referred to several British manufactured goods—Huntley & Palmer's Biscuits, Keiller's Marmalade, and Sunlight Soap—which had a large sale abroad, and pointed out that the effect on all the country's industries should be considered.

Mr. H. HIRST, in his reply on behalf of Tariff Reform, made a good point at first in reference to Mr. Oppenheimer's eulogism of the German Zollverein. Tariff Reformers, he said, wanted to do exactly what the Zollverein had done, namely, to do away with the customs duties between the countries of Greater Britain, viz., to establish internal Imperial free trade. This would not only be commercially advantageous, but it would cause the Empire to become more united, in the same way as it had drawn together the various States of Germany. We had now to pay what the foreigner asked for corn, as we could not produce enough for ourselves. With regard to wages, he mentioned that in Germany the status of the teaching and other professions had been raised at three successive periods recently on account of the attraction of the best brains into industrial work. He complained that there were no definite statements in Mr. Kingsbury's speech which he could attack. The beginning of the decline of England's industrial supremacy in 1880 was, he thought, chiefly due to the fact that this was about the date of the introduction of tariffs in Germany by Bismarck. Under Tariff Reform he expected that the manufacturers would be able to pay much higher wages than at present, which would more than cover the possible rise in the price of food and clothing. New manufacturing works were now being put down, and it was, he thought, because tariff reform was "in the air." It was not true that a new industry rose out of an industry killed by foreign competition; it was not so easy for the workpeople to learn a new trade. It had been said that it did not pay the foreigner to sell under cost price, but he knew of cases where the foreigner had imported under cost price until the British industry was killed, and then the prices had gone back to what they were before, or even higher.

East London College.—Three special lectures on the illumination of interiors are being given on Wednesdays, June 8th, 15th, and 22nd, by Professors J. T. Morris and C. A. Smith. Yesterday's lecture dealt with principles and daylight illumination, the second with artificial illumination by gas and electricity, and the third with petrol air-gas systems. Applications for tickets of admission should be made to the Registrar at the College.

Extensions to the Shawinigan Falls Plant.—It is announced that the generating plant of the Shawinigan Water & Power Co. is to be more than doubled by the addition of a new power-house of 75,000 h.p. to the existing 55,000 h.p. plant, and taking its water supply through pipes from the same forebay. According to the *Canadian Electrical News* the distribution system of this company is the largest in Canada, consisting chiefly of 50,000-volt lines of aluminium on wooden poles, and including a 25,000 volt subfluvial cable 7,000 feet long, at Three Rivers, Quebec.

MEMBERS AND VISITORS ATTENDING THE I.M.E.A. CONVENTION

THE following is a list of the Members and invited guests who had intimated their intention of attending the Convention up to the time of our going to press.

The abbreviation *Ch'n* stands for Chairman of the Electricity Committee, *C'r* for member of the Electricity Committee, *E.E.* for Chief Electrical Engineer.

Adam, R. (*Ch'n*, Govan).
Allen, S. T. (*E.E.*, Carlisle).
Allen, W. Gough (*Ch'n*, Wolverhampton).
Andrews, Leonard (*Key Engineering Co.*).
Angus, H. W. (*E.E.*, Eccles).
Ashworth, Jas. (*Ch'n*, Heywood).
Atchison, C. C. (*E.E.*, Rochdale).
Atkinson, H. S. (*Ch'n*, Cleckheaton).
Ayton, F. (*E.E.*, Ipswich).
Babb, Thos. G. (*Chief Assist. E.E.*, Taunton).
Bache, Walter J. (*E.E.*, Cheltenham).
Ball, G. (*Ch'n*, Stockport).
Bastian, Jas. (*Stockport*).
Bastow, S. E. (*Bruce Peebles & Co.*).
Beauchamp, J. W. (*E.E.*, Tunbridge Wells).
Bell, Stuart (*Siemens Bros. Dynamo Wks., Glasgow Branch*).
Billing, Chas. P. (*C'r*, Bristol).
Black, A. S. (*E.E.*, Southport).
Bland, A. V. (*C'r*, Morecambe).
Blascheck, C. A. (*E.E.*, Canterbury).
Beecham, Alderman J. (*Ch'n*, St. Helens).
Bell, J. A. (*E.E.*, Aberdeen).
Binns, W. (*Gen. Man.*, Reading Corporation Trams.).
Bishop, H. Collings (*E.E.*, Newport, Mon.).
Blackman, A. S. (*E.E.*, Sunderland).
Bloxam, T. W. (*E.E.*, Belfast).
Bolam, J. H. (*E.E.*, Weymouth).
Bones, Fras. R. (*C'r*, Hastings).
Boyd, J. (*C'r*, Bristol).
Boyd, W. J. (*Ch'n*, Londonderry).
Bremner, Ashton (*E.E.*, Burslem).
Brewster, Ald. W. R. (*Ch'n*, Bootle).
Britton, S. L. E. (*E.E.*, Chester).
Broekman, L. (*Leeds Branch Manager, Chloride Elec. Storage Co.*).
Bruce, J. G. (*E.E.*, Willesden).
Bruce, Ald. Wm. (*Ch'n*, Sunderland).
Brydges, J. K. (*E.E.*, Eastbourne).
Buchanan, John (*Ch'n*, Govan).
Burbidge, A. H. (*E.E.*, Kilmarnock).
Burnett, H. R. (*E.E.*, Barrow-in-Furness).
Butler, H. W. (E.P.S. Co.).
Campbell, G. (*Holophane Co.*).
Campion, R. H. (*E.E.*, Dewsbury).
Carr, R. M. (*E.E.*, Leek, Staffs).
Chattock, R. A. (*E.E.*, Birmingham).
Chisholm, G. S. (*Siemens Bros. & Co.*).
Christie, J. (*E.E.*, Brighton).
Clegg, Stanley (*E.E.*, Lincoln).
Clothier, J. H. (*E.E.*, St. Anne's-on-Sea).
Clothier, T. D. (*E.E.*, Bootle).
Clough, A. (*E.E.*, Liverpool).
Collins, Ald. J. H. (*Ch'n*, Mansfield).
Collis, Alfred G. (*Cowans, Ltd.*).
Colvill, G. H. (*C'r*, Swansea).
Cooke, W. H. (*E.E.*, Luton).
Cooper, A. G. (*E.E.*, Colne).
Couzens, H. H. (*E.E.*, West Ham).
Cox, J. D. R. (Babcock & Wilcox).
Craig, G. (*Ch'n*, Leith).
Cramb, Alex. C. (*E.E.*, Croydon).
Crawford, N. (*Bellis & Morcom*).
Cross, Ed. (*E.E.*, Rotherham).
Crow, Ald. W. (*Ch'n*, West Ham).
Crowther, J. P. (*E.E.*, Worksop).
Crowther, J. W. (*C'r*, Sheffield).
Davidson, C. S. (*E.E.*, Barnes).
Davies, Alderman R. C. (*Ch'n*, Chester).
Day, A. A. (*E.E.*, Bolton).
Day, Chas. (*Mirrlees Watson Co.*).
Denton, H. H. (*E.E.*, Crewe).
Dick, J. R. (*W. Lucy & Co.*).
Dickinson, E. (*Ch'n*, Wigan).
Dixon, H. L. (*E.E., Leatherhead and District Electricity Co.*).
Dixon, Wm. (*C'r*, Lancaster).
Dormann, E. (*Aron Meter Co.*).
Eckersall, N. (*W. T. Glover & Co.*).
Ferguson, R. F. (*E.E.*, Hastings).
Ferranti, S. Z. de (*President-Elect, Institution of Electrical Engineers*).
Fisher, Andrew (*Ch'n*, Paisley).
Foale, W. S. (*E.E.*, Portsmouth).
Foulds, H. (*Faraday House*).
Francis, O. F. (*E.E., Kirkcaldy*).
Friederichs, H. F. (*E.E.*, West Hartlepool).
Gatehouse, T. E. ("*Electrical Review*").
Gilchrist, J. (*Ch'n*, Falkirk).
Gill, John C. (*E.E.*, Peterborough).
Good, W. F. (*Ch'n*, Maidstone).
Goslin, E. T. (*E.E., Glasgow Trams.*).
Gray, Harold (*E.E.*, Accrington).
Gregory, J. P. (*B.T.-H. Co.*).
Harrison, Haydn (London).
Hawkins, H. J. (*Deputy E.E.*, Salford).
Heald, J. (*Ch'n*, Lancaster).
Heath, Geo. (Stamford Hill).
Helme, D. (*E.E.*, Nelson).
Hewlett, E. Holcombe (*E.E.*, Mansfield).
Higham, C. (*Vice-Ch'n*, Blackburn).
Hollingsworth, E. M. (*E.E.*, St. Helens).
Homer, J. F. (*Ch'n*, Handsworth).
Hopkinson, A. H. (*J. Hopkinson & Co*).
Hornby, R. (*Siemens Bros. Dynamo Wks.*)
Howard, H. L. (*E.E.*, Barking).
Huddleston, J. M. (*Siemens Bros. & Co.*).
Hudson, Robt. (*C'r*, Sunderland).
Hurlbatt, E J. (*Dick, Kerr & Co., Manchester*).
Hutchinson, A. J. (*E.E.*, Farnworth).
Jackson, J. (*Ch'n*, Partick).
Jackson, W. A. (*E.E.*, West Bromwich).
Jacob, Arthur (*British Aluminium Co.*).
Johnston, C. M. (*E.E.*, Shrewsbury).
Jowett, Ald. W. H. (*Ch'n*, Morley).
Juttke, J. (*Aron Meter Co.*).
Kerr, H. G. (*C'r*, Govan).
Kerr, W. T. (*E.E.*, Hereford).
Kilburn, J. E. (*C'r*, Dewsbury).
Kilpin, Ald. S. L. (*Ch'n*, Bedford).
King, F. W. (*C'r*, Bootle).
King, J. H. (*C'r*, Burton-on-Trent).
Kinghorn, D. M. (*E.E.*, Southwark).
Knight, Douglas (*E.E.*, Ealing).
Lackie, W. W. (*E.E.*, Glasgow).
Livingstone, D. (*C'r*, Hull).
Lloyd, Ald. S. (*Vice-Ch'n*, Bristol).
Logan, T. (*C'r*, Partick).
Long, F. M. (*E.E.*, Norwich).
Lunn, J. R. P. (*E.E.*, Darlington).
McLean, J. Hardie (*Midland Elec. Corpn. for Power Distribution*).
MacLean, A. B. (*Craigpark Cable Co.*).
McMillan, J. (*E.E.*, Falkirk).
Macrory, R. V. (*E.E.*, Londonderry).
Madgen, W. L. (*Brush Co.*)
Mallins, C. W. (*Tram. Man., Liverpool Corporation*).
Mathias, F. V. (*E.E.*, Warrington).
Merrette, W. J. (*Ch'n*, Cheltenham).
Miller, H. W. (*Berry Construction Co.*).
Milton, C. O. (*E.E.*, Maidenhead).
Mountain, A. B. (*E.E.*, Huddersfield).
Murray, Lee (*Bruce Peebles & Co.*).
Nash, E. A. (*St. James's & Pall Mall Electric Light Co.*).
Nevill, H. A. (*E.E.*, Wakefield).
New, E. Sanford (*D.P. Battery Co.*).
New, Max (*General Electric Co.*).
Newington, F. A. (*E.E.*, Edinburgh).
Newington, S. W. (*E.E.*, Oldham).
Nisbett, G. H. (*B.I. & H. Co.*).
Nixon, F. A. (*E.E.*, Handsworth).
Okell, E. G. (*E.E.*, Plymouth).
Osborne, N. J. (*C'r*, Southend).
Papworth, J. W. (*E.E.*, Stirling).
Parkinson, C. (*E.E.*, Paisley).
Pauls, S. (*E.E.*, Middleton).
Pearce, S. L. (*E.E.*, Manchester).
Pearson, Ald. W. (*Ch'n*, Eccles).
Pearson, Ald. G. (*Ch'n*, Bristol).
Phillips, F. (*Ch'n*, Newport, Mon.).
Phillips, R. W. L. (*E.E.*, Bedford).
Pickersgill, A. (*E.E.*, Cleckheaton).
Pickvance, W. G. (*E.E.*, Wrexham).
Popple, Thos. (*Ch'n*, Heywood).
Preece, G. G. L. (*W. T. Glover & Co.*)
Pringle, P. J. (*E.E.*, Burton-on-Trent).
Proctor, H. Faraday (*E.E.*, Bristol).
Prusmann, C. A. L. (*E.E.*, Swansea).
Purse, F. W. (*E.E.*, Watford).
Raistrick, G. (*Ch'n*, Shipley).
Raphael, F. C. ("*Electrical Engineering*").
Renfree, T. R. (*British Electric Transformer Co.*).
Richards, W. (*Ch'n*, Ilkeston).
Riley, M. (*C'r*, Morley).
Robinson, T. C. (*Richardsons, Westgarth & Co.*).
Robson, Ald. E. (*C'r.*, Hull).
Rogerson, W. M. (*E.E.*, Halifax).
Roles, Thos. (*E.E.*, Bradford).
Rowland, R. (*E.E.*, Stretford).
Ruddle, Mark (*E.E.*, Dublin).
Rutherford, A. P. (*E.E.*, Leith).
Sankey, B. (*E.E.*, Whitehaven).
Schattner, E. B. (*Electrical Apparatus Co.*).
Schofield, S. D. (*E.E.*, Shipley).
Scholey, H. (*Dick, Kerr & Co.*).
Seabrook, A. H. (*E.E.*, Marylebone).
Sells, F. S. (*General Electric Co.*).
Sharp, E. E. (*Venner & Co.*).
Shaw, C. M. (*E.E.*, Worcester).
Shawfield, C. E. C. (*E.E.*, Wolverhampton).
Sillery, W. (*E.E.*, Partick).
Sinclair, A. (*Ch'n*, Swansea).
Sinclair (*Vice-Ch'n*, Falkirk).
Slevin, J. (*E.E.*, Wigan).
Sloan, R. P. (Manager, *Newcastle-on-Tyne Elec. Supply Co.*).
Smethurst, Ald. J. (*Ch'n*, Warrington).
Smith, J. J. (*E.E.*, Stockton-on-Tees).
Smith, Arthur T. (*E.E.*, Leigh, Lancs.).
Smith, Ald. J. P. (*Ch'n*, Barrow-in-Furness).
Smith, R. W. (*Drake & Gorham*).
Smith, William (*C'r*, Halifax).
Sowter, W. J. U. (*E.E.*, Bray).
Staniland, Norman (*E.E.*, Hornsey).
Steinitz, J. J. (*Brush Co.*).
Stewart, C. L. (*E.E.*, Rawtenstall).
Stokes, H. (*E.E.*, Ilkeston).
Stott, Jas. (*E.E.*, Heywood).
Tapper, J. E. (*E.E.*, Beckenham).
Taylor, H. M. (*E.E.*, Middlesbrough).
Taylor, Ald. T. (*C'r*, Mansfield).
Tester, W. A. (*E.E.*, Lancaster).
Tough, Geo. (*E.E.*, Coventry).
Tudman, A. R. (*E.E.*, Colwyn Bay).
Turnbull, C. (*E.E.*, Tynemouth).
Turner, H. Davey (*C'r*, Willesden).
Vignoles, W. A. (*E.E.*, Grimsby).
Ward, J. C. A. (*Callender's Cable Co.*).
Watson, C. (*C'r*, Accrington).
Watson, S. J. (*E.E.*, Bury).
Webster, A. ("*Electrical Engineering*").
Weekey, R. F. (*Jandus Arc Lamp Co.*).
Wheelwright, P. P. (*E.E.*, Blackburn).
Whiteside, J. (*Vice-Ch'n*, Stretford).
Wilkinson, Geo. (*E.E.*, Harrogate).
Wilkinson, H. (*E.E.*, Radcliffe).
Wilkinson, J. (*C'r*, Warrington).
Wilkinson, J. (*E.E., Hull Tramways*).
Williamson, C. (*Vice-Ch'n*, Greenock).
Wilson, C. (*Robertson Lamp Works*).
Wilson, Ald. J. H. (*Ch'n*, Hornsey).
Wilson, R. M. (*Jandus Arc Lamp Co.*).
Winter, Ald. D. L. (*Ch'n*, Rotherham).
Wood, A. P. (*Lancashire Dynamo Co.*)
Wordingham, C. H. (*Electrical Engineer-in-Chief to the Admiralty*).
Wyld, W. (*E.E.*, Birkenhead).
Wylie, Judge (*Ch'n*, Stirling).
Zingler, V. (*Siemens Bros. & Co.*).

LOCAL NOTES

ACTON: *Position of Electricity Undertaking.*—A special meeting will be held to-morrow to consider a report by the Town Clerk, which will constitute a history of the electrical undertaking. At the last meeting of the Council many members candidly confessed they did not understand the position. In fact, there was a hint that members of the Electricity Committee are not very familiar with the details of the undertaking.

ARGENTINE: *New Electric Supply Company.*—The *Financial News* states that a joint stock company is to be constituted in Rosario for supplying electric light and power to the city. The capital of the new undertaking is to be 17,500,000 francs, in which the Rosario Tramway Co. will be interested to the extent of 4,000,000 francs. The new company will supply electricity to the tramway company.

Electric Supply Statistics.—The annual report for 1909 of the Deutsch-Ueberseeische Elektrizitäts Aktiengesellschaft, which, besides supplying electrical power to the city of Buenos Ayres, has also important electrical interests in Montevideo, Santiago, and Valparaiso, is a very satisfactory one. The company's capital now amounts to £4,500,000. The net profit for the year was £405,600, compared with £382,400. The dividend, which has stood at 9½ per cent. since 1906, is now raised to 10 per cent.

BARROW-IN-FURNESS: *Electricity Profits.*—In our note last week upon the accounts of the Barrow-in-Furness electricity accounts, we regret that by a clerical error, the result of the year's working was incorrectly given. The profit of £249 for 1909-10 compares with a deficit of £384 in the previous year, so that the result for 1909-10 was an improvement of £633.

BEESTON: *Proposed Tramways.*—A Committee has been appointed to approach the Nottingham Corporation on the question of tramway extension.

BIRMINGHAM: *Extension of Boundaries.*—A Provisional Order has been issued, extending the boundaries of the City of Birmingham so as to include Aston Manor, Erdington, Handsworth, King's Norton, and Northfield and Yardley. This extension will mean an increase in the area of the city from 12,639 acres to 39,089 acres; the population from 558,357 to 874,857, and the rateable value from £2,915,506 to £4,175,915. The tramways and electricity undertakings of the various public bodies to be incorporated are to be transferred to the Birmingham Corporation, and the officials who suffer pecuniary loss by reason of the incorporation are to be compensated.

BLACKBURN: *Tramway Accounts.*—The Corporation tramway accounts for 1909-10 show a net profit of £453, against a loss of £4,804 in the previous year. There was a decrease in the total receipts of £917, due to bad trade, which the Committee had foreseen early in the year. Consequently the car mileage had been reduced, with satisfactory results so far as working expenses were concerned.

BOLTON: *Electricity Accounts.*—The electricity accounts for 1909-10 show a net profit, after meeting capital charges, of £7,119. Of this the sum of £6,900 is transferred to relief of rates. The number of units sold was 11,993,271, against 10,677,764 in the previous year. The total generating costs were 0·535d. per unit, and including capital charges, 1·125d. per unit, compared with 0·583d. and 1·199d. in the previous year.

BOOTLE: *Electricity Accounts.*—The profits on the electricity undertaking for 1909-10, after meeting capital charges, allow of £1,725 being added to depreciation fund, £200 to accident insurance fund, and £1,440 to relief of rates.

CANADA: *Electric Power Supply.*—The *Times* correspondent at Toronto states that the municipal system organised by the Ontario Government for the distribution of electrical energy at Niagara Falls is expected to be in operation by the end of the year. The first points of supply will be at London and St. Thomas, which are 100 miles west of the Falls.

COLCHESTER: *Electricity and Tramway Accounts.*—There was a net profit of £414 upon the Electricity Undertaking last year. The tramway accounts show a deficit of £2,531, compared with a loss of £3,940 in the previous year. Electrical energy is paid for at 1½d. per unit, and it is felt that this is excessive.

COVENTRY: *Reduction in Charges.*—In future for energy used for motive power the charge for the first 2,500 units per quarter is to be reduced from 1½d. per unit to 1½d. per unit. Where the consumption is 50,000 units or over per quarter, a flat rate of one penny per unit is to be charged. All lighting consumers are to be charged for energy used for domestic purposes other than lighting at the rate of a penny per unit.

CROYDON: *Electricity Accounts.*—There was a gross profit of £33,433 upon the electricity undertaking. After meeting capital charges, the sum of £4,000 has been transferred to relief of rates.

DERBY: *Price of Tramway Energy.*—The Tramways Committee have been refused a reduction in the price of electrical energy from 1½d. to 1d. per unit.

EDINBURGH: *Opening of Electric Tramway.*—The first electric tramway in Edinburgh, which runs from Ardmillan Terrace to the Corporation markets at Gorgie, was opened this week.

FOLKESTONE: *Corporation and Supply Company.*—At the last meeting of the Town Council the Clerk reported that if the Corporation wished to purchase the electric undertaking from the Folkestone Electricity Supply Co., at the expiration of the 15 years agreed upon, notice must be given before the first of January next. It was resolved that notice be not given.

GLASGOW: *Tramway Receipts.*—The receipts for the Corporation tramways for the year to May 30th were £893,591, an increase of £4,260. The receipts per car mile were 10·22d., and the number of passengers carried was 222,730,571, an increase of 986,002.

GLOUCESTER: *Electricity Profits.*—There was a net profit of £840 upon the electricity undertaking for the past year, compared with £10 in the previous year. The number of units sold was 1,390,000, against 1,452,000.

LEICESTER: *The Late Mr. Colson.*—The Leicester Branch of the Electrical Contractors' Association has passed a vote of condolence with the widow and family of the late Mr. Alfred Colson, Borough Electrical Engineer.

LIVERPOOL: *First Class Cars.*—The receipts from the first class tramcars running in Liverpool amount to nearly 14d. per car-mile, against 11d. per car-mile, which is the average of the ordinary cars.

LONDON: *London County Council: Through Bookings.*—The Highways Committee recommend that authority be sought in the next session of Parliament authorising through booking between the Council's tramways and certain of the London Underground Electric Railways.

Bethnal Green.—Electric Supply.—After further consideration, the Electricity Committee again recommend the Council to adopt an offer by the Shoreditch Council to supply electricity in bulk for a period of seven years. The recommendation was adopted, and the Electricity Committee will now proceed to obtain the necessary consents, &c., and report again to the Council.

Shoreditch.—Supply to Bethnal Green.—The figures at which the Borough Council is to give a bulk supply to Bethnal Green at one or more points on the boundary are as follows:—250,000 units per annum, and under 500,000, 1·15d. per unit; 500,000 units per annum, and under 750,000, 1·10d.; 750,000 units per annum, and under 1,000,000, 1·05d.; 1,000,000 and over, 1d., subject to a seven years' agreement being entered into, and to a coal clause providing for any rise or fall in coal to be followed by a corresponding rise or fall in the above prices.

Woolwich: Supply in North Woolwich.—For some time the Electricity Committee has been considering the question of carrying electric cables through the Woolwich subway, in the event of the Council deciding at a future date to supply electricity in the North Woolwich area direct. The London County Council has decided to allow the Council to lay cables through the tunnel for twenty-one years in consideration of a payment of £50 a year. This offer has been accepted.

NOTTINGHAM: *Tramway Accounts.*—After meeting all charges, interest, sinking fund, and reserve, the accounts of the Corporation tramways for the past year show a balance of £20,000, which is transferred to relief of rates. The reserve and renewals fund now amounts to £62,257. The gross receipts were £56,772.

PAKEFIELD: *Electric Supply.*—A private company proposes to apply for an electric lighting provisional order, and the Council have been asked for their consent.

SEVENOAKS: *Electricity Supply.*—Messrs. Mordey & Dawbarn are being consulted with regard to an electric supply scheme for this district.

SOUTH AFRICA: *Electrical Developments.*—The Delagoa Bay Development Co. are acquiring a controlling interest in the Laurenço Marques Electric Light Co. Messrs. Mordey & Dawbarn are acting for the electric light company. At present the Delagoa Bay Co. also supply electricity.

ST. HELENS: *Electricity Profits.*—After meeting interest and sinking fund charges, the profit of the electricity undertaking for the past year was £1,031, of which £600 have been credited to renewals fund, and £431 to reserve.

SUNDERLAND: *Position of Tramway Company.*—Mr. Justice Swinfen Eady, in the Chancery Division last week, appointed Mr. C. Eves receiver and manager of the Sunderland District Electric Tramways, Ltd. This appointment was the result of an application on behalf of the first mortgage debenture holders, who foresee no possibility of their interest being paid in July, when it falls due.

SWANSEA: *Electricity Works Assessment.*—The assessment of the electricity works has been increased to £3,500, compared with £1,300. The Town Clerk is preparing a report on the subject.

TORONTO: *Projected Tube Railways.*—According to the *Standard*, Messrs. Jacobs & Forgie, an English firm of engineers, have arrived in Toronto to report upon a proposed system of tube railways. The report is expected by July 1st.

WEST INDIES: *Lighting and Traction.*—The Bermuda Electric Light, Power, & Traction Act, 1910, authorises the incorporation of a company with this name for the electric

Digitized by Google

lighting of Hamilton. The Bermuda Trolley Company's Act is under consideration, and there seems to be every prospect of the Canadian company obtaining the necessary authority to go ahead with this undertaking.

WIGAN.—*The Tramways Undertaking.*—The Council have engaged Mr. C. W. Mallins, General Manager of the Liverpool Corporation tramways, to report on the financial position and management of the tramways.

WORCESTER: *Electricity Accounts.*—After payment of £3,646 for interest, £963 the equivalent to dividends on cancelled stock, and £5,559 for redemption of capital, the electricity accounts for 1909-10 show a deficit of £1,401. The final contribution for redemption of three years loan of £4,012 for replacement of Powick plant is included in this year's accounts. The main cause to which the deficiency may be attributed is the fall in revenue from private lighting, a large proportion of the consumers having adopted metal filament lamps.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ECCLES.—A Local Government Board inquiry was held last week, concerning a loan of £5,234 for the purposes of the electrical undertaking.

ERITH.—The Council require the following:—(1) Lancashire boiler; (2) a 750-kw. impulse type turbo three-phase alternator and exciter. Particulars from the Borough Electrical Engineer, and tenders by June 20th.

GRIMSBY.—Application is to be made to the Local Government Board for sanction to borrow £4,000 for the extension of mains, and £1,500 for services.

HAMPSHIRE.—An electric light and power plant, &c., is required at the County Asylum, Knowle, Fareham. Particulars from the Clerk, and tenders by June 28th.

LONDON: *Bethnal Green.*—The Council have at last decided to undertake a scheme of electric supply.

ROTHERHAM.—The Town Council is to apply to the Local Government Board for sanction to borrow £27,852 for the electricity undertaking. The chief items are as follows:—Mains and transformers, £10,000; one 1,000 kw. turbo-alternator condensing apparatus and switchboard, £5,000; 3½ miles high-tension feeder cable, £6,175; feeder and distributor mains for supplying the Broom District, £2,222; one 250 kw. rotary converter set, one 250 transformer set, and high-tension switchboard set (all for generating station), £1,050; ditto, at Howells, Wincobank, £975.

SHEFFIELD.—An expenditure of £78,207 upon extensions at the Neepsend power station is contemplated. These extensions are mainly due to the increase in the power and heating demand. Quite a new source of demand has developed for the Electric Smelting Works. Already two furnaces have been connected to the mains, and others are awaiting connection.

SWANSEA.—In an advertisement last week, it was stated that tenders are required by Monday, June 23rd, for motors and motor starters. This should read June 27th.

WEST BROMWICH.—Paper-insulated lead-covered feeder and pilot cables are required. Particulars from the Borough Electrical Engineer, and tenders by June 20th.

Miscellaneous

LONDON: *London County Council.*—Tenders are invited by July 5th for 250 electric tramcar bodies, 250 sets of centre-bearing swing bolster car-trucks, and 250 complete electrical equipments for operation upon both conduit and trolley system. Particulars from the Chief Officer of the Council, 62 Finsbury Pavement, E.C.

MAIDSTONE.—A proposal has been laid before the Corporation to extend the tramways to Chatham, at an estimated cost of £60,000.

NORTHAMPTON.—Preliminary plans and estimates have been prepared for the extension of the tramways to Far Cotton, the estimated cost being £14,560, made up as follows:—Permanent way, £9,670; overhead equipment, £1,220; cables and feeders, £1,420; four cars, £2,250.

NOTTINGHAM.—Preparations are being made for the construction of the Carlton Road tramways, the Bill concerning which will shortly be considered by the Unopposed Committee of the House of Commons. The estimated cost is £14,000.

RUSSIA.—Recent Consular reports state that there is an increasing demand for electrical material and accessories of all kinds in Saratoff.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

BARRY.—Alterations to Holton Road School (£2,120). T. B. Tordoff, Sec., Education Committee, Barry U.D.C.

BEXHILL-ON-SEA.—School (£5,000). F. Wilson, Sec., Education Committee, Bexhill Town Council.

BIRKENHEAD.—School, Lee's Avenue. R. T. Jones, Sec., Education Committee, Town Council.

BIRMINGHAM.—Factory for Dunlops, Ltd. Architect, A. Edwards, Bennett's Hill, Birmingham.

BOLTON.—School, Wolfenden Street (900 places). T. Wilkinson, Sec., Education Committee, Bolton Town Council.

CHELMSFORD.—Electric theatre and shops, Duke Street, for the National Theatre de Luxe, Ltd.

CHESTER.—School, Queen's Park (£11,100). Sec., Education Committee, Chester Town Council.

COVENTRY.—School, Mile Lane (£16,850). Executors of Charles Garlick, builder, Coventry.

DERBY.—Picture palace (£2,500). Architect, G. S. Valentine, 18 Charing Cross Road, W.C.

DURHAM.—School, Waldridge Lane (£4,000). W. Rushworth, architect, Shire Hall, Durham.

EPSOM.—Nurses' home and alterations to girls' home at Woodcote (£2,027). Architect, A. C. Williams, 53 Doughty Street, W.C.

FOLKESTONE.—Picture theatre (£3,000). Architect, G. Valentine, 18 Charing Cross Road, W.C.

GLASGOW.—Extensions, Glasgow Tobacco Wholesale Premises, James Watt Street (£7,000). R. Thomson, architect, 276 St. Vincent Street, Glasgow.

LEYTONSTONE.—High School (£11,278). Architects, Messrs. W. & J. H. Jacques, 2 Fen Court, Fenchurch Street, E.C.

PERTH. Academy buildings (£2,700). H. E. Clifford, architect, 225 St. Vincent Street, Glasgow.

P.O., Mill Street (£2,500). F. D. Robertson, West End Cottage, Fife Keith, Banff.

PETERBOROUGH.—School, Millfield (£5,000). W. Boyer, architect, Market Chambers, Peterborough.

PORTSMOUTH.—Hotel, in connection with Day Training College. Sec., Education Committee, Portsmouth.

WEST FIFE.—Extensions to infectious diseases hospital (£10,000). Architect, E., Simpson, 16 King Street, Stirling.

TENDERS RECEIVED AND ACCEPTED

BELFAST.—The Electricity Committee have accepted the tenders of Messrs. J. H. Holmes & Co., for the supply of a booster set and switchgear, and of Messrs. Cowan's, Ltd., for switchboard extensions.

BURTON-UPON-TRENT.—The Council have accepted the tender of the Brush Electrical Engineering Co. for a synchronous motor-generator at £257 10s.

COLCHESTER.—The Electricity Committee have accepted the tender of Messrs. Veritys, Ltd., for six disconnecting pillars, and that of Messrs. W. T. Henley's Telegraph Works Co., Ltd., for cable.

EASTBOURNE.—The Council have accepted the tender of Messrs. W. T. Henley's Telegraph Works Co., Ltd., at £130, for cable.

ECCLES.—The tender of the British Insulated & Helsby Cables, Ltd., has been accepted for cable at £459 11s.

HECKMONDWIKE.—Subject to the consent of the Local Government Board to the necessary loan, the tender of Messrs. Deane & Beale at £2,418 has been accepted for a condensing plant.

LEYTON.—The District Council have accepted the tender of the Reason Manufacturing Co., Ltd., for the annual supply of electrolytic ordinary and slot meters.

LONDON: *London County Council.*—The following tenders have been received for 39 double-deck car bodies; 39 sets of electrical apparatus, and 40 sets of car trucks required in connection with special cars for use on hilly routes:—

39 double-deck car bodies: Hurst, Nelson & Co., Ltd. (accepted), £14,040; Brush Electrical Engineering Co., Ltd., £14,469; United Electric Car Co., Ltd., £14,742; Metropolitan Amalgamated Railway Carriage & Wagon Co., Ltd., £15,366.

39 sets of electrical equipments:—British Westinghouse Electric & Manufacturing Co., Ltd., £12,753; Dick, Kerr & Co., Ltd., £13,006 10s.; British Thomson-Houston Co., Ltd., £13,045 10s.

40 centre-bearing four-wheeled bolster trucks:—United Electric Car Co., Ltd., £4,880; Hurst, Nelson & Co., Ltd., £4,980; Metropolitan Amalgamated Railway Carriage & Wagon Co., Ltd., £5,040.

The tender of the British Westinghouse Co. has been accepted at £2,280 for 40 sets of magnetic track and wheel brake equipments for double-deck cars.

Digitized by Google

Woolwich.—The tender of Messrs. F. Sage & Co. has been accepted for fitting up the new electrical showroom of the Council in Powis Street, at £619 10s.

METROPOLITAN WATER BOARD.—The Board has accepted the following tenders:—Appleby Crane & Transporter Co., Ltd., provision and erection of a motor generator (to be manufactured by the General Electric Co.) for coal transporter apparatus, £105; Rees Roturbo Manufacturing Co., centrifugal pump and electric motor for Ealing, £55 10s.

STRETFORD.—The tender of the General Electric Co., Ltd., for a 500-kw. steam-driven generator at £2,764 has been accepted, and a spare armature at £325.

APPOINTMENTS AND PERSONAL NOTES

Mr. S. E. Fedden, General Manager and Engineer of the Sheffield Corporation Electric Supply Department, has unfortunately been ill, but is now making very satisfactory progress towards recovery. He will, however, not have regained sufficient strength to journey to Glasgow for the Incorporated Municipal Electrical Association Convention next week. Mr. Fedden was to have opened the discussion on "Cheapening the Cost of Mains and Services" on Thursday. His place will now be taken by Mr. S. J. Watson, of Bury, who will be followed by Mr. F. Ayton, of Ipswich, as mentioned in another column. Mr. Fedden's absence will be much regretted, for he was a very regular attendant at the meetings. He read a Paper on "Street Lighting by Electricity" at the second annual meeting of the Association, and since then has read two other Papers at annual conventions, was president in 1907, and has taken part in the discussions at practically every meeting.

Mr. Charles Bright, F.R.S.E., asks us to state that his appointment recently announced by the Australian Commonweath is a home (London) appointment for partial services, and will not, therefore, as appears to have been supposed, take him to Australia.

The recommendation of the Coventry Electric Light Committee that the salary of the Borough Electrical Engineer, Mr. G. Tough, be increased from £350 to £450 per annum has been passed by the Council.

Messrs. Clark, Forde & Taylor, 4 Great Winchester Street, London, are taking into partnership Mr. R. M. Sayers. This will not alter the style of the firm, which remains as before.

We regret to announce the death of Alderman Carey, who was a highly esteemed member of the Cardiff Corporation, and who has done splendid work as chairman of the Electric Lighting and Tramways Committee.

COMPANIES' MEETINGS AND REPORTS

SHANGHAI ELECTRIC CONSTRUCTION CO.—Sir Alfred Dent stated at the annual meeting last week that the Municipal Council of Shanghai had agreed to a modification of the terms of the company's concession, to the extent of the abrogation of their liabilities for road maintenance, to a suspension of the royalty for the year 1910, and also to a slight concession in cost of power. To the board's surprise the ratepayers declined to support the recommendation of the council, and the proposals as regarded road maintenance and royalty were rejected. The result had been delay in the improvement of the service, and in a return to the shareholders on the large capital they had expended. There was a loss for 1909 of £949. The loss in exchange for the native currency into Mexican dollars amounted to £15,541, whilst royalties to the Council, and maintenance of roads amounted to £2,774.

WINNIPEG ELECTRIC RAILWAY CO.—The accounts for 1909 show net earnings of $863,405, and the surplus, after payment of four quarterly dividends, amounts to £263,405. This has been added to profit and loss account, making a total credit of £861,430. In November last year the company's hydraulic works on the Winnipeg River broke down through the bursting of one of the penstocks, but the steam plant was brought into use, and a partial service was maintained.

KALGOORLIE ELECTRIC POWER & LIGHTING CO.—The profit for 1909 has enabled the payment of the preference dividend and the placing of £4,000 to depreciation and renewals. The company are installing an additional generating unit in view of the large amount of power required by the Great Boulder Perseverance Co., and orders for this have been placed.

IMPERIAL TRAMWAYS CO.—The report for 1909 states that no dividend has been received from the company's investment in the London United Tramways Co., which means a loss of £21,111. Consequently, no dividend can be declared upon the preference or ordinary shares. The net revenue was £16,747, and after meeting debenture interest a balance of £4,006 is carried forward. At the annual meeting last week, Sir George White said that in view of the depreciation in the market value of their holding in the London United Tramways Co., it would be unwise to make any payment on account of the cumulative preference shares. The directors had waived their fees, and would continue to do so until a dividend was paid. Previously to 1909, not only had the preference dividend been met, but the dividends on the ordinary shares had averaged 10 per cent. for the previous sixteen years. The present unsatisfactory position is due to the lack of dividend on the large holding of preference shares in the London United Co.

CAPE TOWN & DISTRICT GAS CO.—At the annual general meeting of this company last week, complaint was made that the Cape Town Municipality should be allowed to supply electricity in competition with the company in Woodstock, which is outside the Cape Town municipal area.

UNITED ELECTRIC TRAMWAYS OF MONTEVIDEO.—The net profit for the year to March 31st was £74,981, and a dividend at the rate of 6 per cent. for the year is declared. Renewals and contingency fund is credited with £15,000.

ANGLO-ARGENTINE TRAMWAYS CO.—At the annual meeting on Thursday, the proposal to increase the second preference share capital by £500,000, and the ordinary capital by £1,500,000, and increasing the rate of dividend on the first and second preference shares from 5 to 5½ per cent., was passed. The 5 per cent. debenture stock is also to be increased by £6,000,000.

TRACTION AND POWER SECURITIES.—There was a credit balance of £24,848 for 1909, to which has to be added £5,775 brought forward. Investment reserve is credited with £25,000, and the balance is carried forward. Investment reserve now stands at £110,000.

DIESEL ENGINE CO.—The net profit for 1909, including £6,075 brought forward, was £9,031. After meeting the 5 per cent. preference dividend, and placing £5,000 to general reserve, a balance of £3,093 is carried forward.

BRUSH ELECTRICAL ENGINEERING CO.—Mr. E. Garcke presided at the annual meeting on Monday. Referring to the heavy loss for the past year, the chairman said the troubles of the Brush Co., in common with many others, were mainly due to excessive competition from abroad. But for this, terms could no doubt be made amongst British manufacturers with regard to the present mutually destructive competition. The unsatisfactory position of affairs had been accentuated during the past few years by the advent of the metal filament lamps. Further, the company had been badly hit by the absence of any extensions of tramways or light railways, which had rendered their large car building shops idle. In these circumstances there was nothing to be done but to attend closely to the details of the business, to reduce expenses to the smallest possible limits, and to hold on until conditions improved. Fortunately, the current half-year had been to some extent better. Mr. Garcke concluded with warm praise for the manner in which the officers and staff were contending against adverse difficulties.

NATIONAL ELECTRIC CONSTRUCTION CO.—The accounts for 1909 show that after providing for debenture interest, depreciation, &c., the credit balance of £9,661 brought down was reduced to £6,322.

Cable Fire.—According to the *Manchester Courier*, the breakage of a wire strung overhead in a subway under Church Street, St. Helens, caused an outbreak of fire in the subway on Monday. It is stated that both the electric and gas supplies had to be temporarily cut off, and that a Post Office telegraph cable in the subway was destroyed.

Institution of Mining Engineers.—At the London meeting of the Institution of Mining Engineers, last week, it was announced that among the authors of Papers to whom the Council had awarded prizes was Mr. R. Nelson (H.M. Electrical Inspector of Mines), for his Paper on "Electricity in Coal Mines," read last year. (See ELECTRICAL ENGINEERING, Vol. V., page 527, June 10th, 1909.)

Naval Appointments.—New regulations have been approved by the Admiralty for the appointment of electrical engineers at the Admiralty and in the Royal dockyards. Electrical engineers will be selected from first assistant electrical engineers, but vacancies for the latter can be filled by outside candidates. Candidates must have passed through a suitable training course and have had at least five years' practical engineering work, part of which time must have been spent in a responsible position as electrical engineer. As a rule every second vacancy will be filled by an outside candidate, the others being taken by second assistant electrical engineers or dockyard *employés* who have held at Admiralty scholarship. Appointments in vacancies for second assistant electrical engineers will be made by means of a competitive examination, at which inspectors or electrical fitters and first-class draughtsmen of three years' seniority and persons qualified by Admiralty scholarships will be eligible to compete. The Admiralty scholarship will be instituted tentatively, for a period not exceeding six years, and will be awarded to an electrical fitter apprentice who has completed his four years' course of study in a dockyard school.

Electric Control.

HOW THE "WATKIN SWITCH" REGULATES ELECTRICITY FOR LIGHT OR POWER.

It is not too much to say that the greatest obstacle to the general adoption of electricity for lighting, heating, engineering, and other purposes has been the difficulty of regulating and adjusting the current in accordance with the requirements which vary not merely from day to day, but from hour to hour.

Take, for instance, the matter of lighting, whether for the home, a business office, or the factory. The superiority of electricity alike in point of efficiency, of cleanliness, and health is indisputable. Yet at the same time in actual use electric lights suffer from the drawback that they cannot be modulated according to the illumination required, that they cannot be turned half or a quarter on, as can be gas, by the turning of a tap, but that they must either be clicked on at full cock or clicked off altogether.

By the invention of the Watkin Switch and Electric Current Controller, that drawback hitherto associated with electric lighting and the use of electric power for domestic and other purposes is overcome. For this ingenious patented instrument enables full and perfect control to be ever exercised over the electric current used for any purpose, with a resultant saving in expenditure greater than has been hitherto thought possible. Whereas the ordinary electric installation merely provides for the current to be on at "full" or to be turned off, the Watkin Switch enables that electric light or electric power to be applied and varied in seven different and graduating degrees. By the Watkin switch the electric current becomes as readily and completely under control as does water or gas by the turning of the tap. Thus it allows an electric lamp to be reduced to give no more illumination than a night-light, and from that bead of light it can be graduated through seven stages to its full and standard power. What this fact connotes in actual use is shown by the illustration that the cost of a Watkin Switch for one lamp is 17s. 6d., and its use effects a saving on that lamp of £1 per annum, with an even higher proportionate saving on the original cost for a number of lamps. For, in addition to its saving of the actual electric current (by allowing it to be modulated at will), the Watkin Switch economises the wear and tear of the lamp, especially in the case of metallic filament lamps, the life of which is doubled by the adoption of this epoch-making invention.

A Marvellous Saving

Here it may be noted that no alteration of fittings or wiring is necessary for the institution of the Watkin Switch, which is equally applicable to direct or alternating currents. Results of the complete and exhaustive tests of the invention by the Electrical Standardizing and Testing Institution, Faraday House, W.C., are embodied in a certificate which reports that from 12½ to 80 per cent. of electric current is, and may be, saved by the use of the Watkin Switch, the insulation of which satisfactorily passed the test up to 1,000 volts.

Its application to electric lighting is only one of the many uses to which the Watkin Switch is being applied with revolutionary and highly satisfactory results. Fitted to electric radiators it enables the heating of a room to be adjusted with the utmost nicety, precision, and economy. Already a large demand for the Watkin Switch has sprung up in India for the perfect control it affords over electrically-driven fans and punkahs. In the use of such domestic conveniences as electrically-heated irons and equally in the use of electrically-driven surgical apparatus, the Watkin Switch supplies that full and delicate control which has long been desired but never before obtained.

Perhaps the best idea of the usefulness and indeed indispensability of the Watkin Switch for users of electricity in any form whatever may be gathered from the fact that, though placed on the market within only the last few months, it is already being supplied to his Majesty's Government, to the Government of the Commonwealth of Australia, the Indian Government, the New Zealand Government, the Cape Colony Government, and the Offices of Works in London, Bombay, Cape Town, Dublin, Pretoria, and Sydney; to the Corporations of London, Glasgow, Bradford, Dundee, Croydon, Birmingham, &c.; and to leading railways and shipping companies, business firms, hospitals, and public institutions throughout Great Britain. The manufacturers and sole patentees of the Watkin Switch (which is a British invention and a British manufacture) are The Adams-Watkin Co., Ltd., 56 Victoria Street, S.W., where all communications should be addressed.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 to £59 5s. per ton (last week, £59 5s. to £59 15s.).

ALLEN WEST & CO.—We understand that Messrs. Allen West & Co., Ltd. (Lewes Road, Brighton), are now handling the business in stamped grids formerly carried on by Messrs. Wellman, Seaver & Head, Ltd.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—The Electric Sterilising, Carbonising, and Stripping Co., Ltd., is to be wound up voluntarily. Mr. H. Appleyard, Prudential Buildings, Market Place, Dewsbury, is liquidator. A meeting of creditors will be held at the above address on June 20th at 2.15 p.m.

Mr. C. S. Beale, 72 Bishopsgate Street, London, has been appointed liquidator of the Typewriting Telegraph Corporation, Ltd.

The public examination of Mr. W. H. Trentham, electrical engineer, 39 Victoria Street, S.W., will be held at Bankruptcy Buildings, Carey Street, London, on June 28th, at 11 a.m.

CANADIAN AGENTS WANTED.—A London firm of electrical and mechanical engineers wish to appoint agents at Montreal, Toronto, Halifax, Winnipeg, and Vancouver. Particulars from the High Commissioner for Canada, 17 Victoria Street, London, S.W.

CHANGE OF ADDRESS.—Messrs. Charles Macintosh & Co., Ltd., have removed from 1 and 3 Golden Lane, to 22-3 Jewin Street, London, E.C.

THE BECK FLAME LAMP CO.—We are informed that the Beck Flame Lamp Co., Ltd., are carrying out some important municipal contracts, which include several hundred lamps for the lighting of Sydney, Cape Town, and Worthing. Encouraged by their success, they have decided to build additional workshops, and, by arrangement with the carbon manufacturers, are greatly increasing their stocks.

NORTHAMPTON ELECTRIC LIGHT & POWER CO.—The existing shareholders are being offered the opportunity of subscribing to an issue of 15,000 £1 ordinary shares at a premium of 2½ per cent.

Newcastle Local Section, I.E.E.—The annual general meeting of this section was held on Monday, May 30th, at the Armstrong College, Newcastle-on-Tyne. A vote of thanks to Mr. C. Faraday Proctor for his long continued service as Honorary Secretary of the Section was moved by Mr. H. W. Clothier, the newly elected Hon. Secretary, and seconded by Prof. Stroud, the retiring Chairman.

Renold Chains at the Japan-British Exhibition.—Messrs. Hans Renold, Ltd. (Progress Works, Brook Street, Manchester), have an effective display of their well-known chains on a stand in the Machinery Hall of the Japan-British Exhibition. The four small chain drives shown include sizes for powers ranging from 3 to 40 h.p., and speeds from 400 to 1,300 ft. per minute. The silent chain drive is provided with a shock-absorbing sprocket, part of the cover-plate of which has been cut away to expose one of the springs. On the same stand a complete range of patent silent, bush roller, block, stud, balance, textile and pipe wrench chains are exhibited. A mortising chain outfit with guide bar and sprocket is also shown, with blocks of wood illustrating the sizes of mortise that can be cut.

The Batti-Wallahs' Society.—At an extraordinary general meeting on Monday, a resolution was passed altering the title of the P. and O. Batti-Wallahs' Society, by deleting "P. and O." It is now the intention to admit electrical engineers as members, irrespective of any association with the P. & O. company. Mr. Walter Riggs, a Past President of the Batti-Wallahs' Society, has placed his sailing barge *Alde* at the disposal of the members from July 30th to August 8th, for the purpose of a cruising trip. Members intending to join the party are requested to communicate with the Hon. Secretary, Entertainment Committee, Mr. A. W. Robinson, 116 Charing Cross Road, London, W.C.

Prosecution *re* Home Office Rules.—On Thursday, in the Hamilton Sheriff Court, Scotland, the Clyde Valley Electric Power Co. were charged with having, on March 3rd last, allowed a labourer, J. Noble, to work on a H.T. switchboard at the Cambuslang sub-station, which was not adequately protected. The part on which the man was working was not separated from the live part by screens, and he came in contact with an 11,000-volt conductor and was killed. A representative of the company pleaded guilty, but explained that though it was impossible to make the whole board dead, it was the practice to provide screens. The responsibility for their use rested with the district engineer in charge. Noble had had considerable experience of electrical work. The board was erected in 1906, whereas the new regulations only came into force in January of this year. A fine of £20 was imposed.

ELECTRICAL ENGINEERING

NO. 181 [VOL. VI., NO. 24] THURSDAY, JUNE 16, 1910. [PRICE ONE PENNY.
All rights reserved. *Registered as a Newspaper.*

"Electrical Engineering," although the Cheapest Electrical Paper (Price 1d. weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.

ELECTRICAL ENGINEERING.

The Engineering Journal of the Electrical Industry

PUBLISHED EVERY THURSDAY. Price **1d.**

SUBSCRIPTION RATES.

United Kingdom. 6s. 6d. per Annum.
Canada. 8s. 8d. per Annum.
Other Colonies and Abroad. 13s. per Annum.

Small prepaid Advertisements for SITUATIONS VACANT AND WANTED, ARTICLES FOR SALE AND WANTED, &c., are inserted at the rate of One Penny per word, minimum One Shilling, three insertions for the price of two.

OFFICIAL NOTICES and TECHNICAL COLLEGE ANNOUNCEMENTS are inserted at the rate of Ninepence per line (column width).

Other Advertisement Rates on Application.

Latest Time for Receiving
Letters for Insertion, *Tuesday first post.*
Small Advertisements and Official Announcements, *Wednesday first post.*
Displayed Advertisements, *Tuesday first post.*
Corrections in Standing Advertisements, *Monday first post.*

All letters to be addressed to "Electrical Engineering," at the EDITORIAL AND PUBLISHING OFFICES: 203-206, TEMPLE CHAMBERS, LONDON, E.C.

Telegrams: "Circling, London." *Telephone No.: 5509 Holborn*

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

A SUPPLEMENT "ELECTRICAL ENGINEERING IN MINES" IS INCLUDED (GRATIS) IN "ELECTRICAL ENGINEERING" ON THE FIRST THURSDAY OF EVERY MONTH.

SUMMARY

THE Annual Convention of the Incorporated Municipal Electrical Association was opened in Glasgow on Tuesday. Mr. W. W. Lackie, in his Presidential Address, dealt with a variety of subjects. He thought it would be for the best welfare, not only of the supply undertakings, but also of the wiring contractors, if the supply authority were to furnish the lamps to consumers. Dealing at some length with methods of charging, he suggested a flat rate calculated from the average rate that would have been charged the consumer in the previous year on the maximum demand system, and that a "Rating Committee" should meet once or twice a year to settle disputes. Two Papers by Messrs. Cramb and Collings Bishop dealt with the commercial development of electricity supply undertakings, and outlined the details of the organisation of a sales department. In the discussion, Mr. F. Ayton expressed his intention of training lady canvassers in order to push the sale of domestic electrical apparatus. Some strong remarks were made in support of municipal wiring, and Mr. C. H. Wordingham was alone in advocating that electric supply undertakings should not do this work. Mr. Cramb and Mr. Ayton both advocated the policy of leaving the contractor out of the question altogether, the former saying that the present position was that the central station manager should sell the apparatus and the contractor take the discount. Other speakers referred to the fact that whilst the wiring contractors had had the field to themselves for years, the sale of heating and cooking apparatus had never been pushed. (Pages 385 and 393.)

THE original Marconi patent describing several important features of wireless telegraphy expired on June 2nd last, the Marconi's Wireless Telegraph Co. having decided not to proceed with the application which was made for an extension of term. The Company has brought an action against the British Radio Telegraph & Telephone Co. for alleged infringements of patents relating to syntony, the magnetic detecter, and the rotary spark-gap transmitter. The infringement is denied, and the Marconi patents in question are claimed to be invalid. (Page 386.)

AT the Congress last week of the Tramways and Light Railways Association at Dublin, a description of the Dublin tramway undertaking was given by Mr. R. S. Tresilian. A standard form of brake-shoe, put forward for discussion by Mr. J. A. Panton, was discussed, and Papers were read by Mr. J. R. Salter and Mr. H. England on "Tramway Economics" and "Railless Traction" respectively. Both these authors agreed that there was a limit of frequency of service below which a tramway could not possibly pay, and the latter considered the possibilities of trolley omnibuses in this connection. (Page 387.)

THE "Z" Electric Lamp Manufacturing Co., Ltd., have been successful in their opposition to the grant of a patent to the Glühlampenwerk Anker Ges. for

Digitized by Google

the use of phospham to prevent blackening of metal filament lamps due to the disintegration of the filaments. (Page 390.)

THE judgment of Mr. Justice Parker, which decided that Messrs. Marples, Leach & Co. (now Adnil Electric Co.) are selling lamps which infringe one of the "Z" Company's patents, is to be appealed against. (Page 390.)

IN a Paper read on Tuesday before the Institution of Gas Engineers, Mr. J. Abady reviewed the question of municipal street lighting both by electricity and gas. He did not touch upon the controversy between the two systems, but confined his remarks to a discussion of forms of contract and the size, spacing, and arrangement of lamps to obtain good illumination. He favours charging for the actual light rather than for the energy supplied, and points out the advantages of small units close together. (Page 391.)

THE International Electrotechnical Commission has issued its first annual report. So far the work has consisted mainly of organisation, but reports on nomenclature and symbols are before the various Committees. International rules for electrical machinery will shortly be considered, and a report on the rules already in existence is being prepared. (Page 392.)

AN endeavour is being made to obtain an injunction to restrain the Leicester Corporation, who work under a Provisional Order, from carrying out electric wiring and selling electric fittings, &c. The case commenced on Monday, and evidence of considerable interest was given, including proof of the sale of an electric lamp to a non-ratepayer, and the wiring of a private electrical installation outside the borough boundary. The Corporation contend that they are entitled to wire consumers' premises and to supply consumers with fittings under Section 10 of the Electric Lighting Act of 1882, which empowers them to "do all such acts and things as may be necessary and incidental to" the supply of electrical energy. (Page 397.)

AT the Annual Meeting of the Electrical Contractors Association in Edinburgh on Monday, Mr. Harland Bowden was duly installed as President. Among the matters discussed were the question of guaranteeing the work of members of the Association, and a proposal to endeavour to obtain an amalgamation of the interests represented by the various organisations of consulting engineers, station engineers, manufacturers, cable makers, and the E.C.A. Committees were formed to deal with both of these matters. (Page 398.)

A DEPUTATION from the Acton Borough Council is to arrange terms with the Metropolitan Electric Supply Co. with regard to the electricity undertaking.—The abandonment of the conduit system at Bournemouth now only awaits the sanction of the Board of Trade.—The Eastbourne electricity accounts show a net profit of £2,200, or nearly ten times that of the previous year.—At Mirfield the price of supply is to be raised on account of the use of metal filament lamps.—The power station at the Rosyth Naval Base has been destroyed by fire.—The last two sections of the reconstructed York tramways were opened last week. (Page 399.)

APPLICATIONS have been made during the week for the following loans to the Local Government Board:—Newport (£31,255); Nuneaton (£4,804); St. Anne's-on-Sea (£3,000); St. Helens (£10,230); Sheffield (£78,207). Extensions, at a cost of over £11,000, are contemplated at West Bromwich. (Page 400.)

THE report of the British Electric Traction Co. records a net profit, including the amount brought forward, of £150,760. A dividend of 3s. per share is to be paid on the preference shares, and £15,000 carried to reserve and £14,067 carried forward. (Page 401.)

A LONG letter from Mr. A. C. Eborall comments on some phases of modern switchgear, and contains a suggestion that, with the very large units likely to be used in future, the expense of the automatic switchgear may become prohibitive, and protection may have to be obtained by adopting a different class of machine. A letter from a well-known metal filament lamp firm relates to a forthcoming patent action. (Page 403.)

THE Donnersmarckhütte Oberschlesische Eisen- und Kohlenwerke Akt.-Ges. of Zabcze, Germany, have been granted leave to appeal against the judgment of Mr. Justice Parker in March, which decided that the Ilgner patent for electric driving of reversing rolling mills is invalid. The notice of appeal was not given until two days after the expiry of the period allowed. (Page 403.)

AMONG the specifications published by the Patent Office on Thursday last was one by W. E. Ireland for a tramcar controller with auxiliary contacts and a pilot circuit to warn the driver if the controller has been left in the wrong position when changing ends.—A process for strengthening tungsten filaments by introducing a small percentage of tellerium into the mixture before squirting is covered by C. H. Weber.—Methods of preparing filaments of vanadium and titanium are described by the French Auer Company.—C. H. Pearson describes an interlocked cover for iron-clad switches.—Opposition has been entered to the grant of a patent by the Chemische Fabrik Griesheim-Elektron for an arc furnace for treating gases. (Page 404.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JUNE 16TH.

Incorporated Municipal Electrical Association.

10 a.m. At Institute of Engineers and Shipbuilders, Glasgow. Discussions on (1) "Advantages of Continuous Records of Costs and of Steam Consumption," to be opened by G. Wilkinson (Harrogate) and C. E. C. Shawfield (Wolverhampton); (2) "Cheapening of the Cost of Mains and Services," by S. J. Watson (Bury) and F. Ayton (Ipswich).

2 p.m. Visits to Electricity Works, &c.

7 p.m. Annual Dinner at Windsor Hotel.

FRIDAY, JUNE 17TH.

Incorporated Municipal Electrical Association.

10 a.m. Annual General Meeting at Institute of Engineers and Shipbuilders, Glasgow.

MONDAY, JUNE 20TH.

Institution of Mining Electrical Engineers.

Visit of Warwickshire and South Staffordshire Branch to works of the Electric Construction Co. at Wolverhampton.

TUESDAY, JUNE 21ST.

National Electrical Manufacturers' Association.

2.30 p.m. Committee Meeting at Balfour House, Finsbury Pavement, London.

Faraday Society.

8.0 p.m. At Chemical Society's rooms, Burlington House, Piccadilly, London. (1) "Electrometallurgy of Ferro-Alloys and Steel," by Paul Girod. (2) Exhibition of new Mercury Vapour Lamps by Dr. F. Mollwo Perkin.

WEDNESDAY, JUNE 22ND.

Institution of Civil Engineers.

8.0 p.m. "James Forrest" Lecture. "Recent Developments of Telegraphy and Telephony," by Sir John Gavey, C.B.

Poplar School of Engineering.

(Association of Electrical Engineering Students.)

Debate on "Gas *versus* Electricity."

Institution of Electrical Engineers.—The removal of the offices of the Institution to the new building will begin on Monday, June 20th, and from Thursday, June 23rd, the address of the Institution will be Victoria Embankment, London, W.C. The new telephone number will be Gerrard 764.

FIFTEENTH ANNUAL CONVENTION OF THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION IN GLASGOW

THE fifteenth Annual Convention of the Incorporated Municipal Electrical Association, which commenced in Glasgow on Tuesday, is being attended by a larger number of members and visitors than any previous convention. There were over 400 persons present in the Rankine Hall of the Institute of Engineers and Shipbuilders in Scotland, when the Hon. A. McInnes Shaw, Lord Provost of Glasgow, officially welcomed the Association. In a short speech he drew attention to the great progress which the electrical industry has made since the Association held its annual Conference in Glasgow in 1901, under the presidency of Mr. W. A. Chamen, who was then City Electrical Engineer. Bailie Willock, Convener of the Glasgow Electricity Committee, also spoke a few words of welcome, to which Mr. W. W. Lackie, the President, replied.

Mr. Lackie then delivered his Presidential Address.

PRESIDENTIAL ADDRESS.

Mr. LACKIE reminded his hearers that this was the third time the Association had met in Glasgow. The first time was in 1901, under the chairmanship of Mr. Chamen, and on the second occasion the visit was on one day only, when the Convention was held in Edinburgh under Mr. Newington's presidency in 1905. In Glasgow in 1901 electrical energy cost, including interest, depreciation and sinking fund, 2·96d. per unit, as against 1·73d. to-day. Excluding the standing charges, the works costs then were 1·41d. per unit as against 0·562d. per unit to-day. Very important work, Mr. Lackie continued, had been done by the Association's Council during the past year. The amendments made in the Electric Lighting Acts Amendments Bill and embodied in the Act which was passed had been practically all in accordance with the expressions of opinion received from the representatives of the Municipalities interested. To the Scottish Municipalities whose areas had been threatened, it was particularly gratifying that an amendment was accepted at the last moment protecting both authorised private companies and authorised municipal undertakings from unfair and unreasonable competition on the part of unauthorised companies. The clause of the Bill regarding the raising of capital by municipalities for the purpose of wiring consumers' premises, and the hiring-out of motors, had been dropped out entirely. If the clause authorising the work in consumers' premises to be done "through a contractor only," had been passed, it would have been contrary to the existing Electric Lighting Acts and Orders, and undoubtedly would have been found quite unworkable. If these words became law, it would have become necessary to engage a contractor to erect the main fuses and switches, and to connect, disconnect, remove, and repair all meters. "I think I am not overstating the facts, nor doing violence to the reputation for efficiency of the local contractors," said Mr. Lackie, "when I say that there is not an electrical contractor in Glasgow, nor in any other municipal area, who would feel himself qualified to undertake this work as cheaply or as well as the municipalities are doing it at the present moment."

The President then went on to point out that a private supply company may let on hire motors, and may fit up and maintain complete light and power installations on consumers' premises, and they may buy land and feu it for consumers' premises. Before a municipality can do any of these things they must get Parliamentary sanction, and such sanction, in many cases, would be refused—and, Mr. Lackie added, in some cases rightly so. On the other hand, municipalities had, in many burghs, undertaken the supply of electrical energy at a time when no company would have ventured to do so. They could borrow money at a low rate of interest, enabling them to give a cheaper supply, resulting in a proportionately larger amount of plant being installed in consumers' premises and benefiting the manufacturer who makes all the plant both for the supply authority and for the consumer. Some kind of protection, Mr. Lackie thought, should be extended to those municipalities who, after having acted as pioneers, now find their areas surrounded or invaded by private supply companies, who could select the more profitable consumers, and were also in a position to secure a large power user by offering a specially low rate which, while it did not pay the company, might be an indirect means of profit. This led to unfair comparison in the same district between the charges made by the municipality and the company. In like manner Mr. Lackie was averse from a municipal concern harassing a company in this way.

On the question of depreciation and its relation to sinking fund, the speaker expressed the following views :—Depreciation of value due to wear and tear is met by the sinking fund if it is properly calculated upon the probable life of the plant. On the other hand, if the ordinary maintenance chargeable to revenue is not sufficient to keep the plant up to its original efficiency, this should be met by provision for depreciation. Lastly, obsolescence he considers not to be true depreciation. A prudent authority would annually lay aside a sum for replacing old plant with more modern plant of higher efficiency, but such a course, he pointed out, is not compulsory under the Electric Lighting Acts. Moreover, it is not legal to create a deficit by setting aside a sum either in the name of depreciation or of reserve fund. Only such sums as are profits are available for this purpose. The Court of Session in 1880 had held that the deduction for wear and tear to be made under the section of the Act above referred to is deduction for diminished value as a means of earning income, and not as a saleable subject, and that inasmuch as the plant in question was undiminished in value for the purpose of earning income, no deduction from income tax charge could be made beyond repairs already allowed for.

Reviewing the past year's progress, Mr. Lackie observed that, while gas engines had been improved, most of the new plant had consisted of reciprocating steam engines for small and steam turbines for large units. Municipalities could not afford to indulge in hazardous experiments with untried forms of plant. Suppliers of electrical energy had been seriously affected by the general depression in trade emphasised by the effect of the metal filament lamp, which had caused many stations to cease putting down additional plant for a year at least. When the metal filament lamp came on the market it was said that it would be necessary to obtain three applications for every one previously received, but this has not been found to be the case, for the obvious reason that all the applications previously received were not for lighting purposes, and all the lighting is not even now done by the metal filament lamp. Moreover, during the past few years there had been applications for the larger power supplies; one was glad to think that no such radical change in the efficiency of motors could take place. Touching on a more debatable question, Mr. Lackie next expressed the opinion that it would be for the best welfare, not only of the supply undertaking, but also of the wiring contractors, if the lamps were left to the supply authority, either to be supplied and the price included in the charge per unit, or sold direct to the consumer by the supply authority. If the former method were adopted, one lamp, he suggested, might be given for every 100 or 200 units used, and if the latter, the price would be, at most, net cost.

The great improvement in heating and cooking appliances was briefly alluded to, and the President had observed that the chief effect of the temporary lull in output had been that municipal engineers had had time to re-examine their methods of organisation to see if any untapped economies could be effected.

The last part of Mr. Lackie's address dealt with the system of charging for electricity supply. He recognised that a flat rate per unit is what is wanted by most consumers, and he suggested that, in Glasgow, for instance, a change from the maximum demand to the flat rate might be effected by charging the same as the average rate paid by each consumer during the previous year on the maximum demand system. The maximum demand would still be taken during the year, and the average rate worked out. This would mean that there would be flat rates for different consumers or for various kinds of consumer, ranging from 3½d. per unit to ½d. per unit, decreasing from the former to the latter by tenths or even hundredths of a penny, and he therefore suggested that a rating committee might be appointed, and sit once or twice a year to hear and settle cases in dispute. He conceived that such a method might even lead to increased consumption of energy: for consumers paying 3½d. and ¾d., working out to an average price of, say, 2d., would only remember the 3½d. rate, and when they found that they were only to be charged 2d., would not exercise

Digitized by Google

the rigid economy which is often practised in connection with the 3½d. rate. An innovation which might also be made would be, instead of charging a rate per unit, to charge so much per 10 units; this would enable the making of fractional reductions smaller than the minimum possible reduction of ¼d. per unit with the present method of charge. For instance, the rates in Glasgow vary from 3½d. to ¾d.; this would work out at 2s. 11d. per 10 units for light, and 7½d. per 10 units for power. The fixed rate system of charging, say, £4 or £5 per kw. per annum plus a low rate of ½d. or ¼d. per unit, had been tried ten years ago in Glasgow by Mr. Chamen, but they had serious complaints from lighting consumers because of their bills being as heavy in summer as in winter, although many used practically no light in summer. On the "knotty" question of specially low rates to users of a large amount of energy for an exceptional number of hours in the year, two remarks were made. The suggestion that the municipal electricity supply undertaking should, in certain circumstances, give power supplies to large industrial concerns even at a loss, for the sake of the secondary profit that may accrue through the employment thus provided, Mr. Lackie thought to be based on unsound reasoning, as municipal enterprise stands or falls according to whether or not it can justify its existence by continued financial solvency. Secondly, he suggested that those who have a number of large lighting or power users connected to their mains should come to some agreement as to the basis upon which the rates of charge to such consumers should be founded, as this would mitigate the difficulty in satisfying consumers who insist on quoting one supply authority against another to prove that the local rates are exorbitant. This means that the engineer concerned has to write to the other cities of approximately the same size and presenting the same conditions as his own to get the particulars of the charges there, and then by comparison to show the consumer who has instituted the inquiry that, after all, the local rates are not exorbitant.

Mr. Lackie concluded by expressing the hope that the meetings and discussions during the next few days might not only extend knowledge, but confirm old friendships and make new ones.

The usual vote of thanks was proposed by Alderman J. P. Smith (Barrow-in-Furness), and seconded by Mr. C. H. Wordingham.

THE PAPERS AND DISCUSSIONS ARE REPORTED ON PAGES 393-397.

THE MARCONI PATENTS

MR. G. MARCONI and Marconi's Wireless Telegraph Co., Ltd., having decided not to proceed with their application for an extension of the life of the original Marconi patent, this patent expired in the ordinary course on June 2nd last, fourteen years after the date of application. The patent in question is No. 12,039 of June 2nd, 1896, and described, among other things, the metal filing coherer, the use of mercury in coherers, various methods of decohering, the combination of a relay with a filing coherer, spark-gap transmitters of various forms, and several different arrangements of transmitting and receiving apparatus, including the connection of the transmitter and the coherer to earth.

The Marconi Co. applied to the High Court in December last for an extension of the life of the patent, but, as has been stated above, the application has not been proceeded with, and no hearing has taken place. The ground upon which an extension of the term of a patent may be granted is that the patentee has been inadequately remunerated for his patent. The period of extension may be seven years, or in exceptional cases fourteen years. The claims of the patent in question were remarkably broad, but the Marconi Co. never attempted to make use of them to suppress the work of their rivals. This was probably chiefly due to the fact that the competition of other systems has not been of sufficient commercial importance to justify legal proceedings.

As already announced in our columns, however, the Marconi Co. have commenced legal proceedings in respect of some of their later patents, and an action against the British Radio Telegraph & Telephone Co., Ltd., will probably be heard by Mr. Justice Parker about next December. The Marconi Co. allege infringement of their patents Nos. 7,777 of 1900, 10,245 of 1902, and 4,593 of 1907, all granted to G. Marconi and the company. The first patent describes the use of a transformer between the aerial and oscillator circuits, the periods of oscillation of these circuits being the same or harmonics of each other, and the use of similar receiving transformer circuits tuned to the transmitting circuits. The second patent is for the well-known magnetic receiver, comprising a band of iron subjected to the influence of a varying magnetic field, a coil round the band through which the received oscillations are passed, and a second coil connected to a telephone. The third patent is for a high-speed toothed-disc machine for producing electric discharges at a very high frequency.

It appears that the British Radio Telegraph Co. have equipped the s.s. *Nonsuch*, of Messrs. Bowles Bros., London, with a wireless outfit to which the Marconi Co. take exception, as they deem it an infringement of these three patents. On the other hand, the British Radio Telegraph & Telephone Co., while refusing to admit that they have infringed the patents in question, contend further that these patents are invalid, and have a whole budget of prior patents by Sir Oliver Lodge, Dr. S. P. Thompson, F. Braun, Nikola Tesla, Prof. E. Wilson, and R. Scharf, and also a number of other publications, which, in their opinion anticipate Marconi. They are prepared to indemnify users of their apparatus against any claim in respect of the Marconi patents. The Marconi Co. are also instituting proceedings against the United Wireless Telegraph Co. of New York for infringements of patents Nos. 12,326 of 1898 and 7,777 of 1900, and are warning users of wireless telegraph apparatus that they are liable to an action for damages if they employ apparatus which infringes the Marconi patents.

Telegraph Traffic.—The cable between Gibraltar and Tangier broke down on the 10th inst. The Malta-Tripoli section has not yet been put into working order, and the Assab-Perim cable, which has been down since July 8th, 1909, also remains in that condition.—The various restrictions in connection with communication in Central and South America still hold.

Parliamentary.—The London County Council Tramways and Improvements Bill came before a House of Commons committee on Thursday, and consideration of it is being continued. The Bill contemplates an expenditure of £931,335 for the construction of new tramways, the reconstruction of horse tramways, and the widening and making of new streets. The Bill is opposed by the Borough Councils of Islington and Lambeth, the Gas Light & Coke Co., and owners of property along the proposed routes. The first line considered was one between Brixton Hill and Herne Hill, joining up with the Norwood tramway line. Further evidence was given on Saturday and on Monday, and the committee was adjourned.

The Metropolitan District Railway, the Metropolitan Railway, and Wimbledon and Sutton Railway Bills were read a second time in the House of Commons on Thursday.

The Weston Cell.—A Paper entitled "The Limitations of the Weston Cell as a Standard of Electromotive Force" was read by Mr. S. W. J. Smith recently before the Physical Society. Experiments on cadmium amalgams are discussed from the point of view of the modern theory of alloys. Theory and experiment alike suggest that there is no range at any temperature over which the E.M.F. of a Weston cell is absolutely independent of the percentage of Cd in the amalgam. Even if the materials are quite pure, the existence of surface energy must cause some variation. Within the range over which the E.M.F. is usually taken as constant the E.M.F. appears to rise, very slowly, with increase in the cadmium content. The rate varies, but is never more than a few millionths of a volt for one per cent. Cd. From the data it seems possible also to discover the precise way in which the use of the richer two-phase amalgams may lead to variability of the E.M.F. of the Weston cell. The interpretation advocated is that the irregularities are due to electrolytic skin effects arising out of want of uniformity of composition of the surface grains. The probable reason why the temperature coefficient of E.M.F. of a Weston cell, always small, actually vanishes near 0° C. is indicated. An outline of the way in which the phase rule can be used to exhibit the nature of the incomplete equilibrium of the Weston cell is also given.

CONGRESS OF THE TRAMWAYS AND LIGHT RAILWAYS ASSOCIATION

THE annual Congress of the Tramways Association, which was to have been held early in May, but was postponed owing to the death of the King, was held in Dublin on Thursday and Friday of last week. The first day was devoted to the reading and discussion of Papers, and the second to visits to works, &c. Abstracts of the Papers and discussions are given below:—

The Dublin United Tramways.

The Paper by Mr. R. S. TRESILIAN (Secretary to the Dublin United Tramways Co.), read on the Thursday, describes the development of the Dublin tramway systems from 1867 to the present day. After giving some notes on the original horse tramways and the gradual amalgamation of the various companys (one of which, the Dublin Southern Co., converted a portion of their system to electric traction in 1896) into the Dublin United Tramways Co., he recounted the events leading up to the granting, in the year 1897, of an Act of Parliament authorising the use of electric traction on all the lines. The work was carried out with Mr. H. F. Parshall as consulting engineer. The Ringsend power station was set to work in August, 1899, and in June, 1900, practically the whole system was worked by electric traction. The present rolling stock, continued the author, comprises 314 cars, all of the double-deck type, and six new double-deck cars fitted with Hurst-Nelson bogie trucks and G.E. 80 equipments, are in process of construction at the company's works at Inchicore. In 1901 it was decided that all the power should be generated at Ringsend, and the Clontarf and Balls Bridge stations were closed down. In the half-year ended 31st December, 1901, 46·34 miles were open for service, 23,816,084 passengers were carried, an average of 129,380 per day, and £128,416 was earned.

The Ringsend station is on the bank of the Grand Canal Dock and coal is obtained from barges thereon by a grab, trucks, and conveyor. The engine-room plant consists of six 700-b.h.p. Allis's engines of the vertical cross-compound type, running at 90 r.p.m. The flywheels are 19 ft. in diameter, and weigh 31 tons each. Five of the engines have keyed on to their shafts 10 pole 550 kw. continuous-current generators, and the sixth engine drives a 2500-volt three-phase alternator of like capacity. Since the opening of the station, one of the engines has been fitted with a three-phase alternator in addition to the original D.-C. generator. This was done by removing the flywheel and erecting a flywheel alternator in its place. In 1907 a 1,000 kw. Willan-Parsons turbine with Westinghouse alternator was installed. A 250 kw. rotary convertor by the B.T.-H. Co. forms a connecting-link between the systems. The switchboard is of the B.T.-H. Co.'s manufacture. The sub-stations at Blackrock, Dalkey, and Clontarf differ only in capacity. That at Blackrock contains three rotary converters, each 200 kw. capacity, and nine single-phase 80 kw. transformers. The rotaries are of the six-pole type and run at 500 r.p.m. The cables from the power station at Ringsend are laid in cement-lined iron pipes bedded in concrete. Both the high-tension and feeder cables are carried in these, there being two high-tension cables from Ringsend to Clontarf, three to Blackrock, and one from Blackrock to Dalkey, and 19 feeder cables feeding the 19 sections into which the system is divided. The cables are paper insulated and lead covered. Where the traffic is heavy, No. 00 Phono-Electric trolley wire is employed, as this wire has been found to give very little wear even with a fast service of cars operating, and does not become crystalline. In outlying districts the wire is of hard drawn copper, most of it of 00 B. and S. gauge. All trolley wire is anchored at each suspension after it has been in service for two years, thus preventing broken wires from falling in the street.

The company has since 1883 conducted a parcels delivery system, not only over its own lines but in conjunction with the Dublin and South-Eastern Railway Co. to about seventeen miles south from Dublin, and has instituted a system for haulage of goods, minerals, &c.

Concluding, the author states that for the half-year ended the 31st December, 1909, the receipts, including those of the Clontarf and Hill of Howth Tramroad Co., which is now worked by the Dublin United Co., amounted to £152,952 7s. 8d., and the passengers carried to 27,119,849, an average of over 147,000 per day, the mileage operated being over 54 miles.

Brake-Shoe Standardisation.

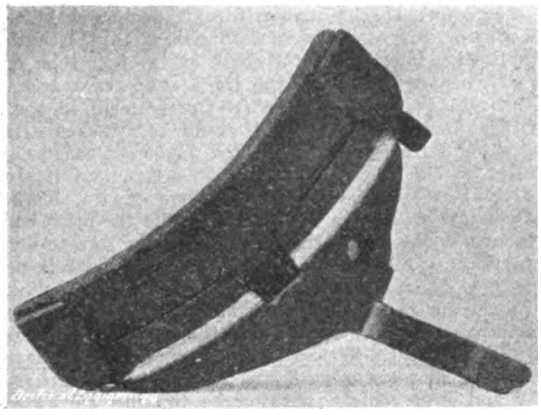
Mr. J. A. PANTON (chief assistant engineer, Liverpool Overhead Railway), in his Paper on the above subject, pointed out that as the outlay on brake-blocks often amounts to 10 per cent. of the car maintenance, more attention should be paid to the amount of material scrapped in discarded brake-shoes. At the present time some 40 to 60 per cent. of the material received is returned to the scrap heap. The brake-shoes are not nearly worn out, but are worn to such an extent that their consignment to the scrap heap is a wise precaution against accident. It is found that a soft cast-iron shoe in cooling after a hard and heavy application takes a sharper curve on the face than on the wheel, and when re-applied, unless thick, will crack and break off. A few years ago blocks were frequently made in one solid piece, so that the brake-block itself could be attached direct to the truck lever. However, this method increased the weight of that portion of the block that goes into scrap, and it also required more time and labour in changing. Again, blocks are frequently found worn thin at one end, while the other end has barely been in contact with the wheel, and it is safe to say that not more than two-thirds of the available material is usually worn away. Brake-blocks, according to their material, are classed by the author as follows:—The first class covers the soft iron shoe, which is the most efficient though least desirable, on account of rapid wear. The second class embraces the part chill and composite shoes with hard and soft inserts, which occupy a useful and intermediate position in braking efficiency and durability. The third class includes heavily chilled and white iron shoes, which are the least effective in braking, though most durable.

In dealing with the co-efficient of friction, the author makes the following remarks:—The importance of determining the effect upon the wheel becomes apparent when one considers the possibility of a shoe showing a high resistance to wear, which may, in fact, be protected at the expense of wear upon the wheels. It is suggested that a specification should be framed on these lines, covering frictional qualities of brake-shoes provided that shoes when tested shall give results as follows:—Upon a chilled wheel in effecting stops from a speed of 35 m.p.h. a mean co-efficient of friction of not less than 22 per cent. when the brake-shoe pressure is 2,800 lbs., and a steel-tyred wheel in effecting a stop from a speed of sixty miles per hour, a mean co-efficient of friction of not less than 18 per cent. when the brake-shoe pressure is 2,800 lbs., or an average of 20 per cent. for all purposes. That the rise in the value of the co-efficient of friction at the end of a stop shall be within such limits. That the value of the co-efficient of friction for a point 15 ft. from the end of the stop shall not exceed the mean co-efficient of friction by more than 7 per cent.

The author is of the opinion that while a high co-efficient of friction is in the abstract a desirable characteristic to be possessed by a brake-shoe, operating conditions make uniformity of action desirable for the purpose of securing uniformity both in time and intensity of its action, in order that the surging of trains and trailing cars may be prevented.

Improvements in brake-shoe heads have been made in the past by separating the head from the shoe, accomplishing a saving in first cost and scrap weight, but the practice still remains expensive on account of lack of interchangeability. Under heavy breaking conditions, malleable iron holders take a permanent bend or set much to the detriment of shoe wear and braking conditions. Within the last two years steel back brake-shoes have been introduced. The best argument in favour of steel back shoes is that they can be worn down very thin without danger of breaking and causing derailment of the car.

The comparison of wearing properties of different shoes is only possible under standardised conditions, and comparisons should be made not on the basis of cost per thousand car miles, but on the basis of percentage of metal worn. The standard brake-shoe should be one-third the diameter of the wheel tyre (within reasonable limits) and applicable to any wheel from 30 to 33 in.



The pressure applied to the brake-shoe should not exceed 75 per cent. of the total weight of an empty car. The gearing should be arranged to obtain the pressure with a standard pull of 50 lbs. applied by the driver. Whatever the pressure the results clearly distinguish between the slow-wearing and the rapid-wearing shoe. All shoes wear more rapidly on a steel-tyred wheel than on a cast-iron wheel. In general terms, it may be said that for the absorption of a given amount of work, the wear on brake-shoes upon the steel-tyred wheel is twice as rapid as upon a cast-iron wheel. A standard shoe should develop for

Digitized by Google

each pound of metal worn away 350,000,000 ft. lbs. of work in contact with a cast-iron wheel, and 200,000,000 ft. lbs. of work in contact with a steel-tyred wheel.

Standardisation does not mean standard material, but does mean standard dimensions for all classes of material to suit the different conditions, and to attain the standard co-efficient of friction and wear herein described.

In the author's proposed standard brake-head and brake-shoe shown in the figure, the plan contemplates keying the contacts at the centre lug of the brake-head, while the ends of the brake-head fit close to the full length and width of the brake-shoe back, that function being a great support to the shoe. The

PROPOSED STANDARD BRAKE SHOE.

raised recess at each side of the iron lug, in conjunction with the end abutments, is merely to keep the shoe in vertical alignment, and should fit the holder and lug so snugly as to prevent any upward or downward movement of the shoe, the centre lug transmitting the load directly to the beam, by virtue of the usual wedge-shaped key. It is important also to notice that the brake-head shown has been so designed that however much the block may be worn, the brake-head cannot be injured. Some unnecessary metal has been removed from the flange and back of shoe. The author believes that better results in braking would be secured if all the braking were done on the tread of the wheel, and none on the flange.

The author estimates that the universal adoption of the standard shoe would effect a saving of 50 per cent. in the material scrapped.

DISCUSSION.

The discussion opened with a contribution from Prof. ERNEST WILSON, who gave results of some experiments at King's College on the efficiency of geared brake spindles, from which it appeared that, with 50 lbs. pull on the handle, about 16 per cent. of the pull would be taken up by friction.

Mr. J. R. SALTER (General Manager, South Lancashire Tramways Co.) said that the number of car miles which could be run with a set of brake blocks depended too much upon the nature of the track and the human element for accurate comparisons to be possible.

Mr. EDWARDS (Resident Engineer, South Lancashire Tramways Co.), in a written communication, said that the cost of brake maintenance given by the author, viz., 10 per cent. of the total cost of car maintenance, was very high, and on the S. Lancashire Tramways the corresponding figure was only 2·2 per cent., or 0·012d. per car mile. He considered 2¼ lbs. of scrap shoe cutting matters rather fine, as it only left $\frac{1}{16}$ in. thickness of metal for tread of shoe. They had used both cast-iron and cast-iron with metal inserts, and both cost the same for maintenance, although the life of composite blocks was 9,000 car miles, as against 4,000 for cast-iron. Composite blocks were better on wet, greasy rails.

Mr. F. SAUNDERS said that soft cast-iron for brake blocks could be obtained for £5 7s. 6d. per ton, and chilled £8 10s.

Mr. R. J. HOWLEY (British Electrical Federation) said that undertakings would greatly benefit if managers would agree to standardise. The design of brake shoes was an important matter, and they should be so designed that it would not be necessary to scrap a large amount of metal at each renewal. It was also necessary to study the personal comfort of the passengers. In his experience they did not always obtain the best results from chilled blocks, and he preferred best grey cast-iron.

Mr. A. A. BLACKBURN (Car Works Superintendent, Belfast Corporation Tramways) said that data obtained in connection with work on the Liverpool Overhead Railway was in no way comparable with street tramways. In Belfast they found the wear of brake blocks was different on different routes, depending upon gradients, condition of track, and material of road surface. Mr. Blackburn instanced one route near the seashore where the wear was very heavy, due to sand blowing on to the track. He did not think that the brake shoe caused wear on the wheel flanges, and thought such wear was caused by the track.

Mr. MCCULLAGH (Liverpool) said great difficulty was sometimes experienced when changing drivers from light to heavy cars. The coefficient of friction should be a fixed quantity, and the life of blocks would depend upon weight of car.

Mr. J. A. PANTON, in reply, said the figure given in the Paper, 10 per cent. of the cost of car maintenance, was the result of standard American practice. His brake blocks cost £10 per ton, but he maintained it paid to use them in preference to other patterns.

Tramway Economics.

This Paper by Mr. J. R. SALTER (General Manager, South Lancashire Tramways Co.), dealt with some general points connected with the commercial principles upon which tramways are run. It was pointed out that although in the relations between standing charges and running expense there was much analogy to electric supply undertakings, the effect of load factor was not so great as the capital cost that has to be incurred for dealing with the heavy hours of the day, is a small proportion of the whole. The author gave a series of curves showing the relation between car miles run per route mile and headway in minutes, the proportional cost of running and standing per car mile, assuming certain figures for the sake of comparison. The curves showed that with a less frequent service, the standing charges represent a rapidly increasing proportion of the total cost per car mile, whilst with a more frequent service, the standing charges represent a rapidly decreasing proportion of the total cost per car mile. There is a critical point in the service at which the standing charges per car mile are equal to the running costs per car mile, this point on the curve being at a 14 minutes' service. Again, the increase in the total costs per car mile above the critical point is very much more rapid than is the decrease in the total costs below the critical point, and in consequence the more frequent the service, the less important do the capital charges become.

It is also apparent from these curves that with the rapidly increasing capital charges due to the reduction in the service, and with a practically constant running charge, that the less frequent the service, the less is the proportion or percentage of the working expenses to the total costs or equivalent gross receipts; and as a corollary, the more frequent the service, the greater is the percentage of the working expenses to the gross receipts to obtain a given result. It would seem, therefore, that tramway undertakings must look rather to an increase in the gross receipts by increasing the car mileage, and thus reducing the standing charges than to a reduction in the working expenses to improve their financial position.

The curves also show the error of striving after high receipts per car mile. In all these considerations, the number of car miles per route mile per annum seems to be the determining factor, and Mr. Salter considers it extraordinary that so little use is made of this factor. He thinks that this figure could well be introduced into tramway accounts, and divided by 10,000 could be called the density factor.

The next point considered is the question as to the point at which, having regard to the increasing capital charges, with a reduction in the service, the construction of a tramway is justified. With a service of this character, and with the fares obtaining in this country, it is unlikely, except in very special circumstances, that the receipts per car mile will exceed 11d.; this being the case, it would appear on the basis of the curves that an average 17½ minutes' service is in the neighbourhood of the limit at which a tramway undertaking can be remunerative. The question then arises whether such methods as motor-omnibuses or railless traction systems can be employed, but it is pointed out that such figures as 11d. per car mile can only be attained with the large carrying capacity which a tramway offers for dealing with "rush" traffic, and examples are given to illustrate this. It would therefore seem, continues the author, having regard to the fact that the carrying capacity of any self-propelled vehicle is only half the carrying capacity of a tramcar, that at least double the number of vehicles will have to be provided. With motor omnibuses it is unlikely that the expenses per car mile will be less than 10d., and to compare, therefore, the expenses of running such a system with that of a tramway, the cost per car mile for operating must be doubled to provide the seating capacity. Although, therefore, the motor omnibus is relieved from many of the capital charges which are so serious to a tramway with a small service, the working expenses are so high that this method of transit is not as remunerative as a tramway, even at a 30 minutes' service. It must not, however, be overlooked that the provision of the two 'buses, or the splitting up of the capacity, would result in a very much quicker service, and would undoubtedly conduce towards increasing the number of passengers during the slack periods.

Digitized by Google

With the railless traction system, the carrying capacity is only about one-third that of a tramcar, and the expenses on this system may be assumed at 5½d. per car mile; but in this case, if we are to provide for the excessive carrying capacity to obtain the average receipts, we find again that the systems are incomparable until a 30 minutes' service is reached.

This therefore leads to the conclusion that tramway undertakings need have no fear of being replaced by self-propelled vehicles unless the cost of operating them is reduced at least one-half, or unless, with the same operating costs, the carrying capacity can be doubled, until we arrive at a 30 minutes' service, assuming that the same fares are obtainable in each case.

The Paper concludes with a recapitulation of some of the terms of the Act under which through running between Bury, Heywood and Rochdale is conducted.

DISCUSSION.

The discussion was opened by Mr. C. W. MALLINS (General Manager, Liverpool Corporation Tramways), who went into the qualifications required by a successful tramway manager, and considered that commercial training was of more importance than engineering knowledge. With regard to the doctrine laid down that tramway undertakings must in the future look rather to an increase in the gross receipts by increasing the car mileage, thus reducing the standing charges, than to a reduction in the working expenses, to improve the financial position, he was of opinion that a service should not be increased or diminished on any given system or route except after a careful scrutiny for a considerable period of the car mile earnings per hour of the working day, and whenever the receipts are found to exceed a certain figure the service should then be increased, and where they fall below a certain figure the service should be decreased, unless there is some special reason for doing otherwise. He heartily agreed that any less frequent service than 17½ minutes would not justify the building of a tramway with any hope of financial success.

The discussion was continued by Mr. Jas. Devonshire, Mr. Stephen Sellon, Mr. H. E. Blain, Mr. J. Hatton, and Mr. W. Clough, and most of the speakers differed from Mr. Mallins regarding the qualifications necessary for the successful tramways manager. The question of traffic load factor was also discussed, and one speaker remarked that if all the vacant seats in their cars could be filled during off hours at ½d. per head they would reap a rich harvest.

Mr. SALTER, in reply, said that he thought the fact that some tramway systems were managed by men who were not engineers only went to show the disadvantage under which these particular systems were worked, and therefore they were entitled to extra credit for the good results they had achieved under such an adverse circumstance. Regarding the question of traffic load factor, he thought that, considering that 80 per cent. of the takings on most tram systems consisted of 1d. fares, not much could be done in increasing the revenue by granting cheap fares at certain periods of the day.

Railless Traction.

The Paper on this subject by Mr. H. ENGLAND (General Manager, Wakefield & District Light Railway Co.) commenced by giving a few figures, from which he argued that owing to the larger influence of the standing charges on the costs per car mile as the service is less frequent, no tramway service under ten minutes minimum average can be expected to pay under ordinary circumstances. Motor 'buses as a substitute are dismissed in very few words. The author admits that given long-distance fares and suitable running conditions they can certainly pay, but considers that it has been many times demonstrated that such services are not financially successful when dealing with short-distance traffic.

Passing on to "railless" traction, mention is made of the early attempts in Paris, and of the lines at present at work or under construction on the Continent. These include eight lines, aggregating some 60 miles, on the Filovia system in Italy, five Austrian examples of the Mercédès-Stoll system, and seven German lines, and one French line on the Schiemann system (the last ground including some goods lines opened as early as 1903).

The Filovia System employs two 12-h.p. motors mounted on the chassis, one driving each rear wheel through gearing and a chain. The controller of the series-parallel type is fitted with magnetic blow-out, and is provided with five forward contacts and reverse. There are two mechanical brakes and an electric brake. The chassis is fitted with a single-deck body, seating 24 passengers, and weighing, with passengers, 53 cwt. A speed of 18½ miles on level roads is obtained, and half that speed up a grade of 5 per cent. The trolley, built on the "Cantono" patent, consists of an ordinary trolley boom with a head consisting of a four-wheled truck affixed by means of a ball socket joint.

The chief feature of the Mercédès-Stoll system is the use of 20-h.p. gearless motors built into the wheels of the same pattern as used in the Mercédès electric automobiles (*see* ELECTRICAL ENGINEERING, Vol. I., page 690). The cables are carried through the interior of the axles, and the motor armatures are keyed to the axle. The controller has six forward positions; three series and three parallel, and three positions for reverse. Three brakes are fitted; an electric brake and two mechanical brakes. The body in use in Vienna is constructed to seat twelve passengers, and standing-room is provided for twelve more. The car complete weighs 2½ tons. The trolley consists of a frame or carriage fitted with four wheels. The wheels run on the tops of the wires, and the current-collecting device is attached to the car by means of flexible cables. A pendulum weight is attached to the centre of the trolley carriage to keep the carriage balanced, and the wheels well pressed down on the wires. The conducting cable is wound round a small drum which is mounted upon the chassis, and about twelve yards of spare cable is carried which can be played out to allow the car to run on the whole width of the road. The Schiemann system uses a single 22-h.p. motor on the front forecarriage, and usually has iron tyres on the rear wheels.

The Paper then gives particulars of the Railless Traction Co.'s demonstration car at Hendon, which was fully described and illustrated in ELECTRICAL ENGINEERING, Vol. V., page 855. In this case the chassis follows the design of the usual motor omnibus chassis, and wheels with single solid rubber tyres on the front, and twin tyres on the rear, are employed. Two 25-h.p. motors, mechanically independent, each motor driving one-half of the counter shaft through bevel gears, are used. A controller of the series parallel type is fixed, and foot and hand brakes are provided for the driving wheels and counter shaft. A single-deck body, with seating capacity for twenty-four passengers, is used. The trolley of the double pole type is fitted with a head of new design. The company state they are about to place on the market heads of different patterns; one head carrying three trolley wheels, the two outer wheels of which are connected, both making contact with positive wires, and the centre wheel with negative wire. Another design employs two trolley wheels, one for positive and one for negative wires.

The author considers the last system the most up-to-date and best adapted to British requirements, and points out that the company has attempted to avoid any risk of "live" cars by designing a three-wheeled trolley head mounted upon two connected trolley booms; the two outer wheels being for positive wires and the inner wheel for the negative wire, the idea being to connect the steel frame and metallic parts of the car through the trolley wheel to the negative wire. This construction necessitates the use of three wires instead of two, and six instead of four, which is expensive and objectionable. The company has devised an alternative design employing a head with positive and negative trolley wheels, and using two wires only; and an arrangement is fixed to give audible warning should the polarity of the wires be through any cause reversed.

The author estimates that a trackless trolley system can be fully equipped, provided current is purchased from a supply authority, at about £3,000 per mile of route, but, of course, much would depend upon the local conditions in each case. He then gives a table of estimated working expenses, adding up to 6·164d. per car mile (as against the average figure of 6·494d. for tramways). The above figure includes 1d. per car mile for tyre maintenance, and does not include any contribution to the county authorities for road maintenance. Mr. England sees great possibilities in the system for the conveyance of minerals and goods, and concludes by regretting that powers to operate railless cars have to be obtained by Parliamentary Bill. This fact is a serious stumbling-block to the development of railless traction. The cost of securing the consent of Parliament may cost as much as the equipment of a small system, and promoters will therefore hesitate before embarking upon any scheme.

DISCUSSION.

Mr. J. DEVONSHIRE (Chairman) thought the object of such a system would be for the purpose of making extensions in less populous districts, with a view to feeding existing lines, and that being so he was in cordial agreement with the author.

Mr. A. H. POTT (North Metropolitan Electric Tramways) said his company had carried out experiments with an electric trolley 'bus, and he suggested that the Mercédès system was the least desirable from an engineering point of view. A pioneer system such as this must be able to work in with an existing tramways system, and the Mercédès system was the least able to do so; they must be able to run on an ordinary trolley line. If such a system is to be cheap, the capital cost must be very low, and unless existing car sheds, overhead equipment, &c., can be utilised, there is nothing in the trolley 'bus. The author thought that trailer cars will be used, but had he considered the possible attitude of the Board of Trade and London County Council to such a suggestion? Regarding the author's figures, he had compared like with unlike; why, if corrugated iron car-sheds, wooden poles, &c., could be used for

Digitized by Google

railless systems, could they not also be used for ordinary tramway systems? Repairs were given at 1·543d. per car mile, whereas probably tyre maintenance alone would exceed that figure, and surely the wear and tear of a motor-'bus must be much greater than a large car. In the case of the railless 'bus his company had tried, on an average route, the current consumption worked out at 1·8 units per car mile for a car capable of only accommodating 26 passengers, therefore there was no economy there. Generally the speaker was of opinion that the railless system would not be extensively adopted.

Alderman IVEY (West Ham) referred to the possibility of undertakers using this system having eventually to pay road maintenance through the districts run.

The Tramways Act of 1870.

A short Paper by Mr. FRED COUTTS (General Manager and Engineer to the Paisley District Tramways Co.), entitled "Should the 1870 Act be Revised?" pointed out the necessity for simplifying Parliamentary procedure in relation to the construction of tramways, and the anomaly of having to carry on electric tramway undertakings under the Tramways Act of 1870. This Act had never undergone any modification, and had become so obsolete as to render it only fit to be included in the list of Parliamentary Acts which have now ceased to be of practical use. The period of twenty-one years as the period allowed for purchase by the local authority he suggested should be increased to forty-two years, as although, in some instances, a longer period than twenty-one years was allowed, this concession had invariably been dearly bought for the local authorities. Clause 5, which compels promoters to secure the consent of two-thirds of the local authorities concerned, should be cut out, as also should Clause 9, which prevents a tramway being laid with less than 9 ft. 6 ins. of roadway between the outer rail and the footpath, if one-third of the owners or occupiers object. Mr. Coutts laid stress upon the question of cost of the upkeep of roads, and pleaded for some relief from the present compulsion on the part of tramway companies to maintain the whole of their tracks, in view of the fact that the cars caused wear only upon the rails. At present the tramway track was being maintained for the benefit of the other users of the roads; frequently a motor omnibus company, and any large horse contractor, could tell that he can, wherever a tramway track is laid, increase his load by at least 25 per cent. The paper also suggested a few clauses that might be inserted in the Act in the interests of the travelling public; for instance, all other vehicles should be compelled to carry front and rear lights, and all slow-going traffic should keep clear of the tramway track. The appointment of a committee to devise a scheme which should be placed before Members of Parliament was urged.

Students' Section of the I.E.E.—The sanction of the Council has been given for the students' annual visit to take place this year in Birmingham and the surrounding district. Permission has been obtained to inspect, among others, the following works:—The British Thomson-Houston Co., Ltd. (Rugby), Messrs. Siemens Bros. & Co., Ltd. (Stafford), Messrs. Alfred Hickman & Co., Ltd. (Bilston), The General Electric Co., Ltd. (Witton), Messrs. Bellis & Morcom, Ltd. (Birmingham), an electrified coal mine, the University of Birmingham, the Corporation Generating Station, Summer Lane, Birmingham. The party will leave Euston on Monday morning, July 25th, visiting Rugby on the way down, and will return to London on the following Saturday afternoon, July 30th.

A New Petrol Electric Motor-'bus.—A demonstration has been recently given of a new design of omnibus on the Pieper or "auto-mixte" system, which has been brought out by the Daimler Co., and contains many novel features. Two separate 12 h.p. "Silent Knight" engines are employed, one to drive each rear wheel through a worm gear, so that no differential is required. On the shaft of each engine is a machine which can be used either as a motor or as a generator to charge a battery carried on the vehicle, and a magnetic clutch. As in previous examples of the Pieper system, no change of gear ratio is made, but the extra torque for starting and hill-climbing is supplied by the motor, drawing current from the battery, while at times, of light load, or when braking electrically, it acts as a dynamo and charges the battery. The engines need not be kept running when the vehicle is standing, as they can be started up electrically with the car. Reversing is effected entirely electrically. The engines and "dynamotors" are placed outside the frame on each side of the vehicle, and the metal body is designed on engineering principles, and is integral with the frame. Wire wheels are used, and the whole vehicle has a lightness and compactness for the number of persons carried which has not been attained hitherto. Control is partly on the electrical controller and partly on the throttle. The vehicle is to be known as the K.P.L. Omnibus, as it embodies the patents of Knight, Pieper, and Lanchester. It is said to be practically noiseless, and it is hoped that even allowing for the battery, its upkeep will prove cheaper than the noisy gear-driven 'buses which throng the London streets.

THE USE OF PHOSPHAM IN METAL FILAMENT LAMPS

THE "Z" Electric Lamp Manufacturing Co., Ltd., have been successful in their opposition to the grant of a British patent to the Glühlampenwerk Anker Ges. of Berlin for a method of preventing the disintegration of metal filaments and consequent blackening of the bulb by the introduction of gaseous compounds, such as arseniuretted hydrogen or phosphoretted hydrogen, produced by placing certain chemicals in the bulb. Three mixtures were specified, each containing phospham, phosphorous, and either phosphorus- or arsenic-hydride. Disclaimers admitting the previous use of phorphoretted hydrogen and of gases produced by heating phospham were appended to the specification.

The application for the patent in question (No. 19,847 of 1908) was made in September, 1908, and an abstract appeared in ELECTRICAL ENGINEERING of Oct. 21st, 1909, p. 924, after acceptance of the complete specification by the Patent Office. Opposition was then entered by the "Z" Electric Lamp Manufacturing Co., on the ground of anticipation by their British Patent No. 21,654 of 1906 granted to J. Y. Johnson, which covers a process of decarbonising metal filaments by heating them in a gas produced by heating phospham. The introduction of phospham into the bulb in the form of a paste on the stem or supports, is described in this specification.

The hearing before the Comptroller took place last month. Mr. Gordon appeared for the applicants, and Mr. Walter, K.C., Mr. Colefax, and Mr. K. R. Swan for the opponents. Mr. Gordon argued that the opponents' patent was concerned with the extraction of carbon by the direct action of phospham, whereas the object of the applicants' invention was to prevent the disintegration of the filament whether carbon were present or not. This was done by setting up a permanent gaseous atmosphere from any one of the three mixtures described. In reply, the opponents argued that carbon was always present in metal filaments, and, if not the direct cause of blackening, had some effect on it. Phospham, in any combination, they argued, tended to prevent blackening. This argument was based on the decision of Mr. Justice Parker in the recent action for infringement brought successfully by the "Z" company against Messrs. Marples, Leach & Co. (see ELECTRICAL ENGINEERING, March 10th, 1910, page 171). The opponents also argued that their process left a gaseous atmosphere produced from phospham in the bulb exactly as claimed by the applicants. In his decision, refusing the grant of the patent to the Glühlampenwerk Anker Ges., the Comptroller, Mr. W. Temple Franks, stated that the important constituent in the applicants' mixtures was evidently phospham, and pointed out that phospham was not mentioned in their German specification. There was an absence of any definite statements as to quantity. Even if the "Z" Company's patent were based on an erroneous theory as to decarbonisation, the use of phospham had been shown to prevent disintegration and blackening, and he did not think a patent could be granted for a proper statement of the theory (assuming the Glühlampenwerk Anker Ges.'s explanation to be the correct one). He therefore refused the patent, awarding the opponents twenty-five guineas in respect of their costs.

Heating Apparatus and Electricity Supply.—A good many supply authorities are enquiring for heating apparatus to be supplied on special terms for assistance in creating interest in electric heating and working, and we understand that the British Prometheus Co. (Salop Street Works, Highgate, Birmingham) are willing to enter into negotiations on this subject with central station engineers in cases where the charge for current for heating purposes is sufficiently low to permit of electrically-heated apparatus being used at a reasonable cost. They naturally cannot make a hard and fast rule as to the supply of goods on approval, but they are prepared to submit definite proposals in each case on terms and conditions entailing very small initial outlay on the part of supply authorities, or to make up apparatus to meet special requirements at rock bottom prices.

The "Z" Metal Filament Lamp Patent.—In the Appeal Court on Saturday, a motion by Messrs. Marples, Leach & Co. (now Adnil Electric Co.), who have been held by Mr. Justice Parker to have infringed the "Z" Electric Lamp Company's patent No. 21,654 of 1906, was mentioned. The decision of Mr. Justice Parker is being appealed against, and Messrs. Marples, Leach & Co. asked for permission to put in further evidence. It was eventually agreed to allow the motion to stand over until the hearing of the appeal, when the point will then be raised. Mr. Terrell, K.C., stated that the Bergmann Co. of Berlin, who are the real defendants in the action, had since carried out experiments at a cost of £1,600, and it is desired to place the results before the Court.

STREET LIGHTING

A PAPER dealing with several aspects of the street-lighting question, and entitled "Public Lighting from a Municipal Point of View," was read by Mr. J. Abady, chairman of the Works Committee of the Westminster City Council, before the Institution of Gas Engineers on Tuesday. Mr. Abady dealt first with the relative advantages of several forms of contract for street lighting from the points of view of the facilities for satisfactory observance of the terms of the contract; the efficient maintenance of the required standard of lighting; and the facility or encouragement for either party to take advantage, during the contract period, of the introduction of improved methods, to either reduce the cost of producing the light, or obtain a greater light for the same cost.

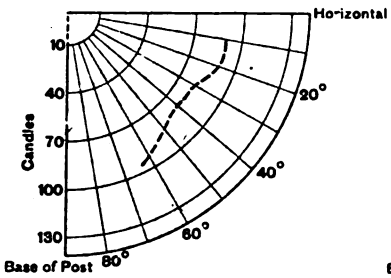

FIG. 1.—INVERTED BURNER IN LANTERN. 86 C.P.

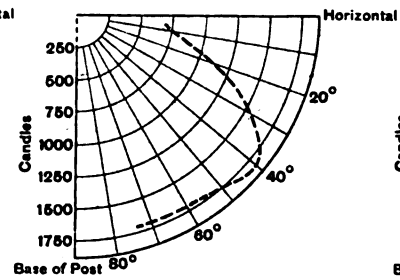

FIG. 2.—EIGHT-AMPERE FLAME ARC (OLD PATTERN). 1,435 C.P.

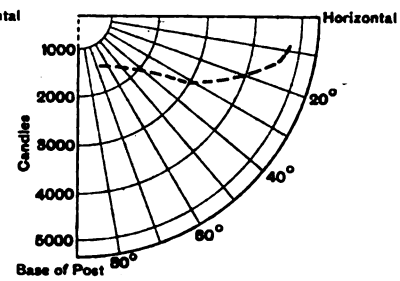

FIG. 3.—"EXCELLO," 660-WATT FLAME ARC, WITH DIOPTRIC GLOBE. 2,812 C.P.

The due observance of the terms of a contract for the supply of and payment by energy, maintenance being undertaken by the contractor for energy, hinged largely upon the facility for measuring the energy supplied, and there were objections both to the average meter system and to basing the charge on tests of consumption *in situ*. Again, in the case either of electric or gas lighting, there is not sufficient safeguard for the maintenance of the standard of lighting, nor inducement for the introduction of improved or more economical methods.

The form of contract which is for the supply of and payment by energy, maintenance being undertaken by a separate contractor acting for the municipality, or by the municipal public lighting department itself, was on a different footing as regards maintenance, for while the municipality has greater control over efficiency, the interests of the contractor for the energy are very much at the mercy of the municipality. If the maintenance contractor neglects the maintenance, the energy contractor suffers; while if the municipal lighting department (taking as it often does the energy from another municipal department which is in competition with a competitive form of lighting) is interested in doing what it can for its sister department, it is plain that the competitive form of lighting suffers, and real competition is at an end. With regard to the facility or encouragement to either party to introduce improvements which would reduce cost or increase the lighting without increase in cost—there is a position strikingly different to that under the first form of contract. Provided the contract does not limit the pressure of the gas supply, the municipality can obviously, if it chooses to pay for them, instal improved lamps and give its public a better light, without affecting the contractor's position in the least. What it cannot do, however, is to give the same light by the introduction of improved lamps, and reduce the cost of gas or electricity, and so reduce the cost to the public of its lighting bill.

The third form of contract to be considered was that for supply of light, payment being made for so much light irrespective of the energy required to produce it. The working of this form of contract depends largely on the nature of the clause relating to the testing, and the author puts forward a clause, of which extracts are given below. This is on the same general lines as that contained in the much-discussed Westminster contract, but differs slightly in the drafting.

The candle-power shall be arrived at by taking the average of two sets of readings in any position with regard to the light under test—one set at an angle of 20° and a second set at an angle of 50° to the horizontal. Not less than three and not more than six readings, at regular intervals of not less than thirty or more than sixty seconds, shall be made at each angle; and the average of the readings shall be termed the reading or illuminating power at that angle. If, upon a test being made, the illuminating power of any lamp falls below the prescribed standard and is not more than 10 per cent. below it, a test may be made of each of the two nearest lights; and if the aggregate of the light from the three lamps equals the aggregate required by the contract, no damages shall be recoverable. The tests only to be made in reasonably clear weather—not during rain, mist, or fog—and in the presence of a representative of the contractor should he so desire. The intention of this contract is that the contractor shall assure himself, by continued test and inspection, that the lamps he provides are, during lighting hours, fulfilling in all respects the requirements of this contract; and he shall not claim relief from the conditions of this contract on the grounds of non-notification on the part of the Council of any failure to comply with the terms of this specification.

Mr. Abady explains that the angles were chosen with a view to fairness to all forms of lighting, as it is found that in the majority of cases, of both gas and electric lamps tested, the mean of the light given at 20° and 50° practically coincides with the mean hemispherical intensity, and therefore represents the value as candle-power. Tests on a candle foot basis he regards as unsatisfactory for the purpose, as there would have been introduced all kinds of difficulties and problems (as to the behaviour of light rays with respect to surfaces and view point), about which photometrists themselves are not agreed. This form of contract also facilitates the adoption of improved methods, because if the contractor finds he can produce the same light at a cheaper cost, or a better light for the same cost, he would surely approach the corporation and offer to share the benefit of such improvement.

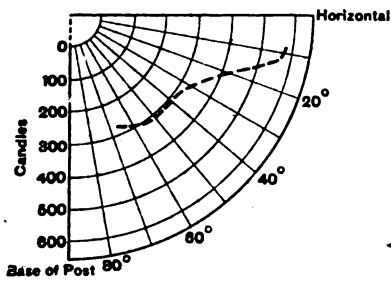

FIG. 4.—OPEN ARC, 500-WATT. 363 C.P.

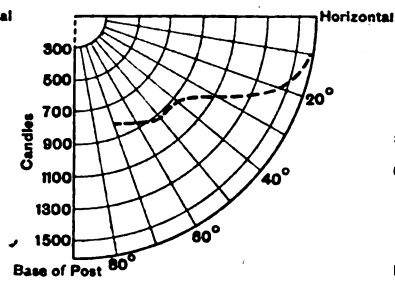

FIG. 5.—HIGH-PRESSURE UPRIGHT BURNER IN LANTERN. 1,193 C.P.

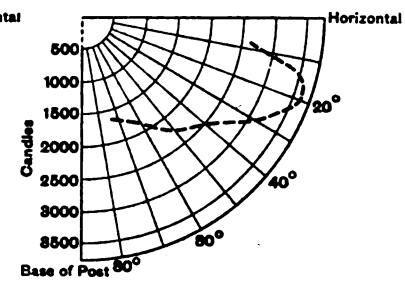

FIG. 6.—THREE HIGH-PRESSURE INVERTED BURNERS IN LANTERN. 2,965 C.P.

The author then passed on to the general consideration of the size, height, and spacing of lamps to obtain "adequate lighting." Tables of figures were given showing the relative influence of the height of the lamps and their distance apart upon the distribution of light. Further tables are given showing the relation between height of post and candle-power required.

It was pointed out that if lamps are so placed in the streets that the 10° ray of one lamp meets the 10° ray of the next, then one will be relying for the lighting of each area upon the unaided illumination of a single lamp, and the illumination on

Digitized by Google

a line between the lamps will decrease in the porportion of 1 : 32 (with portions of the street having even less illumination) unless it can be corrected by either providing lamps with higher candle-power at 10° than greater angles of depression by the use of reflector or otherwise.

In this connection the accompanying polar curves are of interest :—Fig. 3 is from a 660-watt "Excello" arc lamp with dioptric globe; and it will be seen that this is entirely in the right direction, and that the light gets less and less as one approaches the angle nearest the column. Fig. 5 is from a high-pressure vertical incandescent burner; and Fig. 6 from a high-pressure 3000-candle-power triple inverted burner. It will be seen that here also the lighting curve is in the right direction, but not to the same extent as the "Excello" lamp. They contrast signally with the light curves of some of the other specimens, which comprise all types of light and are the diagrammatic representation of figures obtained, not from makers' but from independent tests. A bad example is Fig. 2—a flame arc without dioptric globe. That is the sort of thing which would give a mass of brilliant, dazzling, glaring light near the column and comparatively little in the midway position. A bad example of a gas lamp is Fig. 1—an inverted burner in lantern. Failing the possibility of making lamps with such a polar curve as will compensate for this disproportionate distribution curve, the only method of producing anything approaching even lighting is to bring the lighting units closer together, for it is no remedy to increase the power of the units on each column. It will also be possible to reduce the candle-power of the sources of light, because there is always an excess of light near the column on account of the initial candle-power necessary to give enough light at the distant points. A suitable arrangement (though not possibly an ideal one) of what might be termed "overlapped" lighting, is to plot the positions so that the 20° angle of one lamp meets the 20° angle of the next, or in many cases 15° will be sufficient.

The following examples of the lighting of the streets in the City of Westminster are of interest :—

Street.	Description.	Height of Light. (Approximate.)	Distance Apart. (Approximate.)	Approximate Arrangement.
Atterbury Street ...	60 c.p. Incandescent	12 ft.	130 ft.	10° meets 10°
Berwick Street ...	100 ,, ,,	12 ,,	80 ,,	15° ,, 20°
Bond Street	500 ,, Open arc	20 ,,	140 ,,	15° ,, 15°

INTERNATIONAL ELECTROTECHNICAL COMMISSION

THE first annual report of the International Electrotechnical Commission covers the work of this body up to the end of the year 1909. Fifteen committees are now constituted, and reports of their work will shortly be forthcoming. Reports on Nomenclature are now before the committees, and a large number of terms and symbols have been collected and agreed upon. (The first portion of the British collection was given in ELECTRICAL ENGINEERING, Vol. IV., p. 218.) With regard to the proposal of the British Committee on the question of the unit of candle-power (see ELECTRICAL ENGINEERING, Vol. V., pp. 619, 646), it is stated that, although this committee has informed the Central Office that it does not intend to take any further steps in regard to this proposal, a report on the subject will be issued. The question of international rules for electrical machinery will shortly be considered, and a report on the rules already adopted by various countries for continuous-current apparatus is now being prepared. The countries adhering to the Commission are America, Belgium, Brazil, Canada, Denmark, France, Germany, Great Britain, Hungary, Italy, Japan, Mexico, Spain, Sweden, and Uruguay. The Indian Government has made a grant towards the funds, and Austrian and Russian committees are practically formed. Two or three unofficial meetings at Brussels are being organised by the Belgian Committee for the purpose of giving members of the various committees an opportunity to become personally acquainted. These will be held from August 8th to 13th, and will assist in the preparation of the programme to be laid before the official plenary meeting of the Commission in Berlin next year.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

THE ENGINEERS' STANDARDISED PUBLICATIONS ASSOCIATION.—We have received from the Engineers' Standardised Publications Association (Craven House, Kingsway, W.C.), one of the Association's files, with the first batch of lists in the standardised form, together with a card index of the same. The lists in the electrical section include R. W. Paul's testing sets and other "unipivot" instruments; Messrs. D. H. Ponella & Sons' "Ampere" cells and lighting accessories; motors, starters, &c., of W. A. Stevens, Ltd. (Maidstone); Messrs. Purcell & Nobbs's "electroyl heaters," and the time switches of Messrs. Venner & Co. The other main divisions of the classification are steam, water, gas, oil, and air, civil engineering, mining, manufactures, machinery for various manufacturing trades, tools, and transmission machinery, and materials. Each section is further sub-divided.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

SWITCHBOARD INSTRUMENTS.—A new catalogue is to hand from Messrs. Crompton & Co., Ltd. (Salisbury House, London Wall, London, E.C.), describing new patterns of ammeters and voltmeters of both the moving coil and moving iron types for switchboard use.

METAL FILAMENT LAMPS.—The Foster Arc Lamp and Engineering Co., Ltd., are sending out copies of their metallic filament lamp showcard, measuring 11 ins. by 16 ins. It depicts the consternation of a meter reader at the effect of the introduction of these lamps on the quarter's consumption.

The South African Institute of Electrical Engineers.—The April issue of the Transactions of this institute contains a report of a Paper on the application of electricity to medicine and surgery with special reference to Roentgen rays and high-frequency currents, by Mr. W. H. Perrow, embracing a general survey of the subject, and including some interesting notes on a variety of applications.

The Electrical Industry and Tariff Reform.—On page 376 of our last issue, in our report of the discussion on Tariff Reform *v.* Free Trade, which took place on Monday, June 6th, by a clerical error the National Electrical Manufacturers' Association was referred to as the National Electrical Contractors' Association in the first line.

Wireless Telegraphy.—A wireless station with a range of 300 miles has been inaugurated at the Cape, and will be used for communication with the ships of the Union Castle line, all of which are to be equipped with wireless telegraph apparatus, and other steamships. There is already a commercial wireless station at Aden, and another is projected at Gibraltar, in addition to the Admiralty station.

Engineering and Scientific Association of Ireland.—The annual excursion of this Society, which took place on Saturday last, included a visit to the Great Northern Railway power house, Sutton, which supplies power to the Hill of Howth tramway service. The battery sub-station, which is provided with an E.C.C. booster for regulating the voltage supply to the cars, was also visited. The battery is also used for running the service at night.

Wavertree Telephone Exchange.—On Saturday last, the 11th inst., at 1 p.m., the National Telephone Co. transferred the subscribers connected to its Wavertree Exchange to a new central battery equipment installed in new premises at Wellington Road, Wavertree, Liverpool, which have been specially designed. The new equipment has been manufactured and installed by the Western Electric Co., Ltd., of North Woolwich, and is of the No. 1 C.B. type, consisting of 12 subscribers' positions, giving accommodation for 1,440 lines, four incoming junction positions, and one exchange testing position. The equipment is of similar design to those previously described in ELECTRICAL ENGINEERING.

The Electric Supply Publicity Committee.—A further issue of publicity matter has been made in the form of a four-page illustrated folder on ventilation, and a card for enclosing in correspondence on the uses of electricity for the seasons—the fan for summer, the radiator for winter, the griller and kettle all the year round. A certain amount of newspaper advertising has also been done in London dailies. The last effort in this direction took the form of two full-page illustrated articles dealing with the various uses of electricity in the home. These appeared in an evening paper consecutively about a week apart.

PAPERS READ AT THE I.M.E.A. CONVENTION

COMMERCIAL ADVANCEMENT OF ELECTRIC SUPPLY.

By A. C. CRAMB.

(Chief Electrical Engineer, Croydon.)

Mr. Cramb commenced his Paper with a quotation from an article by an American engineer, in which he criticised the "procrastinating somnolence" of the electric departments in Great Britain. He insisted upon the necessity of a proper expenditure on business getting and a thorough scheme of organisation of the commercial side of the business modified to suit the conditions of each particular undertaking.

For undertakings of appreciable size, he advocated the appointment of a competent sales assistant, working immediately under the direction of the engineer-manager. At the moment, he said, there is a lack of suitable men, but "many engineers with natural aptitude for business getting would soon become fully competent to carry out this work if many posts with a sufficiently remunerative salary were offered."

The policy of Sheffield, West Ham, and Marylebone was cited as being the most fruitful in increasing business. The public who have been educated by the gas companies to expect to be able to buy, hire, and hire-purchase almost everything in connection with gas supply, naturally expected the same of electrical supply. But gas companies, he said (who generally supply under the condition that increases in dividend are co-dependent on a reduction in price to the public), rather than reduce the price of gas, use large sums of money in fitting up houses free, or nearly so, and in doing a great deal of work for the public with a view to keeping out the electric supply which generally has not such powers.

In the case of undertakings in which the business is confined to the sale of electrical energy, the author suggested a sales staff consisting of a sales manager at £150-£300 a year, and four district representatives £78-£104 and commission, or £120-£180), an advertising assistant (£100-£120), three specialists in power, lighting and signs, and heating and cooking, respectively at £120-£250 a year, a show-room attendant (£100-£150), and a clerk (£80), all working directly under the sales manager.

As commission for the district representatives, Mr. Cramb suggested 3½d. per 35-watt lamp, 2s. 6d. per B.H.P. in motors, and *pro rata* for heating and cooking apparatus. Each man should make an average of thirty calls per day, and a record should be kept of the number of calls per order for each man—in one case this works out at nine. The advertising assistant's salary is based upon literature and advertisements being arranged through the Joint Publicity Committee. The total cost of rent, rates, wages, advertisements, literature, and all other expenses of the commercial department are chargeable against working costs, in undertakings run on these lines, and the expenditure for commercial development under these conditions should be in the neighbourhood of 2 to 3 per cent. of the annual revenue.

When sales and installation departments are carried on, Mr. Cramb continued, the expenditure on sales, installation, hire, &c., should be covered by profits on this work, but the remaining expenditure, including publicity, should be charged to working expenses as in the former case. The suggested staff for a large town with a sales and installation department comprises a sales manager at £400 a year; an assistant manager at £200; four "experts" as before, but with separate experts for "lighting" and "signs"; a "business-getting representative" with a show-room assistant under him at £100 a year or £85 and commission; and five outside canvassers at £100 plus commission; construction and maintenance and dispatch departments under a construction superintendent at £200-£250 a year; a staff of four typists for the whole correspondence; and a publicity man at £120-£150 a year, with two assistants at 40s. and 10s. a week. The canvassers are to take orders both for electric supply and for the carrying out the work, and consumers generally prefer to have the whole business dealt with by one party. The experts will only be required in large undertakings, in others the manager or assistant undertaking the supervision of special work. The bonus, it is proposed, should be paid on net sales, disconnections being debited. On sales 2½ per cent. up to £450 turnover per annum, 5 per cent. between £450 and £750, and 7½ per cent. over £750. On hire and hire-purchases and maintenance schemes, the bonus suggested is 2½ per cent. on amount paid each quarter. On heating, cooking, and other special applications, 7½ to 10 per cent. Bonus on connections: Lighting, 2s. 6d. per kw. up to 5 kw. in excess 1s.; heating and power, 1s. 6d. per kw. up to 5 kw. in excess 1s.; cooking, 2s. 6d. per kw. up to 2 kw. in excess 1s. The bonus paid is less than in the previous case, as canvassers get a bonus on sales also.

The author next considered the charges that should be made to the convassers on hire and hire-purchase agreements. For hire he advocated a gross profit rental of 30 per cent., made up as follows:—Redemption of capital, 15 per cent.; interest, 5 per cent.; repairs and maintenance, 5 per cent.; contingencies and other charges, 5 per cent. The rental to include inspection and maintenance, but the hirer to be charged for any breakdowns not due to fair wear and tear, and fire insurance. For hire-purchase (two to five years) a profit of 15 per cent. over the list price of the motor should be taken, or, alternatively, 25 per cent. of cost paid in advance and the remainder in eight quarterly instalments. Arc lamps are hired at inclusive prices, and in one case the charge is £8 4s. per annum up to 800 hours' use per annum, payments to be made in advance, 2½d. per lamp per hour being charged for excess use. Hour meters are installed at small rental. Electric vacuum cleaners, hired, including delivery, at a rental of 7s. 6d. to 10s. per day, should have a fair demand. Sales should be strictly maintained at list prices except to the trade. Curves showing turnover, expenditure, and rate of profit are recommended, and similar curves applied to each canvasser.

The Paper next dealt with the arrangement of showrooms, and recommended that the collection of accounts should be made from these premises, consumers having to walk through the showrooms to reach the cashier. The author recommended the holding of exhibitions at intervals, the out-of-pocket expenses in connection with which should not exceed £50 to £100 if the exhibition does not pay its own way. Advertisements are recommended in the local Press, "backed up by chatty paragraphs on new apparatus or work carried out," and in church magazines; posters on hoardings, "which should be full of human interest and of artistic merit"; showcards distributed in contractors' windows; artistic calendars distributed to tradesmen; tramcar advertisements; and illuminated signs, "perhaps the most effective of all if properly thought out." In addition, Mr. Cramb advocates circular letters and pamphlets, and puts the expenditure for advertising and publicity literature in a medium size undertaking at only 0·3 to 0·5 per cent. of revenue.

The author then referred to the recently formed Joint Publicity Committee, representing company and municipal electric supply interests, which should save the time of the staffs of the various undertakings, as they will be able to purchase suitable literature from the committee; moreover, owing to the "literature" and posters being turned out in large quantities, a saving in cost will be made. This committee may, at a later date, act as a registry for the commercial staffs of the undertakings.

The Paper next described in some detail a card system in connection with the business-getting department. Among Mr. Cramb's other recommendations were that a close watch should be kept on new premises being erected, and that it is important to obtain early notice of premises let. Complaints should be received in a "sympathetic" manner. The sales manager should be kept in immediate touch with disconnection notices and reduced accounts. A list of unused services should be kept, and these should receive occasional calls. Considerable increase in lighting revenue can be obtained by two or three year hire-purchase of installations, and, if financially sound, certain hiring schemes will also assist. Quite 50 per cent. of small power users can only be obtained by a proper hiring or hire-purchase scheme. Certain small lines of heating and cooking apparatus, such as electric irons, should be vigorously pushed; these should be placed on 14 to 30 days' trial, and 60 per cent. to 80 per cent. should be sold. An electric iron should produce a revenue of 15s. to 25s. per annum. Electric cooking is retarded more by the initial cost of the apparatus than by the cost of current, and a progressive scheme of hiring out is necessary.

A few lines in the Paper were devoted to the attitude of the local contractors: "Attempts at a more active business development of the supply undertaking has been accompanied by hostility from the contractors. There are two alternatives for the future, either co-operative arrangements between the contractors and the supply authority, or a vigorously conducted sales department by the latter. The author is of opinion that the sales department would bring a more rapid increase of business, and must be the final solution of the problem, as already proved by the experience of the gas companies, but the former schemes being properly supported might produce useful results. If a co-operative arrangement can be effected, the supply undertaking should insist on seeing that, as far as their powers will carry them, good installation work is done and a fair price obtained. The canvassers should have a schedule of prices for estimating. Consideration of each other's interests must be shown. The supply by combining requirements and buying the best apparatus in large quantities would obtain the goods at a minimum cost, thus enabling fair profit to be made by the contractor, who could be supplied at almost cost price, and he would not have to carry a large amount of stock. Where the supply departments go in for installation work they should confine themselves to small orders, or where competition renders it advisable to displace rival apparatus. The difficulty of attempting co-operation, however, seems mainly to be due to trade jealousy amongst the various contractors in any particular district."

NOTES ON THE COMMERCIAL PROGRESS OF ELECTRICITY UNDERTAKINGS.

By H. COLLINGS BISHOP.
(Chief Electrical Engineer, Newport, Mon.)

The following are the main points of Mr. Collings Bishop's Paper :—

At the present time no town need suffer from the want of advertising matter, as plenty can be obtained free from the various manufacturers if one is prepared to push their goods, and there is more than one company from which a supply of such literature can be bought. The author is of opinion, however, that the correct way to deal with the problem is to make up your own advertising matter to suit your special requirements.

The author has spent a good many years in America, but has not returned with the American idea of advertising, which necessitates dumping a postcard or letter on your breakfast plate every day until, from sheer exhaustion, you succumb and give an order. Introducing specialities is another matter, and can very well be done in the first instance by circular, to be followed by a call showing the article you want to introduce. When that article is likely to be suitable, such, for instance, as an iron, it should be left for a week's free trial. Nine times out of ten this will result in a sale.

It is no good writing to a man worth £2,000 a year suggesting, say, the purchase of electric radiators at 5s. a quarter, or to ask an artisan to buy cooking apparatus costing £30 or £40.

Canvassing is the most important of all the departments connected with the commercial development of electrical undertakings. Payment by commission should not, in the author's opinion, be indulged in. It leads to the temptation to get work whether the prospective consumer is financially sound or not, and dissatisfaction on the part of the canvasser if the customer is rejected. If a commission is necessary to make a man look after your interests get rid of him; he is no good to you.

Two or three years ago the Newport Corporation appointed a combined canvasser and illuminating engineer, and the appointment has been an unqualified success, not only in the way of obtaining new consumers, but in satisfying those who grumble. He has also been able to cover practically the whole of his salary by the casual sale, during his rounds, of lamps, irons, radiators, &c. The canvasser reports daily to the chief the result of the previous day's work, and generally discusses the work in hand. Close co-operation between the chief and the canvasser enables the man to give a customer a decisive reply without keeping him waiting whilst the matter is referred to the office. Where the canvasser has difficulty in persuading a man to decide, good is often done if the manager takes the trouble to see the individual himself; in the larger jobs the manager has to do a great deal of the negotiating himself.

There is no doubt that, were the field free, the electrical undertakings are in an excellent position for dealing with all the necessary installation work for their own consumers, and a good percentage of electricity users prefer that all repair and installation work should be carried out by the undertaking. Newport, which possesses full powers for dealing with all work connected with the undertaking, has so far rested content with carrying out such work as has been directly thrust in its way and in carrying out work under the hire or hire-purchase systems. The general run of work has been left to the contractor. The number of consumers who now send direct to the electricity department is, however, growing rapidly.

The properly trained and conscientious contractor has little to fear, but the man who becomes an expert in a night must, in the interest of the whole industry, go. A great deal of harm is also being done by some of the large plumbers and ironmongers, who often put on an inexperienced man as electrical foreman and leave the whole department to him.

To give one example: A small job of arc-light wiring was sublet to a local firm. The total run consisted of about 80 yards of cable. It was afterwards discovered that there were 21 joints (there were no branches), not a single one of which was either cleaned or soldered, and no attempt had been made to properly insulate the copper, save by a small quantity of sticky tape, bought for about 9d. per lb.

The author has yet to find the consumer who discards electric power once he has started, except due to failure in business or other like cause. It is necessary to run the hire department upon business lines. Ten per cent. to cover interest and all other charges, based upon the cost price, is bound to end in a loss to the department. In Newport there has been no difficulty in obtaining 20 per cent. return on the cost price.

It may be of interest to know the rates obtained in Newport for the hire of various sizes of motors. The figures given include a starter, switch and fuses, and wiring up to a run of 50 ft.

H.-P.	£	s.	d.	H.-P.	£	s.	d.	H.-P.	£	s.	d.
1 ...	2	17	6	10 ...	7	5	0	85 ..	18	0	0
2 ...	3	10	0	15 ...	9	15	0	40 ...	19	0	0
3½ ...	4	0	0	20 ..	11	10	0	45 ...	21	0	0
5½ ...	4	15	0	25 ...	13	0	0	50 ...	23	0	0
7½ ..	6	7	6	30 ...	16	0	0				

At the present time 283 arc lamps are on hire from the Newport Corporation. The whole of these lamps are maintained by the Corporation for an inclusive fee per hour (in use) for current and carbons. In addition to these there are 55 lamps owned by consumers, but maintained by the Corporation at a given sum per annum.

The rates charged in Newport are as follows :—

One 360-watt alternating lamp, 2d. per hour.

One 400-watt alternating lamp with metal core carbons, 2½d. per hour.

Two 400-watt alternating lamps with metal core carbons, 5d. per hour.

Four direct-current metal core carbon 400-watt lamps, 10d. per hour.

The above rates are for yellow carbons.

The rates charged for the hire of the lamps are as follows :—

One alternating lamp and transformer, £2 8s. per annum.

Two alternating-current lamps, £4 3s. per annum.

Four direct-current lamps, £6 18s. per annum.

The business done in the hire-purchase department has been fairly good, without unduly pushing it; if a consumer is prepared to buy outright he is left to the contractor. On the other hand, hire-purchase is popular, even amongst those who are able to pay outright, for the reason that they like to have the maintenance in the hands of the Corporation. The basis of charge is generally as follows, say for a five years' agreement :— Payments per quarter : one-twentieth part of the capital; 5 per cent. interest on capital not repaid; 5 or 10 per cent. on total capital for maintenance.

So many Corporations undertake installation work themselves that it is questionable if they are the right ones to do inspection of work that may be done by a competitor.

At Newport the charge for ordinary lighting is 4½d. per unit up to 1,500 units per quarter, and then 3½d. per unit. On a guarantee of 10,000 units per annum a net charge of 3½d. per unit is made for the whole quantity. Power users have special lighting rates that vary from the maximum down to a nett charge of 1d. per unit if sufficient power units are used. The power rates are first a general scale of 2d. per unit, falling as low as 1d. according to quantity; for a guaranteed 20 per cent. load factor, 1d., or with a guaranteed use of 100,000 units per annum, 1d. per unit.; by two-rate meter, 3d. per unit during the restricted hours and 1d. per unit during other hours; heating, 1¼d. per unit net.

Gas competition does not exist to nearly the same extent that it did a few years ago. There is no doubt that the advent of the flame arc and the metallic filament lamp has put quite a different complexion on matters. Where the competition really does exist is with the small consumer, who, at the present time, uses gas, oil, or candles. The competition in street lighting is dead. The advent of the flame arc for main streets and the high candle power metallic lamp for side street lighting has put the necessary finishing touch of superiority. One is able now to attack successfully that stronghold of the gas company, heating, and the gradual increased consumption in heating units that is being made each year is bound to tell in time.

In Newport considerable success has been obtained with prepayment meters, and 50 to 60 have been put out during the past seven or eight months. For the very small consumer, however, whose demand does not exceed two or three lights, the revenue allowed in the charge made is not sufficient to make a sufficient return on the cost of the meter, and the author now puts forward for consideration a scheme for the inclusive rental of wiring and energy, somewhat similar to that of the Fixed Price Light Co. (see ELECTRICAL ENGINEERING, Jan. 20, 1910, p. 39).

Briefly the scheme is :—To charge a weekly rental for current and hire of fittings; to use a cheap form of surface wiring; a variable weekly rental according to the time of the year; an arrangement by which all rooms can be wired and a varying rate charged according to the number of lamps it is desired to have power to light up at the same time; and a locking holder to minimise the theft of lamps.

The charges are based upon the following rates :—Charge for energy, 4½d. per unit; capital cost for wiring (without lamps), 10s. per point; capital cost for each service, 20s.; capital cost of the instrument to prevent the use of more lights at a time than are paid for, 15s.; collection charges, 1d. per house per week; annual allowance per lamp for renewals, 2s.

The average number of burning hours per annum taken is, for one point installed, 1,000 hours per annum; for two to six points installed and two lights permitted at a time, 1,300 lamp-hours per annum; for three, four, or five lights installed and three lights permitted, 1,500 lamp-hours per annum; for four lights installed and four lights permitted, 1,700 lamp-hours per annum; for five lights installed and five lights permitted, 1,900 lamp-hours per annum; for six lights installed and six permitted, 2,000 hours per annum.

The charges work out to from 7d. per week in winter and 4d in summer for one lamp, to 1s. per week in winter and 10d. in summer for six lamps permitted.

It is estimated that 100 consumers divided among the various classes will produce a revenue of £184 per annum, and that on the assumption that the 5,330 units consumed by them cost 0·75d. per unit to generate, and after allowing for interest and

Digitized by Google

repayment on installation costs, services, and the proportion of plant and mains required (basis maximum demand 5·6 kw.), collection expenses and cost of lamps, £16; limiting apparatus, &c., £15; with a further allowance of 20 per cent. in extra units for waste, the net profit will be £56.

During the past three years the number of new consumers obtained at Newport has been 710, and the equivalent in 30-watt lamps, 74,800. The total revenue from sales and wiring (mostly hire-purchase), £8,101, and the total horse-power of motors connected has increased from 1,080 to 2,450.

The annual revenue now obtained by Newport for goods or maintenance of apparatus supplied under the powers required for the purposes of commercial development are as follows:—Annual receipts for motors on hire, £328; annual receipts for the hire of arc lamps, £461; annual receipts on hire-purchase account, £1,047; annual receipts for the maintenance of arc lamps, £380. Total capital involved, £8,800.

DISCUSSION.

Mr. A. H. SEABROOK (Chief Electrical Engineer, Marylebone) said he found it easy to get from 40 to 50 per cent. profit on his sales and installation department, and, this being so, no wiring contractor could have great cause for complaint as to undue competition. The period for hire-purchase should not exceed two years, unless there were very strong guarantees from the consumer. In this case, he would regard 25 per cent. paid in advance as a necessity, and not an alternative, as suggested by Mr. Cramb. He thoroughly agreed that sales should be strictly on a cash basis, except to the trade. On the question of circular letters, there was no doubt that a specially typed letter in every case was much more effective, but many engineers and managers disliked them because of the laborious task of signing each one. The remark had been made that morning that electricity was in its infancy, and the more he went into this question of commercial management, the more it was impressed upon him that we are in our infancy with regard to systems of charging and business-getting generally. For instance, although electricity supply had been going on in Marylebone for 25 years, less than 40 per cent. of the premises had services in, and not half of these were using electricity exclusively even for lighting. His opinion on the payment of canvassers was that they should be paid a small salary up to £2 a week, plus a commission. This was the only way in which to get the best work out of a class of men over whom it was very difficult to have any control. With regard to the basis of a hiring scheme, 10 per cent. return was insufficient. Such a scheme which he had introduced had been a total failure. His present return was between 50 per cent. and 60 per cent., and it was quite easy to get this. He assured Mr. Collings Bishop that gas competition did exist, in London, at any rate, where both public and private lighting was most vigorously competed for. The gas company arranged its prices in a very artful way, the annual charge including maintenance, and it was impossible to get at the price of the gas. In one case the gas company had gone so far as to assist the consumer in the cost of his electric motor to supply his compressing arrangements. He did not think that electrical undertakings would ever get at small property until a scheme were devised which abolished meters, and he instanced some one-, two-, and three-room tenement-houses in which the cost of the wiring was £150 and the cost of the meters £300.

Alderman J. W. CROWTHER (Sheffield) said that the experience of Sheffield was that periodical exhibitions were of greater value than permanent showrooms, and were less expensive. He was opposed to newspaper advertising, as no results had been traced to this in Sheffield. A large number of electric furnaces were now being erected in Sheffield, and supply was given at prices ranging from 0·6d. per unit to 1d. per unit. His committee were in a curious position, for after having paid £8,000 for the goodwill alone of the installation business of the old company in Sheffield, they had had a writ issued against them at the instance of the local wiring contractor, and it was still hanging over their heads. He agreed with paying canvassers salaries, and regarded the bonus system as mischievous. That there was need for even more commercial development in Sheffield was shown by the threat of the gas company to reduce their price to 11d. per 1,000 ft. The position in regard to this in Sheffield was that it was necessary to make the gas for the sake of the by-products, which produced more revenue than the actual sales of the gas, and even if they could not sell any gas at all they would still make it and blow it out into the atmosphere.

Mr. C. H. WORDINGHAM (Electrical Engineer-in-Chief to the Admiralty) thought Mr. Cramb rather overdid specialisation when he suggested a separate official for lighting, heating, and power, and imagined the feelings of a hairdresser who wanted 20 lamps, a radiator, and a motor to drive his hairdressing machinery. Surely a good all-round man could be procured who would carry through all classes of work. On the question of advertising, he objected to what he termed the Ally Sloper style of pretty pictures. Consumers wished to be told facts in a straightforward way, and electricity supply managers might perhaps do a great deal of good if they adopted the same style as the innocent articles in the newspapers which disinterestedly told how cheap gas was. We were not nearly so wily as the gas people. He also suggested keeping in touch with house agents in order to keep records of properties which were being let. Mr. Wordingham next championed the cause of the wiring contractor, who, he said, was the best canvasser of the central station. He did not think anything should be done to "get his back up"; in fact, it was unfair to poach upon his preserves at all. The wiring contractor was not treated, in the Papers, as he should have been. He also recommended that central station engineers should be allowed to undertake consulting work within their own area, rather than leave prospective consumers in the hands of wiring contractors for advice. Mr. Collings Bishop's advice, that a man should be paid a good salary, should be written in letters of gold in every committee room in the kingdom.

Mr. W. A. VIGNOLES (Chief Electrical Engineer, Grimsby) pointed out the possibility of a successful canvasser earning a larger salary than the manager of the undertaking if Mr. Cramb's scale of commission were adopted. The cost of the staff, under Mr. Cramb's scheme, would be about £2,000 per annum, which was out of the question for the average undertaking. He urged the Publicity Committee in London to bear in mind, in preparing their literature, that the provincial undertakings were not in exactly the same position as the London ones, and they ought to keep in touch with provincial engineers as to what their requirements are. He had been very successful in putting his canvassers on to particular trades, dealing with one at a time. A butcher, for instance, quickly adopted electric light if he was informed that the butcher opposite had done so. He did not think they ought to look for direct results from newspaper advertising, and looked forward to a universal scheme of newspaper advertising in the daily papers, on some joint basis. A great educational work could be carried out in this way. He had found a consumers' guide, in which was given particulars of lamps, wiring, &c., a great help—a kind of book of the words which was believed in by the consumers. He thought 20 per cent. on the cost price of motors hired out was too high, and further, consumers who had their motors five years ago would have cause to grumble now that the price of motors had gone down, as the amount they had to pay was very much more than that paid by present consumers.

Councillor D. LIVINGSTONE (Hull) urged electrical engineers to turn their attention to the smaller property as the most likely outlet for increased consumption.

Mr. F. AYTON (Chief Electrical Engineer, Ipswich) suggested a radical departure in methods of canvassing, viz., the employment of ladies. It was his intention to train some lady canvassers, who, he thought, would be better able to talk to the lady of the house than a man. At Ipswich they did everything they possibly could for the consumer, and did not consider the wiring contractor at all. A contractor desired to get in the largest number of lamps, and he advised the most expensive apparatus, which was all against the interest of the undertaking, because the consumer told his neighbours how expensive electricity was. The Ipswich sales department last year had a turnover of £3,043 for actual work done for the consumer, in addition to £500 for wiring. The cost of the staff was £300 per annum, which worked out at 1¾d. per cent. on the total revenue, or 10 per cent. on the installation department revenue. They did not carry out work under cost. With the best class of materials, the cost of wiring per lamp point was 8s. 9d. actual cost, and with establishment charges 9s. 8d. They charged 13s. 6d., but this did not include fittings. They tried to persuade every consumer to have a better method of illumination. Contractors, speaking generally, did not interest themselves in illumination; all they wanted were as many lamps and as many fittings as possible. He had in one case put in an improved system of lighting, with ceiling fittings, &c., and offered to take it out in three months if the consumer did not like it. But it was still in use. He could not understand why corporations owning tramway systems did not make use of their tramcar windows for advertising the electricity undertakings. Such methods as these, together with street lighting, made people think electrically, and that was going to do an enormous amount of good. He also adopted the plan of sending a man out with fans on hot days, and the other day he sold six fans in this way.

Mr. MARK RUDDLE (Chief Electrical Engineer, Dublin) remarked that it was of little use suggesting methods of developing electricity supply when so many corporations were debarred by law from adopting them. They ought to make a big effort to see that powers to undertake wiring and fitting were granted to every electric supply authority.

Mr. E. E. HOADLEY (Chief Electrical Engineer, Maidstone) spoke on the same point. It was not a question of municipal trading, but one purely of business. All authorities, municipal or company, should have these powers. A direction in which little progress had yet been made was in illuminated facia boards.

Mr. F. M. LONG (Chief Electrical Engineer, Norwich) said advertising was not so essential as the provision of attractive schemes to put before consumers. One which had been successful in Norwich was the system of charging on the rateable value of the house and one penny per unit. This enabled any class of apparatus to be used. He had also a scheme for selling metal filament lamps by quarterly payments which had been successful. The hiring of arc lamps had also been very successful in Norwich, the charge now being £5 per annum and 1d.

Digitized by Google

per unit. In this way he had 400 lamps on hire, and about 125 lanterns with metal filament lamps. He did not think Mr. Bishop had allowed a sufficient number of units in his scheme for a fixed price.

Mr. A. C. CRAMB, in reply, said his scheme for a publicity department was arranged for a large undertaking, and could be modified for smaller ones. With regard to a scheme of universal advertising, it was the intention of the Joint Committee to initiate one, if all the undertakings in the country contributed their share of the cost. With regard to Mr. Wordingham's remarks concerning wiring contractors, he said that every engineer in the country would co-operate with the contractors if the latter would only concentrate their attention on the business. The present position seemed rather to be that the central station managers should sell the apparatus and the contractors should take the discount. He was entirely in favour of lady canvassers. On the question of wiring powers he asked if the wiring contractors were fair to the municipalities in regard to the Electricity Supply Act last year. It seemed absurd that in England there could be two undertakings side by side, one having authority to do wiring and the other being forbidden by law to do it.

Mr. H. COLLINGS BISHOP also briefly replied. He said his remark as to gas competition was to infer that it was not so great now, relatively, as it had been in the past. He thought it was best to be diplomatic with the wiring contractor. There was no good in throwing him over altogether. But the contractor did not go far enough, and they would have to take up the work in which he was lagging. Therefore, with every respect to the contractor, it was necessary for the undertakings to push the sales and hiring departments. The contractor did not worry much about auxiliary apparatus. In Newport, although the contractor had had the field to himself for years, heating and cooking apparatus were almost entirely absent until the electricity department took the question up. The rate of 20 per cent. on the cost of motors was fixed when the cost of motors was high, and it had not been altered. Tramcar windows were very difficult to get, as there was always a demand for them for advertising purposes. In answer to a question by Mr. Furness, Chief Electrical Engineer at Blackpool, Mr. Bishop said his fixed price light scheme contemplated running one service to supply a row of houses. He also proposed the use of current limiters as a means of reducing the waste.

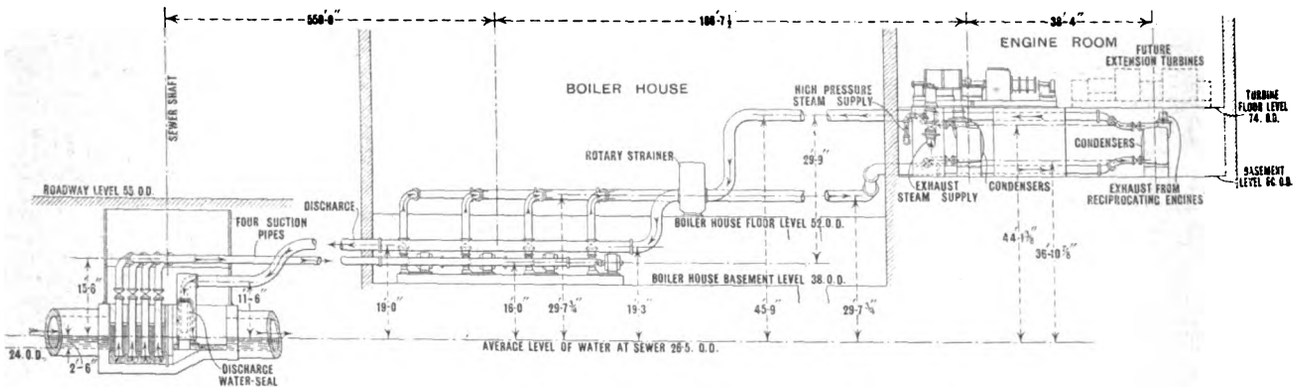
After the conclusion of the discussion of these papers on Tuesday morning, the members and visitors were entertained at luncheon in the City Chambers, when a very large company were present.

In proposing the toast of the Association, the Lord Provost said that the best proof of the success of the Association was to be found in the fact that the charges for electrical energy for lighting and power purposes in all the principal towns were now sufficiently low to enable municipal supply undertakings to connect up all large works to their mains. Mr. W. W. Lackie, in reply, pointed out that when the Association met in Glasgow in 1901, the membership was 160. To-day it was 450, whilst the capital invested in municipal supply undertakings had increased from £19,000,000 to £42,000,000, or, including tramways, £84,000,000.

Visits were subsequently made to the Springburn sub-station of the Electricity Department, the Pinkston power house of the Tramways Department, and the Port Dundas Electricity Works.

There was a reception and conversazione at the City Chambers in the evening.

EXHAUST STEAM TURBINES AND CONDENSING PLANT AT THE McDONALD ROAD STATION, EDINBURGH.



By F. A. NEWINGTON.

(*Chief Electrical Engineer, Edinburgh.*)

The average flow of the water of Leith main sewer is about 750,000 gallons per hour, and as there were certain objections to the use of cooling towers and difficulties in obtaining a supply of water otherwise, it was decided to utilise this for condensing purposes, so that the required extensions of plant could take the form of exhaust steam turbines. The general arrangement of the plant is shown in the figure.

The sewer is 6 ft. 6 in. inside in diameter, and 22 ft. below the level of the road. A shaft, 26 ft. in diameter, formed of cast-iron segments bolted together, was sunk down until the top of the sewer was reached and a ring of brickwork, of the same diameter as the cast-iron shaft, was continued downwards for about another 9 ft., that is, to the bottom of the sewer. Four suction pipes, each 18 in. in diameter, and one discharge pipe, 26 in. in diameter, are laid from the shaft to the station. Straining screens are fixed in the shaft just in front of the suction pit. The end of the discharge pipe in the sewer is water sealed, so that a syphon action is maintained. Four 14-in. motor-driven centrifugal circulating pumps, each with a capacity of 182,400 gallons per hour, are placed in the basement of the boiler-house, each pump having a separate suction pipe from the shaft. The pumps deliver into a common pipe 26 in. in diameter, to which is connected a Bailey & Jackson rotary strainer. From this the circulating water passes through the four condensers back through the rotary strainer, and then is returned to the sewer. On account of the pipes forming a closed system, the average head against which the pumps work is 15 lbs. Two air extracting pumps have been provided; one extracts the air on the suction side of the pumps, the other the air on the delivery side. By this means the syphon action is maintained, and the pressure at the highest point of the pipe system averages about 20 in. of vacuum.

Four surface condensers of the Contraflo type are used, each

GENERAL ARRANGEMENT OF PIPEWORK, CONDENSING PLANT, AND EXHAUST STEAM TURBINES.

having a cooling surface of 3,750 sq. ft. The air pumps are of the Edwards type, with three-throw cranks. The feed water force pump is also driven off the same shaft. One line of each air pump was altered so that it now delivers the condensed steam to the force pump, the other two lines working dry. The air pumps are driven by motors geared through Renold chains.

The straining arrangements in the shaft consist of three iron grids, each 5 ft. high and 3 ft. 6 in. wide, with vertical bars spaced ⅜ in. apart. These are kept clean by scrapers automatically worked by a small motor, but a certain amount of scraping by hand is necessary at the time of top load.

Mr. Newington then proceeded to describe the Bailey & Jackson rotary strainer, particulars of which were given in ELECTRICAL ENGINEERING, June 9th, page 370.

The most interesting point about these strainers was the way in which the discharge water washes off from the grids everything that has been deposited on them on the delivery side, and carries it back to the sewer. In connection with their working, he remarked that there was considerable leakage of water from the inlet chamber to the outlet chamber, which increased the power required for pumping. The temperature of the sewer water ranges from 60° to 70° F., and as it is prohibited to return the water to the sewer above 90° F., the quantity of circulating water required per pound of steam condensed is large.

At present only two exhaust steam turbo-generators have been installed, but there is sufficient steam from the reciprocating engines for two more exhaust turbines. The turbines are of the Rateau type, running at 1,250 r.p.m. The guaranteed output of each set is 1,200 kw., with 45,600 lbs. of steam per hour at a pressure at the inlet to the turbine not exceeding 14·7 lbs. per sq. in. absolute, and at the exhaust 1·3 lbs. absolute.

The exhaust steam from two of the 780-kw. reciprocating sets is sufficient to give an output of 1,200 kw. from one of

Digitized by Google

the turbo-generators. Live steam is also available through reducing valves.

The dynamos were built by Brown Boveri & Co. They are four-pole machines, and are separately excited by a small dynamo at the end of the shaft. Copper brushes are in use on one machine. The commutator of the other machine has been altered to give increased ventilation, and carbon brushes are fitted. There was some little trouble at first with commutation, but this has been overcome, and both machines are now running well, especially the one fitted with carbon brushes. This commutator keeps very cool, being only 42° F. above the temperature of the air after a six hours' full-load run. Each commutator works with a pressure of about 22 volts per bar.

Automatic atmospheric valves are placed in the exhaust pipes between the reciprocating engines and the turbines. They are balanced to open at about 3 lbs. above atmospheric pressure, so they are always nearly in equilibrium. Those now in use have a special dash pot which admits air freely on the upward movement of the valve, but by means of a non-return valve only allows it to escape very slowly when the valve is closing.

Oil separators of the Blake type between the engines and the turbines extract the greater part of the oil. The feed water is further treated by the Davis Perrett electrical process of oil separation.

There is not the least difficulty in running the turbo-generators in parallel with the other dynamos. The old dynamos are shunt-wound, and the turbo-generators compound-wound. The whole regulation is done by the switchboard attendant by means of the shunt resistances. The only point to be careful about is to see that steam is not escaping past the atmospheric valves, which would mean waste. In order to prevent this, indicators have been fitted just above the atmospheric valves, and directly any steam passes the valve an electric circuit is closed which rings a bell on the switchboard. The switchboard attendant then puts more load on to the turbine and so reduces the pressure of the steam in the exhaust pipe.

The capital cost of the condensing plant, which is sufficient to deal with the steam from reciprocating and exhaust turbines of 11,000 kw., was £13,800, or 5·7d. per kw.

The working costs per unit generated since the plant was installed have shown savings (by comparing figures of 1908 and 1910) of 33·4 per cent. for fuel; 50 per cent. for oil and stores; and 78 per cent. for water; the total works costs are now 0·281d. as compared with 0·398d.

In conclusion, Mr. Newington says:—"Some engineers seem to think that exhaust steam turbines are only a passing fashion and will disappear in a few years, but in stations with existing reciprocating engines, either exhaust steam or mixed-pressure turbines seem the most suitable for extensions, as the combination of reciprocating engine and turbine is as economical as high-pressure turbines, and obviates all necessity of scrapping the old sets until these are worn out."

The discussion of this and Mr. Bremner's Paper, both of which were read yesterday, will be reported in our next issue.

DISPUTE re MUNICIPAL WIRING AT LEICESTER

AN extremely important case was opened before Mr. Justice Neville in the High Court of Justice on Monday. The case is "Attorney-General (at the relation of John Charles Utley) *v.* Leicester Corporation," and it is an endeavour made by the local wiring contractors to prevent the Corporation from wiring houses and from selling and hiring out electric light fittings, motors, &c. The Corporation work under a Provisional Order obtained in 1890, and have no Special Act with wiring clauses similar to those owned by other Corporations.

The plaintiffs claim that the Leicester Corporation have carried on, and still carry on, the business of installing, selling, and repairing electric light, cables, wires, and fittings, electric bells, dynamos, and motors. It is alleged that installations are erected, and that such material is sold, not only to their own consumers, but also in connection with houses and buildings of non-consumers, and even outside the borough.

Mr. FELIX CASSEL, K.C., in opening the case for the plaintiffs, contended that Section 10 of the Electric Lighting Act of 1882, which authorises a supply authority "generally to do all such acts and things as may be necessary and incidental to such supply," did not empower the Corporation to do the work complained of. He referred to the Special Acts of other Local Authorities who had obtained powers to do wiring work, and to sell and hire motors and fittings, and pointed out that these Local Authorities had not relied upon Section 10 of the Electric Lighting Act of 1882 to give these powers, but had embodied clauses in their Special Acts, in which these powers were specifically granted. Mr. Danckwerts, K.C., objected that Mr. Cassel could not cite clauses in Private Acts in order to construe clauses in the General Act, but the judge decided that Mr. Cassel might be heard on this point, and Mr. Cassel thereupon read the clause in the Marylebone Electric Lighting Act which authorises the Marylebone Borough Council to do house-wiring, selling, and hiring of motors and fittings, &c.

The first witness for the plaintiffs was Mr. TAYLOR, whose premises are situated on the Leicester Borough boundary. He stated that for his gardens and stable, in which there were no electric fittings, he paid rates to the Corporation, but for the house he paid rates to the Parish of Oakby. The electrical installation in his house had been erected by the Corporation, and he enumerated some of the fittings which were supplied.

The next witness was Mr. TWEEDIE SMITH, of the firm of Turner & Co., who acts as honorary secretary to the Electrical Contractors' Association. He stated that he had examined the electric lighting fittings stock book and other books of the Leicester Corporation, and had found that the Corporation dealt in large quantities of motors and fittings, and also bells and batteries, and such things as shaving pots, foot-warmers, hair-driers, electric signs, cigar-lighters, "magic mirrors," omelette pans, and had found in their stock book also entries of an "extra lid for omelette pan" and "a sewing machine complete with motor." He had found large sums allocated in the books to wages for work done in carrying out installations. Among other things he had found an account against Messrs. Smith, Faire & Co. for £515 14s. 1d. for the erection by the Leicester Corporation of an installation for generating electricity in competition with themselves. He was proceeding to state that an examination of the ledgers had shown that, in spite of the figures in the Corporation's public accounts, its installation business was carried out at a loss, but the judge interrupted him and said that if the Corporation had statutary power to do what they were doing it did not matter whether they made a loss or not. Witness described the showrooms occupied by the gas and electricity department, in which the stock was exhibited, as it would be by an electrical contractor, and the showroom had the appearance of an ordinary shop. There was nothing to indicate that the fittings would be sold only to firms supplied by electricity.

In cross-examination, Mr. DANCKWERTS suggested that the stock of telephone and bell material was for the Corporation's own public building, but Mr. Smith replied that there would be then no reason to have them in the showroom. Mr. Smith admitted that the Corporation might have a large number of public buildings for which such goods would be required, but he stated that he had taken out a list of goods supplied to other departments by the Electricity Department (supplied at 33⅓ per cent. profit), but this was not sufficient to account for the large stock of material. He admitted that the workhouse, although technically under a different authority to the Leicester Corporation, might be maintained by the same ratepayers. During the course of Mr. Tweedie Smith's examination, large scale plans of the Borough were examined by the witness, the judge, and council on both sides to ascertain whether certain houses were only or partly within or entirely outside the borough boundary.

Mr. I. J. FOX was next called, and stated in reply to Mr. M. N. Drucquer, on behalf of the plaintiffs, that his residence, Manor House, was outside the Borough of Leicester, and that he pays rent to the Middleton Union in respect of it, and not to the Corporation of Leicester. In December, 1904, his house had been installed with electric light by the Corporation, and he produced the account which he had paid for it. Since 1904 all the repairs to his installation had been done by the Corporation, and any additional fittings that might have been obtained were obtained from the Corporation. In cross-examination by Mr. Danckwerts he said that he was still a consumer, and did not wish to cease to be one, and was supplied also with gas and water by the Leicester Corporation.

Mr. R. I. CRAWFORD, Managing Clerk to Messrs. Turner & Co., solicitors for the plaintiffs, gave an account of a visit by him to the Corporation showrooms at Leicester, and stated how he had bought a lamp for 1s. at the showrooms, and was not asked by the assistant whether he was a ratepayer or not. He also asked for a Leclanché battery, but the assistant said there were none in stock, but offered to procure one.

Mr. JOHN CHARLES UTLEY, at whose suit this action is brought, said that he was sorry to say that he was a ratepayer to the Leicester Corporation. In cross-examination by Mr. Danckwerts he said that his business was that of an electrical engineer, and he did wiring work and erected lightning conductors. He paid rates in respect of two premises of rateable value of about £20 and £11 respectively, and his turnover last year was about £1,200. He was finding a portion of the money for this action, but when asked how much, he said he had not got the bill in yet. Mr. Danckwerts produced an advertisement from a local paper which stated that Mr. Utley was contractor to the Leicester Corporation. Mr. Utley admitted that this was so but said that it was not for wiring but for lightning conductors.

On the Court resuming on Tuesday, the first witness was a youth, who stated that he had purchased some electrical material at the Corporation showroom. In cross-examination it appeared that he was in the employ of a local electrical contractor, by whom he had been sent to the showroom for this purpose, and

Digitized by Google

it was elicited that the contractor was a consumer on the Corporation mains.

After evidence had been given by Mr. Squires, honorary solicitor to the Leicester branch of the Electrical Contractors' Association, Mr. S H. Webb, an electrical engineer and contractor at Leicester (and chairman of the Leicester branch of the Electrical Contractors' Association), said that he had, at the time, seen the Corporation carrying out the electric wiring of Messrs. Smith, Faire & Co.'s installation, the private electric plant previously referred to, which is a suction-gas plant.

Mr. WATHES also gave evidence to the effect that he had been engaged in work on Messrs. Smith, Faire & Co.'s premises, and had seen the electric wires being fitted by the Corporation.

Mr. LEONARD G. TATE, Secretary of the Electrical Contractors' Association (Incorporated), said he had been electrical engineer and contractor since 1892, and explained to the judge the method of connecting up the mains and services, and the position of the main fuses, main switch, meter, &c. He said that installation business was recognised as a separate business, and the supply of electrical energy as a business by itself. He was cross-examined by Mr. Danckwerts as to whether the Electrical Contractors' Association was bearing the cost of the present action. He explained that individual members of the Association, as contractors, had promised to provide funds for the present case. He also said that the biggest gas companies in the United Kingdom, including the Gas Light & Coke Co., were sub-letting installation work to contractors. Asked by Mr. Danckwerts whether a large number of Corporations were not carrying out wiring work themselves, he said that there were about a dozen Corporations who were doing it, and about forty who had powers.

Mr. W. R. RAWLINGS, an electrical contractor and also on the Wiring Rules Committee of the Institution of Electrical Engineers, explained further the arrangement of the connections between the service cable and the consumer's installation. He stated that he had been in practice for twenty years, and that the installation business was recognised as a separate and distinct business to that of supplying electrical energy. Asked in cross-examination by Mr. Danckwerts if the cut-outs were inserted on the consumer's premises for the purpose of safety, he said that this was so.

This closed the case for the plaintiffs.

Mr. DRUCQUER then addressed the Court on behalf of the plaintiffs. He contended that the Corporation were restricted to the wiring which was necessary in order that the consumers might obtain a supply, and that a distinction was made throughout the Provisional Order as to what the supply authority should do and the consumer should do. He pointed out that a number of clauses in the Electric Lighting Acts were copied from the clauses of the Gas Works Act of 1847, but that Section 13 of this latter Act was deliberately omitted, a section which gave express powers to the undertakers to supply the consumer with pipes, burners, meters, and lamps, and to repair them.

Mr. DANCKWERTS then opened the case for the defence, and expressed the view that the words "necessary and incidental" in Section 10 of the Electric Lighting Act of 1882 quoted above should read "necessary *or* incidental." He gave precedents in which it had been held that "and" could be read as "or" in Acts of Parliament if the context proved that this was the correct sense, and argued that, as what is necessary cannot be incidental, and what is merely incidental cannot be deemed necessary, the words "necessary and incidental" obviously meant "necessary or incidental." In his view Section 10 gave power to wire houses and supply fittings to consumers, as these were incidental to the supply of electricity. Dealing with the alleged sales by the Corporation, he said that, to begin with, the Corporation had not supplied anybody with telephones or tele phone wire. The stock of these was for use for their own purposes in their own buildings. In the case of bells, these were not supplied unless they were to be operated by means of electricity supplied by the Corporation, and he did not pretend that they were entitled to supply them in any other case. It had happened, however, that, when they were wiring houses, the owners sometimes had wanted the bells and telephones to be fitted by the Corporation workmen also, and it had been done "as a favour." Eighteen months ago, however, Mr. Alfred Colson, who was engineer and manager to the Gas and Electricity Department, had given orders that this should be stopped. The circumstances in connection with Messrs. Smith, Faire & Co.'s installation were as follows: At the time that the firm wanted electricity, the Corporation were not yet in a position to supply them from their mains. They, therefore, wired the consumers' premises for connecting provisionally to the consumers' own dynamo with the idea of their being ultimately transferred to the Corporation mains. Referring to the other premises alleged to be outside the Corporation area, Mr. Danckwerts stated that with one exception these premises were partly in and partly outside the area.

Mr. JAMES SWINBURNE, F.R.S., was then examined as the first witness for the defence, and explained the principles of the electric circuit. In reply to questions, he said that electricity was supplied at a certain pressure, and the lamps had to be suitable for this pressure. He was asked to explain the different effects of a leak in the case of gas and electricity, and pointed out that whereas a leakage of gas in consumers' premises did not affect the gas company, as the gas leaking away merely passed through the consumers' meters and the leakage did not affect other consumers, a leak in the consumers' installation, on the other hand, was prejudicial to the supply undertaker as it might affect the supply to the whole system. It was, therefore, advantageous to supply undertakers to know that the electrical wiring and fittings should be well done, as, of course, they would be enabled to do if they had supplied them themselves. In cross-examination by Mr. Cassel, Mr. Swinburne admitted that there was a Board of Trade regulation which, in such a case, would protect the supply undertaker, as they could refuse to supply if the wiring were not well done. He was also questioned as to drop of pressure in the installation, and agreed with Mr. Cassel that the Board of Trade regulations provided that the pressure, which had to be kept constant, should be tested at the consumers' terminals, and that the undertakers were not responsible for drop of pressure within the consumers' installation.

This concluded the proceedings on Tuesday. The case for the defence was resumed yesterday (Wednesday), and was still proceeding when we went to press.

ANNUAL MEETING OF THE ELECTRICAL CONTRACTORS' ASSOCIATION

THE Electrical Contractors' Association (Incorporated) could hardly have had finer weather for their visit to the northern capital on Monday and Tuesday. Needless to say, many members took the opportunity of spending the week-end in Edinburgh or its vicinity, whilst the London party combined pleasure with business in travelling by sea. Business commenced at an early hour on Monday, when the Central Board met at the Caledonian Station Hotel, Edinburgh. This meeting was followed immediately by the annual general meeting, which lasted till 6 p.m., so that, with a brief interval for lunch, the combined meetings lasted all day.

Mr. Harland Bowden's election to the presidency for the forthcoming year evoked universal approval. A resolution was passed making Past Presidents *ex officio* members of the Central Board for one year after their year of office, the object being to secure continuity of policy.

A great deal of time was occupied in the discussion of the various oppositions to municipal trading schemes which the Association has in hand. In view of the fact that the Leicester Corporation case was actually before the court at the time the meeting was being held, it was decided that no further reports should be issued before that case was decided.

The representatives of the various sections reported in detail upon the work done in their respective districts, and all showed encouraging signs of progress. Mr. Martin (Scottish Section) was able to report that not a single subscription was in arrear, and he spoke for some time about the steps which were being taken to prevent manufacturers advertising as their own work done by contractors. For the Northern Section, Mr. Shaw told of the enthusiasm that was being thrown into the propagandist work, modestly making little of his own share. For the Midland Section the most important matter brought up by Mr. Brown was the arrangement arrived at with the Borough Engineer, by which (subject to the authority of the Central Board) the Association would guarantee the proper carrying out of all work placed in the hands of its members. Mr. Brown presented agreements which the Hon. Solicitor to the Section had prepared with a view to carrying out this arrangement, and asked for the authority of the Board to proceed. A long discussion ensued, and it was generally agreed as being most desirable that the Association as a whole should guarantee the work of its members. The difficulty of putting this into effect without incurring financial risk for the completion of unfinished contracts in the event of the failure of a member, was pointed out. Mr. Marryat considered that the proposal resolved itself simply into a question of insurance, for which those members guaranteed should be willing to pay a premium, and that from the collection of these premiums a fund might be constituted from which losses could be paid. It was finally resolved to refer the whole question to a committee for consideration and report, and this committee was duly elected.

The Treasurer was able to report a considerable reduction in the deficit on the Central Board accounts, as compared with last year, and further pointed out that, if the balance in hand with the various branches were taken into account, there was no deficit at all. The balance-sheet and auditors' report were submitted and adopted. A motion to enable the Central Board to collect subscriptions direct from the members instead of through the medium of the branch and section was negatived.

The most important matter brought before the general meeting was contained in a most able address by Mr. W. R. Rawlings (London), in which he advocated an amalgamation of interests, such as are now represented by the various organisations of the consulting engineers, station engineers, manufac-

Digitized by Google

turers, cable makers, and the E.C.A. He referred by way of illustration to the extraordinary success of the Society of Motor Car Manufacturers and Traders, in which all branches of the trade are represented, with the result that conditions of unsatisfactory trading, such as exist in the electrical industry, are unknown, and the society has a bank balance of £33,000, after making a most liberal expenditure in many directions conducive to the welfare of the industry as a whole. Mr. Rawlings's address was received with enthusiasm, and a committee was at once formed to see what steps could be taken to bring the scheme into being.

The annual dinner was held at the same hotel in the evening, when the company was joined by Mr. Gibson, President of the Surveyors' Association; Mr. Berry, President of the National Electrical Manufacturers' Association; and other visitors. The retiring President, Mr. William Finlay, who, it will be remembered, has been obliged under doctor's orders to abandon all business for some time past, was nevertheless able to take the chair for the first half of the evening.

The dinner was excellent, and the haggis proved a great success. Mr. Gibson proposed "The Association," referring to the excellent effect upon a trade which always results from the getting together of its members; it was "better for the man who pays, better for the man who squares the work up, and better for the contractor," that such a body as the E.C.A. should exist and prosper. Mr. Harland Bowden, in his reply, referred to the work done during the day, and to the promising outlook for the future.

Mr. Wright (Glasgow) proposed the health of "The Manufacturers and Kindred Associations" in felicitous terms, "fully believing and hoping," he said, "that by this time next year there will be no kindred associations, because all will be united into one harmonious whole." Mr. Berry (Manufacturers' Association) replied in a most witty speech, and congratulated the Association upon the many virtues and graces of its new President.

Tuesday was occupied by the Scottish Section entertaining the visitors.

LOCAL NOTES

ACTON: *The Electricity Undertaking.*—At the meeting of the Council on Friday it was decided to appoint a deputation to interview the Metropolitan Electric Supply Co., with a view to making the best terms possible with regard to the electricity undertaking. An amendment that notice be given to the company to terminate the present agreement was defeated.

ARGENTINE: *Tube Railways.*—The plans submitted by Messrs. Otto Franke & Co. relative to the construction of an underground electric railway, which will run from the border of the Riachuelo, by way of the Avenida Vélez Sársfield, Entre Ríos and Callao to the Retiro station, and through the Calle Brasil to the Plaza Constitución, thence effecting a connection with the lines at the Buenos Aires and La Plata harbours, have been approved.

BATH: *Electricity Accounts.*—The electricity accounts for last year show a deficit of about £1,400. This is attributed to decreased revenue caused by the use of metal filament lamps.

BELFAST: *Electricity Accounts.*—The Electricity Department for the year to March 31st shows a net profit of £11,040, of which £5,000 is to be handed over to relief of rates.

BLACKBURN: *Electricity Accounts.*—The accounts for last year show a profit of £1,388, after meeting capital charges and transferring £2,000 to depreciation. The number of units generated was 4,535,680, an increase of 111,413 over the previous year.

BOURNEMOUTH: *Conduit System to be Abandoned.*—At the meeting of the Corporation last week, the report of the tramways manager in favour of abandoning the conduit system in Bournemouth was adopted. The approval of the Board of Trade will be necessary before the change can be effected.

BURY: *Electricity Accounts.*—The annual report shows a slight decrease in the consumption of lighting, but a considerable increase for heating and power. The generating costs have been reduced by 12 per cent. from last year's figure of 0·577d. The final surplus was £3,569. Considerable saving in wages has been obtained since the adoption of automatic voltage regulation.

Tramway Accounts.—The tramway accounts for last year show a net profit of £2,635, of which £2,500 has been carried to reserve and depreciation.

CARLISLE: *Extension of Electric Lighting Area.*—The Corporation are applying for a Provisional Order, extending the area for electric supply.

COLCHESTER: *Electricity Accounts.*—There was a net profit of £414 upon the electricity undertaking for last year, against £247 in the previous year. The sum of £200 has been transferred to relief of rates, and £214 added to depreciation fund.

CROYDON: *Tramway Accounts.*—The accounts for the past year show a surplus of £7,005, which has been carried to reserve and renewals account.

DOVER: *Extension of Supply.*—The Council has decided to extend their mains to Alkham at a cost of £250, provided that sufficient consumers can be found to meet the capital charges.

DUDLEY: *Electricity Accounts.*—There was a deficit of £600 on the electricity undertaking last year. The chief factor in this loss has been an increase in the sum necessary for repayment of loans.

DUNDEE: *New Electrical Laboratory.*—The new Peters Laboratory of Electrical Engineering will be opened in October.

EASTBOURNE: *Electricity Accounts.*—There was a net profit of £2,200 upon the electricity undertaking for last year, which is an improvement of £262 compared with the previous year. The number of units sold for power purposes increased by 14 per cent., and there are now 117 motors installed, aggregating 311 h.p. No less than 74 of these motors are on hire for the Corporation. In his report, Mr. J. K. Brydges, the Borough Electrical Engineer, states that the increasing use of the showroom and inquiry office has produced excellent results, especially as regards connections to the mains in Hamnden Park. The total costs for the year were 1·92d., against 1·98d. in the previous twelve months.

EAST HAM: *Electricity Supply.*—Wanstead Urban District Council have written stating that they cannot see their way to give permission to the East Ham Council to supply electricity under Section 6 of the Electric Lighting Act, 1909, to premises belonging to the West Ham Guardians situated within Wanstead District. The Town Clerk of East Ham is to take the necessary steps to obtain the consent of the Board of Trade to a supply of current being given to the premises named.

FINCHLEY: *Electricity Accounts.*—After meeting capital charges the electricity accounts for last year show a net profit of £577, which is to be carried forward.

FROME: *Transfer of Electricity Works.*—The Council have passed a resolution in favour of transferring the Electricity Works to Messrs. Edmundson's Electricity Corporation.

KING'S LYNN: *Electricity Accounts.*—The electricity accounts for last year show a net profit of £858. The committee recommend that £200 be carried to meters account, and the remainder carried forward.

LEIGH: *Electricity Accounts.*—The accounts of the Electricity Department for last year show a net profit of £112, against £350 in the previous year. The output increased by 5·2 per cent., which is considered satisfactory in view of the very unsettled state of trade during the past twelve months.

LINCOLN: *Electricity and Tramway Accounts.*—The accounts of the electricity undertaking for the past year show a net profit of £2,503. On the tramways, there was a loss of £44.

MIRFIELD: *Increased Charges for Supply.*—A recommendation of a special sub-committee that the price of electricity be increased from 4½d. to 6d. per unit for lighting, in view of the general use of metal filament lamps, has been agreed to by the Council.

LONDON: *Woolwich.*—The Borough Council have given permission to the West Ham Corporation to supply electricity to the Port of London Authority in the North Woolwich area on condition of a payment of £40 to Woolwich.

MARYLEBONE: *Wiring.*—The General Purposes Committee report having considered an estimate from the Electricity Department for the maintenance of the Town Hall electrical installation. The Committee has decided to have the work done on the basis of cost price, plus 10 per cent. for supervision. The Public Health Committee have accepted an estimate of £50 from the Electricity Department for re-wiring and overhauling the electric light installations at four conveniences, and also for re-wiring and overhauling the installation at the mortuary.

MARKET HARBOROUGH: *Electric Lighting.*—The Council's electric lighting Provisional Order expires this month, and the Board of Trade have intimated that they will not be prepared to grant an extension of time.

NORTHAMPTON: *Tramway Extension.*—The proposal of the Tramways Committee to extend tramways to Farcotton has been adopted by the Corporation. Parliamentary powers have yet to be obtained.

NORTH BERWICK: *Electric Supply.*—Messrs. Crompton & Co. have submitted an electric supply scheme to the Council which is now under discussion. The Council are offered the option of purchasing the undertaking at the end of twelve years.

ROSYTH: *Fire at the Power Station.*—A serious fire broke out at the Rosyth Naval Base on Saturday, and the contractors' power station, which contains generating plant driven by suction gas producers, was practically destroyed. Damage was done to the extent of some thousands of pounds, and the progress of the work will be seriously interrupted.

SOUTH AFRICA: *Power Scheme.*—It is stated that a proposal by Messrs. Harper Bros. & Co. for the establishment of a power station on the Kroonstad coal mines is under consideration. Power is to be transmitted to Kimberley, Koffyfontein,

Digitized by Google

Jagersfontein, Bloemfontein, and Kroonstad for mining and other general purposes.

SWEDEN: *New Water Power Scheme.*—The proposal to establish an electric power station at the Porjus waterfall and electrification of the State frontier railway in the north of Sweden has been agreed to by the Government. The estimated cost of the scheme is £1,194,500.

WARRINGTON: *Electricity Accounts.*—There was a net profit of £1,691 on the working of the electricity undertaking for last year, against a loss of £943 in the previous year. After writing off various small sums, a balance of £938 has been placed to reserve fund, which now amounts to £9,099.

The total works costs, not including capital charges, work out at 0·656d. per unit sold, as against 0·774d. for the previous year.

Tramway Accounts.—The net profit on the tramways undertaking last year was £2,750, compared with £2,370 in the previous year. The sum of £1,000 has been transferred to relief of rates, and the balance placed to reserve fund, which now stands at £8,437.

WEYMOUTH: *Electricity Accounts.*—The cost of coal per unit for the year was reduced from 0·60d. per unit to 0·145d.

WOLVERHAMPTON: *Tramway Accounts.*—After meeting capital charges, the tramway accounts for last year allow of £3,855 being transferred to renewals, and £1,037 to reserve. There has been some reduction in traffic receipts due to adverse weather, and the operating expenses were 6·423d. per car mile, an increase of 0·049d. over the previous year. This is attributed mainly to extra repairs on the permanent way and the Lorrain equipment.

WORCESTER: *Water Power Plant.*—Mr. C. M. Shaw, the Borough Electrical Engineer, has been granted permission to visit America to inspect water-power systems. Mr. Shaw will pay his own expenses.

YORK: *Completion of Tramways.*—Two new sections of the Corporation tramways were opened on Thursday. These complete the system, although some work has yet to be done upon one of the bridges.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BATLEY.—The Council require a battery and automatic reversible traction booster, and one battery charging booster. Particulars from the Borough Electrical Engineer, and tenders by the 28th inst.

BELFAST.—The Harbour Commissioners require a steam generating set. Particulars from the Harbour Engineer, and tenders by the 22nd inst.

CHATHAM.—Application is to be made to the Local Government Board for a loan of £3,500 for extension of mains and services.

CLACTON.—The Council require 440 yards of armoured twin 7/18 V.B. cable.

COVENTRY.—A Local Government Board inquiry has been held concerning a loan of £54,200 for electrical extensions.

CROMPTON.—The District Council invite tenders for electrical plant at their new sewage works. Particulars from Messrs. J. P. Wilkinson & Son, 301 Cathedral Street, Manchester, and tenders to the Clerk by June 30th.

DEWSBURY.—The Electricity Committee have decided to instal a mixed pressure turbine, the cost of which will be defrayed out of revenue.

HEREFORD.—A Local Government Board inquiry was made last week in respect of a loan of £3,000 for electric lighting purposes.

LEITH.—Extensions to the generating plant are contemplated. The Electricity Committee are undecided whether to instal a reciprocating engine or turbine.

LONDON: *Fulham.*—Alterations to sub-stations to meet the requirements of the regulations under the Factory and Workshop Act, &c., are to be carried out at a total cost of £823.

NEWPORT (Mon.).—An inquiry was held on Thursday concerning a loan of £31,255 for electrical extensions. This application is the result of the Corporation acting upon the main suggestion put forward in the report of Mr. C. P. Sparks, who recently investigated the undertaking, and suggested a centralisation of the generating plant.

NUNEATON.—A Local Government Board inquiry has been held concerning a loan of £4,804, for electric lighting purposes.

ROME.—Tenders are required for the supply of three-phase cable, insulators, generating and sub-station plant, and line material, by the Commissione Consultative dei Tramvia Elettrici Municipali, Piazza S.S. Apostoli, 49.

ST. ANNE'S-ON-SEA.—An enquiry has been held into an application for a loan of £3,000 for extensions at the electricity works.

ST. HELENS.—An inquiry was held last week concerning a loan of £10,230 for extensions to the electricity undertaking. These extensions have been rendered necessary by the increase in the demand for power purposes.

SHEFFIELD.—An inquiry was held last week concerning a loan of £78,207 for extensions at the Neepsend power station. It is proposed to duplicate the Neepsend plant. Owing to the illness of Mr. S. E. Fedden, engineer and manager of the electricity undertaking, his evidence was taken at his home. The present capacity of the plant is 11,000 kw., and the maximum demand last winter was 6,980 kw. During the coming winter the demand is expected to reach 8,500 kw.

Mains are to be extended at an estimated cost of £490.

STRETFORD.—Mains are to be extended to supply current to 140 houses and some shops off Chester Road and Warwick Road, Old Trafford.

TONBRIDGE.—The Council require a Lancashire boiler, an extension to economiser, and pipe work. Particulars from the Electrical Engineer, and tenders by July 1st.

WALSALL.—Mains are to be extended along Green Lane, Birchills, at a cost of £65.

WARRINGTON.—An inquiry was held last week concerning a loan of £7,420 for extensions at the Electricity Works.

WEST BROMWICH.—Extensions to the generating and distributing plant at a cost of £11,386 are contemplated.

WEDNESBURY.—The sanction of the Local Government has been obtained for a loan of £2,858 for extensions. Application is to be made for a further loan of £4,600 for a gas-driven generating set.

Miscellaneous

BIRMINGHAM.—The Electricity Department invite tenders by June 30th for general stores, including electrical accessories. Particulars from the City Electrical Engineer and Manager.

CHILE.—Tenders are being invited for the conversion to electric traction of the sections of the Chilian State railways from Valparaiso to Santiago and Los Andes, and will be received at the Ministerio de Obras Publicas up to July 15th.

ITALY.—Tenders are invited by the Commissione Consultative dei Tramvia Elettrici Municipali, Piazza S.S. Apostoli, 49, Rome, for the supply of 50,000 metres of three-phase cable, 30,000 insulators, supplies for the equipment of generating and transformer stations, alternators, transformers, water turbines, &c., and about 4,000 insulators to withstand 30,000 volts. No date is given for the receipt of tenders, which, it is stated, are open to international competition.

MANCHESTER.—The Electricity Department require meters, service cables, motors, and motor-starters. Particulars from the Secretary, Electricity Department, Town Hall, and tenders by June 22nd.

MOROCCO.—It is stated that tenders are to be invited for the installation of both telephone equipments and electric light services in various towns.

NOTTINGHAM.—The Tramways Committee require 400 tons of steel rails of British standard section No. 4. Particulars from the City Engineer, and tenders by July 4th.

RAWTENSTALL.—The Corporation invite tenders for the erection of a tramway along Burnley Road East. Particulars from the Borough Engineer and Borough Electrical Engineer, and tenders by July 1st.

SHEFFIELD.—The tramway track, in a portion of Attercliffe Road, is to be relaid at an estimated cost of £4,700. Points and crossings are required at the Shoreham Street depôt.

TURKEY.—Tenders are invited by the Ministère Impérial Ottoman des Travaux Publics, Constantinople, up to November 10th next, for a tramway scheme for Constantinople. A copy of the specification (in French) may be seen at 73 Basinghall Street, London.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

S.W.—Extensions of South-Western Polytechnic, Chelsea (£14,000), for the Governors.

S.E.—New Cross Branch Library, Deptford (£4,500). Builder, F. J. Gorham, Point Hill, Greenwich.

Bioscope Theatre, Eric Street, Mile End Road, E., for C. D. Cox.

Conversion of buildings into rink, rear of Spray Street, Plumstead. Architects, Church, Quick & Whincop, William Street, Woolwich.

Small hall, Newington Public Baths (£175). Builders, John Marsland & Son, York Street, Walworth, S.E.

E.C.—Markets, Charterhouse Street (£17,185). Builders, E. C. & J. Keay, Ltd., 47 Victoria Street, S.W.

PROVINCES.

BARROW-IN-FURNESS. — Woodwork centre (£2,347). Builder, H Britton, Barrow.

Digitized by Google

BEXHILL.—School (£5,000). Secretary, T. Wilson, Education Committee, Bexhill Town Council.

CREWE.—Convent and school, Nantwich Road (£6,134). Architect, Hy. T. Sandy, Stafford. Builder, C. W. Davenport, Warrington.

CROYDON.—Additions, Borough Hospital (£9,831). Builder, Thos. Wm. Moss, Rayleigh.

EASTBOURNE.—Extensions, motor-bus depôt, Roselands (£3,305). Builder, F. W. Allcock, Eastbourne.

EAST GRINSTEAD.—Council offices (£5,000). W. E. Woollam, surveyor, East Grinstead Urban District Council.

HORNSEY.—The Education Committee has decided to invite tenders for the electric lighting of the Stroud Green School.

HULL.—Library. H. Hirst, City Architect, Hull.

ILFORD.—"Homes of Rest," South Park (£1,245). Architect, A. C. Russell, 13 Basinghall Street, E.C.

KINGSTOWN.—Library (£4,000). Surveyor, Kingstown Urban District Council.

LEIGH-ON-SEA.—Infectious Diseases Hospital. J. W. Leversedge, architect.

LOCHMABEN.—Addition, public school (£1,400). Architect, J. Gladstone, Lockerbie.

RAMSEY.—Police station and court (£2,498). Builders, Thackray & Co., Huntingdon.

READING.—Additions, workhouse (£6,770). W. Roland Howell, architect, Reading. Builder, McC. E. Fitt, 118 Oxford Road.

SOUTHAMPTON.—School, French Street. C. L. Crowther, engineer, High Street.

SWANSEA.—Club premises (£5,500). Builder, G. Davies, Paxton Yard, Oystermouth Road.

TORQUAY.—Municipal buildings (£28,869). Builders, R. Wilkins & Sons, Bristol.

WALSALL.—Sub-station, Darwell Street (£1,150). Builders, J. & F. Wootton.

Alterations and extensions, Birchills Tramway Depôt (£2,000). Tramways Manager, Walsall.

WEDNESBURY.—Schools, Holyhead Road (£15,385). J. Summershill & J. O. G. Jellyman, Ltd., builders.

WESTON-SUPER-MARE.—Adaptation of premises, Anstree Gardens, into a working men's club. Builder, C. Addicott, Locking Road.

TENDERS RECEIVED AND ACCEPTED

BLACKPOOL.—The tender of the British Thomson-Houston Co., Ltd., for high-tension switchgear at the new electricity sub-station at South Shore has been accepted.

CROYDON.—The Town Council has accepted the tender of Johnson & Phillips, Ltd., at £349, for electric lighting, call bells, &c., for the hospital extension.

DUBLIN.—The Corporation has accepted the tender of Messrs. Fletcher and Phillipson, Dublin (£1,273) for the electric lighting of the new Technical School, Bolton Street, Dublin. Eight other tenders were received, ranging up to £2,368.

DUNDEE.—The tender of a local contractor has been accepted at £130 for wiring the new part of the public baths.

EASTBOURNE.—Tenders for a twelve months' supply of electricity meters have been received from the following:—The Electrical Co., Ltd., Siemens Bros.' Dynamo Works Co., Ltd., British Thomson-Houston Co., Ltd., the British Westinghouse Co., Ltd. (accepted), Bat Meter Co., Ltd., Aron Electricity Meter, Ltd., Ferranti, Ltd.

EDMONTON.—The following tenders for an electric light and power installation at the Edmonton Union have been accepted:—Electric motors and accessories for laundry equipment, Messrs. G. Harland, Bowden & Co., £240 (E.C.C. motors); electric lift motors and fan, Messrs. R. Waygood & Co., Ltd., £293.

LLANDUDNO.—The contract for replating the storage battery has been placed with the Chloride Electrical Storage Co., Ltd.

LONDON: *London County Council.*—The tender of Messrs. Hurst, Nelson & Co., for 39 double-deck car bodies and 40 trucks for £14,040 and £4,980 respectively has been accepted.

NUNEATON.—The tender of Messrs. Callender's Cable & Construction Co., for cable at £144, has been accepted.

SHEFFIELD.—The Council have accepted the tender of the Electric Supply Department, at £45, for a 10 h.p. motor and wiring at the Baths. The Electric Supply Department is also to wire the new lending library in Surrey Street, and provide lamps and fittings at an estimated cost of £81.

SOUTHAMPTON.—The tender of the Electric Construction Co., Ltd., for the supply of a 300 kw. motor-alternator, has been accepted (£598); the tender for a 300 kw. two-phase alternator has been referred to the Borough Electrical Engineer to report upon; the tender of Messrs. Dick, Kerr & Co., for a generator with Cole, Marchant & Morley engine and condensing plant, has been accepted (£8,131); and that of Messrs. Babcock & Wilcox for a water-tube boiler (£1,590).

WALSALL.—The Town Council has accepted the tender of F. & J. Wootton, at £1,150, for erecting a sub-station in Darwall Street.

WEST HAM.—The Council have accepted the tender of Messrs. Babcock & Wilcox for water-tube boilers with superheater and mechanical stoker (£1,650), and the second alternative tender of the British Westinghouse Co. (£1,835) for condensing plant.

OSRAM·LAMPS

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—Western Telegraph Co.: a third quarterly interim dividend of 3s. per share, free of tax, for the year to June 30th, 1910, has been declared.—Sao Paulo Tramway, Light & Power Co.: a quarterly dividend of 2½ per cent. has been declared.

Havana Electric Railway Co.—3 per cent. on the ordinary shares.

Provincial Tramways Co., interim dividend 8d. per share, payable 27th inst. India Rubber, Gutta Percha Telegraph Works Co., interim dividend 2½ per cent., payable July 1st.

Aron Electricity Meter, Ltd., 9 per cent. on the preference shares, making 12 per cent. for the year. Canadian General Electric Co., 1¾ per cent. for the three months ending June 30th. Notting Hill Electric Lighting Co., 3 per cent. and a bonus of 1½ per cent., payable July 1st.

COMPANIES STRUCK OFF REGISTER.—The names of the following companies have been struck off the register:—Booston Accumulator Syndicate, Birmingham Electrobus Co., Electric Canal Haulage Co., Lancashire and Yorkshire Electrobus Co., Liverpool Electrobus Co., Manchester Electrobus Co., Nottingham Electrobus Co., Nottingham Gas and Electric Fittings Co., Provincial Electrobus Co., Scottish Electrobus Co., and Tramways Development Co.

CITY OF BIRMINGHAM TRAMWAYS CO.—At a special meeting last Thursday a resolution that £4 per share be paid to the holders of fully paid ordinary shares by way of reduction of capital was confirmed.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 to £58 10s. per ton (last week, £59 to £59 5s.).

AGENCY.—The Kramax Manufacturing Co., 12 Cambridge Lane, Glasgow, inform us that they are no longer represented by the Electric Lamp Lock Co., as selling agents for their "Elleo" invisible lamp lock. All orders and inquiries, therefore, should now be addressed direct.

We are informed that Mr. E. C. Seear (16 and 17 Devonshire Square, E.C.) has been appointed sole agent for the United Kingdom for the F. W. Bosch Co., of Lüdensheid, manufacturers of electrical apparatus, in succession to Mr. A. Branckmann. Mr. Seear was formerly manager of Mr. Branckmann's electrical department.

INDUSTRIAL SITES.—A pamphlet has been issued by the Great Central Railway Co., calling attention to the advantages of North-East Lincolnshire as an industrial centre, offering favourable opportunities for the establishment of successful enterprises. The completion of the Company's new dock at Immingham has greatly added to the resources of that portion of England, and firms contemplating the erection of new works in the provinces would do well not to overlook this district.

EHRHARDT & SEHMER GAS ENGINES.—Mr. R. B. Slacke, a director of the Key Engineering Co., Ltd., has joined the staff of Messrs. Galloways, Limited. It will be remembered that Messrs. Galloways are now manufacturing the Ehrhardt & Sehmer gas engine at their works at Manchester. The Key Engineering Co. will continue to act as agents for the Ehrhardt & Sehmer gas engine, and will be prepared, as hitherto, to quote alternatively for these engines made at either the English or German works.

DISSOLUTIONS OF PARTNERSHIP.—Messrs. J. Cecil McFerran & F. O. Rooper, electrical engineers, 26 Victoria Street, London, have dissolved partnership.

The partnership between E. Downer and J. M. Connare (Connare, Downer & Co., electricians, 110 High Street, Watford) has been dissolved by an order of the County Court of Hertfordshire. Creditors are to submit their claims before June 25th to H. M. Turner, Court House, King Street, Watford.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—A meeting of creditors of the Typewriting Telegraph Corporation, Ltd., will be held at 72 Bishopsgate Street, London, today (Thursday), at 12 noon.

J. P. Donlevy, consulting electrician, 125 Tulse Hill, London, S.W., has been adjudicated bankrupt. The public examination will be held on July 14th, at 11 a.m., at Bankruptcy Buildings, Carey Street, London.

Digitized by Google

A first and final dividend of 4½d. in the £1 is to be paid in the bankruptcy of J. G. Cunnington, electrical engineer and contractor, 7 Great Newport Street, London. The dividend will be paid on and after June 14th at 28 King Street, Cheapside.

The last day for receiving proofs in the bankruptcy of J. Platt and R. Bleasdale, electrical engineers, Victoria Square, Bolton, is June 28th. Mr. Harold Mather, 10 Acresfield, Bolton, is the trustee.

J. A. Frederick, electrician, 258 Hungerford Road, Crewe, has been adjudicated bankrupt. The public examination will be held at 11.15 a.m. on July 22nd at the Court House, Edleston Road, Crewe.

FOSTER ARC LAMP & ENGINEERING CO.—The company have informed us that they have just heard that a very large consignment of metal filament lamps sent abroad has been received without a single lamp broken. They have introduced a train lighting lamp specially constructed to withstand vibration.

APPOINTMENTS AND PERSONAL NOTES

Mr. Henry M. Sayers has been appointed Resident Engineer in Santos, Brazil, to the City of Santos Improvements Co., Ltd., and sailed to take up his new position on Friday, June 10th, by the R.M.S.P. Co.'s s.s. "Amazon." Mr. Sayers will have in his charge the water supply, electric light and power supply, electric and mule tramways, and the steam railway undertakings owned and operated by the City of Santos Improvements Co.

Mr. F. T. Olding, traffic superintendent on the Bournemouth Corporation tramways, has resigned, having obtained an appointment in Queensland. A successor has been advertised for, and fifty applications have been received. The salary is £175, rising to £200 per annum.

An assistant engineer is required by the Watford Council at a salary of £120 per annum, rising by £10 every two years to £170 per annum. Applications by June 20th to the chief electrical engineer.

Walsall Town Council has appointed Mr. S. Whitehouse substation superintendent to the electricity undertaking, at £2 per week, rising by annual increments to £2 10s.

Mr. R. E. Middleton has been re-appointed Lecturer in Municipal Engineering at University College, London, for the session 1910-11.

Applications are invited for the position of Secretary in the Birmingham Corporation Electricity Supply Department. (See an advertisement on another page.)

COMPANIES' MEETINGS AND REPORTS

BIRMINGHAM & MIDLAND TRAMWAYS CO.—The net profit for 1909, after meeting debenture interest and preference dividends, amounted to £4,524, and a dividend of 1¼ per cent. is recommended on the ordinary shares. The company has been granted a lease of the Dudley tramways for 30 years, and an arbitrator has been appointed to determine the price which the company should pay the Corporation, during the first five years of the lease, for electrical energy. In order to meet the increasing demands from power and lighting consumers, an additional 1,000 kw. generating set has been installed, whilst a 2,000 kw. turbo-generating set is under construction.

BRITISH ELECTRIC TRACTION CO.—The profit for 1909, after reserving £12,500 for depreciation of undertakings worked by the Company, &c., and transferring £10,398 (profit on sales of investments), to reserve, is £150,760, including the amount brought forward. After meeting debenture interest and a dividend of 3s. per share on the preference shares, and transferring £15,000 to general reserve, there is a balance of £14,067, which is carried forward. The full dividend on the 6 per cent. cumulative preference shares is now paid up to June 30th, 1908. The reserve fund now stands at £633,582, whilst to meet depreciation the associated companies have made various reserves, which amount to £1,175,997. After referring to the restricted scope for tramway enterprise in this country, the report mentions that the directors have recently met with some success in their endeavours to secure participations in electrical enterprises abroad, and they are giving their attention to several other promising schemes.

R. WAYGOOD & CO.—The report for the year ended March 31st gives the available balance, including £3,159 brought forward, as £23,755. After deductions for directors' fees and preference dividends, writing £1,090 to experimental work, and placing £1,000 to reserve, a dividend at the rate of 7 per cent. is recommended, making, with the interim dividend, 6 per cent. for the year. £2,665 is carried forward.

M & M VULCANISED FIBRE.
MOSSES & MITCHELL, 122 & 124, GOLDEN LANE, LONDON, E.C.

Electrical Distributing Networks and Transmission Lines.

BY Professor Alfred Hay, D.Sc., M.I.E.E.

The author's aim is to provide the reader with a simple and concise account of the theoretical and practical aspects of a subject of great importance to every electrical engineer, but one which has not, perhaps, received as much attention as it deserves.

The theoretical portions of the book are sufficiently simple to appeal to those whose duty it is to maintain conducting networks in efficient working condition, and the book is characterised throughout by the greatest possible simplicity of treatment.

LIST OF CHAPTERS
Showing the Scope of the Work.

Systems of Distribution. Comparison of Different Systems. Types of Cables. Insulation of Cables. Capacity of Self-Inductance of Conductors. Voltage Drop and Current Distribution in Network. Determination of Cross-Sections of Conductors. Insulation Resistance of Network. Potentials and Fault Resistances of Mains. Alternating-Current Networks. Localisation of Faults. Electrical Resonance and Surges. Overhead Lines. Methods of Laying Underground Mains. Joints and Joint-Boxes. Protective Devices. Exhaustive Index.

The Work contains over 100 Diagrams and Illustrations.

Demy 8vo, cloth, gilt, 10/6 net.

Prospectuses free from Cassell & Co., LTD., La Belle Sauvage, London, E.C.

SOME EARLY OPINIONS OF THE PRESS.

"Professor Hay's skilful and clearly-expounded treatise will accordingly be the more welcome because it breaks new ground in this field of instruction. A well systematised and lucid treatise, plentifully equipped with illustrative diagrams, it forms a valuable addition to the technical literature of electrical engineering."—*The Scotsman.*

"Professor Alfred Hay has already proved that he possesses an attribute somewhat rare among engineers—the knack of making complicated technical matter enjoyable reading. The 108 diagrams are of great assistance to the reader; they have been well selected."—*The Birmingham Post.*

"The book covers the ground very completely, beginning with systems of distribution, and passing on to deal with cables, conductors, voltage, insulation, and a large number of other topics comprised within the scope of the title, concluding with 'Protective Devices.' There are many diagrams, the book is well indexed, and the author has achieved, in dealing with his subject, what seems to be the greatest possible simplicity of treatment."—*The Glasgow Herald.*

CORRESPONDENCE

HIGH-PRESSURE SWITCHGEAR.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—With reference to the highly interesting and instructive review of the development of high-pressure switchgear in this country, given by Mr. H. W. Clothier recently at Newcastle, and reprinted in your issue of the 9th inst., I would like to remind Mr. Clothier in the interest of historical accuracy that the oil switches installed at Bankside in 1894 were not the first of their class. So far back as 1891 Mr. G. W. Partridge designed switches of this type, the first of which were made and put into use on the L. E. S. Co.'s system in 1892. As far as I know, these were the first oil switches constructed for commercial use on high-pressure alternating-current systems.

Arising out of Mr. Clothier's remarks on the present position of the oil circuit-breaker, one is inclined to wonder whether finality has really been reached in this direction. The oil circuit-breaker undoubtedly constitutes to-day a highly important factor in the successful operation of large power plants; in fact, it is not too much to say that without it such supply undertakings as that of the Newcastle Co. could not be commercially exploited. But it appears likely that the time is coming when, due to the great increase in the size of power stations and of generating units, it may be necessary to look at the problem of machine and feeder protection from another point of view. On the one hand, the direct and indirect capital expenditure on switchgear becomes a matter of increasing importance as soon as a power station capacity of 50,000 kw. has been passed; on the other hand, as soon as we are called upon to deal with undertakings having double and treble this plant capacity, it is doubtful whether we can rely *solely* upon the oil circuit-breaker—or upon any circuit-breaker—to deal satisfactorily with the enormous surges of energy that may arise from time to time.

As far as this country is concerned, it is likely to be many years before even our largest undertakings (with one or two exceptions) will call for plant capacities exceeding 100,000 kw., but in other countries station outputs corresponding to this are already rapidly approaching realisation, and the size of the generating unit now in demand for such undertakings is continually increasing. A broad survey of the largest electric power plants in the different countries (but excluding the U.S.A.) shows that the size of the generating unit called for is rapidly increasing; roughly speaking, in 1904 it was 3,000 kw.; in 1906, 5,000 kw.; in 1908, 7,500 kw.; and to-day it is 10,000–12,000 kw. Further, due to the characteristics of turbine-driven stations, to considerations of capital cost, and to the large developments which are in sight in connection with electrochemical and electrometallurgical work, it is highly probable that in five years' time the demand will be for units of 20,000 kw., and even larger. And when it is considered that, whether such plants are placed in one or several stations, parallel operation throughout is an economic necessity, that the *momentary* short-circuit current of turbo-generators of present-day design is usually twenty to thirty times the full-load current, and that circumstances may arise in which a station full of such machines may be pouring current through a short circuit which has to be cleared instantaneously, the question arises: What will be the cost of circuit-breakers and the buildings to contain them capable of dealing with such terribly severe conditions? And, again, can we be sure, no matter how much we spend on protective devices, that the continuity of the supply will be preserved under these conditions?

Careful study of this question indicates that the capital cost of such protective gear (and the buildings for it), which will with reasonable certainty afford the same degree of security to the class of generating station referred to above as is readily obtainable at the present time with a station of 20,000–30,000 kw. capacity, will turn out to be prohibitive. And it cannot be doubted that the attainment of the essential degree of security at moderate cost for the case of these very large power stations of the near future will prove to be a very difficult matter.

It is possible that the solution will be found to lie in the adoption (or partial adoption) of a type of generator that will have different characteristics from those of the present-day synchronous machine, rather than in further improvements to oil circuit-breakers. Thus, if it was not for its high exciting current and inability to carry a wattless current, the asynchronous generator might well come into consideration in this connection, for, running in parallel with synchronous units, it ceases to generate under short circuit, which in reality is what is wanted. Although at present this type of machine is nearly uncommercial (at any rate, in large sizes), it may be that it will undergo development before long—perhaps on the lines indicated by Heyland in 1903. If the disadvantages at present inherent to this type of generator could be even partially eliminated, its sphere of usefulness would be greatly extended, and the use of such machines would furnish, at any rate, a partial solution to the problem referred to above.

A question in connection with high-pressure protective devices which was not touched upon by Mr. Clothier in his Paper (perhaps because it does not often arise in an acute form in this country) is that of providing really effective means for taking care of the pressure surges which arise from a change of circuit conditions. Such surges, as is well known, can easily attain destructive dimensions on these very large high-pressure systems, and although by the use of electrolytic and other forms of arresters they can be taken care of to a certain extent, finality is far from having been reached in this direction.

Yours faithfully,

Caxton House, Westminster, S.W., June 13th, 1910. A. C. EBORALL.

OSRAM LAMP WORKS, LTD., *v.* G. M. BODDY & CO.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Reference has been made in the Press to the pending litigation between ourselves and the Osram Lamp Works, Ltd.

In the interests of the trade generally we are writing to request you to insert this letter in your next issue, inviting anyone attacked to put themselves at once into communication with our solicitor, Mr. Jonathan E. Harris, of 95 Leadenhall Street, E.C., who is defending the action on our behalf with the approval of the Messrs. Philips Metallic Glow Lamp Works, Ltd.

15 Gray's Inn Road, W.C., June 13th, 1910. Yours obediently, G. M. BODDY & Co.

Electric Driving of Reversing Rolling Mills.—An application was made in the Appeal Court on Saturday by the Donnersmarckhütte Oberschlesische Eisen- und Kohlenwerke Akt. Ges. of Zabcze, Germany, for leave to appeal against the judgment of Mr. Justice Parker in March, which decided that the Ilgner patent for electrically driving reversing rolling mills, is invalid. The Electric Construction Co. were alleged to have infringed this patent in a plant erected by them at the works of Sir Alfred Hickman, Ltd. The time for giving notice of appeal expired on May 28th, but it was not given until May 30th. Mr. Bonsfield strongly opposed the application, on the ground that the whole action had been unduly delayed from the start. It was first commenced 2½ years ago, and all through the plaintiffs had been as dilatory as possible. Should the application now be allowed, he asked that there should be no further question of damages or injunction in regard to the Hickman installation. He had no objection to the validity of the patent being fought out. The Court allowed the application, and as the notice to appeal had already been made, no terms were put upon the plaintiffs.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 9th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

11,242/09. **Wireless Telegraphy.** A. W. SHARMAN. This patent covers the master switch for controlling the receiving and transmitting circuits in wireless telegraph stations, referred to in the description of the Helsby system in ELECTRICAL ENGINEERING, May 26th, p. 342. Five claims, four figures.

12,139/09. **Tramway Controller.** W. E. IRELAND. Cases have occurred in which the reversing drum of one controller has not been left in its "off" position, with the result that when operating from the other end of the car, the electromagnetic brakes have failed to act on account of the connections being affected by the other controller. To avoid this, additional contacts are provided on the reversing drums so that any displacement from the "off" position will close a pilot circuit and warn the driver by an audible or visible signal. Two claims, three figures.

12,146/09. **Cable Expansion Joint.** C. VERNIER. To obviate troubles due to expansion of cables or subsidence of the ground in which they are laid, expansion joints are provided at suitable intervals. The alignment of the cable is maintained by one or more sliding sleeves, while the joint is bridged by symmetrically arranged, flexible, braided conductors. Five claims, nine figures.

14,790/09. **Interlocked Switch Cover.** C. H. PEARSON. To prevent the cover of an iron-clad switch from being removed when the switch is closed, a roller or pin projecting from the switch-handle rides over a projecting rib cast on the cover. When the switch is opened, the pin is clear of the projection, and the cover can be lifted. One claim, two figures.

15,193/09. **Metal Filaments.** SOCIÉTÉ FRANÇAISE D'INCANDESCENCE PAR LE GAZ (SYSTÈM AUER). Filaments of vanadium, niobium, or titanium are prepared by reduction from the oxides of these metals. The filaments are squirted from a paste of the oxides mixed with powdered metal and lamp black, and, after being heated to make them conduct, are raised to a red heat in a suitable atmosphere to decarbonise them. Finally, the decarbonised filaments are reduced at a white heat (about 1,800° C.) in an atmosphere of hydrogen and ammonia to the metallic state. The decarbonising and the final reduction can be performed in one treatment by the addition of a small percentage of an oxidising gas to the hydrogen and ammonia. One claim.

17,106/09. **Railless Traction System.** E. M. MUNRO and THE RAILLESS ELECTRIC TRACTION CO., LTD. A crossing or junction for the three-wire overhead system described in ELECTRICAL ENGINEERING, Vol. V., p. 855, comprises a movable switch or "gate," which joins up the sections of overhead conductors at places where two lines meet or cross. The overhead conductors cross at different levels, and the "gate" is removed automatically to allow the trolley head to pass without breaking the continuity of the central negative conductor. Three claims, six figures.

18,808/09. **Strengthening Tungsten Filaments.** C. H. WEBER. In order to render tungsten filaments less brittle, a small percentage of tellurium (a brittle metal vaporising at 1,400° C.) is added to the tungsten mixture before squirting. After the usual baking process, the filaments are heated in a reducing atmosphere at a red heat for a considerable time in order that the tellurium may melt and alloy with the tungsten. Finally, the filament is raised to a bright red heat, and most of the tellurium is vaporised. About 0·05 per cent. tellurium is present in the finished filament, however, and this is about the amount which gives the toughest alloy. Selenium can be used instead of tellurium. Two other processes for obtaining the required alloy are described in the specification. It is stated that blackening is not accelerated, as the tellurium is retained by the filament, and the carbon content of such filaments is less than that of ordinary tungsten filaments. Seven claims.

26,845/09. **Electric Furnaces.** A. HELFENSTEIN. A series of arc furnaces are constructed side by side with the upper electrodes suspended in the upper shafts, and a long solid conducting structure at the base forming a common lower electrode. The working hearths are independent. Two claims, four figures.

Opposition to Grant of Patents

19,847/08. **Metal Filament Lamps.** GLÜHLAMPENWERK ANKER-GES. This patent, relating to the use of phospham for preventing blackening, has been refused as the result of opposition on the part of the "Z" Electric Lamp Manufacturing Co., Ltd. Further particulars will be found on page 390 of this issue.

11,060/09. **Arc Furnace for Treating Gases.** G. W. JOHNSON (*Chemische Fabrik Griesheim-Elektron*). Opposition has been entered to the grant of this patent. It is for a furnace in which a long horizontal arc is drawn out, the gases being blown down on to the arc at a sharp angle from a series of slits arranged above it in the manner of louvres. The gases are thus supplied all along the arc, and owing to the pressure of the gas jets the arc is kept horizontal in spite of the great length.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: LONSDALE BROS., LTD. [Insulating material] 13,693/09; LAVY [Telephone insulators] 19,834/09; MONNIER [Distributing box for multiple core cables] 23,937/09.

Dynamos, Motors and Transformers: BRITISH THOMSON-HOUSTON CO. and KINGWELL [Motor control] 12,047/09; DEUTSCHE ELEKTRO-SPARLICHT GES. [Transformers] 17,761/09.

Electric Ignition: BROOKS and ALSTON. 15,803/09.

Incandescent Lamps: JAHODA [Metal filaments] 15,496/09.

Switchgear, Fuses and Fittings: HAMILTON [Combined section-insulator and switch for trolley wires] 12,442/09; WEEKES [Switch fuses] 12,585/09; DAMEY [Lamp lock] 21,109/09; BOULT (*Felten & Guilleaume Lahmeyerwerke A.-G.*) [Control gear for electrically-driven machine tools] 27,026/09; SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens Schuckertwerke Ges.*) [Cartridge fuses] 29,087/09; LUNDBERG [Switches] 3,927/10.

Telephony and Telegraphy: SHARMAN [Production of harmonics in oscillations for selective wireless telegraphy] 12,790/09; TATTERSALL [Telephone mouthpieces] 16,520/09; AITKEN and BRITISH INSULATED & HELSBY CABLES, LTD. [Telephone switching apparatus] 2,057/10; GOTTSCHALK [Telephone transmitters] 4,446/10; JUILLAC [Wireless antennæ mast] 7,082/10.

Traction: COLEMAN [Signalling] 12,795/08; HAMILTON [Section insulator] 12,442/09; CARBONI and TIRONI [Signalling] 22,866/09.

Miscellaneous: COWIE [Mariner's compass] 11,940/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Propulsion of ships] 19,872/09; MASCHINENFABRIK OERLIKON [Electro-hydraulic press] 24,784/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distribution Systems, &c.: NEW [Transformer system] 8,563/10.

Dynamos, &c.: GARCIN, 11,356/10.

Electric Ignition: R. BOSCH [Magnetos] 6,653/10.

Electrometallurgy, &c.: KAISER [Production of Nitrogen oxides] 12,229/10; AKTIEBOLAGET ELEKTROMETALL [Electric smelting furnaces] 12,430/10.

Instruments, &c.: COMPAGNIE POUR LA FABRICATION DES COMPTEURS ET MATERIALS D'USINES À GAZ [Recording galvanometers] 6,782/10.

Telegraphy, &c.: FESSENDEN [Wireless signalling] 11,903/10; DROOP [Telephone relays] 12,408/10.

Traction: BUTLER & ROCKMAN [Suspension railway] 12,124-5/10.

Miscellaneous: ALLGEMEINE ELEKTRICITÄTS GES. [Air compressors] 12,338/10.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: J. STEVENSON [Lowering gear] 4,390/03.

Dynamos, &c.: B. G. LAMME [Single-phase commutator motors] 27,705/04.

Switchgear, &c.: H. H. LEIGH (*F. J. Sprague*) [Control of lift motors] 4,549/98; H. LEITNER AND R. N. LUCAS [Automatic reversing switch for train-lighting dynamos] 4,732/03; G. SPERRYN AND W. H. WOOD [Tumbler switch] 4,451/04; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Control of electric hoists and overhead runways] 3,919/05.

Telephony, &c.: T. SLOPER AND J. H. PARSONS [Intercommunication telephone system] 4,793/02.

Traction: P. HALLOT [Brakes] 4,664/04; A. E. TANNER AND E. A. CLAREMONT [Automatic signalling] 4,164/05.

Miscellaneous: J. HOGARTH [Electrical treatment of flour and other foodstuffs] 4,695/97; H. J. DOWSING [Radiant heat baths] 4,736/97; J. BARR AND R. ANDERSON [Electrically-driven reciprocating saw] 4,709/03; C. D. ABEL (*Siemens and Halske A.-G.*) [Springs, &c., of alloys of tantalum] 3,691-1A/05; R. LOMAX [Automatic electrically-driven stoker] 3,867/05; MAY-OATWAY FIRE APPLIANCES, LTD. [Fire alarm] 4,073/05.

SUMMARY

A portrait and biography of Mr. John Christie, who has been elected President of the Incorporated Municipal Electrical Association for the coming year, appear on page 407.

A motor generator for meter testing is described on page 407.

Some pyrometers having several interesting features have been introduced. Various patterns are supplied to suit different conditions and with different ranges. An alarm device, and an instrument for taking a continuous record of one or more pyrometers are described. (Page 408.)

Mr. Justice Neville delivered judgment on Monday in the action in which the wiring contractors of Leicester are endeavouring to obtain an injunction to restrain the Leicester Corporation from carrying out electric wiring and selling electric fittings. He held that the Corporation were not entitled to wire premises and sell fittings, and granted the injunction asked for, subject to an appeal, which must be set down within three weeks. (Page 407.)

A submarine telegraph cable 3,144 miles in length, and said to be the second longest in the world, has been opened for service between Ascension and Buenos Ayres. (Page 410.)

We give a few details of the central car repairing depot of the L.C.C. tramways, which was recently visited by the Society of Engineers. (Page 377.)

We conclude our Report of the Proceedings at the I.M.E.A. meeting last week. On Wednesday Mr. F. A. Newington described the exhaust steam turbines and the special condensing plant using sewage effluent as circulating water at the McDonald Road Station, Edinburgh. This Paper, an abstract of which was given in our last issue, was discussed, together with one by Mr. Ashton Bremner, describing the mixed pressure turbo-generator at Burslem. More than one speaker in the discussion questioned whether better ultimate economy could not often be obtained by the entire replacement of old by new plant rather than by the addition of exhaust steam turbines, and Mr. Shawfield went so far as to say that even the capital cost would be less. Mention was also made of the ways in which early commutator troubles on continuous-current turbo-generators had been overcome.—On Thursday there were two discussions. The first of these was on the advantages of Continuous Records of Costs and of Steam Consumption, and was opened by Mr. G. Wilkinson, who insisted particularly on the undesirability of feeding into the economisers at too high a temperature, and explained that he obtained greater efficiency by returning the condensed water from the steam traps, &c., direct to the boiler instead of taking it to the feed tank. Mr. Shawfield, who followed, gave an instance to show the practical value of continuous tests. He was not in favour of returning the condensed water direct to the boiler, as he preferred to measure it, and thus obtain an indication as to

Digitized by Google

defects in the lagging or arrangement of the steam pipes. He had, however, not had good experience with CO_2 recorders. Mr. Ayton, Mr. Wordingham, and Mr. Ruddle all thought that there was danger of the taking of records in stations being overdone. Mr. Ayton's experience with CO_2 recorders coincided with that of Mr. Shawfield, and he explained the probable cause of the trouble and the remedy he was trying. He also described the methods he used to prevent air leakages into the furnaces and flues, a point which had also been raised by Mr. Wilkinson. Mr. Newington described some tests he had made on the moisture in coal; Mr. Lea related some interesting experiences which had led him to evolve his water recorder, and complained that plant-running was not taught at engineering colleges; and, finally, Mr. Rowland expressed a high opinion of the CO_2 recorder, which instrument, he said, had led to economies at Stretford.—The next discussion was on Cheapening the Costs of Mains and Services, which was opened by Mr. S. J. Watson and Mr. Ayton. In this some valuable figures were given as to the cost of service connections. In Glasgow they average £4 6s. 6d., but a few years ago they were actually £7. Some speakers explained how they had been successful in reducing the cost of services; an extended use of looping in was also advocated, and one suggested that it would be worth while in some cases to lay the services at the same time as the mains.—At the annual meeting, on Friday, Mr. J. Christie, Chief Electrical Engineer to the Brighton Corporation, was elected President for the coming year, with Messrs. Wilkinson (Harrogate) and Shawfield (Wolverhampton) as senior and junior Vice-Presidents respectively. The annual report of the Council did not raise any contentious points, but a discussion followed upon the desirability of municipalities throughout the country having powers to wire premises and hire out apparatus. Eventually a recommendation was passed that the Council should consider what steps can be taken to promote a Bill for this purpose. Among other matters discussed were a new method of electing Members of Council, the establishment of a Central Information Bureau, and the appointment of Special Committees at the annual conventions to discuss points of limited interest. Mr. C. H. Wordingham has been elected an honorary member of the Association. (Pages 411-419.)

AMONG the specifications published by the Patent Office on Thursday last was one by W. G. Hamilton for a combined section insulator and switch for trolley wires, to obviate the necessity for switch-boxes and cables other than the feeders.—An ignition coil, in which the magnetic flux is reversed by reversing the direction of the current flow in the primary, is described by B. Brooks and F. H. Alston.—The British Thomson-Houston Co. have protected a system of electrical propulsion for ships, in which low-pressure low-speed turbines on the propeller shafts assist the electro motors at high speeds. The low-pressure turbines are driven by exhaust steam from the turbo-alternator sets supplying the motors.—A method of control for heavy planing machines, in which the motor is slowed down electrically before reversing, is described by the Felten Guilleaume-Lahmeyerwerke A.G.—A patent by S. Johnston for wiring fittings is opposed.—T. A. Carver has applied for an extension of the life of two patents relating to electrically-controlled jacquards for looms. (Page 418.)

A COMPACT switch for regulating the brilliancy of incandescent lamps or for controlling fans and other motor-driven apparatus is described. (Page 420.)

THE Board of Trade have refused the Lancashire Electric Power Co. permission to supply electrical energy in Radcliffe in competition with the Council. At the same time they express the opinion that the Council is not affording facilities for a cheap supply, and urges them to take the necessary steps to do so. (Page 421.)

THE report of Mr. G. S. Ram, H.M. Electrical Inspector of Factories, for the year 1909, shows that out of 447 accidents in electricity works, 90 were due to electrical causes, and that of these only four were fatal. In fifty cases the accidents were caused by men cleaning or working near exposed H.-T. conductors. Mr. Ram makes some comments with regard to the interlocking of isolating switches in H.-T. stations, two accidents having been caused by opening these on load. Of 257 electrical accidents in factories, only eight were fatal. Many were due to the use of cheap switchgear and insufficiently protected flexible wires. (Page 421.)

THE adoption of trolley omnibuses is under consideration at Cardiff and Lowestoft.—The Bradford Tramway accounts show a net profit of £32,365 for the past year.—The Fleetwood Borough Electrical Engineer has been instructed to prepare estimates of the cost of superseding gas for street lighting.—Mr. C. H. Yeaman, of Hanley, has been recommended for the post of Electrical Engineer to the new County Borough of Stoke-on-Trent.—The estimated surplus on the L.C.C. tramways for 1910–11 is £244,182 after meeting capital charges. (Page 422.)

FURTHER plant is to be installed at Hampstead at an estimated cost of £6,600; Manchester Corporation require three-phase transformers and high- and low-tension switchgear; an electric lighting plant is required in the neighbourhood of Dublin. Loans are contemplated as follows: Gillingham (£3,500), Pembroke (£8,000), Portsmouth (£24,000), Rawtenstall (£11,000), Rochdale (£13,941). (Page 423.)

THE Aron Meter Co.'s accounts for last year show a net sum available of £27,667. In addition to the full dividend on the 6 per cent. preference shares, a further 9 per cent. is paid on account of arrears.—At the annual meeting of the British Electric Traction Co., last week, Sir Charles Rivers Wilson stated that there were indications of improvement in the immediate future. The profit on the last year's working of Marconi's Wireless Telegraph Co. was £11,432. (Page 424.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JUNE 23RD.

National Telephone Co.

7 for 7.30 p.m. Staff dinner at Trocadero Restaurant.

FRIDAY, JUNE 24TH.

Physical Society.

Visit to the National Physical Laboratory.

SATURDAY, JUNE 25TH.

Institution of Mining Electrical Engineers.

3.30 p.m. Notts and Derbyshire Branch. At University College, Nottingham. "The Adaptation of the Cascade Induction Motor for Mine and Quarry Work," by M. J. Williams-Ellis.

3.30 p.m. South Wales Branch. Visit to Treforest Power Station of the South Wales Electrical Power Distribution Co.

TUESDAY, JUNE 28TH.

Institution of Electrical Engineers.

9-11.30 p.m. Conversazione at Natural History Museum, Cromwell Road, London, S.W.

Telegraph Traffic and Movements of Cable Ships.—On the 15th inst. the cable between Gibraltar and Tangier was restored, while on the 18th inst. the cable between Souakim and Djedda was again working.—The c.s. *Minia*, of the Anglo-American Telegraph Co., which left port on April 26th, returned to Halifax, N.S., on May 3rd.—The Commercial Cable Co. has had considerable trouble with one of their short sections, the work occupying the c.s. *Mackay-Bennett* some considerable time. The vessel had to put into port once or twice, and finally finished the work on the 31st ult. It is also understood that some gear was lost.—The repairing steamer of the French Cable Co. did not leave port during the past month.—The *Robert C. Clowry*, of the Western Union Telegraph Co., is at Canso, where she arrived from the United States.—The c.s. *Colonia*, of the Telegraph Construction & Maintenance Co., has been employed on the laying of the new section between Weston-super-Mare and Waterville, for the Commercial Cable Co.

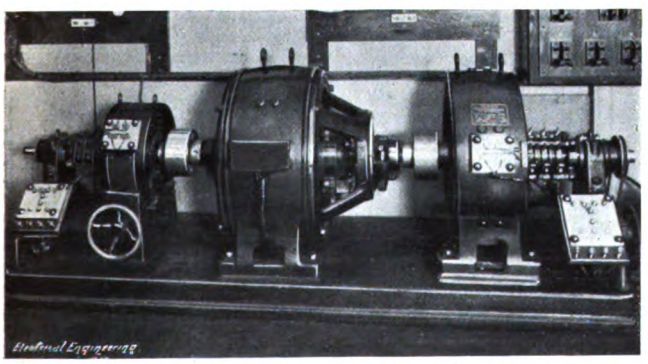
THE NEW I.M.E.A. PRESIDENT



MR. JOHN CHRISTIE, who has just been elected President of the Incorporated Municipal Electrical Association, is Engineer and Manager of the Brighton Corporation Electricity Works. He will be forty-two years of age next month, and is a native of Glasgow. His apprenticeship and early experience was as a marine engineer, and he started his electrical work at Messrs. Crompton's Works at Chelmsford. His first municipal job was as Second Engineer to the St. Pancras Electricity Works, in which situation he was for about a year, and, after a few months in the testing department of Messrs. Siemens Bros. & Co. at Woolwich, he proceeded to Glasgow as Second Engineer at the Corporation Electricity Works. Early in 1894 he was appointed Chief Electrical Engineer at the Londonderry Corporation Electricity Works, which at that time only supplied public lighting. He remained there for four years, and in 1898 he returned to Glasgow as Power-house Superintendent under Mr. W. A. Chamen, who was then City Electrical Engineer. He remained there 2½ years; but his work was not confined to the charge of the generating station, as he also assisted Mr. Chamen in superintending the installation of the plant at the Port Dundas Power Station, which was under erection during that period. In the summer of 1900 he was appointed Engineer and Manager to the Brighton Corporation Electricity Works when Mr. Arthur Wright retired from the position of Chief Engineer and started his practice as Consulting Engineer, retaining his association with the Corporation in that capacity. The Brighton electricity undertaking was then a far smaller one than it is now, but in June, 1906, the present new turbine power station at Southwick was opened by Mr. John Burns, and Mr. Christie has been responsible for its running and management. The success which he has achieved in the reorganisation of the electric supply in Brighton since the starting-up of the new works is well shown by the fact that last year there was a net profit of £6,251, largely due to the development of a large power load.

For many years Mr. Christie has taken the keenest interest in the affairs of the Incorporated Municipal Electrical Association, and although, owing to his retiring disposition, he has never been prevailed upon to read a Paper and has seldom spoken in discussions, yet his work upon the Council and the committees has been invaluable, and he is one of the most popular members of the Association.

A MOTOR-GENERATOR FOR METER TESTING

ONE of the latest additions to the electrical engineering laboratories at the Manchester School of Technology is a small motor-generator set for testing meters and carrying out experimental work. This set, which was manufactured by the British Westinghouse & Manufacturing Co., Ltd. (Trafford Park, Manchester), is illustrated in the accompanying figure. It consists of three machines rigidly coupled together on a combined bedplate, and is driven by a 13-h.p. D.-C. shunt-wound motor, suitable for operating on a 400-volt circuit. This motor is of the variable-speed type, and capable of running between speeds of 500 to 1,700 r.p.m., giving its rated output throughout this range.

MOTOR-GENERATOR SET FOR METER TESTING.

Two generators of the revolving-armature type are arranged one on each side of the motor. These have ratings of 1 to 5 kw. respectively, three-phase, 25 to 85 cycles, 100 to 340 volts at 500 to 1,700 r.p.m. Each machine is designed to give a sine-wave, and is fitted with six slip rings. The motor is fitted with a terminal board arranged for connecting the field coils in parallel, as they may occasionally have to be excited from a lower voltage than 400. The 1-kw. generator has its yoke machined on the outside, and fitted into a circular seat on the bedplate, and is arranged with a worm-gear for rotating the field, which enables this machine to be given a displacement of as much as 200 electrical degrees with respect to the 5-kw. generator. A gradual variation of phase adjustment is obtainable by this means while the set is running. This is necessary, as the phase has to be adjusted for each variation in current output, on account of the varying lag with a varying current in the armature. By this arrangement one is able to get from maximum lagging to maximum leading current. Terminals are also provided for making easy and rapid connection with the external circuit. Great care has been taken in specially balancing the set to avoid vibration and disturbance of the standardising instruments where the set is run. The engineering staff are carrying out a number of very interesting and valuable experiments on the effect of wave-form, &c., on the indications of induction type meters, in which this set is employed.

INDICATING AND RECORDING PYROMETERS

SOME new indicating and recording pyrometers, the manufacture of Messrs. Keiser & Schmidt, of Berlin, are being introduced into this country by Mr. H. I. Lewenz (6 Trinity Square, London, E.C.). These instruments have many new features of especial interest, and great accuracy and reliability is claimed for them. For temperatures up to 600° C., two thermo-couples in series of copper and constantan, or of iron and constantan (the latter have been found to retain their accuracy longer), are enclosed in a glass tube protected by a steel tube. A pyrometer of this type, suitable for recording or measuring the temperature of superheat in steam plant, is illustrated in Fig. 1. This pattern, but generally with a longer tube, is also used in chemical and gas works. The couples are connected to a millivoltmeter, calibrated to read in degrees Centigrade, or if necessary to a recording instrument. In order to obviate the error which occurs when the temperature of the cold junction (*i.e.*, the connection at the head of the pyrometer) is not at the same temperature as it was when the instrument was calibrated, a special compensating cable is employed. This contains four conductors of special metals; two connect one pole of each thermo-couple to the millivoltmeter, while the other two, connected to the other two poles of the couples, are joined together at their other ends, thus removing the cold junction to a place of comparatively constant temperature.

Fig. 1.—PYROMETER FOR SUPERHEATERS.

Pyrometers for steel and iron works, porcelain, glass, and pottery works, &c., for measuring the temperature of flue gases, or for use in electric furnaces where the temperature is not higher than 1,600° C., are constructed with couples of platinum and an alloy of platinum with 10 per cent. of rhodium. Great care is taken to ensure that the metals are pure in order to obtain high accuracy. The couples are either hung without any covering in the furnace or are enclosed in porcelain tubes. For glass works the couples are enclosed in a fireclay tube. Where the temperature does not exceed 1,200° C., the couples are placed in a double porcelain tube, protected by a steel covering. If the pyrometer is to be kept permanently at a high temperature, steel cannot be used, and a fireclay tube is employed.

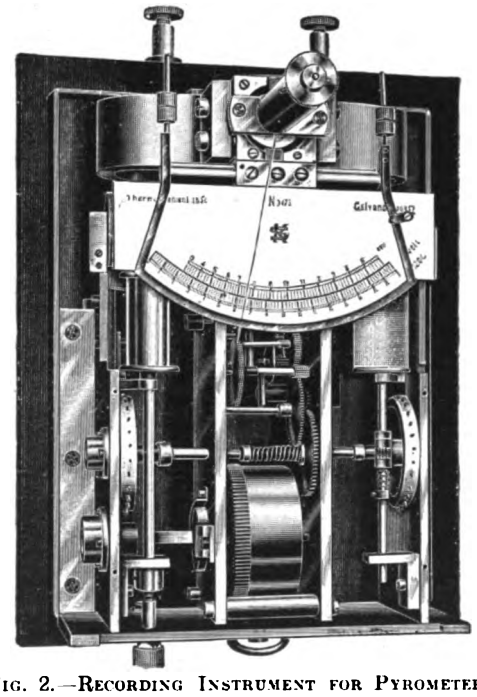

FIG. 2.—RECORDING INSTRUMENT FOR PYROMETERS.

Various patterns of indicating instruments are provided, including wall and portable patterns, and desk instruments for laboratory and workshop use. The laboratory instruments have steel filar suspension, and the workshop patterns jewelled suspension. A multiple-way switch can be employed where several pyrometers are connected to one indicating instrument. When it is desired to give a warning when the temperature exceeds a certain limit, a contact is placed at that point on the scale, and when the needle reaches this point, a relay circuit is closed and a bell or lamp indicates the fact. A disadvantage of this arrangement was that on lowering the temperature, the needle still remained in contact owing to "stiction." The following ingenious device prevents this. An auxiliary thermo-couple is placed in series with the millivoltmeter, but electrically opposed to the pyrometer thermo-couples, and is enclosed in a heating coil placed in series with the bell or lamp. When the bell or lamp operates, the coil heats up the couple and a powerful reverse current is sent through the millivoltmeter. This causes the needle to break contact. If the temperature of the pyrometer is not immediately reduced, intermittent signals will be given at intervals of about 30 seconds, as the needle will return to the contact directly the heating coil cools down.

A recording instrument for use with pyrometers of both classes is illustrated in Fig. 2. It consists of an eight-day clockwork with toothed wheels which unroll a strip of paper perforated at its edges. The teeth enter the perforations and prevent cornering. An ink ribbon travels across the paper strip. The needle of the instrument has a blunt point, and this is brought down at regular intervals on to the ink ribbon, by means of a stirrup operated by the clockwork, thus marking the paper. The electrical movement has a steel filar suspension. Where two or more curves are to be plotted by one instrument, the different pyrometers are connected to the instrument successively by means of a commutator, which also inserts suitable resistances, so as to displace the zeros of the various curves, preventing their overlapping.

These instruments can also be used for measuring and recording low temperatures down to 200° C. below zero; the iron-constantan couples are always used for this purpose. Finally, it may be mentioned that special pyrometers are constructed for measuring the temperature of the superheated steam of locomotives where superheat is employed. The Prussian State railways authorities have just completed a 15,000 mile test on one of these instruments, with satisfactory results.

The "Z" Metal Filament Lamp Patent.—In the Appeal Court on Saturday, a motion was made by the "Z" Electric Lamp Co. with reference to the forthcoming hearing of the appeal against Mr. Justice Parker's decision that Messrs. Marples, Leach & Co. (now Adnil Electric Co.) have infringed the "Z" Company's patent covering the use of phospham in metal filament lamps. The "Z" Company applied for security for the costs of the appeal, and Messrs. Marples, Leach & Co. were ordered to pay £200 into court within ten days in respect of these.

Photo-telegraphy.—We are informed that Mr. T. Thorne Baker has carried out some successful experiments with his system of photo-telegraphy between Boston and New York, and that tests will be made in September next with apparatus especially designed for the purpose between Chicago and New York. If these tests are successful, we understand that permanent stations will be set up in these cities for the purpose of transmission of news photographs for the *New York American*, which publishes in both Chicago and New York. Attempts will also be made to transmit photographs and drawings between San Francisco and New York, but the line disturbances in such long-distance work render accurate transmission very difficult.

American Light Railways Statistics.—The report of the U.S. Census Bureau on street railways, compiled from the census taken in 1907 shows that the total length of track for light railways, including all electrically-operated interban railways, and electric, horse, and steam tramways, was 34,403 miles in 1907, as against 22,577 in 1902, an increase for the whole of the United States of 52·4 per cent. Of this, 34,059 miles, or 99 per cent., was worked electrically. The total number of passenger cars in use was 83,641, and the number of passengers carried over 9½ billion. Some 830 power stations were in operation, with a total capacity of over 1,700,000 kw. The technical portion of the report, prepared by Mr. T. C. Martin, contains detail particulars and illustrations of the engineering equipment of various systems.

Burglar Alarm.—At the invitation of Mr. S. Lichtenfeld (300 Regent Street, London), we recently inspected a burglar alarm which he has patented. Spring contacts are placed under mats and carpets in suitable positions, and these are connected to a common relay across the lighting mains in series with a lamp. When a contact is made, the relay operates to release a clockwork mechanism which turns a rotary switch. This switch is placed in additional wires in the lighting circuit, so that it causes certain lamps of the house to light up independently of the local switches. Further, the lamps cannot be switched off except by returning the rotary switch to the original position. During the day, the relay circuit is broken by means of a special switch. Besides lighting the lamps, alarms can be sounded and warning signs outside the building illuminated to attract the police. The arrangement for switching on the lamps of the ordinary lighting circuit independently of the local switches is distinctly novel, but will entail further complications in the wiring. The advisability of having contacts under the carpets at the lighting pressure is questionable, however well they may be insulated, and there seems to be no reason why a battery would not be equally effective.

MUNICIPAL WIRING AT LEICESTER DECLARED ILLEGAL

IN our last issue we reported the first part of an important case that is being heard by Mr. Justice Neville in the Chancery Division of the High Court of Justice. The case started on Monday last week, and our previous report dealt with the first two days' proceedings. Judgment has now been given, and an injunction has been granted to restrain the Leicester Corporation, who work under a Provisional Order, from carrying out electric wiring and selling electric fittings, &c. During the first two days of the hearing, evidence of considerable interest was given, including proof of the sale of an electric lamp to a non-ratepayer, and the wiring of a private electrical installation outside the borough boundary. The Corporation contended that they were entitled to wire consumers' premises and to supply consumers with fittings under Section 10 of the Electric Lighting Act of 1882, which empowers them to "do all such acts and things as may be necessary and incidental to" the supply of electrical energy.

On resuming on Wednesday, evidence was called for the defence.

Mr. J. J. P. Barker said that he had had charge of the Corporation's Electrical Fittings Department for the last seven or eight years, and had been in the Corporation's employment for 36 years, having previously been in the Gas Fittings Department. During this time they had done wiring for people who did not take their supply from the Corporation, but it was a long time ago, and very seldom. Although they did not make a speciality of bell wiring, this had been done also at the same time as they did the electric light wiring, or when they had been called in for repair work. Now, however, they no longer carried out bell wiring, and when people asked for this class of work to be done, they referred them to a contractor. In reply to further questions he said that they had never put up any telephones or telephone wires, but the Corporation employees did the telephone work in the Corporation's buildings. In reply to some questions on the quality of work done, he stated that he had known cases in which consumers' fittings and wires were not perfect, and it was very important in his opinion that they should be perfect. If there was any failure of supply, the consumers would go to the Corporation.

In cross-examination the witness was first asked as to the appearance of the showroom, and said that it had a window like a shop window, and admitted that the fittings, &c., which were displayed in the showroom, included shaving brushes and "magic mirrors." He stated that the Corporation did not sell either cells for electric bells or the materials for charging them, and when invoices relating to this class of material were shown him he said that they might have done it in a few instances, but he knew nothing about it. They had put in electric fittings for Messrs. Smith, Faire & Co. for the amount of about £500 about fifteen years ago in the hope that some day this firm would take their supply from the Corporation, but they had not done so yet, and still ran their own installation. He said it had not been their practice to do anything on the premises of people not taking supply from the Corporation unless express permission or instructions were given by the late Mr. Colson.

Mr. Felix Cassel, K.C., for the plaintiffs, then replied on the whole case.

During the course of Mr. Cassel's speech, Mr. Justice Neville said that the word "supply" was used both in the Gas Acts and the Electric Lighting Acts, but, whereas in the former case the supply was deemed to terminate at the burner, and the company had the option of supplying the fittings, in the latter case the Acts did not refer to the fittings at all.

Mr. Cassel said that there was a further distinction between the Gas Acts and Electric Lighting Acts: in the former no mention was made of the consumers' terminals, whereas in the Electric Lighting Acts the supply was defined as being a supply to the consumers' terminals. Under the Electric Lighting Acts, the undertaker had no power to charge for anything except supply and for the meters. Finally, he submitted that even if the Judge should hold that the Corporation had power to do wiring on consumers' premises, they were not entitled to sell such things as motors, cooking utensils, shaving pots, and things of that sort.

The Judge said that if the wiring and fittings were "incidental" to the supply, these things would be also.

Mr. Cassel contended, however, that what the Corporation was doing was really keeping an ordinary shop, and that this was no part of their undertaking.

At the conclusion of Mr. Cassel's arguments, the Judge intimated that he would reserve judgment.

In delivering judgment on Monday, Mr. Justice Neville first expressed the opinion that the plaintiff had proved his allegations. The Corporation had claimed the right to supply wires and fittings under the powers of the Electric Lighting Act of 1882, and their Provisional Order. Section 10 of the Act of 1882 authorised the undertakers to do all such acts and things as might be necessary and incidental to the supply of electricity, and it seemed to him that there was a clear distinction between "supply" and "use." Section 18 of the Act of 1882 expressly negatived the right of the undertakers to prescribe any lamp, or to interfere with the use of electricity by consumers, and incidentally he mentioned that the analogy which had been made between the Acts relating to gas and those relating to electricity failed, for the Gas Works Clauses Act gave gas undertakings the right to prescribe burners. Section 18 of the Electric Lighting Act of 1882 plainly discriminated between the supply of electricity and its use, and gave the undertakers no authority with regard to the latter. The Corporation's Provisional Order interpreted "consumers' terminals" as meaning "the ends of the electric lines situate upon any consumer's premises, and belonging to him, at which the supply of energy is delivered from the service lines." The undertakers had power to charge for the supply of energy, and for meters and fittings, but for furnishing and laying lines they had no power to charge, except in special cases. By Clause 21 of the Provisional Order, however, they were bound to give a supply of energy on demand, and if the wiring of the house and the provision of fittings was part of the supply, they would be compelled to do it without remuneration, and he thought there was force in the argument of the plaintiff that this could not have been intended by the legislature. **In his opinion, "supply," within the meaning of the Act and Order was completed at the consumer's terminals. The installation of electricity and the provision of fittings was a separate business incidental to the use, but not to the supply of, energy. He thought the Corporation had misinterpreted their powers, and had been carrying on a business in excess of them.** The Electric Lighting Act of 1909 did not throw any light upon the meaning of "supply" in the Act of 1882. Section 16 of the Act of 1909 not having reference to any power given by the Act of 1882. The plaintiff was, therefore, entitled to the injunction asked for, and defendants must pay the costs of the action.

On the application of Mr. Danckwerts, K.C., a stay was granted, provided notice of appeal was given within three weeks.

Erratum:—By a clerical error, in our report last week, Mr. Tweedy Smith was referred to as Honorary Secretary of the Electrical Contractors' Association, instead of Honorary Solicitor to the Electrical Contractors' Association.

Induction Motor Design.—In a paper by R. E. Hellmund, published in Vol. 27 of the *Transactions* of the American Institute of Electrical Engineers (1908), the author described some graphical methods for the study of the main field in induction motors. A Paper by the same author describing similar methods for investigation of the zigzag and slot leakage fluxes and their effects has been accepted by the Council of the Institution of Electrical Engineers (London) for publication in the *Journal*. In an appendix to the Paper, the author gives a number of formulæ and curves deduced by the methods described, from which the values of the various leakages for any given motor can be estimated. An expression for the end-connection leakage is given, though, as the author points out, the exact calculation of this is almost impossible. The expression deduced for the total leakage is stated to have given results agreeing very closely with those found from test.

Magnetic Balance.—At a recent meeting of the Physical Society, a Paper describing the magnetic balance of MM. Curie and C. Cheneveau was read by Mr. A. C. Jolley. This balance is intended for the determination of the coefficient of specific magnetisation, susceptibility, and permeability of feebly paramagnetic and diamagnetic bodies. The body is suspended from one arm of a torsion balance, which measures the force exerted on the body when it is placed in the field of a permanent magnet. The balance is formed by a horizontal rod suspended by a fine platinum wire, and carrying at one end a hook, and at the other end a copper sector. The latter moves between the poles of an auxiliary magnet, and thus provides efficient damping. A second arm is provided upon which may be placed counterweights. The suspension carries a mirror, and the movements are read on a scale. A large circular permanent magnet is mounted so that the vertical gap may be made to describe a semicircle of radius equal to the length of the torsion arm. Experiments have been performed with various metals and alloys. Mr. Jolley mentioned that the balance would be useful for making sure that the metals used for making certain instruments were quite non-magnetic. It also indicated the presence of very slight impurities in copper better than a chemical test. Wood and ebonite had been found to be very magnetic, but the results were variable owing to the effects of tooling.

A NEW SUBMARINE CABLE

ON June 3rd a new cable was opened to service between Ascension and Buenos Ayres. This cable, which is the second longest in the world, was laid recently by the c.s. *Colonia*, of the Western Telegraph Co., Ltd., who have carried out all the engineering work connected with the laying of the cable. The total length of the cable is 3,144 miles, comprising one mile of heavy shore end, 188 miles of intermediate shore end, 78 miles of intermediate, and 2,877 miles of deep sea cable. The conductor weighs 700 lbs. and the insulation 360 lbs. per nautical mile. A maximum depth of 3,220 fathoms is reached. The underground land-line extensions consist of air-space and paper-insulated cables laid in conduits, and are 1·7 miles and 41 miles in length at Ascension and Buenos Ayres respectively. We are indebted to Mr. W. Judd for the above information.

CENTRAL CAR REPAIR DEPOT OF THE L.C.C. TRAMWAYS

A VISIT was paid recently by some members of the Society of Engineers to the central car repair depôt of the L.C.C. Tramways at Charlton, by kind invitation of Mr. A. L. C. Fell, chief officer of tramways.

The site of the depôt is at Woolwich Road, Charlton, on the south bank of the Thames, and is nearly seven acres in extent; rather more than one-half being at the present time occupied by buildings, while extension works are in progress.

The smiths' shop, 130 ft. by 34 ft., contains two 5 cwt. electrically-driven Massey pneumatic power hammers, a forging machine, a 10 cwt. drop hammer, one 6 ft. by 2 ft. 3 in. forging and annealing furnace, and 13 smiths' hearths. The machine shop, 143 ft. by 43 ft., is fitted with modern milling, slotting, screwing and drilling machines and lathes, and contains a 3-ton overhead travelling crane (3 motor type). In the wheel shop is a 150-ton wheel press, a tyre hearth, and special tyre-boring mills and tyre-turning lathes; while the truck-overhauling shop, 195 ft. long by 46 ft. wide, contains two 5-ton overhead travelling cranes, and has accommodation for 28 pairs of trucks. Other departments include the traverser-way, inspection shop, paint shop, tool room, small gallery (containing lathes, drilling machines, and small tools), large gallery (comprising the offices, testing room, plough shop, motor shop, controller shop, and other equipment), and the advertisement plant, which is a steam-heated drying apparatus for paper-slip advertisements.

There are ample stores, including the tool stores, having 1,270 bins, the finished part stores with 1,750 bins, and the general stores with 6,720 bins. The power supply is by three-phase high-tension current from Greenwich Generating Station to the transformer room, where it is transformed down to low-tension current at 220 volts, and distributed to sectional distribution fuse-boxes in the works.

The heavy tools are motor driven, while the ordinary and light tools are grouped and driven by motors. With the exception of traverse motors, all the motors are short-circuited rotor three-phase type. Lighting is effected by flame arcs throughout the smiths' shop, machine shop, truck shop, and galleries, and by incandescent lamps between car-ways in the paint and inspection shops.

Accumulator Cars on the Prussian State Railways.—A large number of these cars are now running on various sections of the Prussian State railways, and thirty-three further cars have been ordered this year. The design of the cars now in use was described in ELECTRICAL ENGINEERING, Vol. IV., p. 522. The new cars, of which eleven are now under construction by the Felten & Guilleaume-Lahmeyerwerke A.-G., will be slightly different. As before, they are double cars with the two units coupled back to back. Each unit will have three axles, however, instead of two, as it was found that the weight per axle was formerly too high. With three axles per unit, the weight per axle is less than 6 tons. The extra axles are to be placed at each end and under the accumulator tanks, where the greatest weight is. Further, all the new cars will be provided with electric, as well as compressed-air, brakes, whereas of the original cars only those by the F. & G.-L. A.-G. were so fitted. Applying both brakes simultaneously, these cars have been stopped from a speed of 35 miles per hour in a distance of only 115 yards. A third modification consists in the use of a time-element device in connection with the button on the driving handle. Should the driver release the button accidentally, the current will be cut off and the brake applied only after a few seconds. This will avoid the slowing down of the car due to accidental release, but will still ensure safety in the event of illness of the driver.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

MOTOR STARTERS.—A leaflet from George Ellisson (Victoria Works, 17 and 18 Warstone Lane, Birmingham), describes a series of fully enclosed face plate pattern star-delta starters for three-phase squirrel cage induction motors. These are constructed so that it is impossible to attain the running position without passing through the starting position; also the spring centre and retaining hook (provided even in the plain type) prevent the starter remaining in the starting position unless held there by the operator. They can be fitted with no-voltage and overload releases.

FANS.—We have received from the Electrical Co., Ltd. (122 Charing Cross Road, London, W.C.), a price list of this season's fans. Besides the usual patterns, shaft fans, oscillating bases, and speed regulators are listed.

FANS.—A new catalogue issued by the Electric & Ordnance Accessories Co., Ltd. (Aston, Birmingham), covers a number of types of small ventilating fans for desk, wall, ceiling, and porthole use. The cost of running a 12 in. Universal D.-C. fan for ten hours is stated to be less than 1½d. with current at 3d. per unit. Some particularly neat D.-C. ceiling fans for ships' saloons and railway carriages are listed.

TELEGRAPH AND TELEPHONE APPARATUS.—A new illustrated pamphlet issued by the British Insulated & Helsby Cables, Ltd. (Prescot, Lancashire) as a supplement to the firm's telegraph and telephone catalogues, gives prices and particulars of several pieces of telegraphic apparatus, including the Vyle polarised sounder, Mansbridge's self-sealing condensers, complete Simplex and Quadruplex telegraphic equipments, and several pieces of telephone apparatus. These latter include a new design of magneto table telephone, telephone cable heads, pole boxes, and testing pillars for underground cables.

FANS AND BLOWERS.—Messrs. Atkinson Bros. (Aire Place, Kirkstall Road, Leeds) have issued a new list covering various patterns of electrically-driven box-blade fans and blowers.

*Readers desiring copies of **catalogues** or pamphlets should apply to the firms in question, referring to the notice in "**Electrical Engineering.**"*

ELECTRICALLY-DRIVEN MACHINE TOOLS.—Two leaflets from Messrs. Atkinson Bros. (Aire Place, Kirkstall Road, Leeds) describe various patterns of self-contained electrically-driven sensitive drills and polishers. A hack saw, driven by a ⅓ h.p. motor, is also illustrated.

ELECTRIC DRIVING OF TEXTILE MACHINERY.—A pamphlet from the A.E.G. Electrical Co., Ltd. (121 Charing Cross Road, London, W.C.), deals with the application of electric drive to cotton spinning mills and weaving factories. A brief outline of the A.E.G. system of individual drive is given, together with a number of illustrations depicting the methods of meeting the requirements of the different classes of machinery.

Wireless Telegraph Detectors.—A Paper "On an Oscillation Detector Actuated Solely by Resistance-temperature Variations" was read before a recent meeting of the Physical Society by Dr. W. H. Eccles. Experiments were described in support of the author's hypothesis that in detectors constituted of a loose contact, the energy of the oscillatory current through the contact is transformed into heat at the contact and warms the matter there sufficiently to change its electrical resistance, and, consequently, the steady current through the indicating instrument. A detector of the so-called "crystal rectifier" type was used, from which, however, the possibility of thermoelectric effects had been eliminated. This detector consisted of a loose contact between two pieces of galena—a substance which according to the author's theory ought, by virtue of its large negative coefficient of change of resistance with temperature, to be a very efficient detector of electrical vibrations. The experimental curves obtained were, the steady current curve, the sensitiveness curve, and the power curve. The first has steadily applied E.M.F. as abscissæ, and current through the detector circuit as ordinates, and rises slowly at first, then quickly, and then slowly again; but if the circuit be arranged to have but little resistance other than that at the contact, the curve may possess a negative gradient at the point of inflexion. The sensitiveness curve has the E.M.F. applied to the detector as abscissæ, and the power passed to the indicating instrument as ordinates, the intensity of the electrical vibrations being of fixed amount. It is a curve which rises to a maximum near the point of greatest slope of the former curve, and thereafter descends slowly. The power curve has the power supplied to the detector in the form of electrical oscillations as abscissæ, with the power passed by the detector to the indicating instrument as ordinates, the steady E.M.F. applied to the detector being the best value. This curve is a straight line. The properties of this "crystal rectifier" are therefore just such as are logically deducible from the fundamental fact that the contact possesses a negative resistance-temperature coefficient.

FIFTEENTH ANNUAL CONVENTION OF THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION

ON Wednesday last week, the second day of the Convention, the members proceeded to Edinburgh in the morning, where a meeting was held at the Free Gardeners' Hall. The Rt. Hon. the Lord Provost of Edinburgh welcomed the Association, and in the course of a short speech, questioned the wisdom of continual changes in the conveners and chairmen of electricity committees. He hoped a policy of longer continuity of office would be adopted in the interests of the undertakings.

EXHAUST AND MIXED-PRESSURE TURBINES, AND CONDENSING PLANT.

A Paper by Mr. F. A. Newington describing the exhaust steam turbines and condensing plant at his McDonald Road Station, Edinburgh—in which sewage affluent is used as circulating water—was first read. This Paper was published, in slightly abbreviated form, in our last issue. Mr. Ashton Bremner (Chief Electrical Engineer, Burslem) followed with a Paper on "Extensions to Existing Electricity Supply Station by Means of Mixed-Pressure Turbines":—

At the beginning of his Paper, the author pointed out that it should always be the endeavour of an engineer when called upon to design and afterwards to manage a central station, to make sure that whilst copper in the mains is most liberally provided, the generating plant be installed of such capacity that even in the early days the plant will be efficient, and later, the same plant may be economically run on light loads such as at certain times will obtain, and further that extension may be easily and economically made. He outlined the gradual growth of the demand at Burslem, which led to his advising in 1908 that the extensions should take the form of a 600-kw. Belliss-Siemens mixed-pressure turbo-generator, so designed that it could be used either as auxiliary power on exhaust steam or as stand-by plant on live steam. The original sets were run non-condensing, and the whole of the exhaust steam could be utilised in the turbine to produce additional power without increasing the cost of coal and water.

A study of Fig. 2 will show that the turbine develops approximately the same power as the sets which supply it with steam. Fig. 1 shows the general lay-out and arrangement of the mixed-pressure turbine plant at Burslem. The reciprocating sets can be run either non-condensing or in connection with the turbine or the turbine can be run as a separate unit. The result of tests of the steam consumption per kw.-hour under different conditions and varying loads are given in Fig. 3. From figures given by a firm of turbine builders as a guide to the power obtainable from the exhaust steam of reciprocating engines, it may be taken that, with the engine producing 500 kw. running compound non-condensing with steam at the

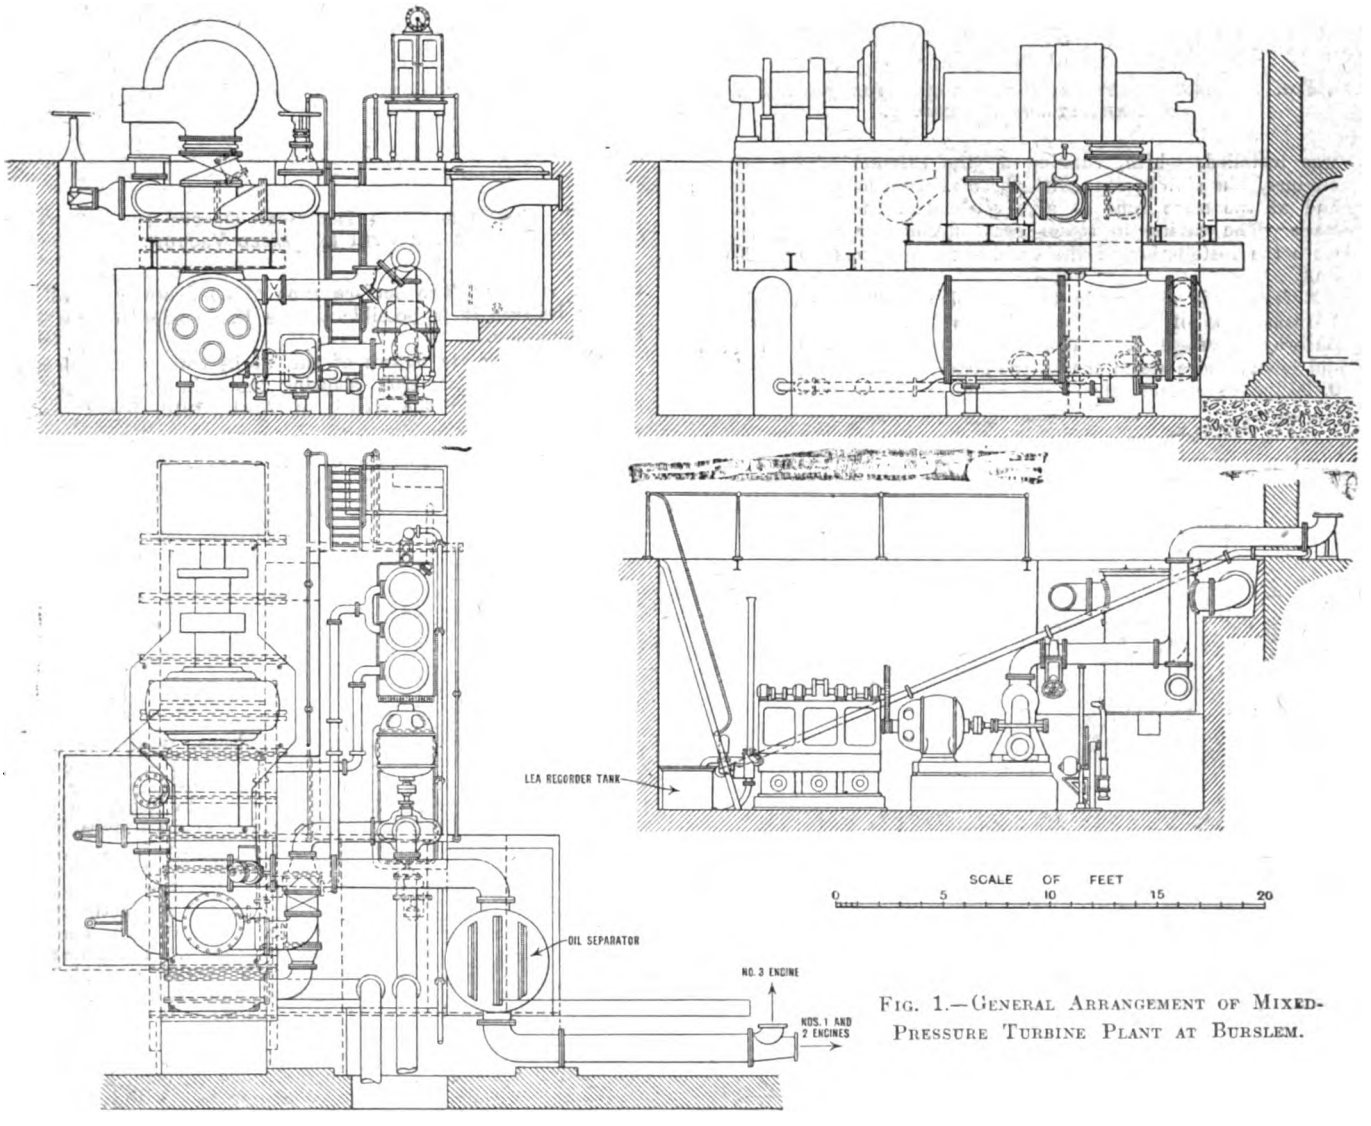

FIG. 1.—GENERAL ARRANGEMENT OF MIXED-PRESSURE TURBINE PLANT AT BURSLEM.

Digitized by Google

stop valve at a pressure of 160 lbs. per sq. in., the exhaust turbine will produce an additional 375 kw., less, say 5 per cent. required to drive the condensing plant.

The Paper also referred to the results of the working economies of the power-house plant of a large engine builder's works, equipped with one 300-kw. and one 400-kw. triple-expansion engine running with a steam pressure of 160 lbs., and vacuum of 26 in., the steam being superheated from 50° to 150° F. At the beginning of 1908 an exhaust pressure turbine

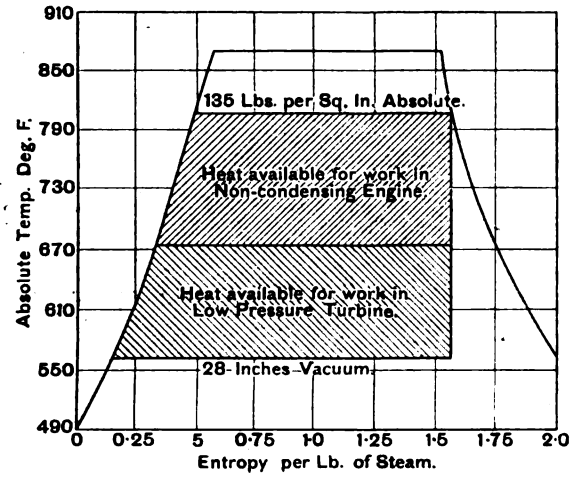

FIG. 2.—ENTROPY-TEMPERATURE DIAGRAM FOR ENGINE AND EXHAUST STEAM TURBINE.

was installed, which, running on the exhaust of one of the engines, was able to cope with the maximum load of the station and at the same time to give economical running on lighter loads. The saving in steam consumption per unit generated since the installation of the turbine ranged from 19 to 26 per cent.

Reference is also made to a turbine of the Westinghouse-Parsons type of 368-kw. capacity installed at the Gloucester Railway Carriage & Wagon Co.'s works, fitted with high- and low-pressure steam chests, the latter capable of dealing with 9,000 lbs. of exhaust steam per hour, and from which 210 kw.

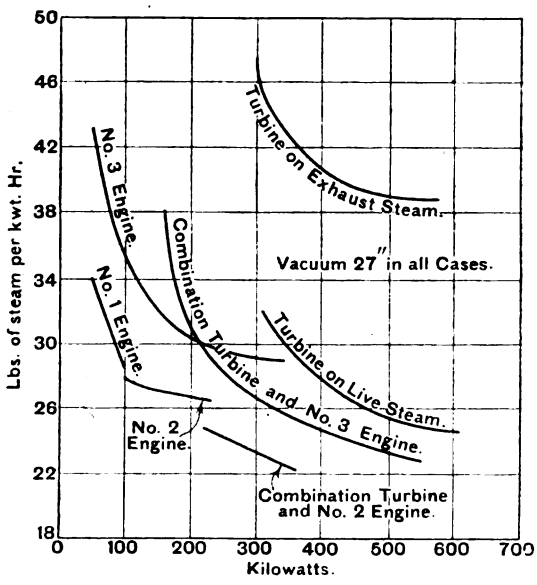

FIG. 3.—STEAM CONSUMPTIONS UNDER VARIOUS CONDITIONS.

is obtained, the rest of the load being carried on high-pressure steam. In this turbine the governing is effected by giving the low-pressure governor valve a lead over the high-pressure, so that the full quantity of exhaust steam is always used before high-pressure steam is admitted.

The following is a short description of the mixed-pressure Belliss turbine installed at Burslem electricity works. The turbine is of the drum type. The rotor is a short forged steel drum supported by two forged steel discs, mounted on a shaft which goes right through the rotor. The blades are of strip brass; each is aligned and held quite individually secure. The fixed blades are inserted in groups, in windows in steel blade rings, and are entirely protected from damage. The bearings are lubricated with water-cooled oil at a pressure of 30 lbs. to 40 lbs. per sq. in.; the oil pump is double acting and valveless. There is a flexible coupling between turbine and generator shafts. Governor throttle valves on both live and exhaust steam supplies, are operated by a powerful and sensitive oil relay, which is in turn operated by a governor of the same type as on the "Belliss" engines. Emergency valves are provided for both h.p. and l.p. steam, which operate at prescribed overspeed.

In order that a mixed-pressure turbine may run to the best advantage a high vacuum is necessary. The condensing plant is therefore a very important feature of the equipment. Fig. 4 shows the increase in output from exhaust turbine with in-

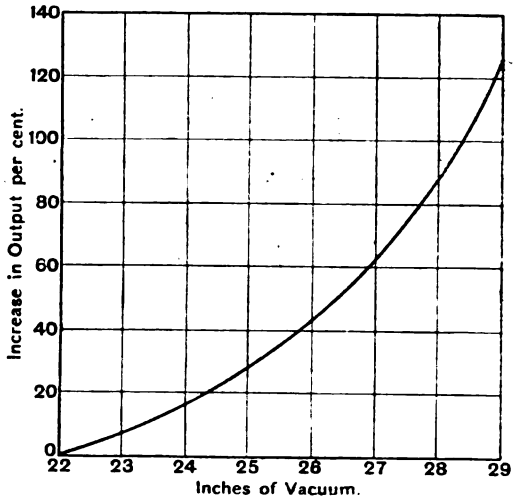

FIG. 4.—CURVE SHOWING INCREASED OUTPUT FROM EXHAUST TURBINE WITH INCREASED VACUUM.

creased vacuum. The surface type of condenser was selected mainly because it is possible to use the condensed steam for boiler purposes.

The following are figures of the works costs at Burslem for the month of April, 1909, showing the gain due to installing the turbine during the month of April, 1910, based on coal at 7s. 3d. per ton:—

Pence per Unit Generated.

	Without turbine.	With turbine.
Coal	0·244	0·184
Water	0·071	0·028
Total ...	0·315	0·212

The saving is thus 32 per cent.

Mr. Newington's and Mr. Bremner's Papers were discussed together:—

Mr. I. V. ROBINSON (Messrs. Richardsons, Westgarth & Co.) remarked with regard to the general proposition of using exhaust steam turbines that they were being considered for many stations where it really was not advisable to put them down, such as when the existing reciprocating engines were getting near the end of their useful life. There were, however, many cases in which they could be used with great success, and McDonald Road was one of them. His firm had recently brought out a new type of air-pump, called a kinetic ejector, worked by a combination of steam and a water jet, somewhat similar to that used in the vacuum augmenter. There was then a small water spray which condensed the steam which was added, and the uncondensed vapours were carried forward by means of a straight line water jet. The water used in the spray and the jet was circulated by a small centrifugal pump. This combination of spray and jet was maintained in a circular sump of cast iron about 3 ft. in diameter and 4 ft. 6 in. high. Condensed steam water from the condenser was withdrawn by a two-stage centrifugal pump. One advantage of this type was that the latent heat of the steam which had been used in the primary jet for withdrawing air from the condenser was not required for the circulating water, but was given up to the water in the steam which was used for hot-well purposes. This had the effect of giving a hot-well temperature ten or fifteen degrees above the temperature corresponding to the vacuum. The pumps were all rotary and were driven by a small steam turbine or motor, which, if desired, could drive the main circulating pump also.

Mr. C. H. WORDINGHAM (Electrical Engineer-in-Chief to the Admiralty) asked if Mr. Newington had found any trouble from

Digitized by Google

corrosion, because it would appear that a number of paper mills discharge into the sewer, and there was no doubt a good deal of bleach which he should think must attack the condenser tubes. Again, was there any trouble with the foul nature of the water affecting the health of the station staff? The necessity for scraping by hand during time of full load might be a very serious disadvantage. With regard to Mr. Bremner's preliminary remarks, he thought the first designers of stations often came in for a good deal of criticism which they did not deserve. People often remarked on the smallness of the plant, but the critics forgot that if the plant had not been put in on a small scale to begin with, the station would not have paid its way in the early days and no extension would have been wanted. On the general question of installing exhaust steam turbines in reciprocating engine stations, attention should be paid not only to the possible economy, but to the practical operation of the station. These turbines practically doubled the switchboard, and gave what might be an inconvenient thing to run when they had to put on two units instead of only one at a time.

Mr. S. Z. DE FERRANTI had found a good many prospective users of exhaust steam turbines who did not realise to the proper extent the value of the exhaust steam that they were going to deal with. As a matter of fact, it was most important to utilise exhaust steam to quite the best advantage. They could not get more exhaust steam without having a greater capital expenditure and increasing the whole undertaking. He would like to suggest that specifications should be so drawn that it was worth while designing turbines to get the best possible value out of the steam. It was possible to get very much higher economies than those ordinarily obtained in everyday practice, but this usually involved building turbines of a larger size, much more ample exhaust pipes, bigger casings, higher velocities on the blades, much more carefully designed blades and structures all tending to greater capital costs. Exhaust steam turbines generally were an excellent makeshift at the present time. He did not follow Mr. Newington to the full by saying that a combination of this kind was as good as a new turbine. It was not finality; it was a financial process of bridging over the present position. This was largely brought about by the difficulty of putting aside for scrapping existing plant and having the difficulty of dealing with the matter in the accounts. The only solution appeared to be that the contractor might take a price for increasing the total output of a station to a certain number of kilowatts, and be allowed to do it in whatever way he liked. He could then sell the plant for scrap iron, but the Corporation would have a new plant at a less price per kilowatt and absolutely up-to-date with the latest practice in generating costs. He had no doubt, however, that in the majority of cases at present, it was quite the best thing to instal these exhaust steam turbines, and to leave to some later date a more complete reorganisation of the generating stations.

Mr. C. E. C. SHAWFIELD (Chief Electrical Engineer, Wolverhampton) was inclined to think that Mr. Newington would have obtained better financial results if he had scrapped his reciprocating engines and put down high-pressure turbines direct. In the first place, there would have been a distinct saving in capital expenditure. Also, the economy of working to be obtained with a live steam turbine was distinctly greater than with the combination. He gathered that the average steam consumption per unit generated with the exhaust steam turbines was 22·2 lbs., including stand-by losses, probably about 19 lbs. per actual unit generated. With a high-pressure turbine with similar vacuum the figure would not be more than 17 lbs. Further, it would only require half the size of condenser, and the total costs, including water, would be considerably less. In his own station he had had three 500-kw. reciprocating sets, to which he had thought of fitting exhaust steam turbines. When he had the whole scheme complete, however, he found that if he put down a 2,000-kw. live steam turbine, he got a much lower capital expenditure and a much lower running cost.

Mr. T. W. BLOXAM (Chief Electrical Engineer, Belfast) had some similar sets to those described in the Paper. His own 2,000-kw. sets were originally fitted with copper brushes, but these required so much daily trimming and attention that the cost of maintenance was excessive. Carbon brushes were substituted, but there was difficulty in getting each brush to take its proper share of the current. The result was the burning away of the carbon in patches, which aggravated the trouble. If additional load was put on, the temperature rise of the commutator became greater than the provision for expansion could deal with, and distortion of the commutator took place producing an out of balance fatal to running at even quarter-load. The makers now suggested re-construction of the commutators, with flexible end rings instead of the original method of a sliding cone, and making effective provision for ventilation inside the commutator. He wished Mr. Newington had said whether he considered separate exciters or self-excitation the best. There seemed to be some doubt as to which had the greater advantage. With regard to the facilities for clearing the strainers on the suction side of the circulating pumps, they had a tidal river in Belfast, and a great deal of rubbish floated down and caused trouble by blocking the strainers. A good way of clearing these was to hold up the retentive valve after the station was shut down at night, and discharge one or other of the pumps backwards through the particular pump whose strainer they wished to clear. It seemed to be quite sufficiently effective if done once or twice a week to keep the strainers of each pump in rotation clear of any accumulation.

Mr. R. BIRKETT (Southend) did not think it was much use applying exhaust steam turbines in power stations with very poor load factors. They would only be required for half an hour a day, and this would surely not pay for the plant. He had some difficulty in getting clean water at Southend, and had gone into the question of using the sewage. The difficulty was to make the sewage water keep pace with the demand on the station. He had thought of condensing by air, and had adopted a Ledward condenser, which always maintained a 25-in. vacuum. He questioned whether any plant could beat his efficiency of 23 lbs. per kw., especially with a load factor of 16 per cent. With his air condenser he connected small branch pipes to each layer of main pipes the whole length of the condenser, and on each of these he put a valve, which was regulated so that it did not matter what the load on the station was he always got a constant vacuum. There was previously a certain condenser with cooling tower capable of dealing with 30,000 lbs. per hour. The present plant was capable of dealing with 60,000 lbs. per hour, and the whole of it was run at a less cost than it took formerly to run the fan for the cooling tower.

Mr. S. L. PEARCE (Chief Electrical Engineer, Manchester) did not question the possibility of using exhaust steam turbines, but thought they all should have a very clear idea of the principles underlying their use. The work got out of steam was proportional to the heat given out by the steam, and, looked at from that point of view, an exhaust steam turbine was a piece of apparatus that did not give up the greatest proportion possible. Having regard to the range over which they were getting the greatest amount of heat units from the steam, it was at once clearly apparent that a good vacuum was the first consideration, and unless a good vacuum could be obtained, the use of exhaust steam turbines was practically out of the question. From a well-known curve he saw that for an increase in the vacuum from 27 in. to 28in., there was a percentage increase in the available heat units of practically 20 per cent. It was, however, very easy indeed to expend more capital in endeavouring to get a good vacuum than would really repay them in the end. He thought that Mr. Newington's remark that exhaust steam turbines or mixed pressure turbines were the most suitable for extensions was rather too sweeping, and required some qualification. It was erroneous to say that an exhaust steam turbine, coupled to a first-class triple expansion engine, would enable that engine to do its work more economically than when working as an ordinary condensing engine. Some of them might be familiar with a Paper read in the early part of this year by Mr. Stott before the American Institute of Mechanical Engineers, in which he gave a description of the plant of the Interborough Rapid Transit Company in New York. Mr. Stott coupled a 5,000-kw. vertical exhaust steam turbine to a 7,500-kw. alternating-current set of the Manhattan type. Mr. Stott's figures looked attractive, but he believed this was mainly due to the abundance of cold water from 50 to 55 degrees, and to the particular cylinder ratios of the engines in use. When planning extensions at Manchester, he had carefully considered whether he should put in an exhaust turbine on the Wallsend Slipway Company's engines, but after going into the matter carefully, he could not show a saving of more than ¼ lb. to ½ lb. in the steam consumption as compared with a high-pressure turbine.

Mr. H. FARADAY PROCTOR (Chief Electrical Engineer, Bristol), referring to Mr. Ferranti's suggestion of scrapping existing plant, said he would prefer keeping the reciprocating engines as a standby pure and simple. It was a question of capital expenditure upon buildings rather than upon machinery, or at any rate upon the turbines. If their buildings were inexpensive per square foot of space, they could afford to let their old and inefficient sets remain where they were at present standing and use them as standby. They must have regard to the fact that if they were inefficient their available boiler plant would have to be extended if a breakdown occurred, as it always did occur on top-load, but it was mostly a question of capital cost in respect of buildings, foundations, switchgear, and connections, rather than on the turbine itself.

Councillor D. LIVINGSTONE (Hull) asked Mr. Newington what his position would be if the supply of water from the sewer ran short. They must not forget that high vacuum meant coal. It was essential to keep the feed water going into the boiler at a good temperature, and if they could increase this, even at the expense of the vacuum, he thought it might be a good policy in the ratepayers' interests.

Mr. F. W. PURSE (Chief Electrical Engineer, Watford) referred to the fact that both authors mentioned a saving of 32 per cent. by the use of exhaust steam turbines. The comparison, however, was made between the reciprocating engines turning out a small number of units and the combination with exhaust steam turbines turning out a much larger number of units. He would have preferred to have seen the comparison made with units sold or units sent out to the mains. In the comparison in the papers, no reference was made to capital

Digitized by Google

cost, but in order to get at the real nett saving, the costs should have been worked out after balancing up the capital charges, &c.

Mr. R. H. CAMPION (Chief Electrical Engineer, Dewsbury) said that the circumstances at Dewsbury were more or less represented by the conditions mentioned in the second paper, and he had decided to instal a mixed pressure turbine, and hoped to get something in the nature of 360 kws. out of the exhaust steam available. The advantage of the mixed pressure turbine was that with any failure of the exhaust steam, there was the high pressure side to make up on. With regard to the D.C. end of the set, they had all been waiting for years for a decent commutator, but he thought they had now got this with the radial type.

The PRESIDENT said that in the St. Andrew's Cross station there were two 1,600 kw. Willans & Robinson continuous-current turbo-sets, two of the dynamos being by Siemens and two by Brown, Boveri. The Siemens machines had carbon brushes, and the Brown, Boveri machines copper brushes, and they would be seen working satisfactorily when they visited the works on the following day.

Mr. F. A. NEWINGTON, in reply, said that he had had no trouble from corrosion of the tubes, and neither had the health authorities had any trouble. The scraping arrangements were not perfect yet, but they would probably hit upon some suitable method sooner or later. Mr. Ferranti and most of the other speakers agreed that exhaust steam turbines were not so good as scrapping the existing plant and putting down entirely new machinery. No doubt on paper the live-steam high-pressure turbine did show a better result, as far as steam consumption went, but there was this point of view in regard to scrapping plant. He was quite certain that every engineer present would have a great deal of difficulty in persuading his committee that the best thing to do was to wipe that out entirely and put down new plant. By scrapping the whole of the existing plant, the works costs might have been lower, but he was quite certain that the capital costs would have been a great deal higher. With regard to Mr. Bloxam's remarks about commutation troubles. The one dynamo which he (Mr. Newington) had referred to, had had the commutator altered and fitted with flexible plates and ventilation underneath the commutator bars, and this seemed to have got over all the trouble. The makers of direct turbine dynamos had had troubles with commutators, but they seemed now to be getting over them. As regards excitation, he could not say whether separate excitation or self-excitation was the best, but the makers would not hear of anything but separate exciters at Edinburgh, and therefore they were used. With regard to Mr. Birkett's remarks, the sewer was large enough for 10,000 kws. They realised that sooner or later they would come to the end of their tether as far as the sewer was concerned, and he was very glad to say that the Edinburgh Corporation had now seen the error of their ways, and he believed that in further extensions cooling towers would be used. The objections in the earlier days would be got over by spending several thousand pounds in ornamentation and making them look pretty.

On Thursday, the meeting was again in Glasgow. The President (Mr. Lackie) explained that the meeting that morning was somewhat in the nature of an experiment. There would be no actual Paper, but discussions upon two subjects of great interest to electrical engineers. Both would be treated in the widest possible fashion.

ADVANTAGES OF CONTINUOUS RECORDS OF COSTS AND OF STEAM CONSUMPTION.

Mr. G. WILKINSON (Chief Electrical Engineer, Harrogate), who was called, opened the discussion on this subject, and said that at Harrogate the Works Superintendent had arranged for the costs to be made up every night at 10 o'clock by the switchboard attendant; they were sent down to the office and posted in convenient places in the works. He found that the men all over the works examined these costs daily very much in the same way, and with the same interest that people looked at their morning paper. More was known about the costs from the prime mover to the switchboard terminals than from the prime mover back to the coal heap, and his remarks would have special reference to the boiler house rather than to the engine room.

There were three items which ought to have a prominent place on the records in every supply station. The first was with regard to air leakage into the flues. About eighteen months ago, when visiting one of the largest power houses in the Midlands, he had found that they were regulating the draught by the dampers in the main flues. The engineer at that works told him that they saved, due to the lessened infiltration of air into the flues, something like £500 per annum in fuel. Four or five years ago his attention was more forcibly drawn to the possibilities in this direction by the practice at a very large manufacturing works in the North of England, where the engineer had introduced a cement which had a very great affinity not only for the metal work of the boilers and economisers, but also for the brick-work, and it remained plastic for a sufficient length of time to set after the boilers had been fired and reached their maximum condition of expansion. In addition, he had carefully covered every damper slot with a cast-iron cover, so that his dampers were entirely closed, and the only infiltration that could happen was at the small close-fitting holes where the rods went through the casing to operate the dampers. This engineer told him that he had succeeded in raising the temperature of his economisers an average of 50° F., and when it was considered that 10° F. obtained in the economisers was equivalent in round figures to 1 per cent. saving in fuel, it would be seen that this was a very great accomplishment. He had followed this engineer's lead, and did a similar thing in Harrogate, and ever since then the temperature in his economisers had been from 20° to 25° higher than they were before.

The second point was that of economiser efficiency, and he wondered how many power-house engineers had made any tests as to the efficiency of their economisers. He was led to do this by experimenting to find out how much better a live steam injector was for boiler feed than a live steam feed pump exhausting to atmosphere, and he was very much astonished at the conclusion of the tests, and on their subsequent repetition, to find that the advantage was very much on the side of the feed pump, notwithstanding that its thermal efficiency is very much lower than that of an injector. Pump makers and boiler insurance companies failed to assist him in arriving at an explanation, but he got independent confirmative figures eventually from a firm who are pre-eminent in the matter of economiser practice, and who have spent lavishly in making tests upon engines and boilers. The figures they gave him, taking economisers of 280 tubes, with a Lancashire boiler having an evaporation of 1,320 gallons per hour and a flue gas temperature in their economiser in both cases of 550° F. were that, with an initial temperature in the economiser of 94° F., they got a rise of 166 thermal units per pound, and with the initial temperature of 202° F. a rise of only 122 thermal units per pound of feed-water. This meant that, by having a low temperature of 94°—and they could not go below that on account of destructive effects on the tubes—it made a difference in the efficiency of no less than 26 per cent. This meant a saving of 4·4 per cent. in fuel. He therefore suggested that it was well worth while to use a temperature in the economiser as low as possible. They should take the water directly from the air-pumps and condensers to the economiser. If it happened to be so low that they could not avoid action on the tubes, then they could raise the temperature by putting the economiser on the suction side of the pumps. When visiting the Pinkston Tramways Power Station in Glasgow that week, he took the opportunity of inquiring into the figures there. The water from the air-pumps was from 110° to 120° F., and the discharge from the steam traps was increasing that to 160° F.; it was putting on 40° which very substantially lowered the efficiency of the economiser.

The next point was condensation in the steam pipes. There was an idea in some quarters that superheat was largely a cure for condensation, but in his opinion this was a fallacy. A practice which had crept into numbers of turbine stations recently was to allow the condensed water to gravitate through the pipes and through the turbine into the condensers. Turbine makers had informed him almost unanimously that for every 1 per cent. of moisture in the steam going to the turbine there was a drop of efficiency of 2 per cent. For the long hour light load term, the condensation losses, notwithstanding high superheat, amounted to something like 2 per cent. of the steam going to the turbines, which therefore represented a drop of efficiency for the long hours of light load of 4 per cent. He had made very careful tests of condensation with high pressure steam superheated 150° to 180° F., and with pipes lagged for a depth of two inches with the best magnesia composition, and found that the amount of condensation varied from three to ten gallons of water per hour. It was astonishing how the variation corresponded very closely with the load on the station, being a minimum at full load, but there were never less than three gallons per 100 ft. of surface at light loads. It varied widely between summer and winter and between a dry day and a humid day. Investigations had shown him that where the entrainment of water from the pipes was in one place only, the water of condensation had a habit of accumulating in the pipes and coming over in a rapid rush into the turbines, and he felt convinced in his own mind that it was owing to this that numbers of strips of turbine blades had taken place. For twelve months he had been putting back the condensed water from the pipe range, &c., to the boilers at a temperature less than 10° below that of the steam itself. He worked at 140-lb. steam pressure, and lifted the water 1 ft. for a drop of less than 1° F. There were no moving parts in the apparatus, and it took the water direct from the pipes to the boilers. Mr. Wilkinson next referred to the Hopkinson-Ferranti valve. If this valve were used on high-speed engines, he said, there was a quantity of water between each valve owing to the contracted area of the valve opening. The result was that they had a hot surface on top and a cold surface below which set up racking strains and started the joints. In one Government de-

Digitized by Google

partment they did not use these valves except on vertical pipes. He was using these valves in Harrogate, and by draining in between them he kept the water entirely out of the pipes, and was never troubled with any of the joints going. Mr. Wilkinson concluded by saying that he had had a 5 per cent. drop in the load and a 4 per cent. increase in the price of coal, but, notwithstanding this, he had effected a 10½ per cent. reduction in the cost of the units generated. He could not say that this was entirely due to his having reduced his initial feed-water temperature to the economiser by 20° to 25° F., but it was the principal economy which had been introduced during the year.

Mr. C. E. C. SHAWFIELD (Chief Electrical Engineer, Wolverhampton) said that in the electric supply industry the costs of production are subjected to more detailed comparison and analysis than those of any other, yet, as stations increased in size, it became increasingly difficult to keep a truly continuous record of cost of production, more particularly of the efficiency, or rather inefficiency, of the process of turning the coal pile into "juice." It was usual to put some form of volumetric or weighing apparatus on each boiler which dealt with a few hundredweights at a time, the amount used during the day being checked by some form of counter; but in the station containing from six to sixteen boilers, even with an automatic coal weigher on each, they were still very far from having anything like a continuous record of the amount of coal consumed per hour, and to be able to compare it with the units turned out in the corresponding period, and the difficulties were increased because the hourly consumption of coal per unit generated varied so enormously at different times of the day. It would be found that during a night-shift—from 10 p.m. to 6 a.m.—the coal used per unit would be something like double, and in some cases treble, what it was during the time of normal full load. The results he had obtained from such tests were rather paradoxical. He had actually found that during the night-shift an increase in the production of units meant a decrease in the consumption of coal. During the month of August, when his auxiliary destructor station was shut down during the night-shift, the total weight of coal burned at night was less than it had been during the previous and following months when the destructor station was running, and a series of hourly tests showed that the full output from the destructor station, when that was thrown on to the main station, cost a little less than nothing to produce. Another important matter was water consumption. It was perfectly simple to put some form of recorder on each generating set, but that was only a measurement of the actual efficiency of that particular set, and a much more useful purpose would be secured if the whole water condensation was delivered into one common recorder, so that one continuous daily chart of the whole water consumption at each moment could be obtained. Make-up feed ought also to be separately measured in order that some indication might be obtained of the constant losses of condensed water. He was not prepared to contest with Mr. Wilkinson the thermal advantages of returning any water condensed in the steam range directly to the boiler without any intermediate handling, but he thought much more useful results were to be obtained if they could collect that water and pass it through a continuous recorder, and thus know the amount of condensation going on in the steam system at any time. If it were turned back to the boiler without knowing how much it was, they had no opportunity of mending any defects in the lagging or improperly designed steam pipes. He had found CO_2 recorders by no means as reliable a guide to the efficiency of combustion as the makers would have them believe. After some years of experiment he had come to the conclusion that it is much more satisfactory to have periodical tests taken two or three times on each shift by portable apparatus than to rely on any form of automatic recorder, for he had not been able to get one which would remain entirely satisfactory for more than a week or two together. He thought there was a tendency to pay too high a regard to the extreme lowness of works costs, and that the sinking fund on the capital spent in striving after a record of low costs might sometimes be greater than the value of the coal saved.

Mr. F. AYTON (Chief Electrical Engineer, Ipswich) was in entire agreement with Mr. Shawfield in sounding a warning note that they might spend too much time trying to gain a decimal point in their works costs. He felt that they ought to attend to the other end of the scale as well, namely, the consumers' meters, for, after all, these were a sort of National Cash Register. Moreover, the delicate recording instruments would cost much in repairs and maintenance after the first two or three years. His experience of CO_2 recorders coincided with that of Mr. Shawfield. He had had in operation for six years a Krell instrument, and if it received almost daily attention reliable readings could be obtained, but this took up a great deal of time. The principal trouble was with dust getting into the tubes leading from the boiler to the instrument. The makers recommended the use of glass tubes to reduce the friction of the gases, but at every point where one glass tube was joined to the other there was a piece of rubber piping, which was a continual source of trouble because, owing to the drying action of the heated gases, and also the temperature of the boiler house, the rubber soon perished, and then air leakage took place, which, although comparatively small, was quite sufficient to upset absolutely the accuracy of the CO_2 readings. He had made considerable improvement by lapping an insulating tape over the rubber after it was put on the tubes, but some form of box should be designed in which the whole thing could be run in solid with an elastic compound. The chief fault he found with the recorder was that it did not tell them the amount of air leakage, and those engineers who were looking into the matter were surprised at the amount of air leakage which existed. This taught the lesson that they should be very particular indeed about the building of the brickwork of their flues and boiler settings. Wherever possible, glazed bricks should be used for the outside work, and he believed they repaid their initial cost. Trouble was also experienced with the cracking of brickwork in boiler settings. He now built his boiler settings with Portland cement mortar throughout. Special fire cements were expensive, and he made his own cement very cheaply. The only place in which he used fireclay on his last boiler (a dry-back marine) was just over the fire-brick lining of the combustion chamber at the back of the boiler. At this point there was a sufficient temperature to make it run as a flux, but anywhere else it crumbled away and caused air leakage. Ordinary sand was useless in making cement, because the joints went to pieces under the influence of the high temperature. He used for his cement ground fire-brick, which could be purchased from the fireclay firms at 26s. per ton in bags, and mixed it with ordinary Portland cement. Before he had finally adopted this, he made an experiment by building a wall of brickwork in the combustion chamber of his Meldrum refuse destructor, and had left it there for some weeks. Although it had been at a bright red heat the whole time, the cement joint was holding. The boiler on which this cement was used had remained airtight after three years' work, and there was not a crack anywhere in the settings. To overcome the porosity of the brickwork flues and settings, he had mixed gas tar and pitch into a hot thick liquid, and coated them with it. One of his coal trimmers went round every day looking for leaks in the flues and boiler settings; he carried a candle, and always found one or two every week. They were then stopped up with asbestos, and if they got worse they were filled up with cement mortar. Mr. Wilkinson's remarks on economisers were most interesting, but he would like to know whether any engineers had tried to improve the scrapers of economisers. A thin non-conducting layer was always left in the tubes. In this connection he referred to the drawn steel tubes of the economisers at the Horseferry Road station of the Westminster Electric Supply Corporation, which he regarded as a great improvement on account of the very much smoother surface afforded by these than by cast tubes. Another source of leakage was in the engine room, namely, from air getting through the exhaust pipes. Cast iron was slightly porous under certain conditions, and it was a very good plan to paint the exhaust pipes with some thick bodied elastic paint. With regard to keeping costs, he got out his costs for each of the three shifts, and it made some competition between the men of the different shifts. He also measured the standby coal separately, and this was a very good guide as to the efficiency of the boiler house. The cost of coal during light load hours was considerable. It cost practically nothing extra in coal to run a large number of street lamps during the night after eleven o'clock. This should enable them to put in street lighting at an extremely low price for current, and to beat gas hollow. Dampers could be greatly improved upon; most of them were not airtight, and he had found it a good plan after shutting down a boiler to go into it and pack the damper round with some asbestos rope packing.

Mr. C. H. WORDINGHAM (Chief Electrical Engineer to the Admiralty) said that central station engineers seemed always to have been meter maniacs. In a large station he could not conceive how it was possible to find time to make all these measurements, and even supposing they did, they got such an enormous mass of material that it must pass the wit of man to analyse it and to get any useful results from it. It seemed to him that a few very carefully effected tests made from time to time at long intervals would tell a great deal more than all this fearful mass of material, which is subject to a very great deal of inaccuracy. He very much mistrusted all these daily and hourly and shiftly records that so much was heard of. He felt very strongly that the fewer instruments there were of this character in stations the better chance they had of avoiding interruptions and avoiding wasting a lot of money taking records. Mr. Ayton's Diogenes with a candle was more useful than a CO_2 recorder. All this record taking reminded him of the mother whose little girl had been to a physiology class, and who wrote to the teacher, "Please do not teach Mary Ann any more about her inside. It does not do her any good, and besides it is rude." Mr. Wilkinson's method of putting water back straight to the boiler and saving all the heat was very much better than not doing it and then finding out how much heat they were wasting.

Mr. F. A. NEWINGTON (Chief Electrical Engineer, Edinburgh) spoke on the question of moisture in coal. He used small washed nuts entirely, and had found that the moisture varied from 7 per cent. to 15 per cent. or more, especially if the coal

Digitized by Google

was not well ground. For a large proportion of small, there was a greater quantity of moisture. For some time he did not like paying 7s. or 8s. per ton for water, and had tried to get some means of daily checking the quantity of moisture. He constructed a drying chamber heated by steam from one of the much-maligned traps which had been talked about, and it was the duty of the engineer on the morning watch to take a ten-pound sample from each truck delivered each morning. This was dried for twenty-four hours at a temperature of about 220 degrees, and the moisture calculated. He specified that all above 10 per cent. would be deducted from the monthly accounts of the coal purchased. The coal owners did not like it at all, and for the twelve months during which these tests were carried out, the deductions amounted to between 3 per cent. and 4 per cent. of the total bill. The coal owners thought he was drying the coal far too much and was losing more than moisture, and he could not persuade them that this was not so. For the contract settled for the present year he found that it was not much use persisting in these tests, and therefore he asked for two prices, one, as delivered, and the other, that all above 10 per cent. of moisture should be deducted. The prices for the 10 per cent. moisture coal were from 3d. to 6d. per ton more than the other. He therefore concluded that this moisture was not worth bothering about, and that the coal merchants knew how much moisture there was and what price they could get for it. He did not think it was much use for engineers to test small samples of coal for calorific value. From one colliery the coal did not vary very much, and each colliery had its own marked advantages. He did not think that hourly records were of very much use, for the coal at any rate; the condition of the fires varied so much from time to time. Watch records of coal and water were sufficient.

Mr. MARK RUDDLE (Chief Electrical Engineer, Dublin) said that in a big station, however, working on an ordinary duty supply with a varying load from minute to minute, continuous records could not be taken, and very little could be deduced from such records as could be taken. The time expended in compiling and wading through sheets of records could be better devoted to the systematic inspection and overhauling of the plant in order to keep it in the highest state of efficiency.

Mr. JAMES LEA (Lea Recorder Company) said that his attention was first directed to recording instruments some ten or twelve years ago, when he was engaged on the Witwatersrand Mines, his last work there being to supervise the engines and boilers of a group of the Rand Proprietary Mines. At the end of every month he was supposed by the statistical department to provide figures showing the cost of every item to the fraction of a farthing. He had to hand in a record from every boiler house, of which there were twelve or more, with winding engines, pumping engines, and compressors, and he had to show how much coal had to be debited to the air compressor, to the winding engine, and to the Cornish pump. The problem was rather a difficult one, and in the absence of meters of any kind he was driven to the question of measuring instruments, mainly in connection with water. It had been suggested that the taking of such records was too much trouble and cost too much money, but he hardly agreed with this. With a 4,000 kw. or a 6,000 kw. plant, with coal at 10s. per ton, the cost for coal alone was £20 per day. There was also the expense of wages in the boiler house, and in his opinion recording meters were a very good and economical investment, whilst the cost was very trifling. With regard to running plant generally, he was astonished that at no engineering college was plant-running taught in any shape or form. They taught young men to construct boilers and engines and turbines, but the running of plant was entirely ignored. If there were a greater co-operation between boiler makers and boiler users, and turbine makers and turbine users, a better result would be got out of our boilers and engines. The average efficiency of a Lancashire boiler was about 60 per cent., and with 40 per cent. going up the chimney it would be better if boiler makers looked after their boilers after they were erected to a greater extent than at present.

Mr. R. ROWLAND (Chief Electrical Engineer, Stretford) said he would have liked to hear a little more about the defects of the Hopkinson-Ferranti valve mentioned by Mr. Wilkinson. The filtration of water in the pockets caused by the smaller diameter of the valve had been referred to. He thought the advantage of the small air gap was increased velocity, which caused a greater evaporation of the water. If this was so, there was not such a danger of water coming over in such a quantity as to cause any damage to the turbine or engine. Had Mr. Wilkinson any tests on this point? With regard to economiser temperatures, he always endeavoured to put in about 100 degrees at the inlet, and regulate it at from 300 to 350 degrees to the boilers. The best way was to work on the main dampers instead of the side flues. He agreed with the use of glazed bricks in spite of the increase of cost. Records of coal consumption could not always be relied upon, because some charge engineers might allow a less quantity and put it on to another watch, and it was very difficult to say who was correct. Tests taken at fairly long intervals seemed to be the best way. He had a very high opinion of CO_2 recorders. At Stretford there were two batteries of three boilers each, and since they put in a CO_2 recorder, they had turned out 200,000 more units per annum at less coal cost. He would also have liked to hear from Mr. Wilkinson with regard to the corrosion inside boilers, and how he overcame this. He preferred to give them a lime wash now and again and to keep them well cleaned.

The PRESIDENT, in closing the discussion, said that Mr. Wilkinson had offered to answer in the *Proceedings* a few of the points raised in the discussion, but, of course, as he had only opened the discussion and not read a Paper, he was not bound to. He then declared the subject of cheapening the cost of mains and services open for discussion.

CHEAPENING THE COST OF MAINS AND SERVICES.

A large sheet headed "Cost per Branch," and giving the various items of the cost of laying services, had been fixed conspicuously at the back of the platform, and was referred to by some of the speakers during the discussion. The items on this sheet were as follows :—

Cost per Branch.	£	s.	d.
Jointer's time		17	0
Wireman		6	5
Mason's time		6	11
Joiner's time			3
Watchman			3
Branch Box		9	6
Fuse Boxes		15	0
Cable		19	0
Compound		2	6
Mason's Material			8½
Jointer's Material			2½
Sundries		10	9
	£4	6	6

Mr. S. J. WATSON (Chief Electrical Engineer, Bury), in opening the discussion, regretted the absence through ill-health of Mr. S. E. Fedden, who had originally agreed to start the debate. During the past few years, he said, there had been very large reductions in the cost of generating plant, but the cost of mains remained practically where it was some ten or fifteen years ago, and, in fact, he found that the present prices of cables of a certain size which he used fairly largely, were some 20 per cent. more than in 1902. He was not prepared to say how much this was due to an increase of price in raw materials or whether some portion of it, at any rate, was not due to the Cable Makers' Association. The question had become of great importance, on account of the decreased revenue, due to the use of metal filament lamps. He did not think anything could be done to reduce the cost of excavating and making good, which was practically fixed, but proceeded to give some figures as to the cost of the insulation on a cable. For instance, taking 0·15 sq. in. low-tension cables, with three single cables insulated with paper and lead, or a triple concentric or three-core cable, the price would vary about not more than 3 per cent., and the cost of either of these cables was about 8s. per yard. With copper at 10½d. this meant that copper was worth 4s. 7d. per yard, and the insulation about 3s. 5d. Thus, on the total cost of the cable 42 per cent. was for insulation only. Comparing low-tension cable with high-tension cable, instead of 8s. per yard, a similar three-core cable would cost 9s. 4d., so that although the high-tension cable could transmit some 10 to 15 times as much power as the low-tension, the extra cost was only 16 per cent. With regard to the material for conductors, so far as could be seen, it would appear to be impossible to substitute aluminium for copper, as the increased size necessary for a given capacity necessitated an increased cost of insulation. He did not know of any other conductor that could be considered. A system using bare conductors underground, laid in troughing with filling was put on the market a year or two ago, but he had heard little of it since. In this country we were ahead somewhat of Americans and the Continent, for it was the universal practice here to distribute at 220 volts, while he believed that it was still common practice, even with the American Edison Company, to distribute at 110 volts. It had been suggested that we should again double the pressure and have 800 volts across the outers, but although this would be a very economical thing to do so far as economy in copper was concerned, he thought it very unlikely that the Board of Trade would sanction it. He had come to the conclusion that the only way in which the quantity of copper could be appreciably reduced was by the generation of high-pressure alternating current and transmission to sub-stations, or to transformer pillars placed above ground. The general distribution of three-phase alternating currents had, he said, not received the consideration which it deserved. Such a system was very flexible, as additional distributors could be laid, and additional transformers put in whenever necessary, thus keeping the amount of copper down. Earthing one of the conductors on the low-tension side of a transformer station deserved consideration, and, if the area in which they distributed from that station was comparatively small, the objections to this method would disappear. The question arose whether it would not be possible to get the Board of Trade regulations governing the regulation of pressure

Digitized by Google

revised, because with metal filament lamps the effect of pressure variation was much less than with carbon filaments, and it would enable a reduction to be made in the copper. The use of overhead mains must not be overlooked. In Bury they had about a mile of aluminium overhead three-wire distributor, and the cost was about one-third to one-quarter the cost of underground work, and it had been found very satisfactory. The joints were made mechanically, and the whole line generally had been found very convenient. Reverting to three-phase distribution, he suggested transformers on the consumers' premises, supplied at 400 volts, and with a secondary pressure of, say, 50 volts. In regard to services he could not give very much information. He was located in a busy industrial town, and the question of cheap services had not required to be dealt with so very carefully as was the case in residential towns. He had, however, looked up the question of running services during the past year or two, and found that it varied from about 35s. to £11. The average cost for two years was £5 4s. He felt rather doubtful of giving this figure after seeing the table on the wall, but when he explained that the majority of these services were three-wire services, and that the average capacity of the consumers was about 25 kw., he thought they would come to the conclusion that the cost was not very excessive.

Mr. F. AYTON (Chief Electrical Engineer, Ipswich) said that unless they could lay their mains and provide services at a very much cheaper rate than in the past, the advantages afforded by the metal filament lamp would be largely counterbalanced. It was surprising to find what a small percentage the cost of the cable was of the total cost of the service. Taking a 7/20 solid two-wire service six yards long, the cost was £1 19s. 9d.; for ten yards it was £2 9s. 5d. On the armoured system it cost £2 4s. 5d. for six yards, and £2 12s. for ten yards. With 7/18 the cost on the solid system was £2 0s. 11d. for six yards, and £2 11s. for ten yards. For 7/18 armoured cable the prices were £2 6s. 4d. and £2 14s. 11d. respectively. The difference between the armoured and the solid system was solely in the cost of the service box, which he hoped to reduce considerably. They had been making all their own boxes for the solid system, but had been buying them for the armoured service. The cost of the solid system box, including fittings for a three-wire single conductor main and a two-wire service was 6s. 5d., and including compound, 7s. 10½d. The armoured boxes which they had to buy cost 13s. 8d., and these used more compound, which made the price 15s. 10d. Therefore, if they could make the armoured box at the same price as the box for the solid system there would be practically nothing to choose between the two. The armoured system had an advantage in connection with excavation, for armoured cables could be twisted about in a manner which was impossible with the solid system. He did not think they would gain very much in trying to invent a new sort of service cable. Where it would be possible to gain in connection with the cost of service work was in the fittings inside the consumers' premises. He was going to try an electrolytic meter combined with a house service, which was being put on the market by a certain firm. Mr. Watson had referred to a system of laying bare mains in troughing, and filling them in on the solid system. He had tried this, and although there were troubles at first, the makers relaid the system, and there had been no trouble since. The cost was about 70 per cent. of the cost of the ordinary solid system, and he was rather sorry that financial difficulties made the thing come to an end. With regard to overhead mains, he had some of these, and was perfectly satisfied. They gave far less trouble than underground mains, but there were only a few places where they could be used, and the Board of Trade put difficulties in the way of using them in towns.

Mr. B. SANKEY (Borough Electrical Engineer, Whitehaven) spoke with regard to the cost of services in small residential towns. He had taken out the cost of some twenty services during the past year, consisting entirely of 7/16 and 7/14 bitumen insulated cables. The average length of the service from distributor to cut-out was ten yards, and the average cost, including nothing on the consumer's premises, was £2 16s. To this had to be added the cost of cut-outs, meter and cutting the cable, which made the total cost of the service £3 6s. 7d. This was for ordinary private houses and shops. The closer they could get to the very simple services of the gas companies the nearer they would be to a cheap service. The elaboration of cut-outs, switches, meters, and all kinds of devices on the consumer's premises must add to the cost.

Mr. W. G. PICKVANCE (Chief Electrical Engineer, Wrexham) said that the expenditure of £4 or £5 on a service for a consumer with five or six lights was one for consideration as to when they would get their money back. A service laid direct in the ground was good enough where the soil was of a gravelly nature or of clay, but in most industrial towns the pathways were built up of ashes and slag, and other similar chemical products, and in such cases these services were not desirable. At Wrexham he had found odd lengths on this system which the makers had not considered it worth while to take up. On the question of cost, the depth at which a main or service should be laid came in. He had been noticing that in Edinburgh the distributors were laid about six inches or eight inches deep. It was beyond his comprehension how they managed to do this; in Wrexham some of the original mains were laid six feet deep, because the mains were not to go over the water mains, but underneath. So deep did he have to dig to look for some of his mains that he believed the local people thought he was frequently looking for coal. A depth of two feet should be quite ample. At Wrexham the average cost of laying services worked out at £2 5s. He was now using fibre troughing, with lead-covered twin-cable of 10-ampere size in some cases, and in other cases, ordinary bitumen cable. He thought that in towns like Wrexham, and in industrial towns generally, the best thing to do was to protect the cable by means of bitumen, and thereby have less trouble eventually.

Mr. C. TURNBULL (Chief Electrical Engineer, Tynemouth) said that some years ago he brought up the expression "density factor, in which he took the cost of the cable system, including sinking fund, losses in transmission, sub-station, and everything else, and divided that by the number of units. This gave the cost per unit in distribution, and his own personal opinion was that this "density factor" is probably more important than load factor. If he were laying out a new town, he would put down a system with 1,000 volts with transformers on the outside of consumers' premises, reducing down to 50 volts, and by using the outer protection of the wires as a conductor they could supply to houses extremely cheaply. It would be then possible to put down 3-phase 1,000 volts, and have a transformer for every half-dozen or dozen houses, and run wires outside houses and buildings, and have the main cut-out and transformer inside. It was impossible to run services smaller than 7/18, for mechanical reasons, although there was no need for this size for electrical purposes. He hoped, therefore, that cable makers would some day supply them with cheaper wires —possibly brass wires or a thin galvanised iron wire. He had found his early armoured cables extremely good, but now it was almost impossible to get modern makers to supply a good armoured cable well compounded over the lead. After treating cables properly with compound, they looked after ten years' use as if they had been put in yesterday, and no doubt they would have another twenty years' life. Such a cable was recently in a fire, and was perfectly good afterwards, although it had to be renewed at the terminals where it had been burnt off. The mains and pipes in the streets should be laid according to a plan. At the present time a man came along and laid a main or pipe and said, "Heaven help the next man!" He would like the Council of the Association to see if they could not produce a set of rules by which cables were laid.

Mr. F. CHARLES RAPHAEL referred to the table of cost of branch services exhibited. The cost there worked out was enormous. Incidentally, he could not understand why both a jointer and a wireman should be necessary to lay a simple service. It seemed that the cost could not be reduced unless something radical was done, and he proposed they should consider more frequently the question of laying the services at the time the mains were being laid. If they were to spend £4 6s. 6d. for each service, it was true that the cost of the mains would go up considerably, but by laying the services when the mains were laid they would not spend half this amount. If, for instance, they laid on the solid system, they would save the whole of the junction box. They could connect the service straight up to the cable and pour the whole thing in solid. The point to be remembered was that most station engineers were now connecting up entirely new districts, and were laying mains for an entirely new class of people, every one of whom they intended to be consumers. If a service was laid to such houses, the consumers would come on in a very short time. It might pay better in such cases to loop in the cable from house to house, and to have no junction box at all. He could not agree with Mr. Watson that the cost of excavation could be put entirely on one side. The cost of the cable itself could not be varied very much. It was not like a turbine or electrical machinery where invention and improvements in design could make an enormous difference to the cost. The only scope seemed to be in the use of another metal for the conductor, but, with excavating, the cost varied very considerably, and there was no doubt that it was more than it need be. A method which was used very little now was plain lead-covered, unarmoured cable laid under the side walks. If these were laid 1 ft. deep, he thought they would give very little trouble and not be liable to interruption.

Mr. W. W. LACKIE (the President) said the table which had been referred to had been put up by himself, and showed the average cost of sixty branches during the past two months. A few years ago they were costing in Glasgow £7, but they had brought this down to £4 6s. 6d. by specialising the work. With regard to Mr. Raphael's remark as to a jointer and wireman being necessary, they employed these two men because he did not think it right that the jointer who was working in the street, perhaps on a wet and muddy day, should go into a respectable house or a good shop with his dirty boots. His object in getting out the figures was to show where reductions could be made.

Mr. W. A. VIGNOLES (Chief Electrical Engineer, Grimsby) thought the voltage at which distribution was being made ought to receive consideration, as it was an important factor in the

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 16th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

12,047/09. **Motor Control.** BRITISH THOMSON-HOUSTON CO., LTD., and K. F. KINGWELL. Where an electrically-driven pump works a hydraulic accumulator supplying power to machine tools or other apparatus, it is usual to provide the motor with an automatic device worked by the accumulator to cut off current from the motor when the accumulator is fully restored. According to this invention, the controlling device is electrically interlocked with the apparatus taking power from the accumulator, so that the circuit-breaker is tripped only when the accumulator is fully restored and little or no power is being taken from it. The motor is thus kept running so long as power is required, and the continual stopping and restarting when the power taken is small is avoided. One claim, one figure.

12,442/09. **Combined Section Insulator and Switch.** W. G. HAMILTON. The two feeder cables connecting the trolley wire at each side of the section insulator and the feeder box containing the switches are replaced by one cable connected to the centre terminal of a double-action quick-break switch mounted on the section insulator. The switch is actuated by means of a wheel and eccentric slot, and the wheel is turned by means of a steel rope. We understand that this device has already been in use for several months on a tramway system with satisfactory results. Three claims, three figures.

15,496/09. **Metal Filaments.** R. JAHODA. Powdered tungsten is mixed with an organic binding agent and a small quantity of powdered copper or silver, or oxides or hydroxides of these metals. After squirting, the filaments are decarbonised at a high temperature in an atmosphere of hydrogen, and, although practically all the carbon is removed, the presence of the copper or silver gives the filaments the required strength, enabling them to be handled with ease. During the sintering treatment, the copper or silver is evaporated, leaving a pure tungsten filament. Two claims.

15,803/09. **Ignition Coil.** B. BROOKS and F. H. ALSTON. A wire core is provided with two primary windings wound in reverse directions, and one secondary winding. A special form of change-over switch worked by cams, or a magnetically-operated interrupter, opens the circuit of the first winding when the current has grown to its full value and closes the circuit of the second. This has the effect of suddenly reversing the field in the core, thus producing a higher induced E.M.F. in the secondary than when the primary circuit is merely broken. Nine claims, eight figures.

19,872/09. **Electrical Propulsion of Ships.** BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*). High-speed turbo-alternator sets supply three-phase current to induction motors, the rotors of which are mounted on the propellor shafts. On each shaft is also a low-pressure low-speed turbine. For high speeds of the ship, the turbines of the generating sets exhaust into the low-pressure turbines, and both these and the motors drive the ship. For cruising speeds, the low-pressure turbines are run in a vacuum or are disconnected from the shaft, and the ship is driven by the motors only, the turbo-sets exhausting direct into the condensers. Arrangements for pole-changing of the motor windings permit of speed variation. Six claims, eight figures.

24,784/09. **Electro-hydraulic Press.** MASCHINENFABRIK OERLIKON. This is a self-contained press for riveting, punching, and stamping, and comprises a press cylinder, a reservoir, a system of pipes always filled with liquid, and a pump driven by an electric motor. The reservoir is in the form of a cylinder open at the top, but is fitted with an air-tight float, which is pressed continuously on to the surface of the liquid by atmospheric pressure. Thus the float will keep the liquid in the reservoir even if it is tilted over, and so permits of the whole press being moved into various positions without the liquid overflowing from the reservoir. One claim, three figures.

27,026/09. **Control of Electrically-driven Machine Tools.** A. J. BOULT (*Feltes & Guilleaume-Lahmeyerwerke A.G.*). In large high-speed reversing machine tools, such as planing and mortising machines, the driving motor is reversed at the end of the travel by gradually reducing the speed of the motor by means of stops attached to the table of the machine. These stops can work switches to increase the field of the motor by short-circuiting resistances in the field circuit. The gear is arranged so that the slightest movement in the opposite direction opens all these switches, making the control of the motor when speeding up dependent on the starting gear only. Four claims, two figures.

3,927/10. **Push-button Switch.** A. P., G. C., and P. A. LUNDBERG. The switch member is moved into the "off" or the "on" position against the action of a spring by the depression of a push button, and is maintained in that position only so long as the push button is depressed. The movement provides for quick make and break at the contacts. Two claims, one figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: SIEMENS BROS. & CO., HANDCOCK, DYKES, and RAWLINGS [Sheathing of insulated conductors] 13,220/09; BEAVER and CLAREMONT [Filling joint-boxes] 20,105/09.

Dynamos, Motors, & Transformers: FORTESCUE [Transformers] 23,938/09.

Electric Ignition: BROOKS and ALSTON [Contacts] 3,247/10.

Electrometallurgy & Electrochemistry: NATHUSIUS and WESTDEUTSCHE THOMAS-PHOSPHAT-WERKE GES. [Electric furnace] 13,295/09.

Heating & Cooking: HERZFELD [Hot water and electric supply systems] 12,450/09.

Instruments & Meters: HOOKHAM [Meters] 15,458/09.

Switchgear, Fuses, & Fittings: WARDLE [Lanterns for incandescent lamps] 12,808/09; BERRY [Switches and switch-fuses] 13,442/09; EVERED and EVERED & CO. [Switches] 25,156/09; KÖRBER [Resistances] 26,929/09; WILKINSON and LAMBERT [Motor-starters] 28,476/09.

Telephony & Telegraphy: GODDARD, GROVER and THRALL [Telegraph transmitters] 27,101/09; RENDLE and CHURCHILL [Grapple for submarine cables] 5,282/10.

Traction: HOUGHTON, ALLMAN, and GRAY [Traction systems] 12,937/09; LAUDIE-WALKER and NIBLETT [Tramcar ploughs] 13,238/09; FELTEN & GUILLEAUME LAHMEYERWERKE A.-G. [Petrol-electric driving mechanism] 15,282/09.

Miscellaneous: CREWE [Driving gear for light machinery] 18,598/09; ROBILLOT [Fire and burglar alarm] 26,624/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: SIEMENS SCHUCKERTWERKE GES., 12,483/10.

Dynamos, &c.: BLÁTHY [Machines] 12,594/10.

Electric Ignition: ETABLISSEMENTS DE DION-BOUTON (SOC. ANON.) [Distributors] 10,780/10.

Electrometallurgy: HIORTH [Induction smelting furnaces] 12,214/10.

Switchgear, &c.: SIEMENS & HALSKE A.-G. [Rectifier for H.-T. currents] 5,917/10.

Miscellaneous: GODFREE [Electro-mechanical separator] 10,706/10; VON KANDO [Marine propulsion] 12,417/10; GEB. SIEMENS & CO. [Protective coating for carbon bodies] 12,425/10; BOMBORN [Centrifugal blowers] 12,768/10.

Opposition to Grant of Patent

11,773/09. **Wiring Fittings.** S. JOHNSTON. This patent is opposed. The specification describes ceiling roses, junction boxes, and other fittings, in which the connection between the main wires and the branch circuit is made without screws and without cutting the main cables, by plunger contacts pressed on to bared portions of the main cables. The latter lie in recesses in the base of the fitting.

Expiring and Expired Patents

14,345–6 of June 29th, 1896. **Electric Jacquards for Looms.** T. A. B. CARVER. These two patents expired last year due to non-payment of the renewal fee, but restoration of the patents has been applied for. If this is granted, the patents would expire in the ordinary course on Wednesday next, but application has been made to the Scottish Courts for an extension of term for a further fourteen years. The applicants are the patentee, W. Barnard, Carver Looms, Ltd., and Textile Appliances, Ltd. The decision of the courts has not yet been given. The first patent covers various improvements in jacquards in which the needles are controlled electrically, and the second covers an electrically-controlled mechanism for producing the twill as well as the pattern of the fabric.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: O. WILHELMI [Cement cable conduits] 4,944/03.

Dynamos, &c.: C. J. REED [Motor control for wide speed variations] 4,632/99; R. LUNDELL [Motor with two armature windings for series-parallel control] 7,979/99.

Electrometallurgy, &c.: O. IMRAY (*Farbwerke vorm. Meister, Lucius, & Bruning*) [Electrolytic preparation of dyes] 5,277/02.

Switchgear, &c.: R. T. D. BROUGHAM [Control gear for electric ship steering apparatus, turntables, &c.] 5,168/02; F. O. HUNT [Electric braking control of cranes and lifts] 4,497/05.

Telephony, &c.: W. T. HENLEY'S TELEGRAPH WORKS CO., and G. SUTTON [Armouring of submarine telegraph and telephone cables] 5,379/98.

Digitized by Google

reduction in the cost of mains. During the past twelve months in Grimsby he had been laying a 7/16 three-core distributor, and it was astonishing what a long way this would go with small houses. If one of these were laid on each side of the road so as to keep the services quite short, they could get quite a lot laid along the street at a very small cost. Last year, out of 5,000 yards in stock, he actually laid 3,400 yards, and as a few years ago he was laying cables which cost 5s. 3d. per yard, and this 7/16 cable only cost 1s. 8d. per yard, it would be seen what an enormous saving there was. The cost per yard of excavation varied from 8s. 6d. per yard on one job, to about 9d. on another job. The average for the whole year was 1s. 2d. The cost of labour could be reduced by not going to work piecemeal and laying 40 or 50 yards at a time. In Grimsby, a large number of houses had a front garden about 40 ft. in length, which increased the cost of the services. The cost could be reduced by using alternating current and making one service deal with a very large number of houses, using a small transformer and running low-tension wires from house to house. The plan he had adopted, and which saved a considerable amount of money, was to take a pair of houses together and run a service into one, and when the man next door wanted supply they simply drilled a hole through the wall and looped a cable through to another service box. He had recently put in a batch of services of 36 ft. of cable with a seven-foot loop from one house to the other, and the cost came out at 32s., which was considerably less than his average for the year, namely, £3 2s. 11d. In another instance he had put in two services for fourteen semi-detached cottages, and looped from one cottage to another. The services were 42 ft. long, but as the cottages were semi-detached, they had to open the ground in running from one to the other, and consequently did not make as big a saving as they expected, but the cost was, nevertheless, brought down to 30s. per cottage.

Mr. G. WILKINSON (Chief Electrical Engineer, Harrogate) said one point had not been mentioned, and that was the piracy of electrical energy between the cut-out and the meter. If services were laid into all sorts of premises, the occupier could take what electricity he liked by driving a nail into the cable. He had got a very simple device to prevent that, namely, a bifurcating chamber on the meter, which cost 1s., and a similar one on the cut-out, and by simply using a lead-covered side-by-side cable, the pirating of electricity was absolutely prevented. They rather prided themselves in Harrogate that they could lay a service 36 ft. long suitable for a semi-detached eight-roomed house for £2 0s. 6d., one service serving the two houses, and this included current limiter and everything joined up complete for use with the pirating device.

The annual dinner of the Association was held on Thursday evening. "Glasgow and the Neighbouring Corporations" were proposed by Mr. J. Christie (Brighton) in an able speech, and Bailie Thomas Dunlop (Glasgow), and Provost McMillan (Greenock) responded. The toast of the Incorporated Municipal Electrical Association was given by Sir John Ure Primrose. Catching sight of Mr. Ferranti at one of the tables, Sir John diverted from his main theme to allude with eloquent words of appreciation to his pioneer work. The speaker said that he could remember eighteen years ago going to Deptford with Mr. Ferranti, and if immediate acceptance of his doctrine was not a possibility of those days, to-day the elemental soundness of his deductions had been amply vindicated. The name of Mr. Ferranti would ever be associated with a mission resolutely, unhesitatingly, and unflinchingly fought. This reference to Mr. Ferranti evoked great enthusiasm among the audience, and after Mr. Lackie had replied to the toast, Mr. Ferranti was loudly called upon for a speech, and briefly acknowledged the compliment paid him. The last toast, "Our Guests," was proposed by Mr. G. Wilkinson (Harrogate), and Prof. Barr responded.

THE ANNUAL GENERAL MEETING.

The Annual Meeting was held at the Institute of Engineers and Shipbuilders, at 10 a.m., on Friday, June 17th, Mr. Lackie being in the chair. The first business was the election of officers and filling the vacancies on the Council. The ballot resulted as follows:—

PRESIDENT: J. Christie (Brighton).
VICE-PRESIDENTS: G. Wilkinson (Harrogate), (senior), C. E. C. Shawfield (Wolverhampton), (junior).
PAST PRESIDENTS: H. Talbot (Nottingham), S. L. Pearce (Manchester), W. W. Lackie (Glasgow).
HON. SOLICITOR: Alderman G. Pearson (Bristol).
HON. TREASURER: J. E. Edgcome (Kingston-on-Thames).
HON. SECRETARY: H. Faraday Proctor (Bristol).
COUNCIL: R. A. Chattock* (Birmingham), A. C. Cramb (Croydon), C. Furness (Blackpool), F. M. Long (Norwich), J. H. Rider* (London), A. H. Seabrook* (Marylebone), S. J. Watson* (Bury), T. P. Wilmshurst (Derby), Alderman Bruce* (Sunderland), Councillor German* (Brighton), Alderman West* (Coventry), Alderman Sinclair (Swansea), Alderman J. P. Smith (Barrow-in-Furness), Bailie Willock (Glasgow).

New members of Council and those re-elected are marked with an asterisk. Mr. A. A. Day (Bolton), Councillor Howarth (Manchester), Mr. V. A. H. McCowen (Salford), Mr. H. Richardson (Dundee), Alderman C. West (Coventry), and Alderman Wilkinson (Luton) retired from the Council in the ordinary course, whilst a further vacancy was created by the election of Mr. C. E. C. Shawfield (Wolverhampton) as Junior Vice-President. Of the retiring members, only Alderman West (Coventry) was re-elected.

It was the general feeling of the meeting that the Convention in 1911 should be held at Brighton, and it was left in Mr. Christie's hands to make the suggestion to the Brighton Corporation.

A photograph and biographical notice of Mr. Christie appears on p. 407.

REPORT OF THE COUNCIL.*

Standard Specifications.—The Sub-Committee on Physical Standards of the Engineering Standards Committee, upon which the Association is represented, have in hand at the present moment a standard specification for bayonet socket electric lampholders. This specification is already printed in draft. The Sub-Committee also engaged, in co-operation with the manufacturers, in preparing a specification for metal filament lamps. The completion and issue of this specification is, however, likely to occupy some considerable time.

Charges for Current Supplied for Traction Purposes.—A small Sub-Committee has been appointed, consisting of Messrs. McElroy and Spencer, representing the Municipal Tramways Association, and Messrs. S. L. Pearce and T. Roles, representing the I.M.E.A., and the latter Association's representatives have outlined a suggested method of arriving at a correct traction charge which will be considered in due course by the tramway representatives.

Electric Lighting Act, 1909.—The clause to enable local authorities generally to provide electrical fittings, &c., was unfortunately thrown out, although great efforts were made to get it retained. A clause was inserted protecting the property of undertakers from being seized by mortgagees or otherwise. A clause was also inserted protecting authorised undertakers from encroachment by unauthorised undertakers. This clause did not, however, go quite as far as was desired, although it is of considerable assistance.

Financial Organisation and Administration.—Several letters have passed to and from the Local Government Board on this matter, as a result of negotiations carried out by a Sub-Committee representing the different classes of municipal trading departments, and on which the Council is represented by the Honorary Secretary. Sundry meetings were held last summer, but the Local Government Board have taken no further action in the matter, probably owing to the Government being so much engaged with other matters; and as the Council's desire is that the present law shall not be amended, the question remains at present in a condition that is considered satisfactory. It will, however, be carefully watched.

Income Tax and Depreciation.—The Council have given very careful consideration to the above question, but at present they are unable to make any definite recommendations. It is felt generally that there is far too wide a divergence between the lives of assets, as allowed by the Inland Revenue Department for the purposes of assessment, and the Local Government Board for the purposes of loan periods. As indicated in a circular letter addressed to the members on March 4th, one of the largest cities in the kingdom was about to be penalised under the question of assessment of its mains. It is pleasing to be able to record that immediately the attention of the Inland Revenue authorities was drawn to this letter, the question was re-opened, and the allowance will probably be made. Of about seventy-six returns received, it is found that there are eighteen undertakings where the income tax, although payable, has not yet been paid, and eight of these undertakings are resisting the terms offered by the Inland Revenue Department.

Economic Wiring.—The Sub-Committee of the Council appointed to deal with this matter have been in negotiation with a Sub-Committee of the Cable Makers' Association, who, in accordance with suggestions offered, have drawn up a specification for a class of conductor which it is considered would satisfactorily meet the requirements of the fire insurance authorities, and enable installations of this class to be carried out in an efficient manner at a minimum of cost. The Association's representatives on the Wiring Rules Committee of the Institution of Electrical Engineers (Messrs. Edgcome and Christie), have reported on the matter to this Committee, and the question is coming up for their consideration when this section of the rules is being dealt with.

Travelling Studentship.—The Council again expresses its regret at the lack of interest shown by the Associates in regard to the scholarship of £10 offered annually for the best Paper on some approved subject. This year again no entries were received, and the award has only been made twice in four years.

General.—The membership has increased by 26, but there are still some undertakings not represented at all. The Asso-

* Slightly abbreviated.

ciates' Class, in which there are only 41 Members—and 11 Chief Assistants as Associate Members—does not make the progress which it might.

The attendances at the annual Conferences have increased so much that it has been found necessary to reduce the number of invitations sent to those not members of the Association.

DISCUSSION.

Municipal Wiring Powers.

Mr. M. RUDDLE (Dublin) said he desired to impress upon the Council the urgent necessity of taking vigorous steps to have the power of supplying fittings, wires, &c., extended to all municipalities represented in the Association. It was an absurd anomaly to find a very large number of the members of the Association were prohibited from exercising powers which had proved of such great advantage to the remaining members of the Association who possess them. The motto of the Association should and must be equal rights and opportunities for all its members. It might be said that any municipality desiring such powers could promote a Bill, but the cost of an opposed Bill was prohibitive; and, further, such an important matter of the general good should be fought by the Association. He understood that there were some forty or fifty municipalities which had not these wiring powers, and if they would all join in sharing the expense to which the Association would be put, he did not think a large sum would be required from each. In the case of Dublin, he could promise that the Corporation would pay its fair share of any necessary expenditure. He did not know if it was necessary to move a formal resolution, but would ask that the Council should take steps at the earliest possible moment to have the wiring and plant-hiring powers now possessed by some municipalities extended to all the municipalities upon its membership roll.

Mr. F. W. PURSE (Watford) seconded Mr. Ruddle's proposal, and heartily endorsed all that he had said.

Mr. A. C. CRAMB (Croydon) supported the suggestion, and said he did not think the ratepayers of the country really appreciated the importance of this matter. There was rather a tendency to misrepresent the question in the Press. There was no real antagonism to contractors, but it had been found impossible to arrive at a basis of co-operative working. Especially in the direction of developing heating and cooking, contractors would do nothing. In Croydon, solely through the efforts of the supply authority, they had been doing a fair business with electric irons, and he received objections from the contractors as to the discount. He contended that the supply department should at any rate have a portion of the discount.

Alderman PEARSON (Bristol) referred to the Electric Lighting Bill of last year, which originally gave powers to all municipalities to undertake the wiring of premises and the hiring out of plant. When the Bill reached the House of Lords, words were introduced precluding any work being carried out except through a contractor. The Association at once saw that under these circumstances they would be worse off than they were without a clause at all, and, rather than jeopardise the remainder of the Bill, which contained many other valuable clauses, the only alternative (which was adopted) was to secure the deletion of the wiring clause. If all municipalities who had not these powers were to unite in the promotion of a Bill and bring pressure to bear upon their members of Parliament, the Bill could be passed through the House of Commons, but he did not see how they would get the Bill through the House of Lords in its present temper. They had these powers at Bristol, but had secured them by inserting the clauses in a General Powers Bill, some years ago when the Electrical Contractors' Association was not so lively as it was at present. In attempting to promote a Bill their only chance lay in impressing their members of Parliament that they could influence more votes than the contractors.

Councillor BONES (Hastings), in supporting the resolution, said that the Electricity Committee at Hastings had done their best to get these powers, but at present the Corporation outvoted them. He thought that if the Association promoted a Bill itself his own Council would pay their share, but he could not pledge them.

Mr. J. E. EDGCOME (Hon. Treasurer) said that if the different municipalities who desired the Bill were prepared to find the funds the Association would be prepared to promote the Bill, but, as an Association, they had no funds to promote a Bill themselves.

Councillor BONES said his intention was that a Bill should be promoted officially by the Association, but that they should be guaranteed the necessary funds.

Mr. A. BLACKMAN (Sunderland) asked what the cost would be.

Alderman PEARSON said it entirely depended on the degree of opposition met with. It might pass through the House of Commons and cost practically nothing; but, on the other hand, the Contractors' Association might oppose them in both Houses, and they would have to spend anything from £100 to £500.

Mr. T. D. CLOTHIER (Bootle) said that all the speakers so far seemed to be in favour of taking some action in this matter, but he was connected with a corporation who were opposed to municipal trading of this character, and he thought there must be many others of the same opinion. So strong did the Bootle Corporation feel on the matter that he believed they would withdraw their support from the Association if any such strong action were taken as had been suggested that morning.

Mr. H. FARADAY PROCTOR (Hon. Secretary) said that the members could have every confidence that the Council would not take any action unless they had the confidence of a very large majority of the members.

Mr. W. G. PICKVANCE (Wrexham) said he was astonished to hear Mr. Clothier's remarks. When he first went to Wrexham he had intended to dispose of the wiring department, and to continue the work with the assistance of contractors. He found, however, that it was no use attempting co-operation, and he had been compelled to continue the department, which was a very successful one. It was evident that there was business to be had if the contractors had only endeavoured to get it. He did not believe many municipalities held the views held by Mr. Clothier.

Mr. S. J. WATSON (Bury), asked what had become of the proposal by Mr. Hoadley, of Maidstone, to promote a Bill dealing with this matter.

Mr. A. C. CRAMB (Croydon), in the absence of Mr. Hoadley, said this Bill had had to be dropped owing to the necessity for every municipality calling a town's meeting to put the Borough Funds Act into force.

The PRESIDENT then announced that Mr. Ruddle had agreed to an alteration in his proposed resolution, so that the powers sought should not be confined to members of the Association, and that subscriptions should be asked from all municipalities. Speaking for Glasgow, although the Corporation had these powers, they were prepared to support such a Bill, but not if it were promoted by the Association. As the matter stood now, it merely devolved upon the Council to consider what action could be taken in the promotion of a Bill.

The report was then put to the meeting and adopted.

Honorary Member.

The PRESIDENT announced that the Council had unanimously elected Mr. C. H. Wordingham as honorary member of the Association.

An Information Bureau.

Mr. E. S. RAYNER (Doncaster), referring to the number of inquiries which central station engineers receive each year for information on various points, asked if it would not be possible to deal with these from some central source by the Association. This would avoid a great deal of repetition work, as records could be kept, and many of the points upon which information was now asked could be answered immediately.

Mr. J. E. EDGCOME said this idea was a pet hobby of his, and he had raised it in his Presidential Address in 1906. The difficulty, however, was expense, and the only way of meeting this seemed to be by a large increase in the annual subscription. His idea was that engineers wishing to have information should pay for it, just as now they had to bear the cost of postage, &c., in sending out circulars all over the country. The Council would only be too pleased to co-operate any suggestions that might be made on the subject to prevent the constant overlapping of inquiries, which no doubt they all found irksome to some extent.

Mr. H. FARADAY PROCTOR said that, as honorary secretary, he was to a certain extent treated as an information bureau, and he heartily supported the suggestion of Mr. Rayner. He felt, however, that there would be a tendency for the number of inquiries to increase considerably if a central bureau were established, and unless sufficient funds were forthcoming it would not be feasible to carry it on.

Mr. J. H. CLOTHIER (St. Annes-on-Sea) thought a start might be made with a central bureau if those engineers who had collected information on various points were to present copies of it.

Mr. F. AYTON (Ipswich) supported Mr. Clothier's suggestion, and proposed that the Council might decide at the end of the year which information was worthy of inclusion in the proceedings.

Mr. H. RICHARDSON (Dundee) thought the trouble had, to a great extent, been exaggerated. It was very little trouble to answer these questions, and it should be remembered that the engineers themselves did not do the actual work.

Mr. J. H. CLOTHIER made another suggestion, namely, that special committee rooms should be set aside at each annual Convention, where subjects on which special information was desired could be discussed.

The PRESIDENT announced that the Council would give the matter their careful consideration.

Constitution of the Council.

Mr. W. G. PICKVANCE suggested that the Council might be enlarged with a view to including a few representatives of smaller stations. At present the members of Council mainly represented the large power stations, whereas there were a far larger number of smaller stations represented by the Association, but which were not represented on the Council.

The PRESIDENT pointed out that Mr. Pickvance could, with the assistance of ten other members, requisition a special meeting of the Association to discuss the matter. It was a point which could only be dealt with by special meeting, and was fully provided for by the Articles of Association.

Mr. PICKVANCE, in answer to Mr. Edgcome, said his idea was

Digitized by Google

to define that the Council should consist of so many members, each representing certain sized stations.

Special Committees.

Mr. C. TURNBULL (Chief Electrical Engineer, Tynemouth) asked if it would not be possible for the Council to appoint special committees to discuss problems which were not of interest to the general body of the members, but which were of extreme importance to those working under particular circumstances, such, for instance, as those supplying tramway companies with electrical energy. Difficulties of this character had arisen at Peterborough and Hartlepool, and considerable assistance might be afforded by the appointment of special committees as he suggested.

Supply Outside Area.

Mr. F. W. PURSE (Chief Electrical Engineer, Watford) called attention to a difficulty which he had encountered in connection with supply outside his borough by authority under the Electric Lighting Act of 1909. Before they could go to the Board of Trade for permission to lay their mains, they had to get the permission of the road authority concerned. In his case the Hertfordshire County Council had compelled him to deposit certain sums of money before granting their permission.

Alderman PEARSON (Hon. Solicitor) thought the case was covered by the Electric Lighting Act of 1909, which provided for granting a licence by letter for supplying energy outside their boroughs. If unreasonable conditions were imposed by the outside authority, the Board of Trade could dispense with their consent.

The Joint Publicity Committee.

Mr. A. C. CRAMB (Chief Electrical Engineer, Croydon) mentioned that the Joint Publicity Committee of London has decided to extend their scope, if possible, to include all the provinces, and had dropped the words "of London" from their title. He had been asked to suggest that the Association should appoint two members to represent the provinces on this Committee.

It was decided to appoint Mr. J. Christie (Brighton) and Mr. F. Ayton (Ipswich).

Special Clauses.

The PRESIDENT stated that there were three clauses to which the Council was giving special attention with a view to getting them passed into law. There was the wiring clause; the stand-by clause, which did not cover everything, there being cases in which motors were used as stand-by to gas-engines; and there was the question of expenses of delegates attending their conferences, which in some cases the Local Government Board would not pass.

The Conference concluded with a hearty vote of thanks to the retiring President, Mr. W. W. Lackie, and to the Glasgow and Edinburgh Corporations for their hospitality during the Convention.

THE WATKIN SWITCH

WE have had an opportunity of inspecting the latest pattern of the device known as the "Watkin" switch, at the offices of the Adams Watkin Co., Ltd. (56 Victoria Street, London, S.W.). This device is intended to be inserted in series with electric lamps, motors, fans, or heating or cooking apparatus, and enables the user to regulate these in a convenient way and to effect economy. It consists of a seven-way switch similar in external appearance to an ordinary tumbler switch. The dolly-head, however, works a lever which moves a contact-piece over a row of contacts and successively cuts out or inserts resistances in series. The resistance units each consist of a large number of short pieces of rod of a special composition laid side by side and clamped in a brass frame with mica insulation. Both the switch-movement and the resistances are enclosed in a metal case of artistic design. Special care has been taken to ensure that the resistances are well ventilated to prevent excessive heating, and the composition employed has a temperature coefficient of practically zero, so that the resistance does not vary. Thus, if the device is in series with a delicate rotary surgical instrument, the speed is claimed to remain steady and not to vary due to the heating up of the resistances. When used in series with lamps, any desired reduction of illumination can be obtained, and the current in the circuit is reduced. Thus in the case of lamps reduced to about half brilliancy, an actual economy of about 20 per cent. in the consumption is effected. The use of this regulating switch is also claimed to lengthen the life of metal filament lamps, as they are run for a considerable time below the rated candle-power, and, furthermore, as they may be turned on only after cutting out the resistances, the rush of current on first switching on (due to the low resistance of the cold filament) is avoided. The switch is supplied in various sizes for lamps or other apparatus taking from 70 up to 600 watts, and larger sizes can be obtained to order.

Junior Institution of Engineers.—The summer meeting of this Institution will take place at Dublin and Belfast, from July 16th to 23rd. Visits will be paid to the Ringsend power station of the Dublin United Tramways Co., the shipbuilding and engineering works of Messrs. Harland & Wolff, and other works of engineering interest. Receptions and meetings will be held in Dublin and Belfast.

MUNICIPAL v. COMPANY SUPPLY AT RADCLIFFE

Competition by Lancashire Power Co. Refused

THE Board of Trade have given their decision in regard to the application made a few months ago by the Lancashire Electric Power Co. for a provisional order to supply electricity in Radcliffe in competition with the Council. The Council at present supply under an ordinary electric lighting provisional order. The company alleged that there is a large demand in Radcliffe at present which the Council is unable to meet, and they asked to be allowed to compete for all power consumers above 50 h.p.

Whilst refusing the company the provisional order which they sought, the Board of Trade express the opinion that from the evidence at the inquiry it appears to them the facilities for a cheap supply of electric power in Radcliffe are inadequate, and urge the Council to take the necessary steps to remedy this. In the event of the company making a fresh application at a later date, the Board state they may find it necessary to arrive at a different conclusion if it is again shown that the demand is not being adequately met.

PREVENTION OF ELECTRICAL ACCIDENTS IN FACTORIES

THE annual report of the Chief Inspector of Factories and Workshops for the year 1909 contains the annual statement of the electrical inspector, Mr. G. S. Ram. At the outset Mr. Ram points out that the new regulations came into force generally on July 1st, 1909, and on January 1st of this year as regards such parts of electrical stations as were constructed before July 1st, 1908. These regulations were given in ELECTRICAL ENGINEERING, Vol. V., p. 57. Mr. Ram states that, though in general steps are being taken to comply with the regulations, a good deal of difference of opinion exists as to what is sufficient and adequate, and that some guidance, such as that contained in his recent memorandum, of which a notice was given in ELECTRICAL ENGINEERING, is very generally desired. He suggests that public supply undertakings should supervise the factory installations connected to their mains in reference to the regulations. After referring to one or two doubtful cases of exemption from the rules, such as house circuits supplied from auto-transformers connected to mains at more than 125 volts, Mr. Ram remarks that his suggestions with regard to the design of wall plugs to obviate danger to the user's hand by arcing, have been taken up, and that plugs embodying the features he described have been put on the market. These have a guard disc between the person's fingers and the contacts, and the flexible wires enter from underneath the disc, and do not pass through the hand. In connection with fuse-boards, Mr. Ram points out these are frequently constructed so that the fuses cannot be renewed without danger, especially in the case of small distributing boards. In a design obviating the danger the fuse wires are attached to contacts fixed in porcelain holders, arranged in such a way that they can be readily handled without danger of touching any live metal, and the operator's fingers are also shielded. The fixed contacts are also protected by porcelain plates.

Out of 447 accidents in electricity works, 90 were due to electrical causes, and of these only four were fatal. Of the 24 accidents at switchboards during ordinary routine work, six appear to have been due to faulty switches, in some cases owing to the non-provision of a quick-break action. Several were due to mistakes on the part of the switchman. Two accidents occurred in operating isolating switches on a H.T. system. In one case the accident was due to a faulty method of interlocking the switches, and in the other to a mistake in pulling out a switch while it was on full load. A mistake of this kind on a large system is always likely to involve serious injury to the operator, and may cause a stoppage of the supply. In many stations no means are provided for guarding against such mistakes; thus, there are often a number of isolating switches, all exactly alike, and without labels. Some recent switchboards have the isolating switches enclosed in cells having doors interlocked with the oil switches, so making it impossible to operate them under current. In other cases the isolating switches are worked by gearing interlocked with the oil switches. For existing switchboards, where a positive interlocking arrangement may be impracticable, an ammeter might be provided on each conductor, just below the isolating switch, or an indicator might be fixed at the isolating switch, mechanically operated by the oil switch, to show whether the latter is open or closed. Accidents to persons cleaning, or working near live conductors number 50, and include the four fatal cases. Three of these

Digitized by Google

occurred to unskilled labourers. Mr. Ram points out that since January 1st of this year, the employment of unskilled persons under such circumstances is forbidden under the regulations, and that such accidents, may therefore involve serious consequences to those responsible. The fourth fatality occurred to a sub-station attendant. A transformer, one of several connected in parallel, had broken down, and he was disconnecting it for removal. The H.T. supply had one conductor connected to earth, and in removing the connection to the earthed conductor he appears to have broken its continuity. The terminal which he was holding, although normally at earth potential, consequently became charged at high pressure. The man was acting contrary to the rules of his employers in undertaking such work when alone. Under the regulations such work in future may not be undertaken by any person unaccompanied.

The number of electrical accidents in factories and engineering shops is slightly more than last year, namely, 257, but there have been only eight fatalities. The 39 accidents due to the arcing of switches and motor starters are mostly caused by defects in the apparatus. The use of cheap switches, too small and flimsy for the work, is not unfrequently the primary cause. The 17 accidents from arcing of fuses nearly all occur through the use of unprotected open fuses; ten of these were on motor-starting panels, where the fuses were placed near the switch handle. The 27 accidents in the renewing of fuses were mostly due to short circuits in replacing fuses in live terminals. Of 45 accidents with portable apparatus, 23 were due to burns from short circuits, or shock, when handling the flexible wires. Frequently the flexible wires are insufficiently protected against damage, or are in a damaged condition. Twelve were due to short circuits at connectors when plugging in or out. Three were due to shock from portable lamps, one being fatal. In the fatal case, the lamp was of the old type, now prohibited by regulations. The 32 accidents from unprotected conductors include six fatalities. One of these occurred to a man working close to the live wires of a travelling crane. The obvious precaution of switching off the pressure before the work was undertaken was omitted. Under the regulations definite responsibility is now placed upon the occupier or the contractor in such circumstances. The second fatality was similar. A third fatality due to contact with bare conductors on an overhead travelling crane appears to have been due to the man's own fault. The fourth fatality occurred to an experienced electrician, working on a corrugated iron roof over which passed bare wires (400 volts, three-phase), at a height of five feet from the roof, and Mr. Ram again emphasises that wires crossing roofs of buildings should be at such a height that they cannot be touched. The fifth fatality occurred to an unskilled man who was "cleaning up." He touched a bare terminal at the back of a motor switch panel, 440 volts, three-phase. Mr. Ram writes that many appear to think that if a switch is covered it is all that is necessary, although there may be exposed live terminals at the back. In this case the man appears to have got a shock to earth while standing on a dry cement floor. It is frequently supposed that such a floor is insulating, whereas it cannot be relied upon for safety, even at low pressures. The sixth fatality occurred on a 230-volt single-phase system. A lighting wire, having no protection beyond the ordinary covering of insulating material, was attached to a wooden beam. A chain sling had been put round the beam, and a block and tackle were suspended therefrom for lifting an iron plate weighing half a ton. The chain cut through the insulating material of the wire, and the whole tackle and iron plate became live. Two men received shocks, one being killed. Of the 26 non-fatal accidents under this heading, thirteen were due to unprotected wires within reach of any person employed. Thirty-three accidents occurred to skilled persons when working on live conductors, and one was fatal. In this case, a wireman having to carry out some alterations removed the main fuses in order to make the circuit dead. To do this he had to remove the cover of the fuse box, but he did not trouble to replace it, and subsequently accidentally touched one of the live fuse terminals when standing on wet ground.

Finally, Mr. Ram comments on the use of danger boards, asserting that they are rarely necessary in factories, as there should be no exposed conductors. Boxes, dangerous only when opened, should only be opened by authorised persons, and such boxes might have warnings on their covers. In works where high-pressure is employed temporarily for testing, boards are necessary, but they should be put out only when there is danger.

LOCAL NOTES

BRADFORD: *Tramway Accounts.*—The total expenditure for the year has been £170,699, which is a slight increase over that of the previous year. The expenses per car mile amounted to 7·149d., as against 7·221d. for the previous year, in spite of an increase of 0·039d. per car mile for repairs and maintenance. The net profit on the year's undertaking was £32,365, as compared with £15,318 for the previous year. £20,000 is being handed over to relief of rates, and £12,365 transferred to reserve and renewals account.

CARDIFF: *Trolley Omnibuses.*—The suggestion of the electrical engineer regarding a trolley omnibus service for the outlying districts, such as Whitchurch and Llandaff, has been referred to the Parliamentary Committee.

DOVER: *Electricity Accounts.*—The total receipts amounted to £16,574, and the expenses to £9,545. The capital charges, however, were £12,333, so that there is a final adverse balance of £227, a slightly better result than that of the previous year.

GREAT YARMOUTH: *Electricity Accounts.*—The total expenditure, including generating expenses, management expenses, &c., for the year ended March 31st, was £11,147, and the total income £20,334, giving a gross profit of £9,087; of this £948 was carried to depreciation, and £7,490 absorbed by capital charges, leaving a final net profit of £649.

HANLEY: *Appointment of Electrical Engineer.*—At a meeting of the Electrical Committee of the Federated Boroughs last Wednesday, the applications from the four engineers who had charge of the undertakings of Hanley, Burslem, Stoke, and Longton, for the post of engineer to the combined undertaking, were considered. After considerable discussion it was decided to recommend Mr. C. H. Yeaman, of Hanley, for the appointment. We understand that Mr. Yeaman had a majority of five or six votes over Mr. Tiddeman, of Stoke.

LEEDS: *Electricity Accounts.*—The annual report states that there has been a reduction in every group of items of expenditure except rates and taxes, the aggregate reduction being £5,762. The cost per unit generated, including capital charges, works out at 1·74d. per unit and the average price obtained at 1·91d. The net surplus is £8,931, which has been applied to the relief of rates.

LONDON: *L.C.C. Tramways.*—A report of the Finance Committee gives the estimated surplus on the electric lines for 1910-11 as £934,180, and the deficiency on the horse trams as £22,170. The net surplus, after deduction of capital charges, &c., is given as £244,132, which would be divided between renewals and general reserve funds. It is estimated that a further capital expenditure of £2,800,000 will be required to complete the system.

The first portion of the tramway shelter on the Embankment, near Blackfriars Bridge, is now in position, and will be used experimentally before the completion of the work. The complete shelter will provide a length of 180 feet under cover, and the estimated cost is £1,200. The consent of the City Corporation will be necessary before its completion.

The Highways Committee of the London County Council recommend approval of estimates amounting to £54,350 for the construction of the authorised new line from Battersea Park Road to King's Road, Chelsea. The line will involve special conduit construction where it crosses Battersea Bridge, and considerable alterations will have to be made to the structure of the bridge. The cables will be carried in steel pipes suspended from the steelwork under the road surface.

Hammersmith.—The Borough Accountant reports that the gross receipts of the electricity department for the year ended March 31st, 1910, were £53,433, and the gross expenditure £28,278. After payment of interest and instalments of loan a net surplus for the year of £3,482 is shown.

Hampstead: Electricity Accounts.—The receipts of the undertaking for the year ended March 31st last amounted to £60,270, as against £62,879 in the previous twelve months.

Westminster.—The Assessment Committee report that an appeal was entered by the Kensington and Knightsbridge Electric Lighting Company, Ltd., against the Supplemental Valuation List, dated May 30th, 1908, in respect of the omission on the part of the undertaking of the company in the parish of St. Margaret and St. John. The correction which the company desired to have made in the list was that the property should be inserted therein at a reduction of £900 rateable value. By agreement the appeal came before the arbitrators and an umpire, and a special case was subsequently stated for the decision of the High Court. The matter was referred back to the umpire, but a settlement has since been effected on the terms that the property of the company be inserted in the Supplemental List in question at a reduction of £400 rateable value, that the appellants and respondents respectively bear their own costs, and that the committee pay one-half of the umpire's fees.

LOWESTOFT: *Trolley 'Buses.*—The General Manager of the Tramways has been directed to prepare a report on the trackless trolley system in connection with the Kessingland Light Railway.

ROCHDALE: *Tramways.*—The new line from Ending to Whitworth was opened for traffic last week, after inspection by the Board of Trade, and a through service from Rochdale to Whitworth has been commenced.

STAFFORD: *Electricity Accounts.*—The receipts showed a slight decrease, and were £7,344, and the net revenue was £2,478. After meeting capital charges, £340 was transferred to depreciation, and £144 carried forward.

Digitized by Google

WEYMOUTH: *Electricity Accounts.*—The gross receipts amounted to £6,184, and the expenditure was £2,822. After meeting capital charges, however, there was deficiency of £113, but £101 was carried forward from the previous year.

WORKSOP: *Electricity Accounts.*—The total income showed a small increase over that of the previous year amounting to £17,918, and the final balance, after meeting capital charges, was £576.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BELFAST.—Tenders are invited for erection of a chimney shaft and flues at the power station. Particulars from the City Surveyor, and tenders by Monday next, June 27th.

GILLINGHAM.—Application is to be made to the Local Government Board for a loan of £3,500 for various items connected with the electricity undertaking.

LLANDAFF AND DINAS POWIS.—The Council require E.H.T. switchgear, transformers, distribution switchboard, mains, &c. Particulars from the Consulting Engineers, Messrs. Herbert Lewis & Fletcher, Prudential Buildings, St. Mary Street, Cardiff, and tenders by July 4th.

LONDON: *Battersea.*—Application is to be made to the Local Government Board for a loan of £13,909 for extensions to mains, &c.

Hammersmith.—Tenders are to be invited for a supply of service cables and one 200 kw. transformer.

Hampstead.—The recommendation of the Committee that further plant be installed at the station to the total amount of £6,600 (condensers £3,100 and cooling towers £3,500), has been agreed to.

Islington.—An estimate of £60 has been passed for extending mains to give a supply of current for lighting and power purposes to the Shoreditch Board of Guardians' Workhouse in Hazelville Road.

MANCHESTER.—Tenders are invited by the Corporation for two 25-K.V.A. three-phase transformers, and high- and low-tension switchgear. Particulars from Mr. F. E. Hughes, Secretary of the Electricity Department, Town Hall, and tenders by Friday next, June 24th.

NEWPORT (MON.).—Tenders are invited for high- and low-tension switchgear. Particulars from Borough Electrical Engineer; deposit, £3. Tenders by June 27th.

PEMBROKE (Ireland).—A Local Government Board inquiry was held last week regarding a loan of £8,000 for extensions.

PORTSMOUTH.—A Local Government Board inquiry was held last week regarding a loan of £24,000 for electricity purposes.

RAWTENSTALL.—The Corporation have instructed the Town Clerk to make application to the Local Government Board for sanction to borrow a further sum of £11,000 for electricity purposes.

ROCHDALE.—A Local Government Board inquiry was held last week regarding a loan of £13,941 for extensions to the Electricity Works, including battery and boosters, transformers, mains, &c.

SHANGHAI.—Tenders are invited for two 940 k.v.a. transformers and switchgear. Particulars from Messrs. Preece & Cardew. Tenders by July 10th.

Miscellaneous

AUSTRALIA.—Tenders are invited by July 19th for 4,000 telephone sets.

BARNET.—Subject to the approval of the Local Government Board, tenders are to be invited by the Guardians in regard to a scheme for providing electric light and power at the workhouse at an estimated cost of £700.

DUBLIN.—Tenders are invited for the installation of an electric lighting plant in the neighbourhood of Dublin. Particulars can be obtained from Mr. P. O'Hare, 15 Wellpark Avenue, Drumcondra. Fee 10s. 6d.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

W.C.—Proposed nurses' home at the London Homœopathic Hospital, Gt. Ormond Street, Holborn. Architect, E. T. Hall, 54 Bedford Square, W.C.

Reconstruction of Middlesex Music Hall, Drury Lane, W.C. (£2,700). Architects, F. Matcham & Co., 9 Warwick Court, W.C.

Reconstruction of Royal Standard Music Hall, Victoria Street, S.W. Architects, F. Matcham & Co., 9 Warwick Court, W.C.

N.—Handicraft centre, Barnsbury Park site, Islington, N. Builders, Patman & Fotheringham, 100 Theobalds Road, W.C.

The London County Council invite tenders for wiring and fitting the St. Mark's Road and Haverstock Hill schools. Particulars from the Chief Engineer to the Council, and tenders by July 6th.

E.—Cinematograph palace, Plashet Lane, East Ham. Sir John H. Bethell, M.P., Woodford.

School, Malmesbury Road, Bow and Bromley, E. Architect, L.C.C., Education Committee, Victoria Embankment, E.C.

PROVINCES.

ARMAGH.—School (£2,000). Secretary, Education Committee, Armagh U.D.C.

ASHINGTON (Northumberland).—Council offices (£3,000). Architect, O. Blyth, 28 Wansbeck Terrace, Ashington.

BLACKWALL.—Extensions, Masonic Hall (£1,700). T. Kershaw, architect, Halifax.

BOOTLE.—Theatre. Architect, J. H. Sutton, 101 Dale Street, Liverpool. J. & G. Chappell, builders, Walton, Liverpool.

BOURNEMOUTH.—Theatre (1,000 pl.), for the Bournemouth, Exeter & Plymouth Bioscope Theatres, Ltd.

BRIDGWATER.—Drill hall (£2,000). Architect, P. G. Fry, 49 High Street, Weston.

BURNLEY.—Extensions, Trafalgar Mill (£6,000). Architect, S. Taylor, 78 Manchester Road, Burnley.

BURY.—Extensions to workhouse (£8,700). J. Isherwood, Clerk, Board of Guardians, Bury.

CHICHESTER.—Improvements at infirmary (£10,000). F. B. Tompkins, Clerk, Board of Guardians, Chichester.

DOWLAIS.—Congregational Church (£6,000). The Trustees.

EXMOUTH.—Manual training and art school (£1,800). Architect, P. Morris, 1 Richmond Road, Exeter.

GLASGOW.—Extensions, Andersbon Special School (£2,500). Architects, J. M. Munro & Son, 28 Bath Street, Glasgow.

HEATON (Newcastle).—Hall (£12,000). Architects, White & Stephenson, Grey Street.

READING.—Proposed county offices (£19,276). Surveyor, Berks County Council.

WELLSHOT.—Extensions, school (£10,000). Architects, J. McKissack & Sons, 68 West Regent Street, Glasgow.

TENDERS RECEIVED AND ACCEPTED

BURY.—The tender of the British Westinghouse Co. for a Belliss engine and dynamo (£1,083) has been accepted, subject to the approval of the Local Government Board for the loan.

LONDON: *Battersea.*—The Borough Council has accepted the tender of Baxter & Caunter, at £63 3s. 6d., for the supply of two motors at the Culvert Road depôt.

Hammersmith.—The Borough Council recently accepted the tender of Ferranti, Ltd., for the supply of high-tension switchgear at £155 2s. 6d., and low-tension switchgear at £32 10s. The firm subsequently wrote that they had made an error, and that their tender for high-tension switchgear should be £256 15s. The Council has permitted Ferranti, Ltd., to withdraw their tender, and has accepted the tender of Cowans, Ltd., for high-tension switchgear at £217, and low-tension switchgear at £39 10s. They have also accepted the tender of W. R. and A. Hyde to construct a sub-station at Chancellor's Wharf for £49 10s.

METROPOLITAN ASYLUMS BOARD.—An order has been placed with W. J. Fryer & Co., to carry out, under the supervision of the Engineer-in-Chief, the installation of low-voltage metallic filament lamps at Tooting Bec Asylum. The estimated cost of the work is £350.

NEWPORT (Mon.).—The contract for motor generator plant has been awarded to the General Electric Co., Ltd., the lowest tenderer. Tenders were also received from the following firms: British Thomson-Houston Co., Ltd.; Dick Kerr & Co., Ltd.; Johnson & Phillips, Ltd.; British Westinghouse Electrical and Manufacturing Co., Ltd.; Brush Electrical Engineering Co., Ltd.; Lahmeyer Electrical Co., Ltd.; Crompton & Co., Ltd.; Siemens Bros. & Co., Ltd.; Electric Construction Co., Ltd.; Lancashire Dynamo Co., Ltd. Bruce, Peebles & Co.

WEST HAM.—The Education Committee has accepted the tender of Pritchetts & Gold, at £75 4s. 7d., for renewing the plates of the main storage battery at the Technical Institute.

OSRAM·LAMPS

Digitized by Google

APPOINTMENTS AND PERSONAL NOTES

Colonel R. E. Crompton, C.B., has been appointed Consulting Engineer to the Road Board.

Mr. P. F. Allan has resigned his position with the Clyde Valley Electric Power Co. to join the London staff of Messrs. Siemens Bros. Dynamo Works, Ltd. On taking leave of Mr. Allan last week, the staff of the Clyde Valley Electric Power Co. presented him with a suit-case.

In connection with the foreign appointment which, as announced in our last issue, is being taken up by Mr. H. M. Sayers, we are asked to announce that the business which he has carried on at 39 Victoria Street, S.W., since August, 1906, has been transferred, as from Friday, June 10th, to his eldest son, Mr. William Higley Sayers, who is carrying it on in his own name and responsibility. All matters of account referring to Mr. H. M. Sayers' practice will be dealt with by Mr. Alfred G. Sayers, chartered accountant, of Messrs. Sayers and Wesson, 19 Hanover Square, W.

A proposal of the Devonport Electricity Committee that the salary of the Borough Electrical Engineer, Mr. J. W. Spark, should be increased from £300 to £350 per annum by two annual instalments of £25 each was referred back to the Committee, who, however, have confirmed their previous proposal.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—Liverpool Electric Cable Co., interim dividend of 5 per cent. Melbourne Tramway & Omnibus, 4½ per share for the quarter ending June 30th, equivalent to 15 per cent. per annum. Winnipeg Electric Railway, 10 per cent. for the quarter ending June 30th. Hobart Electric Tramway Co., 1s. per share, payable July 1st.

ANGLO-ARGENTINE TRAMWAYS CO.—An issue of £1,500,000 five per cent. debentures is offered at 96½ per cent. by the Law Debenture Corporation.

ELECTRIC LIGHT & POWER CO. OF COCHABAMBA.—Subscriptions are being invited for an issue of £300,000 six per cent. bonds of this company, which is incorporated under the laws of Bolivia.

NORTH-WESTERN ELECTRICITY AND POWER GAS CO.—A petition for the winding up of this company will be heard on June 29th at the Court House, Manchester.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £57 10s. to £58 per ton (last week, £58 to £58 10s.).

SUNBEAM LAMP CO., LTD.—This company has taken premises at 58 Berners Street, which will be in future their London stores department. Communications are to be addressed as before to 102 Charing Cross Road, but supplies will be made from the stores at 58 Berners Street (Tel., Central 2855).

COMPANIES' MEETINGS AND REPORTS

TORQUAY TRAMWAYS CONSTRUCTION SYNDICATE.—At the annual meeting recently it was stated that an issue of prior lien debentures would have to be made to carry out the extension to Paignton. The profit on the year's working was £2,427, which has been carried forward. The traffic receipts increased by £490, but owing to the heavy cost of working the surface-contact system, there was a decrease in the profit. In consequence of the refusal of the Board of Trade to sanction a continuation of the surface-contact system, negotiations are being carried on with the Corporation for installing the overhead system, and there seemed to be every reason to assume that this course would be adopted.

ARON ELECTRICITY METER.—The directors recommend the payment of a further 9 per cent. on the preference shares, representing 3 per cent., the remainder of arrears, and the full 6 per cent. dividend for the past financial year, amounting altogether to £11,240, and a transfer to reserve towards goodwill and patents of £6,000 (making this reserve £25,000), leaving a balance of £6,679. Out of this amount it is proposed to appropriate £1,326 to pay off the arrears of management commission and directors' fees, held in suspense pending the payment of arrears of preference dividend, and to carry forward to next year's account the balance of £5,353.

BRITISH ELECTRIC TRACTION CO.—At the ordinary general meeting last Friday, Sir Charles Rivers Wilson said that the net profit was only a little better than in the preceding year, but that there were indications of future improvement. The dividend paid on the preference shares was small, but strengthened the financial position of the company in various ways. The general reserve fund now amounted to £633,000, including the addition of £41,780 made during the year. Special reserves and sums written off also amounted to £13,000. The portion of their investments which did not yield any return was £342,000 less than in the previous year. It was as yet impossible to trace how much of the improvement in receipts was due to the introduction of the "fair fare" system. He spoke hopefully of the prospects of the Metropolitan Electric Tramways, but said that the Birmingham and Midland group had suffered severely from the system having been cut up into sections owing to local authorities deciding to municipalise. The City of Birmingham Company, however, was a good example of what could be done in large cities. The Bombay tramways and supply business promised to become one of their best undertakings. Business in the Yorkshire and Potteries districts had been very depressed, but they were receiving a small return for their shares in these companies. The report and accounts (see ELECTRICAL ENGINEERING, June 16th, p. 402) were adopted.

MARCONI WIRELESS TELEGRAPH CO.—According to the report for 1909, the profit for the year, notwithstanding the effects of the destruction of the Glace Bay station by fire, was £11,432. Arrangements were being made whereby the £144,279 owing by the Canadian Company would be repaid at an early date. The French and Belgian companies had declared dividends of 5 and 10 per cent. respectively. A dividend is recommended on the 7 per cent. cumulative preference shares up to June 30th, 1909. It is stated that the Transatlantic service is being conducted regularly.

Wireless Telegraphy.—According to the *Times*, the New York police have arrested Mr. C. Wilson and Mr. S. Bogart, president and vice-president of the United Wireless Telegraph Co. of New York, on a charge of fraud. The company ostensibly sought to combine all the wireless telegraph concerns, including the De Forest and Marconi, and professed to have secured a controlling interest in all the concerns. This is now declared to be untrue. It was also stated that the assets included patent rights worth over £1,100,000, whereas their actual value is said to be under £4,200. The shares sold are believed to have brought in several millions of dollars.—As already stated in ELECTRICAL ENGINEERING, the Marconi Co. have already commenced proceedings against this company for infringing the British Marconi patents.

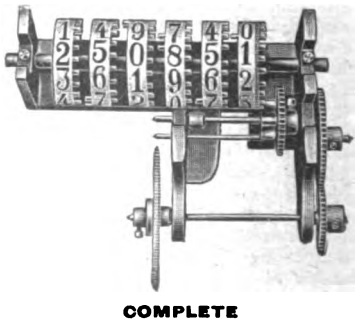
Parliamentary.—The London Electric Supply Bill, which provides for the purchase by the London County Council of the five electric supply companies in the West-end of London, was read a second time in the House of Commons on Thursday.

The Yorkshire Electric Power Bill, which gives the company authority to raise new capital and to finance firms taking electric power from the company, was before the Unopposed Committee of the House of Commons last Thursday. As in the case of the Newcastle-upon-Tyne Electric Supply Bill last year, the Committee objected to the principle of this application, holding the view that it practically turned the company into a money-lending concern. The clause in question was modified, limiting the company to lend money only in respect of electrical undertakings authorised by Parliament.

The London County Council Tramways Bill is still under consideration by a Committee of the House of Commons, the various lines proposed by the Bill being considered in considerable detail.

Instruments & Machinery Tested

THE ELECTRICAL STANDARDIZING, TESTING AND TRAINING INSTITUTION.



FARADAY HOUSE,

62-70, SOUTHAMPTON ROW, LONDON, W.C.

Telephone No.: 9999 Central. Teleg. Address: "Standardising, London."

Tests every kind of Electrical Instrument, Apparatus, and Material.

A Scale of Fees will be sent on application to the SECRETARY.

SUMMARY

A proposal by the London County Council to delete the word "black" from the clause dealing with smoke nuisance in the Public Health Act has been rejected in the House of Commons. The North and South Shields Tube Railway Bill has been withdrawn. The London United Tramways Co. are to be allowed to use the overhead system on Kew Bridge. (Page 426.)

Captain Scott's South Pole Expedition will have the advantage this year of carrying telephones, enabling conversation to be carried on between the main party and the exploring party up to a distance of 26 miles. Aluminium wire will be employed for the line, laid on the ice or snow without other insulators. A description of the equipment appears on page 427.

Sir John Gavey, C.B., delivered the "James Forrest" Lecture at the Institution of Civil Engineers last week, and dealt in an interesting manner with the progress of telegraphy and telephony. (Page 427.)

A short article describes the principal features of the thermo-electric recording and other pyrometers of Messrs. Siemens Bros. & Co. (Page 428.)

Among the features of electrical engineering interest at the Brussels Exhibition are some generators of large size, including a 10,000-kw. Bergmann turbo-alternator. German electric plant is better represented than that of any other nation, but there are, as might be expected, some fine exhibits of Belgian plant. The electrical industries of the Netherlands and Switzerland take their place, but the French exhibits have suffered by extreme backwardness in their erection. The British Section contains little heavy plant of a purely electrical nature, but there is a fine display of electrical instruments and smaller appliances. British gas engines are well represented, however, and British-made air-compressors, coal-cutters, electric lifts, railway signalling gear, and clocks are shown, and there are some interesting exhibits of boiler-house plant. (Page 429.)

A new alternating-current instrument, designed by Dr. W. E. Sumpner, was described in a Paper recently read before the Physical Society. (Page 432.)

A novel electrical machine has been introduced. It consists of a worm-wheel meshing magnetically with a worm wound like an ordinary armature. Running the worm as a motor provides a means of obtaining a low-speed drive without mechanical gear or a slow-speed motor, while the worm can be run as a high-speed dynamo by coupling the worm-wheel to any slow-speed engine. (Page 432.)

The following are reviewed in this issue: "Walker's Loose-Leaf Pocket-Book for Engineers," with tables, &c., by Norman R. Corke; Spon's Architects' and Builders' Price Book. (Page 433.)

In a Paper read before the Birmingham Section of the Institution of Electrical Engineers, Mr. H. W.

Digitized by Google

Kefford described some experiments on fuses, and put forward some suggestions for a specification of standard fuses. (Page 434.)

THE annual staff dinner of the National Telephone Co. was held on Thursday last. Some interesting statistics of the continued growth of the concern were given, and reference was made to the coming transfer to the Post Office. (Page 435.)

NOTES on some insulating materials appear on page 436.

IN the House of Commons last week, the Post Office Vote, amounting to nearly £20,000,000, was discussed. Mr. Herbert Samuel, the Postmaster-General, referred to the success which has attended the purchase by the Post Office of the wireless telegraph stations around the coast, and also gave some figures indicating the progress of the Post Office telephone undertaking. He holds out no hope of an agreement being come to between the Post Office and the National Telephone Co. as to the price to be paid for the company's undertaking, and the matter will therefore go to arbitration. (Page 436.)

DAMAGES to the extent of £500 have been awarded against the Bury Corporation in respect of a tramway accident.—Some serious charges in respect of the management of the Carlisle electricity undertaking have been proved to be unfounded.—Glasgow ratepayers protest against the tramway profits being applied to relief of rates.—It is proposed to separate the management of the Leicester gas and electricity undertakings.—After a lengthy experiment, a special Committee of the Llandudno Corporation recommend the continuation of electric lighting on the promenade.—Portsmouth Corporation telephone accounts show a profit of £400 for the past year.—The L.C.C. tramway accounts for 1909-10 show a profit, after meeting capital charges, of £192,109. The statutory amount has been placed to renewals and £59,878 to reserve. (Page 437.)

CABLES are required at Tunbridge Wells; a cooling tower at Newport (Mon.); low-tension cables, cable boxes, &c., by the L.C.C.; and boiler, superheater, &c., at Luton. Loans are being applied for as follows: Aldershot, £1,500; Hereford, £3,000; Norwich, £17,783; Battersea, £18,909; and Beckenham, £500. Extensions are contemplated at Barking and Surbiton. (Page 438.)

A NET profit of £64,802 was made by Messrs. J. G. White & Co. last year. At the meeting of the Marconi Wireless Telegraph Co. on Tuesday, important negotiations with the British and a number of foreign governments were referred to. The Bombay Electric Supply Co. have abandoned the maximum demand system of charging. (Page 440.)

AMONG the specifications published by the Patent Office on Thursday last was one by Siemens Bros. & Co. for a method of strengthening the lead covering of cables for house-wiring by embedding wires or metal strips in the lead.—A petrol-electric combination, in which the dynamo is coupled to the engine and one driving wheel through a differential gear, while the motor is coupled to the other driving wheel, is covered by the Felten & Guilleaume-Lahmeyer-Werke A.G.—C. J. Beaver and E. A. Claremont have patented a special form of funnel for filling joint-boxes with compound.—Opposition has been entered to the grant of a patent to R. Hopfelt for a process of removing hydrocarbons from metal filaments.—The Glühlampenwerk Anker Ges. has appealed against the decision of the Comptroller to refuse their patent for the use of phospham compounds in metal filament lamps. (Page 442.)

PARLIAMENTARY INTELLIGENCE

LONDON UNITED TRAMWAYS.—A Select Committee of the House of Lords last week passed the London United Tramways Bill, which sought an extension of time for the conversion to electric traction of the line from Kew Bridge to Richmond. When powers were granted in 1908 to the construction of the line over Kew Bridge, it was agreed that the overhead system should not be adopted, but a clause is now inserted in the Bill under which the overhead system may be adopted, with the consent of the Richmond Council.

CAVEHILL TRAMWAYS.—The Belfast Corporation Bill, which provides for the purchase of the Cavehill and Whitewell Tramways Co.'s undertaking upon arbitration terms, was passed by the Unopposed Committee in the House of Commons last week.

NORTH AND SOUTH SHIELDS ELECTRIC RAILWAY.—The Bill authorising the construction of an electric tube railway under the River Tyne between North and South Shields has been withdrawn. The promotors have found considerable difficulty in coming to terms with the South Shields Corporation on the question of the acquisition of certain land, and also with regard to a money deposit.

ELECTRIC LIGHTING PROVISIONAL ORDERS.—Electric Lighting Provisional Order Confirmation Bill No. 3 was read a third time in the House of Commons on Friday. The following are the Provisional Order Confirmation Bills promoted by the Board of Trade this session:—

No. 1.—Chesham (extension), Church, Clevedon, Dawlish (amendment), Derby (extension), Gorseinon, Huddersfield (extension to South Crosland), Ormskirk (amendment), Runcorn Urban and Runcorn Rural, Runcorn (Weston), Smethwick (amendment), Widnes (amendment).

No. 2.—Ardrossan Saltcoats and District, Cambuslang (extension), Cowdenbeath, Lochgelly and District, Skelmorlie.

No. 3.—Navan, Swinford.

No. 4.—Bath (extension).

PROGRESS OF ELECTRICAL BILLS.—The Dunfermline & District Tramways (Extension) Order Confirmation Bill was read a second time in the House of Commons on Friday.

Rhondda Urban District (Tramways & Extensions) Bill was read a first time in the House of Lords on Thursday.

Middlesbrough Corporation Bill has been read a first time in the House of Lords.

Leeds Corporation Bill was read a third time and passed in the House of Lords on Monday.

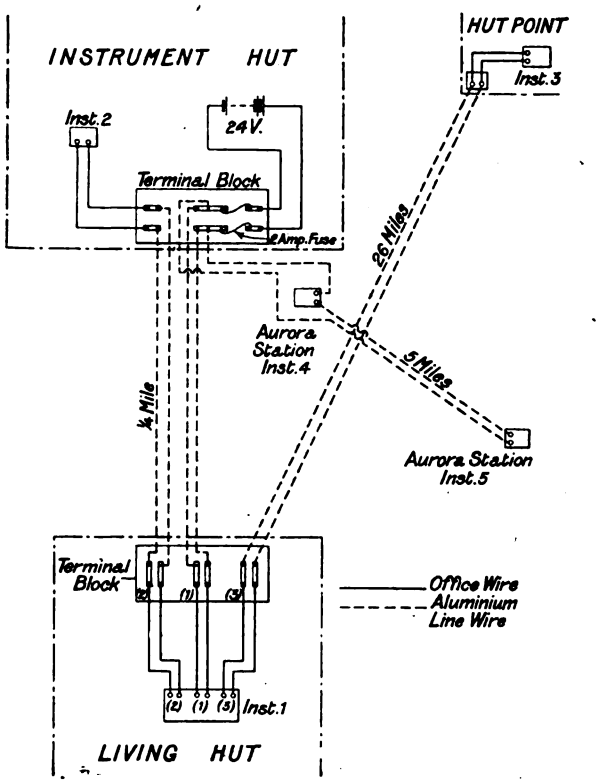
The North-East London Railway Bill was read a second time in the House of Lords on Tuesday.

WIMBLEDON & SUTTON ELECTRIC RAILWAY.—This Bill, which proposes the construction of an electric railway, starting from the District Railway's terminus at Wimbledon, running to Sutton, came before a House of Commons Committee on Tuesday. The capital powers taken in the Bill are £350,000, and the estimated cost of construction is £311,554. The Bill is still under consideration.

THE "BLACK" SMOKE NUISANCE.—The London County Council (General Powers) Bill has been under consideration by the Local Legislation Committee in the House of Commons during the past ten days. One section of the Bill related to the "black" smoke nuisance, and proposed the deletion of the word "black" from the sections of the Public Health Act, 1891, which deal with this matter. The proposal met with the strongest opposition from the Electric Lighting Companies of London, the Gas Companies, and the Government Departments, the views expressed being that it was unfair to place such restrictions upon statutory undertakings which had spent thousands of pounds upon the most up-to-date smoke prevention apparatus available. For the Electric Supply Companies, it was also urged that they were doing a good service in reducing the smoke problem generally by encouraging the use of electric driving. Evidence was also brought showing that by far the greater nuisance from smoke was from domestic chimneys. On Tuesday, after the London County Council had agreed to withdraw a number of sections of the clauses dealing with this matter, the Chairman of the Committee announced that no evidence had been put before them which would justify the omission of the word "black" from the Act of 1891.

Telegraph Traffic.—There has only been one day last week when interruptions of submarine cables have taken place. The cable between Bonny and Duala failed on Friday, and also that between Obok and Djibouti.

Wireless Telegraph Notes.—The War Office are in negotiation for the purchase of 300 sets of wireless telegraph apparatus from the Marconi Co. The particular apparatus ordered is a very portable arrangement introduced by Major Beddington, which is capable of being easily transported.



The Daily Telegraph Copenhagen correspondent states that Captain Howland, of the Norwegian Navy, has been granted permission to visit London to demonstrate an improved wireless telegraph apparatus which he has invented.

A site has been selected for the new Admiralty wireless telegraph station at Scarborough, and the construction of it will be commenced shortly.

TELEPHONES FOR THE ANTARCTIC EXPEDITION

AMONG the new arrangements that have been made in connection with Captain Scott's Expedition to the South Pole, one which will materially improve his chances of success is the provision of a telephone equipment to enable the exploring party to keep in touch with the ship up to a distance of twenty-six miles. The telephones for this purpose have been

presented to Captain Scott by the staff of the National Telephone Co., and, through the courtesy of Mr. F. Gill, the company's engineer-in-chief, we are able to give a description of the equipment.

The instrument employed is a standard hand set with black celluloid mouthpiece and ebonite earpiece. As it is uncertain whether the extreme cold, continued for a long period, may not affect celluloid and ebonite, which are more or less unstable mixtures, a spare metal mouthpiece and two spare wooden earpieces have been supplied for each instrument. The circuits are of the simplest possible description. The minimum temperature recorded by Lieutenant Shackleton was −70° F., and at this low temperature it is highly problematical whether the ordinary dry cells would work satisfactorily. A single 24-volt storage battery will therefore be used at one end of the line, and will be placed in either the Living or Instrument Hut, and the microphones and receivers at the two ends of the lines will all be connected simply in series. Before deciding to employ a direct-working instrument and to dispense with the usual induction coil, a series of experiments were made through resistances equivalent to those of the longest line which will be used, and it was found that this connection gave as good results as any other for the particular purpose, and it has, of course, the particular advantage of simplifying the apparatus considerably. No switch hook is employed, but there is a handle key in the hand set. A magneto bell is used connected permanently across the line through the condenser, and there is a magneto at each station which only comes into connection across the line, in the usual way, when the handle is turned.

The diagram above shows the five lines on which telephones are to be used. There are two instruments five miles apart to enable simultaneous observations to be made of the aurora. These have to be left in the open, and are fitted in strong wooden cases, and it was decided to make all the instruments in similar wooden cases, so that they could be shipped without any packing-case being required. Three other instruments will connect the instrument hut, the living hut, and "hut point," the last-mentioned being where Shackleton built the hut on the exploration route between the ship and the Pole, twenty-six miles distant from the ship.

The fifty-two miles of wire which it is necessary for the exploring party to carry to reach this point will be of hard-drawn aluminium wire of No. 19 S.W.G., which was procured from the British Aluminium Co. The wire is made up in six reels, each containing 100 lb. weight of wire, which has been drawn in lengths weighing about 25 lb. each, and four of these are jointed together with aluminium McIntyre sleeves for each drum. It is interesting to note that, owing to the low temperature, both the tensile strength of the wire and the conductivity will be enormously increased. The drums have wooden barrels 6 in. in diameter and sheet-iron flanges 16 in. in diameter, the width between the flanges being 10 in., and the weight of each drum empty is about 13 lb. A hundred aluminium McIntyre sleeves for jointing have been sent with the apparatus, a couple of jointing clamps, and also a large number of spare instrument parts.

No insulators are necessary, as the ice and snow are non-conductors, and the two wires will simply be laid on the ice a certain distance apart—probably about 6 ft. Detailed instructions how to use these instruments have been sent with them and a sample joint.

PROGRESS IN TELEGRAPHY AND TELEPHONY

AT the Institution of Civil Engineers, on Wednesday last week, Sir John Gavey, C.B., delivered this year's "James Forrest" Lecture, for which the above subject had been selected.

For many years, said Mr. Gavey, the simple Morse apparatus or its equivalents served the requirements of most countries, but as the telegraph traffic grew, means were designed for the transmission of several messages simultaneously over the same conductor, by the use of suitable devices the actual speed of transmission was raised in overhead wires to ten or twelve times that possible by manual operating, and, thirdly, type printing and writing systems were invented with varying degrees of success.

Dealing historically with the first of these three lines of development, the Lecturer described the duplex and quadruplex systems, for the simultaneous transmission respectively of one or two pairs messages in opposite directions over the same wire; the tuning fork system of multiplex telegraphy which originated in America, and was developed and improved by Mercardier in France (where it is said to have given good results recently); and the Delany multiplex, which was developed to some extent in this country, but owing to various causes has recently been abandoned.

Under the second heading, the Wheatstone automatic or machine-transmitting instrument was described. This system has been very fully developed in the United Kingdom. It is capable of dealing with traffic at a maximum rate of 450 words per minute, and it is invaluable when items of news have to be transmitted to fifty or more towns simultaneously. For ordinary public message traffic, on lines of moderate length, where each individual message is short, it is generally considered preferable, in this country, for circuits of moderate length to provide direct Morse apparatus worked simplex, duplex, or quadruplex as circumstances may dictate. With overhead lines the limit of speed in automatic working is that imposed by the self-induction of the receiving apparatus. This difficulty has been overcome by substituting a chemical for an electro-magnet receiver; the current passes through a paper ribbon saturated with a solution which is decomposed by a positive current, and the Morse signals appear in blue lines on the slip. It is said that with this method a maximum speed of 1,000 to 1,200 words is possible under favourable conditions, but there are difficulties in working at such high speeds, one of which is the division

Digitized by Google

and distribution of the slips amongst the large number of writers necessary to keep abreast of the work.

All these methods increase the carrying capacity of the wires—i.e., they reduce the capital expenditure per message—but none increase the output per operator, or diminish the working cost in the instrument-room. Inventors have turned their attention to increasing the speed and reducing the cost of transcription at the received end, in the case of manual as well as automatic sending, by the substitution of typing apparatus worked mechanically or electrically for the manual transcription. Sir John then described the Hughes type-printing instrument, which, although one of the earliest, had met with permanent success. Besides providing a clearly-typed message for delivery, it increases the speed of working as compared with Morse by about 25 per cent., and it can be duplexed. It is used by the Post Office on all its Continental wires. The Baudot system was next dealt with. This admits of the transmission of a much larger number of messages over each wire than the Hughes, and is also more flexible. It is largely used in France, and has been introduced into this country. The Murray type-printing telegraph, in which a punched slip is passed through an automatic transmitter, and the received message is typed in page form, was shown at work, and the system devised by Creed was also described. Both these systems are in use in the British Post Office. The lecturer also dealt briefly with the Siemens and Halske automatic system in which, by means of suitable apparatus, the message is printed by the receiving apparatus direct by photographic methods, the Barclay automatic type-printing apparatus used by the Western Union Telegraph Company in America, the telewriter, and the beautiful writing apparatus designed by Pollak and Virag.

He then passed on to the subject of conductors, and explained that overhead wires are even now the only conductors that serve satisfactorily for really long-distance telephony, having the advantages of low resistance, low electrostatic capacity (from 0·015 to 0·014 microfarad per mile), and relatively great self-induction. Their use admits of attaining the maximum speed in telegraphy; and perhaps the most important limiting factor in this case is the self-induction of the receiving apparatus, which would be a useful factor if distributed over the line, but which tends to act as a choking coil when massed at the extremity. This self-induction in the case of the Wheatstone receiver amounts to as much as one henry, and its effect in prolonging the current, combined with that due to the capacity of the line, is neutralised to some extent by inserting a shunted condenser between the instrument and the earth. Overhead telegraphs are, however, subject to serious interruptions, due to the falling of trees during heavy storms, and to breakdowns arising from a combination of sleety snow and gales of wind. The Post Office has within the last few years laid 138,000 miles of paper-insulated wire underground for telegraph purposes alone; and between 1900 and 1902, as the first step in the development of the London system, the Post Office had laid 240,000 miles of wire underground before a single subscriber had been served. Although at that period 36,000 wires only were led into the building, the spare duct capacity admitted of increasing this number to 125,000 or 150,000 wires as the system grew. The mileage of underground wire laid by the Post Office in Great Britain for telephones is now 521,000 miles.

In submarine telegraphy the high electrostatic capacity, varying from 0·3 to 0·4 microfarad per mile, and the very long lengths that are necessary to connect the great continents of the world, render the use of any but the most delicate apparatus impossible on long cables. The receiving instruments originally invented by the late Lord Kelvin, then Sir William Thomson, are still the only apparatus available for the reception of messages on long cables, and so far it has not been found possible to increase the speed of working materially. Attention has been devoted to eliminating disturbing elements and perfecting the signals by the use of automatic transmission and by the use of curbing devices at the receiving end. The introduction of repeaters at intermediate points where cables land at suitable localities has recently become possible, and it may be that methods of distributed induction referred to later may ultimately be of some value, but this subject, in the lecturer's opinion, "is not ripe for consideration."

In ordinary telegraphy when transmitting through an overhead line the frequency of the current alternations is only 180 per second for 450 words per minute, and the current has actuated the apparatus at the further end before the battery connection has ceased. Another condition is introduced, however, when a conductor is used for telephonic speech in which a maximum frequency of 1,800 to 2,000 vibrations per second has to be dealt with, and the effect of even a moderate capacity becomes far more marked. Sir John then dealt with the "loading" of cables by adding artificially to their self-induction. Attempts have been made to effect this by lapping a copper conductor with thin iron wire or tape of a high magnetic permeability. Another method consists in distributing magnetic coils at uniform distances of a mile or two apart throughout the length of the line. Under these conditions the distance over which speech is possible has been increased from two-and-a-half to three-and-a-half times. The British Post Office has recently laid a cable with distributed inductance between England and France (see ELECTRICAL ENGINEERING, March 17th, page 179), which will increase the range of speech about four times as compared with similar type of unloaded cable.

To illustrate the magnitude of the problem to be dealt with in a telephone exchange, Sir John mentioned that the number of telephone subscribers in a large city runs into five or frequently six figures, when the area covered, like that in London, amounts to 640 square miles, which has to be served by 60 to 100 separate exchanges, between all of which intercommunication must be provided, with the minimum amount of delay. The interurban communications between all the principal cities in the country has also to be dealt with, and when the fact is appreciated that the major part of the business of the 24 hours is concentrated in about 2½ hours in the morning, and a similar period in the afternoon, the difficulties to be solved become apparent, even to the uninitiated. The gradual development of the modern telephone exchange was next traced: first the marked advance which was made by the introduction of the multiple switchboard, then the self-restoring indicator, and finally the common battery system, with glow-lamps as indicators. The working of the automatic telephone exchange was also illustrated.

The following figures were then quoted to show the development of telegraphy and telephony throughout the world between 1902 and 1907:—

Telegraph and Telephone Statistics—Wire Mileage.

	1902.	1907.	Increase.
Telegraphs.			
Land wires	3,659,659	5,038,981	1,379,322
Submarine cables ...	212,894	259,000	46,106 = 21·6 %
Telephones.			
Wire.....	7,467,417	19,839,537	12,372,120
Subscribers' stations.	3,534,036	8,406,336	4,873,330

Large figures frequently fail to impress the mind, but when it is stated that this mileage of wire will soon, if it has not by this time, equalled one-third the distance from the earth to the sun, the remarkable activity of the modern telegraph and telephone service will perhaps be more forcibly realised.

In America the associated Bell companies only possessed 300,000 telephones in 1896. In 1905 this number had risen to 2,000,000, and in 1907 to 3,000,000, whilst at the beginning of the present year the corresponding figure was 5,100,000.

The lecture, which was illustrated by a large number of extremely interesting lantern slides, terminated with a reference to wireless telegraphy and telephony, the progress of which was very briefly sketched from the early Post Office systems to Rathlin Island and from the Skerries to Holyhead, down to the present day. Sir John gave the distance to which it has been found possible to transmit actual speech as 30 or 40 miles, whilst the limit of telegraphy he placed at "perhaps 5,000 miles."

ELECTRICAL PYROMETERS

A QUANTITY of interesting information regarding the industrial applications of electric pyrometry in its various forms is contained in a pamphlet which we have received from Messrs. Siemens Brothers and Co. It is pointed out how the need for specially skilled and experienced furnace attendants can often be dispensed with by the use of electrical pyrometers and other advantages obtained by the substitution of exact measurement for personal judgment. The Siemens thermo-electric pyrometers of the highest class employ platinum and platinum rhodium couples, and these give results accurate to 5° C. up to 1,000° C. The cheaper platinum and platinum iridium couples can also be used up to this temperature, but are not quite as accurate. Up to 600° C. silver-constantan is used with a maximum error of 1° C. and a similar degree of accuracy can be obtained from −190° to 500° C., with copper-constantan couples. Various forms of protecting tube are used. For the highest temperatures, double Marquardt tubes are used, owing to being impermeable to gases and vapours, but for temperatures below 1,000° C., double quartz tubes are recommended, as they are better able to stand the effects of sudden changes of temperature. For temperature measurements of baths of molten metal and metallic salts, double iron tubes with plated inner tubes are used. A large number of patterns are standardised, some with wooden heads, and some with water-cooled iron heads. The indicating instrument employed consists of direct-reading moving-coil galvanometers similar to the ordinary testing-room millivoltmeter with pivoted coils, or a more delicate form with suspended coils. A wall type with horizontal edgewise scale is among the patterns supplied. Each instrument has an adjustment for bringing the needle exactly to zero or to the temperature of the outside terminals of the thermo couple. A special recording instrument is also made in which the needle normally free is pressed down periodically and caused to make a dot on the travelling chart. As many as five couples can be made to give records on one sheet by an automatic switch which causes them to record in turn. Recorders are made both with suspended and pivoted coils, the latter pattern being specially suitable for use in works where a situation entirely free from vibration cannot be found. Recorders can be fitted with minimum and maximum relay contacts for giving an alarm when any desired temperature is attained.

THE BRUSSELS EXHIBITION

By Our Special Correspondent

ALTHOUGH special efforts are said to have been made to render the Brussels Exhibition complete in time for the official opening on April 23rd, yet it was not until long after this date that the various engineering sections were approaching completion.

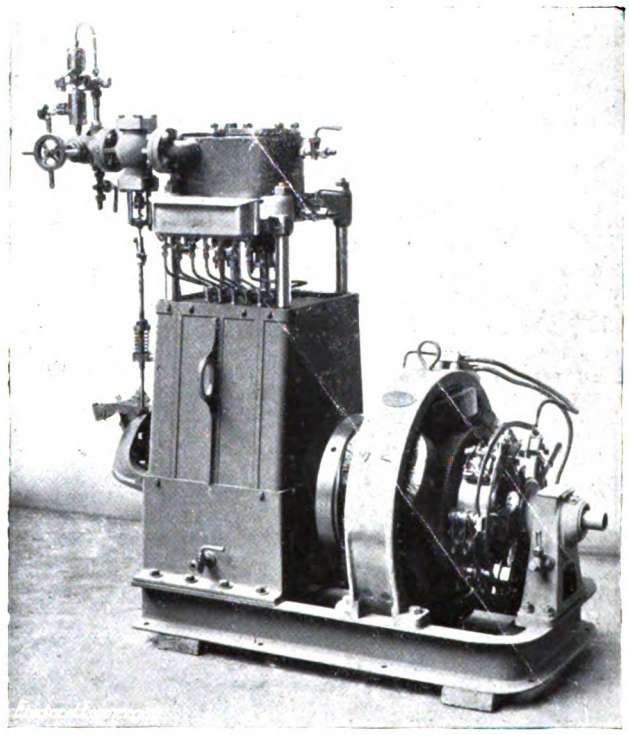
Most of the exhibits of engineering interest are contained in the main Machinery Hall, which adjoins the Industrial Halls, and, together with the railway shed, occupies a floor-space of about 40,000 square yards. The remainder of the machinery and apparatus is distributed in the pavilions and sections of the various countries.

The best represented country undoubtedly is Germany, which has united all its industries in one large, well-laid-out building, occupying a site of approximately 33,000 square yards. This pavilion is self-contained, with its own steam plant, producing power for driving the machinery shown, which, together with the internal and external illumination, will take about 2,000 kw. when everything is in full swing. This power is derived from the generating plant put down by the various exhibitors.

The total power required throughout the exhibition for lighting and power, not including the German section, is estimated to reach ultimately 5,000 kw. Of this, about 2,000 kw. will be required for power, and the remainder for lighting. There are two distinct sources of supply to the exhibition—one from the Brussels station at 2×220 volts, and the other from the Ixelles supply at 2×110 volts. Of the 5,000 kw. the Brussels works supply 1,900 kw. from a sub-station situated in the grounds near the main entrance. The Ixelles station supplies 600 kw., which are paralleled with the remaining 3,100 kw. generated by the power plant of the various exhibitors, and distributed from a sub-station situated at the north-east end of the Main Machinery Hall. Steam is obtained from a battery of ten water-tube boilers of De Naeyer make, at a pressure of 162 lbs. per square inch. Four of these boilers supply superheated steam of 600-620° Fahrenheit, the remaining six saturated steam. The total steaming capacity of the battery of boilers is 110,000 lbs. of steam per hour. The monopoly for the supply of current, wiring, and hiring out of motors, rests with the Société Anonyme "La Mutuelle des Electriciens Belges," whose charges for current are:—50 centimes (5d.) per kilowatt-hour for lighting; 30 centimes (3d.) per kilowatt-hour for power with users of upwards of 70 hours per week. The grounds are lighted by upwards of 700 Körting arc lamps, and a great number of metal filament lamps.

Continental Exhibits.

The general impression one carries away from the exhibition is that the last years have not been very prolific in new electrical inventions or applications, and that manufacturers have devoted their time mostly to the perfecting of existing types. In this respect the exhibition is decidedly disappointing to the electrical engineer. Judging by the large number of slow-speed horizontal reciprocating steam engines, mostly of Belgian make, it looks as if the steam turbine has as yet not been entirely successful in ousting its rival. The following list shows the largest and most noteworthy steam turbines and slow-speed horizontal reciprocating engines on exhibition.



Steam turbo-generators: Bergmann, three-phase turbo-set, 10,000 h.p. and 2,200 h.p.; Brown Boveri-Parsons, three-phase, 1,500 h.p.; Franco Tosi-Parsons, 5,000 h.p., and Stork-Zoelly, 1,500 h.p.

Slow-speed horizontal reciprocating sets: Société Anonyme La Meuse, 1,500 h.p.; Ateliers Van den Kerckhove, 750 h.p.; Ateliers du Thirian, 650 h.p.; Soc. An. H. Bollinckx, 600 h.p.; Soc. An. Zimmermann-Hanrez, 550 h.p.; Carels Frères, 600 h.p.

All these engines are direct coupled to continuous current or three-phase generators. Large gas engines are conspicuous by their absence, which is rather striking in view of the large demand existing for this type of engine. Another significant fact is the scarcity of large slow-speed alternators to which we had grown so accustomed when visiting Continental exhibitions. There are only two of the large slow-speed alternators at the Brussels Exhibition, of which one is a 2,500 h.p. three-phase generator forming part of the exhibit of the Compagnie Générale Electrique of Nancy, France, and a 1,000-h.p. three-phase alternator exhibited by the Electrotechnische Industrie of Slikkerveer, Holland.

In the German engine section the aggregate amount of power plant installed reaches the large figure of 21,000 h.p.; this includes the 10,000 h.p. turbine exhibited by Messrs. Bergmann & Co., Ltd. This firm further has a 2,200 h.p. three-phase turbo-generator set, complete with condensing plant at work and a large variety of their well-known manufactures. They have also in the railway shed a new type of motor coach with electric transmission. The carriage is self-contained, as the energy for supplying the two 50 h.p. driving motors which are mounted direct on the axles is generated by a continuous-current generator driven by a Deutz petrol motor fixed at one end under the conductor's platform. The car can seat eight second-class and twenty-eight third-class passengers, and further provides standing room for ten more, bringing the carrying capacity up to forty-six passengers. The carriage is built for a maximum speed of 50 kilometres per hour.

Other exhibitors of note are the Maschinenfabrik Heinrich Lanz, of Mannheim, with a 1,000 h.p. superheated steam locomobile with direct coupled A.E.G. continuous-current generator, which is claimed to be the largest unit of this class ever made; the Maschinenfabrik R. Wolf, of Magdeburg, with a 600 h.p. superheated steam locomobile driving by belts two Deutsche Electrizitätswerke continuous-current generators. Conspicuous amongst the Belgian electrical firms is the stand of the Ateliers de Construction Electrique of Charleroi. A complete main shaft winding plant with Ilgner motor-generator set and auxiliary apparatus is exhibited by this firm. The winder proper is of the reel drum type, which continues to find favour in Belgium to the exclusion of other types. The drum is direct connected to the winding motor, which latter is separately excited and provided with compensating poles. The motor is capable of developing 1,800 h.p. during the acceleration period, and makes 55 revs. per minute when winding at full speed. The speed range of the flywheel set is 428/500 revs. per minute, and the weight of the flywheel 25 tons. The drum and motor have only two bearings between them, the armature of the motor being overhung. This arrangement has been adopted mainly in view of the ever-present danger of subsidence at the pit top.

12-KW. SHIP LIGHTING SET.
(Electrotechnische Industrie, Holland.)

The high-tension switchboard on their stand presents no novel features, with the exception of the thoroughness of the provision for earthing all non-current carrying parts. The incoming feeder is provided with an earth switch which puts the feeder to earth and is closed each time the board is under repair or inspection.

Switzerland is represented by Messrs. Brown-Boveri & Co., Ltd., whose stand, besides the 1,500 h.p. three-phase turbo set already mentioned, includes a 400-kw. continuous-current turbo-generator set. In order to ventilate the commutator, several small slots of about $\frac{1}{8}$ in. width by about 1 in. long have been provided in the segments. The brush gear is of their newest piston type, which, acting on the centre of the brush, ensures even distribution of pressure and wear. To demonstrate the working of their Aichele train lighting apparatus, a complete installation has been fitted up, including a pair of wheels and axle which will be driven round at greatly varying speeds by

Digitized by Google

a single-phase Deri motor to imitate as near as possible conditions actually obtaining in practice. The Deri motor is specially suitable for these demonstrations, as its speed is varied by simply shifting the brushes on the commutator.

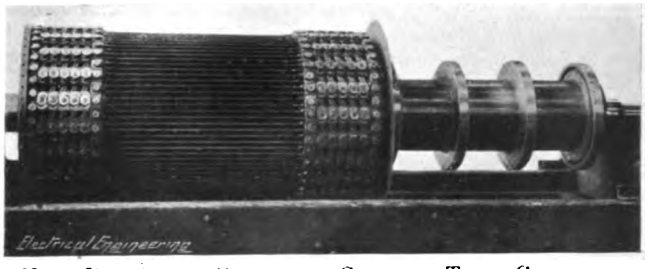
This is the first time in the history of the Netherlands that the Dutch engineering industry has participated to any great extent in an international exhibition. First, we must mention the Electrotechnische Industrie, whose stand is one of the most comprehensive in the whole exhibition. To show the range of their manufactures, this firm is exhibiting a three-phase generator of 1,000 h.p., 125 revs. per min. by the side of a 1,000-h.p., three-phase turbo-generator running at 3,000 revs. per min. Not the least noteworthy is their marine type of lighting set supplied to the Dutch navy, illustrated on the previous page. A feature of this set is its extreme lightness, weighing only three-quarters of a ton, for an output of 12·1 kw. when running at a speed of 600 revs. per min. In order to attain this lightness, the set is fitted with hollow shaft and hollow spider, which latter is directly bolted on to the flywheel of the engine, thereby obviating coupling or third bearing. The bedplate consists of a steel joist of I section.

Messrs. Stork Brothers, of Hengelo (Holland), exhibit the 1,500-h.p. Zoelly turbine already mentioned. Another speciality of this firm which is of interest to the electrical trade is their so-called "continuous flow" steam engine, which they manufacture under the Stumpf patents. For this engine, a very low steam consumption is claimed, the figure of 9·5 lb. of steam per 1 h.p. hour having been obtained with a 300-h.p. engine working with superheated steam at 650-660° F. and a pressure of 132 lb. per sq. in. This type of engine has only one cylinder of special construction, and is a departure from the ordinary design, inasmuch as the exhaust valves are eliminated and replaced by a series of grooves situated radially in the centre of the cylinder. The engine occupies little floor space, and is fitted with an eccentric regulator which reacts on the admission valves, and can be operated by a handle, thus affording an easy means of varying the speed of the engine for paralleling purposes.

A very effective display of metal filament lamps is made by Messrs. Philips & Co., Ltd., of Eindhoven (Holland), whose stand is in the Dutch pavilion. This firm, to demonstrate the immunity of their lamps against shock, have mounted four lamps on a rocking bar arrangement, which is submitted to violent shocks. An ammeter is also arranged to show the difference in current consumption of tungsten and carbon lamps of similar candle-power.

Amongst the French exhibitors we notice the Compagnie Générale Electrique, of Nancy, with the 2,500 h.p. slow-speed revolving field type alternator mentioned above, the Compagnie Gramme with some specially designed single-phase and three-phase commutator lift motors, and a compact direct-coupled gas engine set consisting of a 4-cylinder "Moteur Tabor," fitted with compressed air starting gear and driving a 48-kw., 120-volt, 500 revs. per min. dynamo.

The Verreries de Tolembray (Aisne) have exhibited a great variety of green glass insulators, from the ordinary reel insulator to the 18-in. high triple petticoated extra high-tension type. A great many test samples are shown bearing testimony to the great mechanical strength of both glass and cement, as in each case the stalk has succumbed to bending before insulator or cement gave way. In one particular case the insulator had been submitted to a side pull of 970 kgs., leaving the insulator intact, but bending the 1¼ in. stalk.



The French electrical section promises to become very interesting; unfortunately it was the most backward in the whole exhibition, and during the earlier weeks of the exhibition the public was actually excluded from it.

Finally, electrical engineers should not fail to pay the Belgian Army section a visit, as a very interesting "Generating Car" for field work is exhibited here. The car is of the auto-mixte type, and is fitted with a 30-h.p. motor, an 8·5-kw. shunt dynamo, and a 40-cell, 60-ampere-hour battery. The trailing car is provided with a searchlight of which the arc absorbs 100 amps. at 55 volts. The whole arrangement is very compact and solid looking. In this same department is exhibited the Bremer patent electric automatic targets, the principle of which is as follows. The target is divided up radially in sections which are fixed on movable levers. When a section is hit, it recedes sufficiently to establish an electrical contact, and the shot is recorded on a scoring apparatus placed near the marksman. The advantages of this type of target are that it is portable, and dispenses with the services of a marker. The various types of targets on view are well worth inspection.

British Exhibits.

The British exhibits of electrical and engineering interest are to be found partly in the main machinery hall already referred to, and partly in the British Industrial Hall, but it cannot be said that in either hall is the British electrical industry well represented, especially as regards its heavier branches.

Among stands of a purely electrical engineering nature, one of the most interesting is that of Messrs. C. A. PARSONS & Co. (Heaton Works, Newcastle-on-Tyne). Their principal exhibit is a portion of a 1,000-kw. 550-volt continuous-current turbo-generator for running at 1,800 r.p.m., of entirely new design. The armature, which is illustrated here, is provided with solid conductors firmly locked into dove-tailed slots in the core, a portion of the conductor being external to the core, and a portion embedded in the core. As a result, particularly satisfactory cooling of the windings and commutation is obtained. A part of the magnet system is also shown, including Messrs. Parsons' patented compensating winding. A working model is

NEW DESIGN OF CONTINUOUS-CURRENT TURBO-GENERATOR ARMATURE.
(Messrs. C. A. Parsons & Co.)

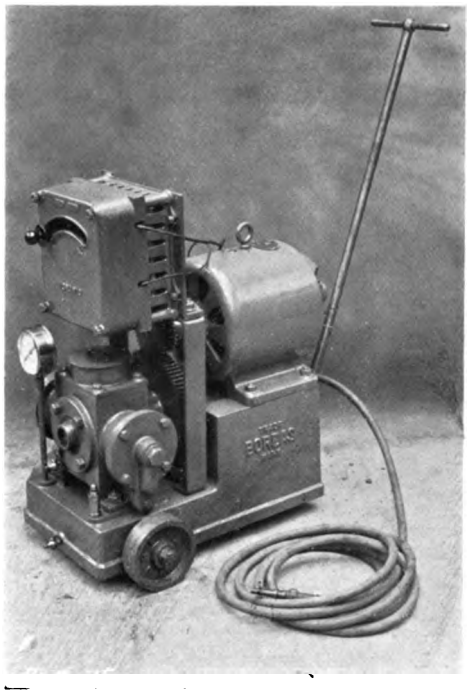
also shown, illustrating the magnetic leakage method of alternator compounding used by the firm (see ELECTRICAL ENGINEERING, Vol. III., page 546).

Another interesting electrical exhibit is that of the MORGAN CRUCIBLE CO., LTD. (Battersea Works, London, S.W.), who have a collection of their special "Morganite" and "Battersea" carbon brushes. Morganite brushes are made of pure graphite by a process not involving raising to a high temperature, which secures great resiliency, and also permits of construction in layers arranged so that the cross resistance is seven or eight times greater than the longitudinal resistance, a feature of the utmost value where commutation conditions are severe. A special brush is also made with a material of high resistance on one side and low resistance on the other. The brushes have a low coefficient of friction, and the method of manufacture renders it possible to embed metal tops and flexibles in the brushes to ensure good electrical connections without solder. A number of grades of these brushes are made, covering an extensive range of conditions. The "Battersea" brushes are of homogeneous carbon, and have flexible connections inserted in drilled holes by being splayed out and held in position by a special metallic powder compressed by a new method. The company also show examples of their carbon turbine gland rings and carbon dust resistances, for lightning arresters and similar purposes, of the type described by Mr. H. Brazil in a recent discussion at the Institution of Electrical Engineers (see ELECTRICAL ENGINEERING, May 14th, page 326).

Turning to electrical instruments, we find a very complete display of Messrs. NALDER BROTHER & Co.'s well-known instruments, both of the switchboard and portable patterns, for the measurement and recording of current pressure, power factor, and periodicity. These include soft iron and moving coil ammeter and voltmeter wattmeter of the dynamometer and Drysdale patterns; the last mentioned of which, for alternating current only, is a moving coil type instrument, with a long, narrow coil of Ayrton Mather form, moving in a field produced by a series winding. Examples of the well-known "Ohmer" electrostatic insulation testing sets are also shown. A novelty is exhibited in the thermal limit switch, which the firm have introduced for use with Messrs. Handcock & Dykes' system of charging. In this instrument, the current is taken through a steel wire, which, if the current exceeds a prearranged value, by means of the heating and expansion of the wire a contact is opened, across which is placed a resistance, which is introduced into the lamp circuit, thereby reducing the current and thus dimming the lights; this reduction of the current allows the steel wire to cool again, with the result that the circuit is closed and the lights return to their normal brilliancy; this goes on until the current is reduced to the limit of value, for which the instrument is set. Another interesting instrument shown is an electrical resistance "telethermometer."

A fine collection of electrical instruments is also shown by R. W. PAUL (33 Leicester Square, W.C.), including the well-known "Unipivot" series of galvanometers and measuring instruments, among which is the new testing set described in ELECTRICAL ENGINEERING, May 19th, page 329. Other instruments shown are electrical thermometers, standard and adjustable resistances, and such special pieces of apparatus as the Duddell-Mather standard wattmeter, the Ayrton-Mather electrostatic, wattmeter, and the Sumpner reflecting electrodynamometer, illustrated on page 432 of this issue.

Messrs. KELVIN and JAMES WHITE have also a fine collection of their well-known instruments on view. Attention may be called particularly to a horizontal scale pattern of the Kelvin astatic wattmeter and the latest type of multicellular electrostatic voltmeter. A new high-tension electrostatic voltmeter has also been brought out under the name of the electrostatic volt balance. This is a compact portable instrument, suitable for cable testing, and can be made to read up to 100,000 volts. There is a complete display of switchboard, recording, and



Digitized by Google

portable instruments, the latter including a combined ammeter and voltmeter, in which all live connections are covered by a vulcanite plate, so that it is impossible to make a short circuit accidentally by dropping a piece of metal on the top of the instrument. Examples of Lord Kelvin's ships' compasses and sounding machines are also shown.

Attention may be drawn here to a semi-automatic pattern-making machine or universal wood milling machine, which, although exhibited in the German section by Messrs. A. H. Schütte, is a British exhibit in that it was manufactured at the works of Messrs. Kelvin and White, and is sold in this country by the Pattern-Making Machine Co., 16 Cambridge Street, Glasgow.

Among the numerous electrical instruments shown by the CAMBRIDGE SCIENTIFIC INSTRUMENT CO. (Chesterton Road, Cambridge), are several Duddell oscillographs, both of the electro-magnet and permanent magnet types. Among galvanometers shown are instruments of the Broca moving magnet and the Ayrton Mather types, and Duddell thermogalvanometers for wireless telegraph measurements. Mr. Duddell's thermo-ammeter on a similar principle is also shown, and another of his instruments is a moving earth-coil magnetic standard for the calibration of ballistic galvanometers. A new instrument is the so-called "string" electrometer, in which a stretched silvered quartz fibre observed through a microscope is supported in an electrostatic field provided by two oppositely charged invar pillars. Other electrostatic instruments are the Dolezalek quadrant electrometer and the Wilson micro-electroscope. Numerous recording and other pyrometers and thermometers, both of the thermoelectric and resistance types, are shown.

Among examples of appliances constructed especially for electric driving are the air compressors, &c., of Messrs. LACY-

PORTABLE AIR COMPRESSOR.
(Lacy-Hulbert and Co.)

HULBERT & CO., LTD. (91 Victoria Street, S.W.). The largest set shown is a substantial vertical double-acting air compressor, fitted with a heavy flywheel, and belt-driven by a 30 h.p. motor. A number of other types of their well-known air compressors are shown, including the convenient portable electrically-driven air compressor for use in central stations, illustrated here, and a small garage set for tyre inflation. Examples of the Boreas rotary pump are also shown.

Messrs. MAVOR & COULSON, LTD. (47 Broad Street, Mile End, Glasgow) have an interesting exhibit of their coal-cutters, including one of their "Pick-quick" electrically-driven bar machines for shallow seams, only 15¼ inches in height. Some larger machines of the same type are also shown.

Messrs. R. WAYGOOD & CO., LTD. (Falmouth Road, S.E.), have installed a double cage electric lift in the British Industrial Hall, for conveying visitors from the ground floor to the gallery. One cage goes up while the other goes down, and each has accommodation for seven passengers. The travel is 13 ft. 8½ in., and the speed is 110 ft. per minute. A lower speed is also provided for. Control is by a car switch and handle, as used in the London Tube lifts. In addition to this lift, the firm are showing a model of an automatic electric push-button lift, which is a replica of one installed by them at Marlborough House.

In addition to a representative exhibit demonstrating their well-known system of electric clocks on their stand, the SYNCHRONOME CO. (32 and 34 Clerkenwell Road) are equipping the whole of the British Section with a circuit of large dials, giving a complete time service. Three types of controlling pendulum are shown, the domestic three-quarter seconds master clock, the commercial seconds, and the high-grade seconds with "Invar" pendulum. It is one of the latter which operates the dials throughout the British Section. The case and dials are of one sheet of metal enamelled at high temperature, which produces a surface entirely unaffected by any of the bad conditions which are likely to exist in a factory. Another feature of interest in their exhibit is a new type of automatic bell controller for working in conjunction with a system of clocks to ring any number of electric bells at pre-arranged times. The one shown permits of any individual minute throughout sixteen of the twenty-four hours being chosen. By means of a slight addition to this instrument an entirely different set of calls can be arranged for the different days of the week.

Among other British electrical exhibits that may be mentioned are the demonstration of the Great Western Railway Company's audible cab-signalling gear (see ELECTRICAL ENGINEERING, Vol. I., page 431); Messrs. Kelvin & White's display of electrical and other instruments; a complete push-button electric lift by Messrs. Marryat & Place, and some examples of Messrs. Reavell and Co.'s well-known electrically-driven quadruplex air compressors. Messrs. Wellman, Seaver & Head also show some electrical apparatus in their exhibit, relating more particularly to controlling apparatus for the electrical equipment of steel works. Fittings are also shown by Messrs. Faraday & Sons and Messrs. J. Dugdill & Co.

British gas engines of moderate size are well represented; Messrs. CROSSLEY BROTHERS, LTD. (Openshaw, Manchester), have a fine display of their engines, driven from a new type suction gas plant using bituminous fuel. The most interesting engine shown is a 110 b.h.p. vertical four-cylinder engine, running at 250 r.p.m. A 175 b.h.p. single-cylinder engine, running at 170 r.p.m., specially built for export, is also shown. As an example of the small engines for direct-coupled lighting sets, the firm show a 7 kw. set with two vertical cylinders. A 4 b.h.p. vertical single-cylinder petrol engine for direct coupling to a dynamo is also shown. Attention should also be called to the redesigned series of single-cylinder horizontal engines exemplified by a 66 b.h.p. engine. There are also some smaller engines fitted for running on benzine or petrol, as well as a marine type oil engine and a lampless crude oil engine.

Several gas and oil engines are shown by the CAMPBELL GAS ENGINE CO., LTD. (Halifax). These include a vertical four-cylinder 100-B.H.P. engine of the type described in detail in ELECTRICAL ENGINEERING, February 17th, page 107, and designed for direct coupling to a Phœnix alternator. This set is destined for the Bradford Technical College. A horizontal single-cylinder electric lighting type engine, also of 100 B.H.P., and fitted with the firm's latest system of throttle governing, is also shown. Other engines exhibited include a 25-B.H.P. suction gas engine with hit and miss governing, and a 15-B.H.P. crude oil engine. The first three engines mentioned are supplied with gas from a 200-h.p. open hearth gas plant. A compressed-air starting apparatus driven by a small oil engine is also shown.

THE NATIONAL GAS ENGINE CO. (Ashton-under-Lyne) show one of their standard single-cylinder horizontal gas engines, and a complete suction gas plant.

The exhibit of the POWER GAS CORPORATION, LTD. (Stockton-on-Tees) consists of a model of a modern Mond gas plant to deal with 120 tons of coal per day of 24 hours, with sulphate of ammonia and tar recovery apparatus. A working 40-B.H.P. suction plant is also shown connected up to a Humphrey gas pump on an adjoining stand.

Exhibits of interest in connection with boiler plant, to which attention may be drawn, include the automatic stokers of the UNDERFEED STOKER CO. (Coventry House, South Place, E.C.). Ten of the boilers in the main boiler house are fitted with these stokers, and further types are shown on their stand, together with examples of their new air-heater. MESSRS. E. GREEN & SON, LTD. (Wakefield) show on their stand a model of one of their well-known economisers attached to a model water-tube boiler, and they have also supplied the 1,440-tube economiser, which is in use in connection with the boiler plant of the exhibition. MESSRS. C. & J. WEIR, LTD. (Cathcart, Glasgow), are exhibiting several examples of their well-known steam feed pumps, and MESSRS. J. HOPKINSON & CO., LTD. (Britannia Works, Huddersfield) have an effectively arranged stand on which are exhibited a pair of full-sized models of a flued and a water-tube type boiler front, respectively fitted with their well-known boiler mountings. There is also an arch at the front of the stand, built up of Hopkinson valves for all purposes.

It may also be mentioned that a display of their well-known driving chains is shown by Messrs. HANS RENOLD, LTD. (Progress Works, Brook Street, Manchester). This includes three complete drives exemplifying the patent bearing, and the bushed roller, silent chains, and the block chain. Numerous examples of these types of chain are shown, as well as chains for special purposes, including chains for balance weights or machine tools, coal cutter chains, and a complete mortising chain outfit.

Digitized by Google

AN ALTERNATING CURRENT GALVANOMETER

A NEW form of vibration galvanometer was described in a Paper by Dr. W. E. Sumpner and Mr. W. C. S. Phillips read recently before the Physical Society.

Tests of effects due to change of current, such as induction phenomena, are often hard to carry out because the ballistic galvanometer available is not sensitive enough. The vibration galvanometer overcomes only a few of these difficulties. It must be adjusted to resonance for the best effects, and its indications vary with current frequency. The instrument described is illustrated here, and is like a moving coil galvanometer in almost every respect, except that its field is due to a specially constructed electromagnet excited by an alternating voltage. This voltage V is applied to a winding of m turns of the electromagnet, and the core flux N is such that

$$V = rA + mN,$$

where r is the resistance of the winding and A the current traversing it. The coil and electromagnet are so designed that for currents of the frequencies used the value of rA is negligible in comparison with V. The rate of change of N will therefore be at each instant a measure of V, whatever the permeability or hysteresis of the core. The instrument has a laminated electro-

THE SUMPNER REFLECTING ELECTRODYNAMOMETER.

magnet formed of stampings of two kinds—a rectangular portion with two straight limbs forming the core of the electromagnet, and a specially shaped stamping between the poles. The moving coil of 50 turns swings in a narrow gap separating the stampings, in much the same way as in a permanent magnet instrument. On the limbs of the magnet are windings of 200, 2,000, and 4,000 turns. The iron will not be too strongly magnetised if the winding used contains 20 turns per volt on 50-cycle circuits, but the instrument is so sensitive that such excitation will only be needed for exceptional tests.

If a voltage V be applied to one of the field coils of m turns, and if the same, or another, field winding of n turns be joined up, through a condenser of K microfarads, to the moving coil, the torque acting on this moving coil will be a measure of

$$Kn\left(\frac{V}{m}\right)^2;$$

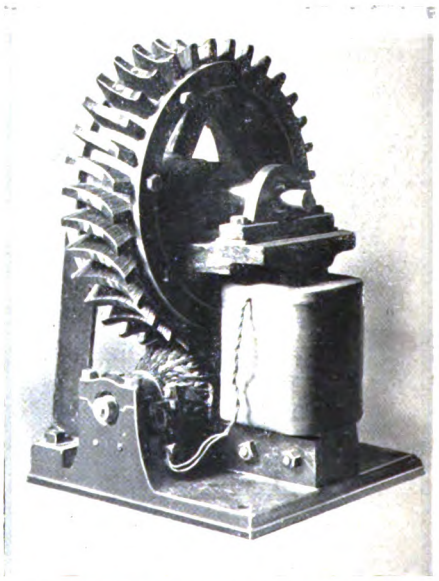
i.e., the deflection is proportional to the square of the voltage. The deflection is independent of frequency and wave-form if the field-winding to which the voltage is applied has a resistance negligible in comparison with its impedance. The instrument may be used with great advantage to compare inductances and capacities by the ordinary bridge methods, the working conditions being (i.) the alternating voltage V applied to the field coil of the instrument must also cause the current in the bridge conductors, (ii.) the alternate current in the bridge must be made in phase with the voltage V by the use of suitable non-inductive resistances, (iii.) the moving coil must be placed directly across the bridge.

The balance can be adjusted with ease to 1 part in 10,000 when the voltages set up on the coils or condensers are of the order of 1 volt. When a balance of great precision is needed, the minute electromotive force e induced in the moving coil by the alternating field of the magnet tends to cause a small deflection disturbing the balance. When the moving coil circuit is non-inductive, the current due to e will be in phase with e and in quadrature with the flux, so that the corresponding deflection will be negligible. But in all cases any effect due to e can be accurately eliminated by working to a false zero.

LOW-SPEED ELECTRIC DRIVE WITHOUT MECHANICAL GEARING

A NOVEL form of electrical machine, applicable as a low-speed motor for driving all classes of low-speed machinery, and as a high-speed dynamo for driving by low-speed engines, has been developed by Mr. J. Lecoche, who some time ago introduced a frictionless magnetic worm gear. In the latter arrangement, the worm and wheel run out of contact with a clearance of about $\frac{1}{32}$ in. The worm is provided with a magnetising coil, and a magnetic circuit is arranged through the teeth so that the whole of the power is transmitted by means of the flux passing from worm to wheel. The motor or other source of power is coupled to the worm, and so long as the torque does not exceed the magnetic pull between the teeth, the gear runs synchronously.

In the present device, the driving motor has been combined with the worm, so that the motor flux serves also the purpose of transmitting the torque. This effects a saving in that the additional field for the gear is dispensed with, and, as shown in the accompanying figures, gives a most compact driving gear especially suitable for machine tools, compressors, air pumps, and other low-speed machines. Fig. 1 is a photograph of a 2-h.p. motor drive of this type designed for a machine running at about 175 r.p.m., and Fig. 2 is a diagrammatic sketch of the same gear. It will be seen that the worm is built up of a



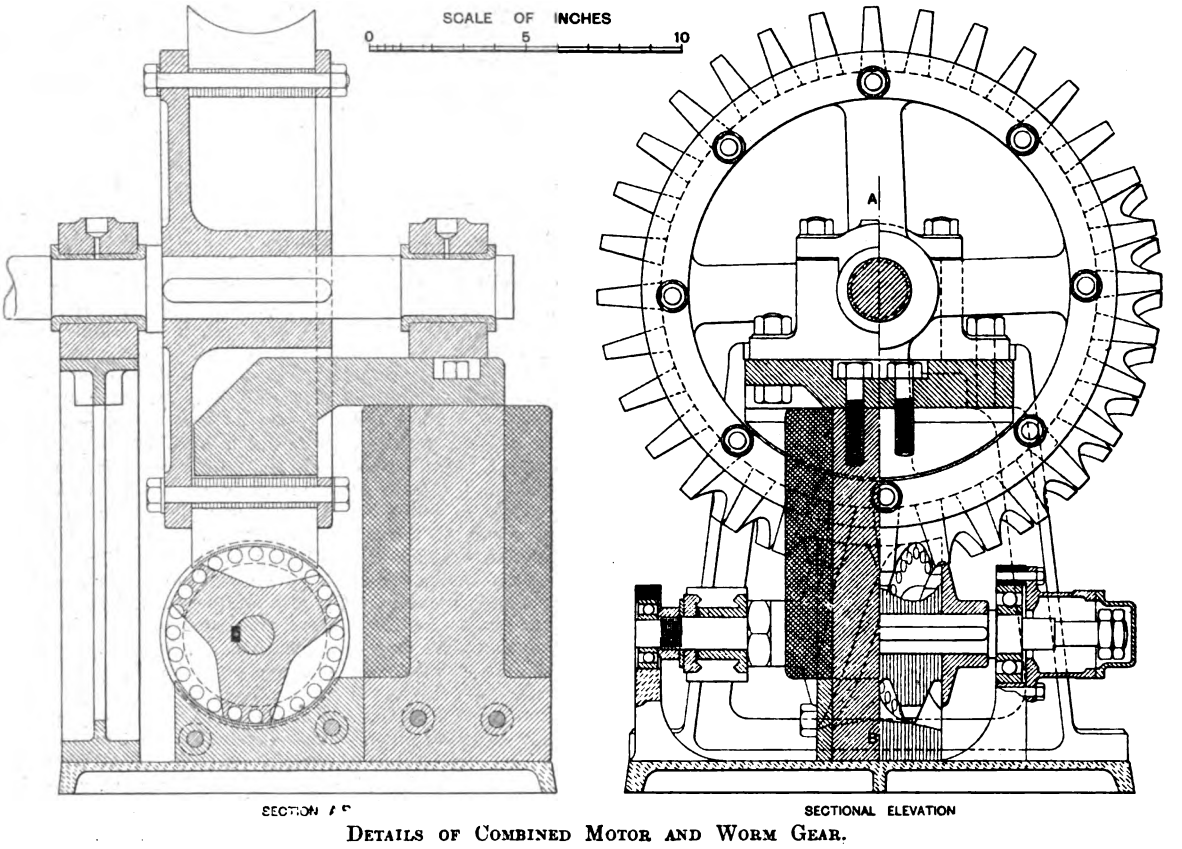


FIG. 1.—VIEW OF COMBINED MOTOR AND GEAR.

number of star-shaped laminations successively displaced so that the projections form the teeth of the worm. Slots are cut parallel to the axle, and the armature thus formed is wound and provided with a commutator. Semi-enclosed slots are used in order to avoid further decreasing the useful armature surface, which consists of the top surface of the teeth of the worm only. The motor illustrated is a two-pole machine with one pole under the armature. The worm-wheel is also built up of laminations displaced so as to give the same pitch, and the second pole of the motor projects over the inner periphery of this wheel. The path of the flux is thus through the rim of the worm-wheel and the armature in series. The gap between the upper pole and the worm-wheel rim need only be very small inded. As shown in the figures, the worm-wheel is cut concave so as to envelop the armature. The magnetic pull on the worm-wheel rim is practically balanced, and the only losses in the gear are the small friction losses in the ball bearings, the losses in the motor, and a very small hysteresis and eddy-current loss in the teeth of the worm-wheel. In the example illustrated, the worm is a 200-volt armature running at 1,850 r.p.m. and the worm-wheel runs at about 175 r.p.m., the ratio being 32 to 3. There is no friction at the teeth, and no wear. The combined gear is claimed to be both more efficient and cheaper than an ordinary high-speed motor coupled to a machine-cut worm gear, and runs noiselessly. It starts up under load, but once the wheels have fallen out of synchronism, the worm-wheel stops, and the motor

Digitized by Google

has to be stopped and started up again. If all the load is taken off, however, the worm-wheel can be run up to speed without stopping the motor. It will be seen that the motor cannot be overloaded, as the wheels will drop out of step directly the torque exceeds the magnetic pull between the teeth. The load at which this will occur is determined by the flux-density employed, and can be fixed at any desired figure. Among the various cases of electric drive for which this device would seem to be suitable are those of coal cutters, compressors, and various machine tools where a slow speed and an elastic drive are required. The device might also be used in place of the small motor with worm-gear and overrunning clutch, which is a feature of some systems of printing-press driving.

The combination is reversible, and Mr. Lecoche has designed a dynamo on the same principle for driving by low-speed engines.

SECTION [illegible]

SECTIONAL ELEVATION

DETAILS OF COMBINED MOTOR AND WORM GEAR.

In this case, the flywheel of the gas or other engine is provided with a laminated iron rim, the teeth of which mesh magnetically with the dynamo armature, the latter being constructed in exactly the same manner as described above in connection with the motor. Though a mechanical worm gear is usually not reversible, the magnetic gear runs equally well in both directions. An interesting feature of a dynamo driven in this manner is that, in the event of a short-circuit, the gear merely drops out of step and shock to the engine is avoided. The 2-h.p. motor described above can be inspected at the offices of MM Lecoche & Cattaneo, 39 Victoria Street, Westminster, London, S.W.

The Zeppelin Airship.—Among the passengers in the first passenger trip from Dusseldorf to Cologne of the new Zeppelin airship *Deutschland* (which was afterwards completely wrecked on Tuesday), was Mr. Sam Mavor, of Messrs. Mavor & Coulson, who was at Dusseldorf attending the International Congress of Mining and Metallurgy.

Conversazione of the Institution of Electrical Engineers.—The annual conversazione of the Institution of Electrical Engineers was held on Tuesday evening at the Natural History Museum, when a large number of members and their friends were received by the President, Prof. Gisbert Kapp, Mrs. Kapp, the President-Elect, Mr. S. Z. de Ferranti, and the Council. The scene was, as usual, brightened by the uniforms of the Corps of Electrical Engineers, and a number of distinguished persons connected with the electrical engineering profession were present. The string band of the Royal Engineers gave a selection of music in the Central Hall, and a vocal entertainment was given in the shell gallery by the Alexandra Ladies' Quartette.

Finsbury Technical College Engineering Society.—The annual dinner will be held on Tuesday next, July 5th, at the Holborn Restaurant.

REVIEWS OF BOOKS

Walker's Engineer's Loose-Leaf Pocket Book, with tables, &c., by N. R. Corke. 50 pp., and blanks. 4¼ × 6½. (London: John Walker & Co., Ltd.) 10s. 6d. net.

THIS is a special form, adapted to the requirements of engineers, of the well-known series of Walker's loose-leaf books, and consists of fifty printed, and a number of plain, ruled and section paper sheets. The printed sheets contain a large number of tables and data which appear to be presented in a very concise form with careful ruling and choice of type to make reference easy. Besides the more general matter, such as metric equivalents, useful constants, logarithm and trigonometric and other tables, a large amount of data peculiar to civil, hydraulic, steam, and other branches of engineering, is included. Data and memorandum sheets not in general use can be filed away, if desired. Fifteen sheets, printed both sides, refer to purely electrical data, including S.W.G. and B. & S. wire tables, British standard cable dimensions, tables of dielectric strength, specific resistance, and other useful constants. It is a pity that the author has chosen, for his formulæ giving sectional area for a given drop, constants which give the result in circular mils, as in almost every other case the tables and formulæ are in British units. New sets of tables can be obtained, as well as refills of blank and used sheets, which can be obtained eyeletted to prevent tearing.
